Announcement in first number of  
FOREST AND STREAM, Aug. 14, 1873.

### GOVERNMENT OWNERSHIP OF THE BUFFALO.

DURING the next session of Congress a strenuous effort should be made by all people who have a respect for things American, to induce the Government to acquire and care for all the remaining specimens of the American buffalo, now alive and not in zoological collections. Lists printed in the past few years seem to show that there are in this country somewhat less than 1,000 head of buffalo in private hands. These should be purchased by the Government, which should also set aside certain reservations for their care, and dividing the buffalo up into small bunches, should have them placed in these different farms and bred there with the same care that, for example, is exercised in the horse breeding establishments of France. Scattered through the old buffalo range are many Indian reservations occupied to-day by different tribes, and from several of these reservations the Government should purchase sufficient territory to pasture a herd of from sixty to seventy-five buffalo and to provide for their increase for twenty or twenty-five years. It is probable that four townships, an area of twelve miles square, would be ample for each such reservation, including the growing of whatever hay might be required for the herd. This land could undoubtedly be bought from the Indians at a price far less than the Government price. Land could be selected of little value from the agricultural standpoint, but excellent for pasture. The expense of fencing such pastures would be an important item, while the help needed to care for the animals would be a slight one, since four men would be enough to attend to each farm. There would have to be a few horses, houses for the hands to live in, and in summer perhaps additional hands would be needed to put up a stock of hay; but it is altogether probable that this putting up of hay would have to be done but once in several years.

It may not be easy to induce Congress to appropriate the money for such a purpose. Congress has very little sentiment about it. It rather prides itself on being sternly practical. Nevertheless there is no body of men in the world so quick to respond to public sentiment as Congress, and if the public really wants the buffalo to be preserved—and it is clear to those who have given much thought to the matter that they can be preserved only in this way—Congress will very promptly respond to that wish; but the public must show that it has a wish in the matter.

A committee recently appointed to urge this matter includes the following names: Caspar Whitney, *Outing*; Hamilton W. Mabie, *Outlook*; Richard Watson Gilder, *Century*; Melville Stone, *President Associated Press*; Grover Cleveland, *Princeton, N. J.*; Dan Beard, *Recreation*; George Bird Brinnell, *FOREST AND STREAM*; Frank N. Doubleday, *editor World's Work*; Charles D. Lanier, *editor Country Calendar*; Clarke Howell, *Atlanta Constitution*; Howard Eaton, *Guide and Ranchman*; John Muir, *California*; W. E. Palmer, *San Francisco*; Henry Van Dyke, *Princeton, N. J.*; Homer Davenport, *cartoonist*, and wild animal farmer; Hamlin Garland, *novelist and lecturer*.

The first question to be faced in all this matter is this: Does the public wish to have America's largest land mammal pass wholly out of existence, or is it worth while for the Government to spend some money to preserve this species for future generations? It is a question of sentiment, not a question of getting back the dollars and cents invested. It is a question of re-establishing a species. The buffalo breed freely in confinement; there are half a dozen different stocks to draw from for breeding purposes; there are millions of acres of forest reserve which after proper laws have been enacted and enforced, so that the Government property within these reservations shall be respected, will form immense game parks as well as forest reserves. It is perfectly possible for the Government within the next twenty-five or thirty years to rear on these suggested farms enough buffalo to stock permanently the different forest reservations in the country so that the buffalo may be left to themselves and need never become extinct.

It is our belief and the belief of many other people who have given careful thought to the matter, this is something well worth doing. We have reason to know that President Roosevelt is heartily in favor of it, and we know that many Congressmen are also in favor of it. But after all, in the last analysis the question as to whether anything shall or shall not be done rests with the people of the country. Do they think that it is worth while that this should be done?

The largest herd of buffalo is that belonging to Michel Pablo, a mixed-blood Indian residing on the Flathead Reservation. This herd, numbering not far from 250 head, is what is left of the old Allard-Pablo-Jones herd and has long been ranged on the Flathead Indian Reservation. This Reservation is soon to be thrown open, the Indians are to be allotted lands in severalty, and the surplus lands to be thrown open to settlement by the whites. When the reservation is thrown open Pablo will no longer have any land on which to range his buffalo, and so will be obliged to get rid of them—to sell them alive or dead. This herd, therefore, will be soon thrown on the market and can be bought for a very moderate price. They should be bought by the United States and places provided in which to keep them.

We should be very glad indeed to hear from any of our readers who may feel an interest on this point.

NOW THAT in this country we have reached a stage where we cannot devise and develop plans for the systematic restocking of game grounds with quail and other birds, the subject is one of constantly growing interest. Our chief obstacle to enterprise in this field has been the interference of the laws forbidding the export of birds from one State to another. The legislation of the year 1905 is characterized in an encouraging degree by a recognition of the need of such stocking enterprises and of the necessity of permitting the taking of live game for the purpose. The Minnesota law authorizes the game commissioner to secure by purchase or otherwise, and exchange specimens of game birds, game animals or game fish with the game commission or State game warden of other States for breeding purposes. A like provision is made by several other States. Thus the Missouri section permits the State game and fish warden, upon application from the game and fish warden in corresponding office of any other State or Territory, to procure and transport to such officer live specimens of the game animals or birds of Missouri to be used for propagating purposes. This opens the way to what might very well grow into an extensive system of transfers of live game from one State to another. Conducted under the direction of the commissioners, there would be no danger that the dealing in live game would be perverted into a market traffic.

There is manifest also an extension of the privilege of keeping and selling live game for stocking purposes. In Massachusetts, for example, a new clause of the law relating to possession in close season provides that "any person, firm or corporation holding a permit from the commissioners on fisheries and game may sell or have in possession live quail for purposes of propagation within the Commonwealth."

THE Tennessee Game and Fish Protective Association has been organized, with Col. Joseph H. Acklen, of Nashville, State Fish and Game Commissioner, as its head, and having vice-presidents to represent the interests of East, Middle and West Tennessee. The purposes are the promotion of sportsmanship, protection of game and fish, and the introduction of new species. The association, which is incorporated, has an extended list of influential citizens as charter members; and we may look for substantial results from the movement. Tennessee is one of the latest of the States to take up in a systematic way the conservation of the game supply, and under the efficient direction of Colonel Acklen an excellent beginning has been made. Game protection is growing in popularity throughout the State. The wide distribution of the members of the new association indicates that it is not a local movement. To the native quail has been added the ring-necked pheasant, and Commissioner Acklen reports that the introduced game gives promise of proving a valuable addition to the feathered resources of the State.

THE Audubon societies have been signally successful in securing the enactment of their law for the protection of song birds in most of the States. Now that the National Association of Audubon Societies has taken up the important enterprise of giving the sea birds a like immunity from pursuit, the public response to its appeals for funds as the sinews of war should meet a generous response. There is no lack of money for the purpose if only the aims and efficient methods of the societies can be brought to the notice of those who would gladly contribute to carry on the work. In another column is printed a statement by President William Dutcher, in which is indicated the very practical methods it is proposed to adopt to put an end to the senseless bird slaughter; and we bespeak for the Association a generous financial support.

SOME months ago we recorded the establishment of a public park system for the city of Wymore, Neb., as a result of the enterprise and intelligent foresight of Mr. A. D. C. McCandless, one of Wymore's citizens, who is well known to the readers of our columns as the author of several sketches of shooting experiences in the grouse country of Cherry county. It is a pleasure to note that Wymore has made acknowledgment of its indebtedness to Mr. McCandless. In grateful recognition of his public service as the founder of the park system and for his liberality to and care of the parks the City Council has named the principal one of the pleasure grounds McCandless Park.

THE angler in Chautauqua county, N. Y., who may happen to hook a maskinongé under twenty-four inches in length must immediately return it to the water "without unavoidable injury." That is to say, he must perform a miracle; but the law requires him to do it, and let us hope that he will find a way to obey the law.

MR. R. B. MARSTON, editor of the *Fishing Gazette*, of London, has invented and patented artificial flies of which the bodies are made of celluloid, and they are said to be very killing imitations of the natural insect. The Canadian Postmaster-General has promulgated a notice that celluloid is regarded by the postal authorities as an explosive. Does this bring Mr. Marston's flies under the ban of the law which forbids fishing with explosives?

SPORTSMEN visiting Florida have complained loudly of the non-resident license system which requires a separate license for each county one may shoot in, with a fee of \$10 attaching to it. This necessitates the taking out of several licenses for a cruise in the Indian River or on the Gulf coast. An endeavor was made this year to change the law, so that there might be one general license valid anywhere in the State, but the Legislature has re-enacted the house provision retaining the single county feature.

THE State of Missouri has come back into the Union again. For some years it was an alien province; that is to say, it made aliens of the rest of us by decreeing in Legislature assembled that no non-resident might hunt within its borders. Thus to make aliens of the citizens of the rest of the country was to make an alien of itself. But under the new and more stringent law, any person, wherever he may have had the fortune to be born, may hunt in Missouri on payment of a fee of fifteen dollars. This is not coming all the way back into the Union, but it is as far as many of the other States have got with their non-resident laws.

OF the late Alonzo Davenport, the famous hunter of Heath, Mass., it is told that he ran down and captured a fox as a condition of obtaining his bride. If that stunt were a common condition precedent many of us would have to go without the girl.

AN international exhibition of hunting trophies will be held in Vienna in 1908. Prince Heinrich Lichtenstein is the president of the committee of organization. America will doubtless be represented with credit; certainly from Alaska we can contribute the largest moose (or as called in Europe, elk) heads known.

## We Three in Canada.

WITH the cool breezes of an early summer twilight sweeping before it the heat of the day, three of our party gathered on the veranda of the boat club to enjoy that fleeting period 'twixt day and dark so well known to tourists on the Sound. Our trip had taken us across the now tranquil water to a famous watering place, and somewhat weary, we sat dreaming. Memory, that omnipresent companion of man, pressed us all into her service, and retrospection, lazily defined in the curling smoke from our cigars, presented to each a different panorama of experiences.

Ted Barmore, his feet dangling over the railing in the corner, related how he had wooed and won the fair young woman whom we were all to meet the next night at the regatta promenade. Ted told how he had gone down to the Indies a bachelor in his yacht *Crest*, alone, save for a chum. Under the most romantic circumstances he met a girl acquaintance, and with less form than the telling had run off and got married.

Reg, our stroke in the races, was full of his spicy yarns of former regattas, and talked till he got tired. One incident recalls another in a peculiar way that stories have, and that, with the dreamy atmosphere, set me thinking. My thoughts wandered back to the summer before, and I noiselessly reviewed my first married vacation. Ted noticed my silence, and told me to bring it out.

"I hardly know where to start," I answered slowly, for through the gathering haze the all too short sojourn stretched itself out before me as if painted by unseen hands. "Please don't mind my dreaming a little as I proceed, for you know, boys, I was rather sentimental about then. We were on our honeymoon, and it really was quite romantic. In the long winter evenings of the preceding courtship we all got our heads together and mapped the thing out. We talked it over and over just as though we didn't know that, after all, the angel would settle upon the ways and means in that calm and positive manner used by a woman of ninety-five pounds in arranging affairs for a man twice her size.

It was quite a novelty in the line of vacations, and more of an experiment until proven to be a huge success. You see, it was much more fun than going off to a hotel, moping around with a crowd of people, all dressed up, and then returning home with hardly enough coin to pay fares from Grand Central to Brooklyn.

Our family is not a large one, but it is interesting. You have not yet had the pleasure, boys, so I'll tell you who they are. The Scribe is just an every-day, hard-working sort of newspaper man, and if I do say so, with a pretty good knowledge of the country, picked up during several years of hoeing corn and potatoes, driving cows and swinging a scythe on a big hill farm in Vermont.

The Angel is that petite little wife whom you are to meet to-morrow night at the dance—small, lively, wide-awake, usually ready for anything that promises fun, and very anxious to learn as much as possible from nature's school.

The Baby is sister to the other, and has been away from her teething ring and rattle some eighteen years or more, but still young in spirit and only too glad to gratify a longing of years to become a scout or trapper and handle a gun.

So, one cool morning in June, at Quebec Junction, N. H., you can imagine us climbing on a train that will land over the border and some miles into the interior of Canada around 6 o'clock in the evening, if nothing shroud happen. We made ourselves comfortable in the one passenger car that the train boasted, shook hands with each other, very solemnly wishing good luck on our journey. Until then it had been a business trip for the Scribe, and even the beauties of Crawford Notch and the nice treatment at Fabyans the night before had been gazed at with a commercial eye. Even the concert in the sitting room at Fabyans Cottage the previous evening by the Bates College Glee Club failed entirely to drive dull care away. But the last line of copy had been dispatched with no return address on it, and a look of joy overshadowed our faces as a pocketful of lead pencils were solemnly buried in a little grave beside the railroad just before we started on the real vacation.

Our actions were so suspicious that two Frenchmen who were in the car, the only occupants besides ourselves, decided that discretion was the better part of valor, and went ahead into the baggage car, no doubt feeling they had left three escaped lunatics behind them. We didn't care what they thought, so long as they left us. As soon as the train got fairly away from the station, with its gaping crowd, we indulged in a war dance, closing with a yell that would do credit to a Sioux, and brought the conductor, or seemed to, for just then he appeared for our tickets and promised to drop us at our station, which we will call Camp 6.

This train on which we were fast leaving civilization, deserves mention as being the slowest, the most accommodating and having the most gentlemanly crew of any train on which yours truly ever rode. It makes the 108 miles between Quebec Junction and Lime Ridge, Canada, in just six hours and thirteen minutes—that is, when it is on time—and its return trip over the same road in eight hours and thirty-five minutes. It carries

everything in the line of freight or passengers that comes its way, has a crew of six men, every one of whom seems to think it devolves upon him in particular to be as hospitable and entertaining as though he owned the train and the passengers were guests.

We were introduced to them all by the conductor, and there was hardly a minute of the journey when one of them was not on hand to point out the interesting things along the road. The Angel and the Baby rode part of the way in the engine cab, and got their eyes so full of cinders that they could hardly see. We got out to pick wild strawberries at the siding as the engine backed off to some sawmill. Lunch was eaten at Beecher Falls—Vermont, New Hampshire, or Canada, whichever you choose—for we left the train at the depot in Vermont, went over to the hotel in New Hampshire and admired the hills of Canada as we ate, and it was with difficulty that I persuaded the Baby not to wade across the Connecticut River on our way back to the train.

A few rods from the station we stopped at the Custom House, where a pleasant old gentleman who represents the Canadian Government came aboard and passed our traps without any unnecessary fuss. Then we steamed ahead into Canada; that paradise of sportsmen and lumbermen, and were in a new country altogether, where sawmills, lumber camps and logcabins were passed for miles. Then of a sudden we would stumble into a little village, brave in its newness and white paint, with its little Catholic church and listless hotel. The girls got down on the station platform to stretch out the cramps, and I presume the rurals who gathered about thought they were dressed pretty plainly for folks traveling.

But even the slowest and most pleasant of journeys will come to an end at last. We had passed St. Malo and Camp 4, and some distance beyond the latter drew up at a 10-foot platform, standing solitary in the woods. Our heavy trunk was rolled off, and we alighted, shook hands with the entire crew, and waved our handkerchiefs at them until the train had puffed away in the distance. We were all alone, and after staring at each other for a few minutes in silence, looked about. The old, tumble-down platform, built years before, when some one decided to cut lumber there and then changed his mind, was without accommodation of any kind. There was not even a roof; aside from the one train a day that passed by, there was no one within twenty miles of Camp 6, so for the next fourteen days we faced our own society.

The trunk was our only baggage, and we were soon making preparations to hide it somewhere in the woods, for we had no intention of carrying it with us some ten miles into the forest. It was unlocked, and three queer-looking, rubber-covered bundles, fitted with shoulder straps, were lifted out, followed by three smaller bundles, each of us taking one. Then we hid behind as many trees, and the squeals and exclamations and giggles that came from the direction of the Angel and the Baby startled the chipmunks for a mile. The Scribe was silent, as became the head of the house, and emerged shortly wearing a look of peace, blue overalls, jumper, wide rimmed hat and tennis shoes. From the trunk he fished a double-barrel light shotgun belonging to the Angel; a pocket rifle, the property of the Baby, and a sturdy .38 Winchester that had been his companion in many mountain journeys and lonely camps.

The guns had hardly been put together, when the girls, if girls they were any longer, appeared on the scene. There was little about their exterior appearance to indicate their femininity; dressed alike in blue overalls, white canvas jumper, hat of the same material, and red tennis shoes. While they might have created some sensation on Fifth avenue, they certainly did look very pretty, and, most important of all, thoroughly in keeping with the grand woods in which we stood.

But it was half after five, and night would soon be upon us in a country strange to all but the one who would mind it the least. So we put our civilized clothes into the trunk, which was hidden behind a huge pine some distance from the platform, and struck off for the first night's camp before we should reach our destination on Trout Lake. We all had a pack on our back, and were soon traveling rapidly and silently, Indian file, dodging drooping boughs, skipping little rills, the girls now and then shying as some wild animal ran at our approach into the haunts of nature but seldom disturbed by man.

For a long time we were mute, the Scribe with thoughts of the trail, the girls still awed with that feeling so common to those who find themselves in the wilderness for the first time, the vagary that makes it seem as though the great forest were some mighty cathedral, too sacred for noise and laughter. The birds and frogs, the treetops and trees, were as old friends to the Scribe, but uncanny to the Angel and the Baby, who at first shunned them as queer. The packs soon grew pretty heavy, and I guess each one wondered if it would be generous to offer to divide with the rest, and the absent linament that had been forgotten grew precious by thinking of it.

When a little more than half the distance had been traversed between Camp 6 and Trout Lake, the Scribe gave a sigh of relief, and announced that it was time to strike camp for the night, and you can wager there was no kick coming from the girls. Our simple pre-

parations were soon under way, and a giant hemlock tree, uprooted by some terrific gale, formed a most convenient ridge pole for our tent. While the Scribe cut the necessary wood, the girls busied themselves with the supper. A dozen or more hemlock branches laid against the side of the big trunk, made a good frame, on which were laid leafy branches, the whole acting as a wind shield and more or less waterproof roof. The place was quickly furnished by scraping out the old leaves and putting in a quantity of pine boughs, over which we laid our rubber and woolen blankets.

The exercise soon brought color to the cheeks of the girls, who were ravenously hungry and quite ready to eat the simple meal prepared from the pack. The Scribe noticed this with a quiet smile, for it meant a lighter bundle for him on the morrow. The repast seemed to revive the lost voices, and praise and admiration of the splendid woods mingled with appreciation of the ingenuity of their guide, so melted his heart that he cheerfully consented to cut the firewood necessary for the night. Drowsiness that could not be shaken off compelled all of us to seek our blankets, and in a few moments we were sleeping that calm, dreamless slumber that comes nowhere else on earth but on a bed of boughs far out in God's wilderness.

Twice during the night did the Scribe get up to throw wood on the fire, but neither of his companions stirred, and just as the night gave way to a rose-tinted dawn, he stole forth for half a mile into the woods. A long, slender maple pole was soon trimmed, to which he fastened a short trout line. Then, as the sun's rays stole over the treetops, he cast a wriggling angler lightly into the largest hole of a winding little brook that gave every promise of an ample breakfast beneath its rippling surface.

There is no need to tell about the sport of such fishing, for depending as we did upon nature for our food, the old-fashioned pole, string and hook were quite enough to yank them out. Of course, it was not at all poetical, but it was businesslike, and served the purpose well. In less than ten minutes the Scribe had thrown away his green pole, and was dressing six large speckled beauties. The sun was just lighting up the camp beneath a hillside, when the noise made in getting a frying pan out of the pack aroused the Baby, who shouted merrily to the Angel. Both were much surprised to discover that they had passed a comfortable night in undisturbed slumber, and also that the exercise of the previous day had not made them lame. A good rubbing of their faces and hands with a wet towel which the Scribe had wrung out of the brook, completed their toilets in a shorter time than they had ever done it in the city, where all conveniences were at hand. Then the remains of the evening's repast, with the trout on the side, put us all on the road to the lake in high spirits.

The end of the level land had been reached by that time, and the five-mile climb that would land us at the summit was begun. We were far more noisy than on the day before, and the Angel stopped every few minutes to gather a lichen or wild flower, but as the rest of the procession showed no inclination to wait for her, she caught up, with many exclamations of delight at the beauties that each step revealed. We did not hurry, but often stopped to rest and admire the denizens of the woodland, so that it was past 11 o'clock, when, high up in a little hollow of the hills, Trout Lake lay before us.

Completely enraptured by the beauty, the peace and the grandeur of the scene that lay stretched like some fairyland before their wide open eyes, the two girls, and even the Scribe, who was supposed to be used to such things, stood minute after minute, until a dozen had passed away, silently blessing the thought that had brought them there. About a mile and a half in length by three-fourths wide, it shimmered in the glistening rays of the sun, a clear crystal, rock-lined, limpid depth of absolute purity. In some places the jagged rocks rose to a height of twenty or more feet, while in others the shore sloped gently to a grassy water's edge.

At the northern end of this beautiful bit of fresh water, and some three rods from a rolling greensward shore, stood a little log cabin, quaint in its rough, homely outlines. It had been built several years before by a trapper, who made it his home, but abandoned it some three summers before our advent. It had not been occupied in all that time, except by rovers like ourselves, who, from the city, perchance, wandered into the wilderness, and for a week or so lived close to nature's heart.

We immediately took possession of the cabin, and with some weary sighs, unloaded our none too light burdens. The cabin was furnished with two bunks, a table and two stools, and had a wide stone fireplace in the side opposite the opening which once had contained a door, long since sacrificed by some one needing dry firewood. It was a very plain little structure, modest to an extreme, perhaps fifteen feet high and as many feet square. From the open doorway, we stood in a group and gazed, fascinated by the scene that lay before us, the bright green woods circling the edge of the glistening gem from whose surface the big, bright orb of day reflected his rays but none of his heat. The Baby's benediction of "Peace be within thy walls" seemed unnecessary, for it looked as if nothing but peace could find a dwelling in such a chosen spot.

There was no time then to admire the bountiful splendor of the Almighty, which that day held us

almost spellbound. We had brought nothing with us in the line of provisions but pepper and salt and a bag of Indian meal, which latter had been the cause of so much grumbling. When we left Portland, it weighed 40 pounds, but during the march through the wooded hillside, notwithstanding that it was being consumed, it had grown in weight until the Scribe was ready to swear it weighed at least a ton. We had met with much opposition from our Brooklyn friends, who thought we should starve if we did not take a four-horse wagonload of supplies, and declared it their intention of starting a relief expedition. We felt secure that we would not go hungry long, and also that there was no more danger of our being found than there was of the North Pole, for, like the general of historic fame, we had burned our bridges behind us, and at once began to keep house.

The Scribe started off for a meal of trout, while the girls began those feminine touches which convert a waste into a habitation, and which put the cabin in condition for our stay. The Baby pulled the old boughs from the bunks and threw them into the fireplace; she brought water from the lake to rinse the bunks and the walls and floor of hard-packed earth. A broom, constructed from a hemlock branch, was her only assistant. The Angel went some distance into the woods and cut some soft, feathery pine with which she made rude beds. Both worked with so much zeal that when the Scribe returned with a string of trout, the cabin looked as clean and homelike as could be wished for. We all ate a record dinner of trout and meal flapjacks, and then slept away half the afternoon, breathing the invigorating pine air, fresh from nature's factory, and enjoying more solid comfort than one could take between city walls in a whole week.

It was the Angel who at length aroused us with a remark which will ever associate itself with Trout Lake, we heard it so often there: "I don't know about the rest of you, but I'm hungry." Out of her bunk she climbed, and attacked a cold trout on the table with so much relish that we hastily joined her, and the last one melted away like so many dewdrops before the morning sun. After this the Scribe expressed opinions freely on the only part of camp life which he never did and never will like, the cutting of firewood. But after the Baby had told him how much she admired his powerful form and enjoyed the artistic way that he sank his ax into the wood, and the Angel had told him how handsome he was when flushed with hard labor—he got his steel and started off quite cheerfully, admiring in turn the subtle persuasion of the fair sex. The Angel followed with her gun over her shoulder in quest of small game, but with visions of grizzlies and elephants in her mind, while the Baby, whose ambitions did not soar so high that afternoon, rambled off fishing.

For some time the only sound was the whack, whack of the Scribe's ax, which lasted only until four armfuls, or enough to last for the night, had been cut, when down he sank on the slope overlooking the lake, meditating on matters in which city newspapers shared no part. He had not time, however, to frame the structure for a day dream, when a shot echoed through the woods from Angel's gun, followed almost instantly by another, and after a moment's interval by two more; then something actually woke him up. It was the sound of Angel's voice, calling to him by the name she used in the old courting days, and in a note that for once in his life entered him in a race at top speed. There is plenty of big game in these Northern woods

which it is not safe to try to bag with No. 6 shot, and with his rifle in hand, he rushed up the hill in the direction of the disturbance at a speed that none of his associates in the city would have given him credit for possessing. Up the hill in the rear of the cabin he ran, and scrambled for a mile or more before he spied the object of his search—the Angel, her gun still hot, standing at the foot of a giant poplar, looking anxiously into the thick leafy top.

She seemed to be uninjured, and he seated himself to catch the breath the hill had stolen before he investigated the animal the Angel assured him was as big as a bear, and which she had shot at four times without effect. She had come to the wise conclusion that she would not stir it any more until she knew something of what it was. Man-fashion he did not tell her, but silently admired her grit in not running away. He then pointed it out to her, and after a well-directed shot from the rifle, which she borrowed from the Scribe, her first game, a big hedgehog, came crashing down. She insisted on dressing it alone, and that finished, started for camp as proud as ever a Napoleon was, but constantly shifting "her meat" from one hand to the other, the Scribe consigned to lugging the guns. Her cup of joy was full, when she found the Baby had returned with a nice catch of fish, and saw her as she stalked into camp as big as life and more than natural. The Baby took a huge interest in the first game, and guessed it to be everything between a moose and a muskrat before she was finally told that it was a homely old hedgehog. It was soon done to a turn over a sizzling hot log fire, and never was meal more enjoyed than then.

After supper we started a series of evening concerts that lasted as long as we were in the woods. And our voices, soprano, contralto and bass, in town not looked on as more than ordinary, sounded wonderfully sweet as the echoes reverberated in the pale moonlight. We sat thus telling stories and singing, the Scribe pulling steadily at his faithful cornucopia filled with a choice mixture brought from the Notch. We sang all the old songs we knew, accompanied by the ripple of the waves, as Trout Lake swashed the rocks at our feet. Then we retired to slumber in those pine-filled and scented bunks, nothing in the world to disturb the tranquillity that good food, hard exercise and fresh air made for us.

Just as the first rays of the sun stole over the treetops the Scribe was awakened by suspicious sounds from the bunk opposite, and he opened one eye cautiously just in time to see two dainty figures disappearing through the doorway, and he smiled significantly as he surmised their intentions. As he lay there half awake, he pictured to himself a big rock by the edge of the lake overlooking a wide ledge in clear view some eighty feet below where a natural shelf rose precipitously about twelve feet out of the water. The Scribe had heard the girls declare that to be a dandy spot for a dive, and he bethought himself of two fairies poisoning lightly on the brink, bathed in sunlight, innocence and grace personified; he could see them shoot downward straight as arrows, and disappear. Then two heads glistening and dripping almost instantly reappeared only a few feet apart as they started for the shore, using those long strokes that a good swimmer employs when in a hurry. The Scribe was up and off for the morning meal of fish by that time, yet he shivered as he remembered the times he used to dive off that very ledge into the same spring, where, if the human body is to be trusted as a thermometer, the temperature is at least

forty degrees below zero. Hunger finally drove him back to the cabin, only to find the Angel and the Baby busy before a cheery fire and as sunny as though there were no cold spring in existence.

If I should try to give a detailed account of the two short weeks that we spent so comfortably at Trout Lake, the larger part of it would necessarily be about our appetites, for they were next to insatiable. Brook trout, lake trout and black bass, horned pout and eels, with hedgehogs and squirrels for a change, hoe cake, johnnycake and flapjacks and all the rest, I must not forget strawberries for dessert, formed our menu for those fleeting, sunny, merry days. And what may seem strange, to look back upon it, we never once grew tired of the diet nor yearned for anything more. Our only regret was the fact that everything must come to an end, and that the time was so short to consume the good things to be had for the getting.

Of course, we did other things than eat; we gathered spruce gum and ferns; we took long rambles through the avenues of trees that stretched interminably on three sides of the cabin. We fished where fish are plenty, and twice had the opportunity to see deer drinking in the moonlight at the edge of the lake. Once we caught a glimpse of a bear, but could not get within range.

We climbed trees and swung among the branches like veritable children of the woods. About a mile away from the lake we discovered a pond warm enough in which to bathe; we soon became excellent marksmen with rifle and revolver, and evenings we made the echoes bring back the music of our songs and hymns.

We were as happy and as free as birds, but, you know yourselves, boys, vacations have a way of drawing to a close all too soon, and it was with a deep and heartfelt regret that we packed up one evening for the return to the world of books and men early the next morning. There was a queer, homesick feeling in our hearts, as we made our way slowly in the bright sunshine of the morrow, headed for Camp 6. We walked the entire distance in leisure, and with far less fatigue than we had experienced on our way out. It was 10 o'clock when we reached the old, tumbledown platform that served for a station and dragged our trunk from its retreat, reloaded ourselves in garments more showy and far less comfortable, and after packing it up again, sat down solemnly to wait for the train. It was past 11 when it crept into view, steaming slowly and emitting smoke like a big factory chimney. Our friends of the train greeted us with zest, and we settled ourselves in such a manner that people would not wonder if we had ever worn clothing before. We succeeded well enough so that when we reached Fabyans at 4:30 in the afternoon, we did not create any undue attention as we walked to the hotel.

The big house was open for the season by that time, for it was two weeks since last we were there, and many visitors had arrived meantime. All hands managed to pass a very jolly evening, but awoke the next morning realizing sadly that our picnic was over until the next summer. And as our train wound down through the Notch, the Scribe opened the window, took one long, backward look, pulled in his head, and with a tremendous sigh, reached to the rack above him for a bundle of New York dailies that were awaiting him at Fabyans. With a pencil borrowed from an old gentleman across the aisle, he was soon equipped, and with a quizzical look at two demure appearing ladies opposite him, once more began work. NELSON SNOW.

## NATURAL HISTORY

### Asiatic Deer in the Zoological Park.

THE already large collection of Asiatic deer in the New York Zoological Park has recently received an addition of an important and very rare species.

By the steamer *Mesaba*, there recently arrived from Burma via London, a pair of the extremely interesting Burmese thameng, or brow-antlered deer (*Cervus eldi*) of Lower Burma. Specimens of this species have been sought by the Zoological Society for the past three years, and this acquisition was made possible only by the placing of an order by the Duke of Bedford for ten pairs, which justified William Jamrach, of London, in sending a man to Burma, spending a considerable sum on nets and services, and in making a capture of twenty-three animals. The price paid by the Duke of Bedford for his specimens was \$750 per pair. The two specimens which recently arrived, and also another female which is to arrive in July, are all the gift of Mr. William Rockefeller, who previously presented to the Zoological Society the entire herds of red deer and fallow deer.

The Burmese thameng is about as large as the Virginia deer. Its antlers are of unique form. The brow tine sweeps very far forward, almost parallel with the upper line of the face, then makes a slight curve upward. The main beam grows backward in exactly the opposite direction, then swings outward and upward in what is very nearly a semi-circle. The points are few in number, but the shape belongs exclusively to this species.

The two pairs of Barasinga deer from India in the collection are at this time very noteworthy. Their summer coat is of a bright golden yellow color, the brightest to be found on any deer—not even excepting the Muntjac.

Besides the deer of the *Rusa* group and those of the *Wapiti* group, the Barasinga are very conspicuous. The largest of the two bucks has now antlers in the velvet, which have attained a length of twelve inches, and they are of the same bright tan color as the pelage.

This interesting deer inhabits northern India, and in many respects is a strong reminder of our mule deer. These two species resemble each other, not only in size, but in horn architecture.

It frequently happens that the antlers of the Barasinga possess a double bifurcation on each beam, which is so characteristic of the mule deer.

The female altai wapiti of the Asiatic deer collection recently gave birth to a fawn, but owing to a mistake of nature, the animal failed to survive. Inasmuch as this is the first instance of the breeding of the altai wapiti on this continent, the loss of the fawn is particularly to be regretted. It was spotted in the same manner as fawns of the American wapiti.

### A Cotton Tail Freak.

MORGANTOWN, W. Va.—*Editor Forest and Stream:* One of the most curious freaks of nature ever seen in these parts, was captured near here recently, in the form of a common gray rabbit, but in such a garb as to make it almost unrecognizable as such.

Aside from its ears being rather smaller than ordinary, it is much like any other "cottontail," except for the extraordinary covering of long hair. It has a covering of fine, silky hair, of a lead color, just the color of an ordinary maltese cat, somewhat wavy and four to five inches in length, falling each way from the line of the backbone like that of a yak. This hair is so thick and long as to completely cover up the natural rabbit fur, except a small patch around the tail and a portion of the head; but the natural fur can be found all over its body by parting the long hair and looking closely. It is the size of an ordinary rabbit, but the thick, long and wavy hair gives it the appearance of a thick-bodied animal like the raccoon or possum, and makes it appear the size of a large possum. It has the ordinary "cotton" tail. Remove the head, legs and tail, and no one could even guess what animal it had tried to be without parting the hair and seeing the rabbit fur un-

derneath. It has more the appearance of an angora cat than anything else; but investigation shows that there are none of these animals within miles of where the rabbit was killed, so that it is hardly a plausible theory that it could be a cross between one of these animals and a rabbit. It is on exhibition in one of the show windows of town, and attracts much attention.

If any FOREST AND STREAM reader can give any light as to the probable identity of this queer animal, we would be glad to hear from him.

EMERSON CARNEY.

[This is a form of diseased pelage, of which examples are reported from time to time. For many years the FOREST AND STREAM had in its office just such a cottontail rabbit as is described—a rabbit with the long coat of a Yorkshire terrier. Rabbits seem prone to curious dermal outgrowths, of which the horns often reported on rabbits from Kansas and Nebraska are examples. The frequently quoted crosses between cat and rabbit, and cat and coon, do not exist in fact. They are beasts of myth; but many folk tales are told about them. The Morgantown rabbit was plain rabbit, but with an unusual coat.]

HUNTINGTON, L. I., June 24.—A fine specimen of a copperhead snake, that rarest of all the snake kind on Long Island, was killed at Long Swamp yesterday by Surveyor Carlos S. Dillon. Without warning the snake raised up its head near Mr. Dillon, flattened out and was ready for fight. Mr. Dillon killed it. The snake was about forty inches long and was found to contain thirty eggs, each as large as a robin's egg.—Brooklyn Eagle.

"To an angler the pleasures of the rod and reel are far reaching, and have no boundary save when the mind ceases to anticipate and the brain to remember. \* \* \* The fish in the pipe-smoke has been as active as was the fish in the water, and afforded as fine a play. My reel has clicked as merrily in the half-dream as on the rod in the long ago."—A Nelson Cheney.

## A Plea for the Sea Birds.

THE passing of the buffalo and wild pigeon is a forceful commentary on the indifference of the people of those days. Are the people of this generation showing any greater degree of interest in the wild life of the present day, much of which is rapidly decreasing in numbers? Few people realize how near the gulls and terns of our coasts came to extinction during the last decade, when fashion decreed that the snow-white plumage of these beautiful denizens of the beaches was necessary for millinery ornamentation.

A simple proposition, in fact a public duty, is now before the American people: Shall the sea birds be preserved for future generations? Unfortunately this class of birds gather in colonies during the breeding season, and are thus in greater danger than the wild bird that breeds singly. Plume hunters can still kill them as in the past, when large colonies on our seaboard were destroyed in a single season. Another method of extermination is eggging; this is quite as fatal as killing the birds. There are yet small colonies of sea birds on the coasts and large inland lakes of the country which will serve as a nucleus, and may, by the greatest care and watchfulness, repopulate our country with these birds. If this desirable result is to be achieved, action must be taken at once by the public; it will not do to neglect the matter another season, or our children will say of us, what we now say of our fathers, regarding the buffalo and wild pigeon: When you had the opportunity to save the sea birds you did not do it, and we are deprived of a part of our heritage. The sea birds can only be saved by placing at each colony, during the breeding season, an energetic, faithful and fearless warden who will stand guard during the three months when the birds are brooding their eggs. The part the public can take in this great economic and æsthetic movement is to supply the necessary funds. The National Association of Audubon Societies, an incorporated body, will do the administrative work.

During the present breeding season this Association has forty such wardens employed; but this number should be increased to at least three hundred men, in order to fully guard all of the remnants of colonies that once existed. The public are urged to join the National Association, the membership fee being \$5 a year, all of which sum is used in bird protection work, as the executive officers of the society contribute their services without compensation.

The seashore without the sea birds would be like a garden without flowers, or a landscape without trees. Unless active measures are taken now to prevent this disaster, it will surely come; then, reader, it will be too late to do more than grieve. This is not a duty you can delegate to your neighbor, it belongs to you; will you help save the sea birds, or will you see them vanish? To your descendants you are responsible.

WILLIAM DUTCHER,  
President N. A. A. S.

## Notes from the Rangeleys.

UPPER DAM, RANGELEY LAKES, Me., June 23.—*Editor Forest and Stream:* Since the recent hot spell the water here has become too warm on the surface for trolling, and that mode of fishing is about over until the fall. Fishing has been very good here this spring, and some very large fish, both trout and salmon, have been taken.

This is my first trip here in five years, and I find the appearance of the lakes much improved by the falling down of the dead trees around the borders. Many trees were killed when the level of the lakes was raised for water storage a number of years ago, and for many years these ghosts of trees lined the shores in great numbers.

Five years ago salmon were rarely caught in the two Richardson Lakes, but now salmon seem to be as plentiful almost as trout, and to have increased greatly in size. It is a well known fact that fish weighing in the neighborhood of 20 pounds are often seen in the late fall under the mill at the Upper Dam. However, the record size caught is, I believe, only a little over 13 pounds, but this record will not stand for long.

Salt water smelt introduced into these waters a number of years ago have thrived wonderfully, and occasionally reach the size of a pound in weight, and by some are considered better eating than trout or salmon. They, however, can only be caught when they come to the Dam in the early spring to spawn, and then only by means of a net, for they do not seem to take to the hook. Their chief excuse for living, however, is to feed the salmon and trout.

Deer and larger game seem to be on the increase, owing undoubtedly to Maine's very good game laws. From all reports the game laws are respected much more than they were ten or fifteen years ago. Protection came too late for the poor caribou, and their name is but a memory here now.

To me it seems strange that mountain lions, or, as they are locally called "Injun devils," are not more plentiful here. There certainly would be good foraging for them. They, like the wolves which were common here once, seem to have departed with the advent of settlers. Well, we do not miss them, for in the deep snows here in February and March they would soon get away with the deer.

It is a mistaken idea which some people have that catamounts will attack only fawns and does, for I have seen large bucks which have been killed by them. While hunting in the Sierra Nevada Mountains last summer I came on the yet warm carcass of a particularly fine buck. He evidently had been lying down on the side of a very steep hill when jumped upon by the cat, and he must have made a great fight of it. I followed the evidences of the conflict up hill for about a quarter of a mile, for bushes, grass and earth were torn up and thrashed around as if a small-sized landslide had taken place. His hide was scratched in long strips where the cat had raked him fore and aft. His neck was not broken nor could I find a mortal wound except where his entrails had been eaten into. This was all the cat had eaten, but I supposed he would return and finish him off at his own convenience. P. W.

[We know of no evidence that the mountain lion, panther or cougar, has ever been found in Maine. A few years ago FOREST AND STREAM took up this question and went into it quite fully, trying to get some tangible evidence of the occurrence of this species so far east. None was forthcoming. Mr. George A. Boardman was interested in this matter during the many years of his residence in Maine, but wrote us only a short time before his death that he had never succeeded in finding any. On the other hand, in a list of the fauna of the Saint Croix published in 1899 and 1900, in his memorial volume, *Felis concolor*, the cougar, is given as well authenticated. It is probable that this may have been from old lists, not revised up to the date of Mr. Boardman's latest information.]

On the other hand, Mr. Manly Hardy, a naturalist, and more than that a fur buyer for many years, said in FOREST AND STREAM in October, 1904, that so far as one was able to ascertain there never was the real live panther in Maine. Mr. Hardy's definition of the term "Indian devil," as used in Maine, is an interesting one; it "is any animal seen or heard in the woods, that the person seeing or hearing can't tell what it is."

Mr. Hardy has taken a great interest in this matter and has run down a multitude of stories bearing on it; when traced to their sources all of them proved false. The late David Libby, of Newport, Me., well known to old readers of FOREST AND STREAM under the name "Penobscot," feels certain that he once shot at a panther. His good faith cannot be doubted, but he himself said that he did not see the animal very clearly and missed, and as Mr. Hardy puts it, "It is unreasonable to suppose that in all these years only one mountain lion has been in the Maine woods, and Mr. Libby is the only hunter that has seen one. Hunters and guides in the bordering Province of New Brunswick ridicule the idea of panthers there. And this reminds us that a year or two ago a contributor sent us a story of an adventure in Maine in which the hero, by a magnificent feat of coolness and courage, rescued the heroine from a ferocious panther. The climax gave a splendid thrill, but fidelity to the truth of natural history forbade the printing of the story.]

## Mother Care.

BESIDES the combativeness of many creatures—ordinarily meek and mild—when they have young, there is the deeply interesting and curious question of ruse practiced on behalf of the young. I think it is Mr. J. Otho Paget, one of the chief authorities to-day on fox-hunting, who holds that an old vixen fox will sometimes, to save her sore-pressed cub, cunningly cross the line of scent, and so draw off the hounds till the huntsman discovers the mistake. Jesse, in the chatty book called "Gleanings from Natural History," notes a statement to the effect that "when a hind hears the hounds she will allow herself to be hunted, in order to lead them away from her fawns." I have no experience in the matter, and cannot say whether the statement is safe or not. But I have had experience in regard to the ruse of both the partridge and the wild duck on behalf of their young. As regards the partridge, mother and father will often collaborate to cheat the intruder, man or dog, and lure him away from their young. Last summer I was within a very few feet of treading on a little family of partridges crouching on some rough ground. As I crept about the field, watching a cuckoo trying to palm off her egg on some small birds, so that she might provide her future child with a comfortable home, a pair of partridges suddenly bounded up almost in my face. They flew off a little way, then dropped to the ground and dragged themselves and cried out in agonized tones, as though they were wounded birds, and I had only to go and pick them up with my hand. But I knew this ruse, and looked down, and there were the chicks, just out of the shells. I remarked on the striking likeness of these partridge chicks in general coloration to partridge egg shells. The same fact struck a friend of mine lately in regard to the lapwing chick and the lapwing egg shell. Does natural selection come in here, too? Is it a sort of unconscious ruse of nature's, by which those partridge chicks which most closely resembled, in the distant past, their egg shells tended to survive, while those not resembling the shells (that harmonize with their surroundings fairly well) tended to attract the notice of enemies and so be wiped out in the struggle of life? In any case, granting the harmony, the belief is again borne in upon one that behind this matter there must be mind. Here, in the case of the partridge, male and female show almost equal affection and anxiety, though, as with the mallard (which resorts to a very similar ruse), I have noticed that the mother is the more anxious and bold of the two.—J. G. Cornish in Cornhill Magazine.

## Where Have they all Gone?

ST. PAUL, Minn.—*Editor Forest and Stream:* Here is a clipping from a St. Paul paper, June 4, 1864: "From the firing of guns all over town early yesterday morning one would have supposed an Indian attack was on. Immense numbers of pigeons were flying over, most of them only a few feet from the ground. Every man and boy who had a gun was peppering them from his dooryard. A number got several dozen without leaving their premises. A great many were killed with stones and clubs."

If, instead of nesting in the trees reasonably close to human habitations, the passenger pigeons had nested in the swamps of the far north, they might be with us to-day. Yet no satisfactory theory has been yet offered for the vanishing of the millions of these birds off the face of the earth. The slaughtering that went on at the nesting grounds did much to thin them out; but other causes have been put forth for their total disappearance.

Destroying game at the breeding places in the far north, it is stated, is prevented by the multitudinous and pestiferous mosquito. In the marshlands, where the geese and ducks breed, the mosquitoes hold undisputed sway, and not only does man refuse to enter the forbidden domain, but egg stealing and bird-eating animals give the region a wide berth. The wildfowl

accordingly rear their families in peace, and when the icy grasp of Jack Frost begins to glaze the lakes and ponds, the birds move southward to open waters.

So, at least, in the far north the sportsman is beholden to the pesky little native of New Jersey for preserving the balance as far as wild geese and other fowl are concerned. There is providence in all things upon this earth, and while we along the Atlantic border fight the mosquito de novo with kerosene, these little denizens of the swamp are acting as game wardens for us in the far north

CHAS. CRISTADORO.

## Fish and Water Temperature.

BY EDWARD A. SAMUELS.

IN a recent convention with one of my friends whose chief recreation is found in the use of the fly-rod, he mentioned a few facts which, although not entirely new to all readers of FOREST AND STREAM, will prove interesting to many of them. He had been reading my article on the use of the sunken fly, printed in FOREST AND STREAM, Feb. 25, and found in my account of the manner in which I employed a large Prince William of Orange fly in a deep, dark pool on the Indian River, N. S., something that corresponded with an experience he had on a famous trout stream not long ago.

The river was, on account of recent heavy rains, more than "bank full," the water extending back into the undergrowth sometimes several rods. Of course, the rapids, as such, were hardly visible, great masses of water tumbling down over the submerged rocks in a wild, angry current; as for the pools they were entirely characterless, for they spread out into miniature ponds and were very deep; their surface, moreover, was covered with flecks of foam and small drift stuff which had floated away from the shores.

On putting his hand into the water, he found it was almost icy cold, the temperature not having risen very much since the great masses of snow in the woods had melted and the frost had come out of the ground, where its presence had tended to keep the little trickling rills which flowed into the river almost as cold as if they had been passing over ice.

This condition of the river was hardly calculated to raise his hopes very high, as far as fly-fishing was concerned, at any rate. But he was on the river for trout, and, being there, he of course determined to make the attempt to entice some of the spotted beauties from their lurking places in the depths of the pools, using the fly only, for he is one of the chosen few who disdain the use of the bait at all seasons. "Drowning angle worms was not to his taste," he said, and he believed that with the fly he could pick out enough fish to make a small creel at any rate.

But after covering the best pools with patience and perseverance that is known only to the angler, he found to his disgust that surface fly-fishing was almost barren of results, a few small trout only responding to his blandishments.

After an hour or more of unsuccessful efforts to rise the heavy fish, which he knew must be in the pool, during which period he changed his flies frequently, and offered as great a variety as possible, he adopted new tactics, and putting in a couple of good-sized, highly-colored flies, he threw them out into the middle of one of the largest pools and permitted them to sink well down into the water, recovering them with short drags of a foot or more in length, such as is used in salmon angling. At the second or third cast he found himself fast to a heavy fish. "It was the sunken fly they wanted," he said, "and I humored them to the best of my ability, but every fish I landed was as cold as if just taken from the ice."

That the temperature of the water has much to do with the success of the fly-fisherman; and, not only that, but with the play of the fish also, I have proved one more than one occasion, particularly in salmon fishing, and the fact has been established beyond question by the observations of scientific anglers on the other side of the water.

I have before me a report of experiments in this direction made by Mr. A. Harper, of Brawl Castle, Scotland. He conducted a series of investigations regarding the temperature of the water and its effect on salmon angling in the River Thurso, from which he drew the following conclusions.

The blood of the salmon is always about one degree warmer than that of the water in which the fish is moving; 33° may therefore be taken as the minimum temperature of the blood—in fresh water at any rate.

An abnormally high temperature of the river water is fatal. Mr. Harper gives a table of sea and river temperatures taken by him during the months of March, April, May, June and July, which tend to show that the ordinary sea temperature is the most healthful for salmon. From his figures it would appear that the "sea during those five months had a range of 12.8°; from 39.9° in March, to 66.6° in July. For the month of April the means of both sea and river were nearly identical, being respectively 44° and 44.7°, and during that month it not infrequently happens that more fish are killed with the rod on the Thurso than during the whole of the rest of the season."

Mr. Harper further says, "That from 44° to 48° is the best temperature for the fish, is proved by the fact that when the water stands between these two degrees, old and stale fish take the fly more freely than at any other time throughout the spring. In May, June and July the ascending fish find themselves in water 12° or 14° warmer than that they have felt in the sea, which accounts for the inferior sport obtained during these months."

## Texas Tarpon Fishing.

TARPON, Tex., June 19.—Tarpon fishing is now in full swing, and following is the catch for this date (one day): J. M. George, San Antonio, 13; F. H. Reed, Oklahoma City, 15; J. E. Cotter, Tarpon, 4; F. W. Chesebrough, New York, 9; H. E. Smith, New York, 3; J. R. Wainwright, Pittsburg, 22; Major L. E. Campbell, Denver, 3; Mrs. L. E. Campbell, Denver, 4; Chas. E. Gast, Pueblo, Col., 2; Joe Curry, Tarpon, 1; total, 77. J. E. COTTER.

# GAME BAG AND GUN

## Across the Clearwater Range of the Bitterroot Mountains.

(Concluded from page 495.)

R. L. IN CAMP COSTUME.

THE next day we corralled the horses bright and early and set out on a long and hard climb. Twice we got lost that day, and right there we had a typical example of the slipshod way of cutting and blazing trails. The old trail led over a ridge to the left and was lost in a high meadow. Retrailing then we discovered our path to the right somewhere in a burned woods. It would have been so simple to cut through the old trail and mark a nearby tree with an arrow. As I said before, the trail to Fish Lake is an old Indian trail and runs like all Indian trails of that country, along the high ridges. That served the redskins a double purpose; in the first place the high ridges became free of snow earlier than the valleys, and in the second place they afforded greater safety when on the warpath. We had been told that in 1877, when General Howard pursued the Nez Perces over the Lo-Lo, the Indians watched him from the heights, while his soldiers were digging trenches and breastworks in the valley. From Lo-Lo Pass the one trail runs via Lo-Lo Hot Springs to Missoula and another continues along the highest crests of the declining chain of hills. "We could have killed every soldier had we found it to our advantage to do so," declared one of the Indian chiefs.

Of course there is a lot of disorder among the pack horses when you come to halt. That is, you do everything but halt, for the spirit of unrest is with the horses. Some stray away down the mountainside, others more ambitious pursue a trail of their own, while still others with an inherent sense of cussedness, try to separate from their packs by wedging against a set of trees or low hanging branches.

This particular trail carried us through burned forests, over high ridges, finally into a place called Two Lakes. To our right was a high, long drawn-out saddle that we had to make at its most inconvenient spot. Otherwise it is not passable, and thus forces the wayfarer to make for the valley and then take to height again. Such is the nature of the beast.

We soon found that it was impossible for us to reach Fish Lake and therefore it was decided to camp on the other side of the high saddle. This camp was named Camp Nash, after our illustrious companion, the Hon. Bill. Deservedly is this spot remembered by his name, for here Bill had an extravagant experience.

A storm threatened after we had finished our meal and so we decided to put up a tent. Into this we all got and adjusted our mattresses, bags and blankets. The best place, or rather the best one to all appearances, we left to Bill Nash, but fate was against him, and it happened this way. The open ends of the tent we had covered up, the threatened south end tightly, and the opposite one partly so as to admit fresh air. As a further protection against draught from his side, Bill's flap of the sleeping bag was fastened up against it. But this-night was not made for slumber, for in the dead, vast and middle of it a storm broke loose, such a one as you only find in the mountains. The rain came down in torrents, and as the wind in the cañon often shifts, our airhole became a regular fountain.

The sharp thunder rolled and rumbled, sounding echos here and there; radiant lightning lit up the tent for moments. The sleepers tightened up in their blankets with a sigh or gasp and the instinctive desire to remain indifferent.

All of a sudden there was a yell. "Help-up!" it yelled out of Bill's sleeping bag. "Some one pull me out of here, you're losing a good man!" Bill's predicament was singular. Being directly under the air vent he got the first dose, and when he commenced to shift and turn around he made the opening larger, while the flap served as a first-class water chute. Bill was hot and that helped him from catching cold, and when I saw him the other day he told me that he does not think much of that kind of jokes.

The following morning, a bright and sunny Sunday, we followed the trail to Fish Lake, our goal for first permanent camp. It was a short ride of two and a half hours

that brought us to the high point from where we could see the lake. A magnificent view opened up before our eyes, a panorama of sublime beauty. Deep at the far end of the valley glistened the long looked-for lake. Beautiful meadows filled the floor of the valley and patches of spruce and balsam were scattered in between.

With the assistance of glasses we made out two camps, one of white men and the other an Indian tepee.

Far over to the east loomed up Graves Peak, and somewhere over north, in among the multitude of peaks, must be the Lo-Lo trail of Lewis and Clark fame. One must possess the pen of Clarence King in his "Mountaineering in the Sierras" to describe the wonders of that landscape. It is a queer experience one has with really big impressions of that sort. To photograph them does not mean to reproduce. The artist's trained eye seems to forsake him here, or else paint and canvas will not yield to the task. Words come a little closer, but best of all is your mind's eye and the memory. There you ride again hour after hour striving for the high points in your trail. Around windfalls and over them winds the pack train until finally you reach a point where the woods get thinner and you bring up against the brink of a cañon. That's a time when life is worth living. So we rode down into the deep cañon, and when we came out near the camping ground we had a good mess of foolhens, a thing not to be sneezed at at any time.

The inhabitants of the nearby tepee turned out to be Tom Broncheau, an old Nez Perces and a friend of one of our party. That same day we lived high, for when we came back from our first day's fishing expedition with filled creels, preparations for an elaborate meal had com-

said it was simple. They had run on to the bear and killed him. But that wasn't Paddie's version. "You know," he said, between munching and chewing, "Ragged Artillery always said when he'd run into a bear he'd hit him in the neck, and by jimminy crickets, that's precisely what he did. We were working down our way into that cañon over across there, and when we thought we were down we found it had a false bottom. So down again we went, climbing over rocks and windfalls. We were just cooning a log when I sees a something coming along over another log. 'Bill,' says I in a whisper, 'there's a bear.' With that he sees him and up quietly with his rifle. Now Mr. Bear comes along over that log, but Bill waits on account of the buckbrush; finally he had a good aim, bang it said and the bear was off the log. We sneaks up and Bill says, 'He's dead, stick him, Paddie.' But thinks I he's playing possum maybe, and reach down and tickles him with the rifle in the nose. But when he didn't mind that I goes down and sticks him."

This narrative was accompanied by Bill's nods and dry cough. "I hit him where I aimed at and that did the business," he said. Have you ever noticed that the people who do things best in this world are the least to talk about it.

Before leaving this great camp we had the pleasure to meet a number of good people. There was a Mr. Brown from Philadelphia, who rode in from the Lo-Lo with a party, then came the three United State Forest Rangers, E. M. Clark, James Stuart and J. Dunham, who, as we know, had been fighting forest fires, which, by the way, were burning now near our trail. This meeting at Fish Lake was remarkable inasmuch as there were at one time sixteen people, or one more than a year's aggregate so far. The trail saw no white man before 1860 or 1870, and none traveled through there regularly up to two years ago.

It was night after supper when the rangers and Tom Broncheau came over for a friendly call. We sat around the camp-fire, that lit up the faces of our friends and visitors, while their bodies seemed to belong to the great unclassified all around us. Brightly shone the stars; no light, no warmth, simply to give the deep azure blue sky depth. But our camp-fire burned, furnished warmth and kept the frost away, while the floating smoke of the pipes put us in that peculiar mood for listening. It was Tom Broncheau and Jim Stuart, both Nez Perces, whom we had asked to tell us about the country and their people. Tom, in his even undisturbable tone, told us of his migrations and hunts, of the pemmican of old, and the bitterroot and Indian tea. He spoke of the days when the red children of the Great Spirit went over the Lo-Lo as far as Wyoming. That night he also spoke of Chief Isaac and his lost mine and how he and Jerry Johnson tried to find it again. James Stuart, too, proved to be a man of thorough information, especially with regard to history and folk-lore of his people.

The camp-fire blazed up and sent its light away into the branches of the spruces; near it only the faces of listeners were visible, while in the uncertain light the figures were swallowed up by the background.

Finally came the parting from our beautiful camp. The improvised smoke house was taken down and the jerked elk meat put away in some kajacs. We had been cautioned that the trail would be pretty bad, but our previous experience dispelled belief that it could be worse than what we had been over. It was another illusion, for the other piece of trail awaiting us was by all odds the worst of any. For miles we had that game of jackstraws in the shape of whole forests of large polepine

burned and fallen over. It was simply incredible, and small wonder that we got lost twice that day, once temporarily and the last time for good. A diligent and business-like investigation the next day showed how it had happened. Riding through Lost Knife Meadows, a beautiful, cool spot with abundant water and vegetation, and about half way between Fish Lake and our intended next camp, Bear Grass Mountain, we had kept on traveling east instead of turning sharply to the left. It is indeed a peculiar feeling to be lost in a few hundred miles of wilderness, but we made the best of it. "If we are lost boys," said Billy Kettenbach, "this is not the worst place we could have picked out." And so it was. The day spent in retracing and finding the point of deviation was put in usefully and successfully in fishing and hunting. The next day's close brought us to Bear Grass Mountain, but here we were cheated out of game on account of a complication of obstacles, for in this camp we formed a practical but highly unpleasant acquaintance with forest fires and barely evaded another one with a snowstorm.

The first day had been strangely unsuccessful. Every one of us had seen many fresh tracks of elk, bear and

Jerry Johnson's log cabin on Lochsa. Trail toward Lo-Lo trail leads over peak back of cabin. Place where Carlin party started on its fateful trip toward civilization.

menced. Bob's ax had skillfully hewn slats and stakes for a table, which was in the course of erection, and the Herr Director had a beautiful fire going, while juicy elk steaks awaited the moment to be put in the frying pan.

In due time we sat down, and as father Homer says, "Gladly raised the hands to the meal festively prepared." 1897 Mayflower, water, sugar and lemon juice toddy à la Bill Nash, punk à la Bob, mountain trout, elk steak, fried onions and potatoes, coffee. Can you beat that? You bet not. When we were home again we had a ten-course dinner with all the tassels belonging to it, but it did not begin to line up with that Bitterroot Mountain affair.

It was an idyllic camp and an ideal one. The next day we had deer, the following elk, but the third had the big surprise for us.

During the day some had built a smoke house and jerked elk; now near dusk all had found their way back except Bill Nash and Paddie. But with the last rays of day gently floating down into the valley there appeared the two mighty Nimrods; Paddie with the bear's hide and Ragged Artillery lugging in the hams.

They were greeted with great deference, and after the usual drink of welcome were made to tell the story. Bill

deer. The solution was furnished after dark when the sky was lit up with a raging forest fire directly below us. During the day the wind must have driven the smoke through another cañon. An investigation was started and we found out to our dismay that there were not one but three fires approaching our camp. There was nothing to do but hold out until morning, and that we did, fortunately the horses were corralled. That night was a peculiar one. From where we slept we could see one of the fires and every once in a while the wind would send over a whiff of the resinous smell of the burning timber.

It was 4.30 when I woke up. Was it possible that the smoke could obscure the sun? That was not the cause, but then— Then Bob woke up and saluted the day with a few of his highly ornamental epithets. "No," he said, "it isn't the fire, but look over there yonder and see what's coming." The wind blew in sharp, short jerks, heavy ice cold drops commenced to fall. "And what is that queer looking air that hangs over the mountains to the south like a dirty tarpaulin." "Snowstorm," said the guide laconically.

No time was lost that morning, and before 8 we were on our way to Johnson Hot Springs. "It is not very far, and once there we will be as safe as in God's pocket," quoth Bob.

So we rode on. Somewhat in a hurry, too, and with a strong feeling of uncertainty. If the snowstorm, which apparently was raging along the Craigs, should overtake us before we reached the Hot Springs there would be a possible delay of a week or more.

"They are shifting the scenery," said the Big Chief, "and I'd like to be in a sort of permanent camp before the curtain goes up."

But it all was not meant for the close of an act, merely a transformation on the open scene, for about 11 o'clock I espied a most welcome blue spot in the skies west of us, about the size of a silver dollar. That thing elaborated on itself until it became a sort of patch, and then

At Syringa Post-office, Aug. 22. Last station in civilization. An irrigated patch on the Clearwater where fruit is grown.

expanded with laudable energy into a deep blue sky. What a change that made in the landscape, not to mention in our own feelings.

That same day, afternoon, we rode into camp at Jerry Johnson's cabin, after having forded the Lochsa above the mouth of Hot Springs Creek.

Here we found company, Dr. Bryan and Mr. Wilford Allen, of Pullman, Wash., Mr. Richie and Mr. Bergen. These gentlemen invited us over into their commodious and comfortably situated camp, where we had a smoke with Mr. Bergen, who "set 'em up" to a cigar; sure enough a cigar. It made a profound impression on us.

Two days were spent resting up, bathing and fishing, and then on a Sunday morning began our long ride toward the Lo-Lo trail.

That day's march cannot be effaced from my memory. Climbing the steep mountain side we reached the high plateau and from there we could see away, away over deep cañons and a mass of peaks, the mountain saddle where the Lo-Lo was said to run. So far the trail only existed on a map little reliable, and we rode along through this perfect desert, following the guide who trusted his memory so that the occasional blazes only served as a sort of verification of his judgment. It was so intensely quiet that your voice sounded as out of a megaphone. But all things come to an end, even cañons and mountains, and soon making a sharp turn east we found ourselves on a clean cut, well blazed trail.

"Boys, we are on the Lo-Lo!" shouted Bob, and so it was. We were in the footsteps of Lewis and Clark, on the same trail over which traveled that dauntless band of men, who helped to find the natural boundaries of the United States.

At first water we went into camp, and when night came we counted six or seven big forest fires across the Lochsa country that we had traveled over. Two days later we forded this stream the last time, and soon came to Packer's Meadows, a beautiful meadow embedded in the foot hills near the Idaho-Montana State line. So we had reached our last camping ground and to-morrow was to be our last day in camp. The last meal was being prepared and then we squatted down to partake of the final effort of the Herr Director.

"Bob, where is the syrup can?" some one asked. "The last time I saw her she was hanging up on the ground." The meal finished we corralled the horses, packed up our personal belongings and then, leaving the camp in

First fresh meat at camp, Fish Lake. Wm. F. Kettenbach and Robt. Willoughby, Guide.

charge of the Herr Director, Bob and Paddie, we rode out toward civilization.

Half a mile from camp we came upon the newly established State line of Idaho and Montana. A plain stone monument marks the spot and blazed bearing trees give the date.

By 1 o'clock we had the first signs of civilization. First a long corral, then a few heads of cattle on pasture, pretty soon some log houses, and then we knew that we had reached the upper Lo-Lo springs. The cows seemed a wonderful sight to us, but our admiration had no bounds when all at once we discovered two little children playing.

Of course it is ludicrous that a month and a half of the life in the wilderness should make one gaze with wonderment upon these articles of creation, but the fact remains that these children's voices sounded like heavenly music to us.

Not far away greeted us Lo-Lo Hot Springs Hotel, where hold out mine hosts Herman and Alvin Gerber. The hotel is a rustic affair, being the main building of a group of log cabins, bath houses, stables, general store, e.c., all scattered along in a picturesque little cañon on the left bank of Lo-Lo Creek. While the hotel lacked some of the essential features of a hostelry, that defect was amply made up by the attentiveness and cheery manner of the two brothers. Indeed we were treated royally, which was the more remarkable as we had hardly enough

Richard Lieber. Paddie the Hostler. NASH'S FIRST BEAR. W. T. Nash. Albert Lieber.

money to pay our bill. But that was a matter of small import with Herman. On the contrary, if we needed money we could have it, besides, he would accompany us to town the next day and see that we were duly taken up at Missoula. At supper time we all assembled in the dining room, and I confess it was a funny feeling to sit down on a chair and eat off a table with a genuine tablecloth on. We also had had a tablecloth in camp. On the march it had served as a pack cover, and in camp the cleaner (euphonically speaking) side was turned up to mark a tablecloth. A chemist would have been able to trace all bills of fare on it. Grease spots, Worcestershire sauce, mustard, syrup and beans had left their marks upon it.

The next surprise was our bed. A closed in room, with a whitewashed ceiling is no fit place to sleep in anyhow. You don't hear the whispering of the leaves, the gurgling of the waters, nor do you see the moon or the stars.

Late the following afternoon we reached Missoula, after a ride of forty miles, grimy, dusty and tired. Our clothes were left behind in Lewiston, so we sent our corduroys to the tailor, although the taxidermist would have been the proper person to take care of them. The bathtub and the barber chair, together with some new underwear and shoes, wrought wonders and soon we thought ourselves on the road to recovery from the wilderness. But that was a delusion, for when Albert and Bill Nash walked along the street I heard one citizen of Missoula say to another one "Wild West," and the other one "Yes, wild and woolly." But that was not the end of it, for when we passed a saloon one of the out-hanging patrons comprised his views in the one word, "Prospectors."

Prospectors, that indeed is the limit; grubstaked prospectors from the Black Lead!

In the meantime, with the kind assistance of Mr. McLeod, of the Missoula Mercantile Company, we had been successful in raising money, and now planned a grand reception for our companions of the pack train. My, my, how they looked, I can't say that I was ashamed of them, for they were all too good fellows to be ashamed of under any circumstances, but they did look just a little bit tougher than I thought possible. Bob's eagle-like proboscis stuck through the dust on his face like a mountain ridge when the snow melts away. But most of it came out in the wash.

At 8 in the evening the house served the best it could afford, and for the last time the boys were together. Mr. McLeod was our guest, representing his home city. Of course speeches were made, not the "I-don't-know-what-to-say" kind, but sportsmen's expressions of satisfaction and good fellowship. For the last time Bob gave us the song of the "White Starched Shirt," and as the hours drew nearer that ended our common experience a faint undercurrent of sorrow at parting crept in. It was a wonderful experience, this ride of 400 miles through the wilderness, with our camps, hunting and fishing expeditions. None of us will ever forget it nor the good fellows that were with us.

So we waited on the platform of the depot at Missoula for the North Coast Limited. It almost felt like a funeral; there we were going to go back in our corduroys, high-tilted, leather-banded hats, only the bandanna had given way to a red necktie.

There, far away, the shriek of a whistle and the glaring headlight of the fast approaching train hove in sight. "Look ahead, Bob," said Billy Nash, "and see whether the trail is blazed."

That allusion was too much for Bob, one great big tear rolled over his cheek when he said, "I do hate to see you boys go." And then followed a great hugging and kissing just as though we were a lot of girls out of a boarding school.

But I am not ashamed to tell it; rather did we feel highly honored by this spontaneous outburst of affection. "All on board," called out the conductor; slowly our palace on wheels glided out into the night and soon the last faint view of our friends was swallowed up in the dark.

When we turned in for the night I took the "sky parlor," for Bill Nash declared that he was done climbing, and before going to sleep to the rhythmic clatter of the

wheels, there passed before my eyes again these wondrous pictures of peaks and cañons, deep forests or burned tracts, there appeared again Fish Lake, its silvery waters, and over there our camp held what comforts the wilderness could offer; there rose up visions of our pack train, of the Lo-Lo trail of bear, cougar, elks and deer; all that and vastly more of which I have endeavored to tell a part to you, my kind and patient reader.

RICHARD LIEBER.

## Reminiscences of a Dog Trainer.

WEST POINT, Miss.—Imagine a beautiful country, framed with narrow, fertile valleys, bordered by low hills, whose sides are grown up to sedge grass, plum ticks and sassafras saplings, with here and there a sea patch or sorghum, also small bodies of woodland now and then, and the reader will have a very fair idea of the country where, twenty odd years ago, Uncle Nat Jesbitt and the writer located to do our winter's training.

Having been entertained at the beautiful and hospitable home of that gifted Mississippian Pious Jeems, was due to his kindness and courtesy that we were so pleasantly situated in a section of country abounding with quail.

Remote as we were from the railroad (having only two mails per week), and the town consisting of a few cross-road stores, we soon became acquainted with many congenial spirits, some of which have remained lifetime friends.

It was our custom after supper to gather at the fires, where the evening was spent in having a good time. Looking back now, I wonder at our being able to walk all day long and still be able to enjoy a social evening after our tramp; but we did, and such a thing is complaining of being tired was unthought of.

Training dogs in those days was a more serious matter and attended with much greater physical labor than at the present day.

Now a trainer gets on a horse, takes out a brace of dogs for a half hour to an hour's run, attended by a wagon to haul the dogs, a driver, and often an extra man to help. When the "workout" is finished, the trainer hies himself to town, leaving the dog wagon to come in at leisure, and the assistant to put up the dogs.

Uncle Nat and myself had no such snap. Routed out of a cold morning to dress in a room without fire, by the time it was good light, we were eating our breakfast, after which we cleaned the kennels, exercised a few dogs that might require it, and were then ready for our day's work. This meant taking a dog each and striking out for an all-day hunt, our objective point often being ten miles or such a matter away. It was out and hunt back, always on foot, and as we believed in those days in killing plenty of birds to a dog, we were loaded with shells when we started, and still heavier burdened with game on our return, for there was abundance of quail everywhere, though we had some favorite spots where they seem to us to be more plentiful than others.

Many an evening at sundown we have come out on the public road ten miles from home, and with dogs at heel, in swinging stride walked the distance quickly, eating our supper by lamp light, feeding and caring for the dogs when done, adjourning afterward to the store for an hour or two before we were in a humor for bed.

One of our diversions evenings at the store was to hold kangaroo court, and much sport it afforded us. Among our many efforts in the way of amusement was laying ghost occasionally on the negroes. One night the ghost, who, by the way, was very fleet of foot, with efflored face and flowing robes, surprised a negro preacher at a particularly lonesome place in the road. The preacher gave one glance of horror, and with a loud "woof," started up the road at his best pace, the ghost right behind him. The race continued until want of breath compelled the preacher to sink gasping in a log by the roadside. The ghost took a seat by him. The preacher edged to the far end of the log, the ghost hitching along after him. It was pretty dark, but the white face and sheet of the ghost were not hard to see.

Finally, the ghost addressed the preacher, remarking, "We come some, didn't we?" The preacher rolled his eyes in mortal terror, and replied, "Yes, Gawd, an' soon as I gets mah bref, Ise gwine to go some mo'." and he did.

We tried possum hunting at times. Just imagine ramping all day and then going out possum hunting until midnight. We did it, with the only result that there was an increase in our appetites.

One morning I proposed to Nat that we go down to the old Rogers field, where I had been told birds were very plentiful and a good open country. Nat agreeing, we started after breakfast, laying our route through the Reeder's field, where we always found four or five species of birds.

Nat was hunting a black and white setter-puppy, by Dash III—Countess Vesta, owned by Luther Adams, and I had a red Irish setter. The dog Nat had, which was named Fred, was the most remarkable roader of running birds that I ever remember to have seen. High-headed always, it for him only required to cross the scent of birds, no matter how much they had fed over the ground, when up would go his head to the body scent, and then at a gallop he would dash up and locate them. Often when they kept running I have seen his body turned so he was going sideways, while his nose was pointing to the running birds like a needle to the pole. So fierce was his onset when he went up to his game, one who did not know him would have believed he would flush them, but he had no intention of doing so. I always believed that his swooping down as he did on running birds had the tendency to alarm them so they quit running and hid, for I always noticed it was seldom that he failed to get them pinned the first wild dash he made, and if the first failed, the second was almost a certainty.

It is strange that we do not see this class of work at the present day. Possibly the habits of birds have changed so it is not possible; but I would like to see old Fred, or many other dogs I can call to mind, give an exhibition on running game and locating it.

We did not hunt the birds close that we found in Reeder's field, as it was convenient to home. In the Sadler place, the Irish dog pointed a bevy. Fred could not be seen, so we put the bevy up, each bagging a pair. The bevy split, part going in a thicket, the balance over a hill. In the thicket we bagged a couple of birds, and followed the others over a hill. The slope on the far side was covered with sedge grass, and sticking up about half-way down was the black head of Fred. The

scattered birds from the bevy we had flushed had lit all around him, we putting up and killing several before we flushed the bevy he was pointing, out of which we scored another brace each. This bevy went to a piece of woods behind us, so we did not follow them. At noon we crossed the Pontotoc road and swung back toward the Rogers old field, arriving there about the middle of the afternoon.

To hunt a dog all day in those days was customary, and our dogs were as eager to hunt as at the start. When we had gone but a short distance in the field—which consisted of many hundred acres which at one time had been in cultivation, but now turned out to grow up in sedge grass and thickets except the branch bottoms which were still in cultivation, the fertile soil producing fine crops of corn and peas—the dogs found the first bevy. This bevy, when flushed, crossed to the opposite hillside and lit in the open in the sedge grass. In going to it we flushed another bevy, which took the same course and lit a little further on. Such an abundance of quail I never anticipated, or expect to see again. The dogs made point after point, until we were surfeited with the sport, and decided to trudge homeward.

Crossing a high hill covered with sedge, the dogs pointed. We walked up to flush the birds, deciding not to shoot, when up darted a woodcock, which Nat knocked over. A little further on the dogs pointed another, which I killed. Further hunting discovered others, until we had added to our bag a dozen longbills.

Leaving the field, we took the road, distributing a mess of quail here and there as we wended our way homeward past the farmhouses, until we had disposed of all our surplus birds. Arriving home, we found supper waiting us, after which we fed the dogs and made all comfortable for the night. Then we walked down to the store and related to our friends an account of the delightful day we had enjoyed.

While we had enjoyed to the fullest a rare day of shooting, we had also given both dogs, which were being finished up in retrieving, the experience that they needed to make them the useful sort. In those days we had better retrievers than is possible now, as they had more opportunity to learn.

Our method was to order the dog to retrieve from where he remained steady to shot, without rendering him any other assistance than a motion in the direction where we had marked the bird down, after finding which the dog came to us on a gallop, sat up and delivered the bird to us at the place where we had fired the shot.

A bolting dog in those days was unknown, because a dog got an opportunity to hunt all he desired, which removed all inclination to bolt. It is a mistaken idea that the dogs of the present day are any different in this respect (at the time their training is begun) from what they were then; the difference is in the method of training.

A number of years ago J. B. Stoddard came into the neighborhood where I was training, and secured an assistant of mine, who began working for me when a mere boy, to help him manage some bolting dogs. Stoddard had five, which bolted every time he took them out. He led them into the field on chain. He brought the chain back. The dogs came in when they got ready, for they bade him good-by the moment they were turned loose.

Stoddard turned the five dogs over to my man. In a week he brought three back to Stoddard following at heel behind his horse, carried them out in the field, showed that they were stanch enough to flush birds to their points, steady, and would back. Another week put the other two in the same shape, accomplishing in two weeks what Stoddard failed to do in the best part of a season. So much for the old methods versus the new.

W. W. TRUSS.

## Points of View.

*Editor Forest and Stream:*

The point made by Mr. Flint Locke is one that was needed, and that gives a valuable hint to some of the contributors to FOREST AND STREAM. FOREST AND STREAM has some charming correspondents, of whom we can scarcely have too much. Cabia Blanco, Lewis Hopkins, Charles Francis Holder and such writers, who tell us something unmixed with egotism, are always delightful. But the man who imagines, because he feels a new emotion at sight of nature's wonders, that he has discovered a new species of the genus homo, and who uses nature only as a background upon which to portray his own superfine sensations is a bore. FOREST AND STREAM prints too much fine writing of that kind; and its editorial comment upon Mr. Locke's article entirely misses the point.

There is something fascinating in the stories of pioneer days, when the hardy settler journeyed into the trackless West to make a home for himself and his family, without other provision for their support than his rifle and well-filled bullet pouch and powder horn; and when he brings down a buck, a bear or a buffalo you rejoice with him in the bounty of the wilderness. But the man who slaughters one of those magnificent creatures, not from any necessity, but to demonstrate his own superiority over a brute and to bring home a hide or a head in proof thereof, is, to say the least, not more heroic than the savage Dyak head-hunter. The savage head-hunter creeps through dense tropical jungles, at night and alone, into an enemy's village, armed only with a knife, to take the head of a man, his equal in power and cunning. The civilized head-hunter betakes himself in a sleeping car to the home of his victim, armed with a high power magazine rifle, employs a guide to lead him to the spot, point out the game and stand by while he assassinates an inferior creature safely at long range.

The savage himself prepares his trophy by stripping it clean to the bone. Our hero resorts to a taxidermist, who takes the gruesome relic, cleans off the gore, extracts the sunken eyes, inserts the painted glass, and almost re-creates the fires of life, for which work of

art our hero assumes the credit. But who shall say that, as a specimen of nature's divine handiwork, it excels the glistening white skull mounted upon the lintel of the Dyak hut? The difference, as the editor of FOREST AND STREAM would say to Mr. Locke, lies solely in "the point of view." Our critical editor reverts to the primitive man for his model of ethical and æsthetic excellence; the Dyak is, therefore, the better model. According to his philosophy, Solomon was not wise, but simply old. His "point of view" was too far removed from that of the primitive savage to be worthy of consideration. From this "point of view" the editorial strictures upon Mr. Locke's logic seem to be unanswerable; and the editor's system of ethics to be as accommodating as it is uninspiring.

R. B. STIMSON.

TERRE HAUTE, Ind., June 19.

*Editor Forest and Stream:*

My college mate and very dear friend Charles Hallock, Esq., whom you well know, sends me a copy of your June 17 issue, with its first article on "The Sport of Hunting," marked to express, I suppose, his sentiments on a subject about which we have a friendly difference, and as the subject is of wide interest and importance, affecting the conduct even of our President, and as its discussion is in a line with your work, will you allow me to make my observations upon it through the medium of your always readable pages?

The writer of the article in question assumes that the objection to killing wild animals in sport arises from the objector's "organic decay," from individual dogmatism and from "the declining appetites" and mature age. But, in this assumption, he goes directly counter to one of the most firmly established principles of Darwinian evolution. It is a great law of nature set forth by Darwin, Haeckel and other leading scientists with wonderful significance, that the individuals of each animal species, including man, pass normally in reaching their maturity through all the preceding forms and phases, alike physical and mental, that their ancestral tribe in its evolution has passed through. Human beings, the same as all others, begin with a single cell, pass in the embryo stage through the adult forms of the animals below them—mollusk, fish, reptile, amphibian and lower mammal—and after their birth, through all the stages from the animal up that the human race has passed through. As infants, they go on all fours and utter only inarticulate sounds; in boyhood have their anthropoid stage of climbing trees and indulging in all manner of monkey tricks; arrive later at the period of savage superstitions and a savage's delight in the use of weapons and in killing other creatures; and only in their full maturity reach the stage of the highest civilized humanity, that of love for all God's creatures and of finding their highest enjoyment in the pursuits of peace.

Now, each of these stages is healthy as a transition stage—no evolutionist denies that, or "views it contemptuously"—but what he does assert is that each one is normally left behind as fast as the one above it is entered upon. There are some abnormal individuals, however, who stop in their growth all along the way, some at one place and some at another, and who never get to the highest one of their adult species, a shortcoming which is known to science as "arrested development." When it takes place before birth the result is human monsters; when in infancy, idiots; when at the boy stage, practical jokers; and when at the savage and half-civilized stage, the criminals, fighters, superstitionists and animal killers of civilized society.

The hunter's instinct, therefore, instead of being in our day the characteristic of the perfected man, is simply a case of arrested development, meaning thereby not that its possessor is undeveloped in his whole nature—for it is well known that one taste and one faculty may stop in its growing, while the others go on to maturity—but that the special part of him which takes delight in hunting is an arrested part; and while its gratification was all right ages ago, at our ancestral stage, as savages, and is right now among savage tribes and perhaps in half-grown boys, it is what the fully civilized man ought now to have got beyond, or at any rate, ought now to repress.

On the other hand, if science is right in this matter, and, as you see, my argument here is based on science rather than on sentiment, then the opposition to hunting for sport, instead of being the result of "organic decay" in civilized man, or "individual dogmatism," or of "declining appetites" coming with age, is, rather, the result of man's organic growth, is the attribute not only of the individual, but of the race, and is the manifestation of his evolved appetites—is "the verdict" to which the evolutionary as well as "ethical weathercock" through all the ages has been pointing.

A few words about its relation to nature. Of course, as your writer says, "the killing of wild animals is a racial instinct implanted in man by nature," and as he again says, "nature has implanted in our nature the capacity to hunt and kill with pleasure." But this is no defense, either ethical or scientific, of its indulgence now, no ground for asserting that "to denounce man as he exists naturally is to denounce the Omnipotence which gave him birth." There is no vice or crime which nature and Omnipotence have not implanted in us the capacity for, none which somewhere in the past they have not made a virtue, not even robbery and murder. Men are continually falling into the mistake of supposing that nature is a fixed condition, and that because an act has been natural and right at some stages of development and amid some surroundings, it must therefore be natural and right at all stages and amid all surroundings.

The very word, nature, however, means not what has been or is, but, as the future participle of *nascor*, that which is about to be, or about to have birth, is a word of progress, of evolution, of an ever better coming state. To know what is truly natural and Divine, therefore, we must look not into the past, or wholly into the present, but forward to see that toward which things are tending. The really natural man, the one who conforms in the highest degree to nature's laws, is not the savage finding his pleasures in the pursuits

of savagery—that is, for one of them, in hunting and killing—but the most advanced civilized man, finding his pleasures in the pursuits of civilization and in the activity of what is highest in his own human nature, the one who has conformed to Tennyson's counsel:

"Arise and fly  
The reeling faun, the sensual feast.  
Move upward, working out the beast,  
And let the ape and tiger die."

I have based my argument thus far on science alone, but it has also its side of sentiment, and of a sentiment not apart from science, but which science justifies and includes. It is a fundamental principle of Darwinism that all animals on the earth are of one primal stock; that all life, from that of the lowest monad up to that of lordliest man, is one life, a spark of the Infinite Life; consequently that we are all relatives, "distant relatives," to be sure, as Mark Twain said when he wept at the tomb of Adam, "but still relatives," and to take away in sport the life of any creature, that which is its most precious possession—what is it, even from the scientific point of view but a form, one form, even if not the worst, of robbery and murder?

Then as regards sport, manly sport. Your writer speaks of those who have "disliked to hunt" as "effeminate men," "timorous souls," those "who among the Indians of our day are rated as squaws and treated accordingly." But I cannot see what manliness there is in a person's going out into the woods armed with all the protections and appliances of modern art and invention to kill a creature which has only its own bodily powers for its defense and escape, or how any man of culture and sensibility can find pleasure in giving any creature pain. All honorable sport implies some equality between the parties engaged in it, and some willingness on each side for the encounter. Even the lowest street urchins cry out against the bully who assails a boy smaller than himself. But what equality is there between a hunter with his repeating rifle, invented and made for him by some other man, and a bird or innocent deer, or even a Colorado bear equipped only with its wings and feet and teeth? Last Feb. 22 four stout men, armed with guns and accompanied with four large dogs, passed my door on their way to celebrate the birthday of "the Father of their Country" by shooting out in the woods little chipmunks six inches long, and they called it sport! Well, it may be, as your writer says, "the vagary of the sewing circle, the overfed stomach and of advanced senility" to have no sympathy with such killing; but to my mind it is a vagary which is manliness itself as compared with the virility of six feet of hunter and a Winchester rifle against six inches of squirrel and a set of teeth. In the days of the cave-dweller, when killing was needed for food and defense, and when man had reached only that stage of development suited for it, there was some equality between the parties—the cave-dweller on one side with only his club, and the cave-bear on the other with only his claws. And let the defender of killing now go forth similarly matched, and we of "the sewing circle, the over-full stomach and advanced senility" will look complacently on the encounter and will not say one word against any sport in it that the hunter so armed may be able to find.

True it is, as your writer says, that "every age has had its groups whose forces were against what is, whether what is was government, society, science, religion, creation or ordinary peace of mind." But this fact only justifies the opponents of hunting. It is the method of all progress. The whole of our race cannot be in the advance. A few, to start with, rise up in every department of life through whom the forces of evolution manifest themselves; a few who first catch the fuller light and the larger view. It is so now with regard to the treatment of animals. In past ages such persons were put in prison, burned at the stake, tortured on the rack for their forwardness by their slower fellow men. Now they are only called names—"effeminate," "squaws," "timorous souls," "theorists," "dogmatists" and the like. But by and by, in spite of the ridicule and persecution, other men rise up and join them on the same level, and eventually the great majority of men take the larger view, see the brighter light and do honor to the once despised leaders,

"For Humanity sweeps onward,  
Where to-day the martyr stands,  
On the morrow crouches Judas  
With the silver in his hands.  
Far in front the cross stands ready  
And the crackling fagots burn;  
But the hooting mob of yesterday  
In silent awe return  
To glean up the scattered ashes  
Into History's golden urn."

All this I write, as my friend Hallock knows, not as an attendant of "the sewing circle," or devotee of "a cat and cake," but as a lover of nature and of out-of-door sports and of a rough-and-tumble encounter now and then with out-of-door forces. But I find the camera a better means of getting acquainted with nature than the shotgun, and a finer pleasure in winning the favor of animals than in winning their fear—more satisfaction in the song and live motions of birds and beasts, always so full of poetry and grace, than in their silence and motionless death, always the dreariest prose. And when I want a real test of the manhood that is yet left in me amid even "the senilities" and "organic decay" of seventy-three years, I find it grandly with my yacht out on the river, lake and ocean in an encounter, generally alone, with the foaming wave, the mad tempest and the lightning-armed storm-cloud, an encounter where surely the risk and strength are not all on one side, and where victory brings to the conqueror no cruelty and to the conquered no pain.

I like your paper, *FOREST AND STREAM*, because it includes in its field these finer sports, which involve no killing—is a weekly journal not only "of the rod and gun" but of the camera, sail and oar. I know well the Sugar Island on the beloved St. Lawrence River that you say in the paper before me is to be the scene of the canoeists' meet this present summer—can testify to its being a most delightful place. I hope that more and

more of your readers will rise up to the pleasures of which canoeing is a type. And my aim in this article has been to show that it is the lovers of such pleasures, rather than the lovers of hunting, who occupy the viewpoint of our latest science and our truest manhood, and on the other hand, that it is those who find their sport in killing animals that are cherishing what the writer I have criticised calls "the point of view of an ash heap"—the ash heap in our human nature of old, burnt-over troglodyte appetites and tastes.

JOHN C. KIMBALL.

GREENFIELD, Mass.

*Editor Forest and Stream:*

Thoreau has said: "If anything ail a man, so that he does not perform his functions, if he have a pain in his bowels even—for that is the seat of sympathy—he forthwith sets about reforming the world." To a certain extent the above would seem to apply to two members of the great *FOREST AND STREAM* family—Brothers Flint Locke and Stephen P. M. Tasker. Their argument against the killing of game does not prove that it is wrong to kill wild animals for sport, but that their own personal opinions have changed, and that they have come to consider it wrong. Could their argument be inculcated into the mind of every individual in this country, how long would it be before we would become the prey of every land and property-grasping country on the face of the earth? This doctrine may seem irrelevant to the one advanced by them, but such an argument as theirs looks like a step toward the element which would dispense with an army and navy, because these instruments of government might some day be the cause of somebody getting killed.

It would seem that it would be an unfortunate day, indeed, for our country, should its citizens come to one mind that the killing of wild animals must cease. It is well known by those who are at all familiar with the subject, that living game is a far more difficult proposition for the marksman to hit than is the artificial target. The movements of game are more erratic and less machine-like than are those of artificial targets, because the game is endowed with natural cunning, and can think; but the artificial targets have neither cunning nor thought.

As I have said before, in the columns of the *FOREST AND STREAM*, the ability of a nation to retain its individuality and independence, depends absolutely upon its ability to defend itself. History proves this. The ability of a nation to defend itself in these days depends upon the ability of its citizens to shoot and hit the target! It must seem that a nation whose people are expert marksmen on animated targets must be superior in warfare to those who have had practice only on inanimate targets. The proof of this is right before our eyes to-day. The Japanese had absorbed knowledge and practice in this respect in their war with China, when their targets were living men, and they are demonstrating to-day the result of that experience in the magnificent manner in which they have thrashed Russia. The Japanese can shoot straight—the Russians can't.

Now we don't want to wait and get our practice on the living men of an enemy. We can utilize time to advantage by putting our wild animals up, under wise game-law restrictions, as targets. It is no hastily arrived at conclusion on my part to say that I believe it to be a duty we owe ourselves to propagate game purposely that we may kill it for sport and profit. Not financial profit, but the return in good marksmanship, which practice gives, on living things.

Should vivisection be discontinued, and the valuable knowledge which results therefrom be thrown overboard because somebody happens to be shocked by the flow of blood, and the look of suffering in the tortured animal's eyes? It is tough to look upon, I admit; but there is not one-tenth of the suffering caused in the hunt as there is in vivisection. We do not butcher our domesticated animals for the sake of inflicting torture, nor have we a fiendish desire to be cruel. We kill them for food. We can use our wild animals to better advantage than this, and it is my opinion we do.

The return we receive in seeking game with rifle and gun is in becoming acquainted with new scenery and surroundings; in different food and congenial companionship round the camp-fire; renewed health and vigor, and, above all, in that proficiency of marksmanship which makes for the protection of home and fire-side, saves our country from the haughty and arrogant grasp of robber nations, and from other national humiliation, because more eloquently than words it proclaims, "Hands off!"

To call President Roosevelt "an educated bulldog," simply proves the unfitness of the Massachusetts official who did so for the position he holds. The sentimental donkey who would bray such an asinine opinion to be world simply proves that "fools are not all dead!"

WILLIAM H. AVIS.

WHITINSVILLE, Conn., June 18.

### Breeding Game Birds.

BOSTON, Mass., June 24.—*Editor Forest and Stream:* The by-laws of the Massachusetts Fish and Game Protective Association require that a meeting of its board of management be held as often as every three months, and accordingly a meeting was held on Monday evening with President Hinman in the chair. While no formal action was taken, many of the members being away, several matters looking toward future work were informally discussed. Mr. A. B. F. Kinney brought a report from Worcester that Professor Hodge now has eight little chick partridges in his aviary, which was pleasant news. The Association is much interested in the Professor's experiments in raising ruffed grouse in captivity. In fact, this has appealed so strongly to the bird committee of the Association that a few months ago a donation of quite a sum of money was voted to Professor Hodge to aid him in carrying on this line of work.

What will be the ultimate result of his efforts no one can say, but if it should be shown that partridges can be

propagated in large numbers it will be a great boon to the sportsmen of all those States where the ruffed grouse is the game bird, as it certainly is in Massachusetts.

The writer has been told that quail (Bob White) have been hatched and reared in very considerable numbers in confinement. If any of your numerous readers can furnish full particulars of such rearing of quail it would be greatly appreciated, not only by your correspondent, but by a host of others.

Mr. Louis Morse, of North Attleboro, succeeded in raising a number hatched from eggs he secured last spring, but I believe only three reached maturity.

Mr. Wright, an enthusiastic sportsman of Rockland, Me., whom I visited in 1894, told me he had hatched both quail and partridge eggs and had been able to keep the chicks several weeks, but they eventually sickened and died. One quail he had laid sixty-two eggs in a single season. Whether Mr. Wright has been continuing his experiments since I saw him I do not know.

Mr. Cyrus A. Taft, of Whitinsville, informs me that he and his friends are so well pleased with the experiment they tried in putting out quail last December that they will try it again the coming winter. He says it is necessary to start in with the first snow and locate the birds and tole them to the feeding boxes. This he does by scattering chaff along between the spot where he finds the birds and the box. After the quail once find the feed they will come to look for it every day. CENTRAL.

### Alcohol in Gunnery Practice.

*Editor Forest and Stream:*

The use of alcohol as an economic agent in army and navy service is being much discussed in military circles. In the effort to determine what factors have most contributed to Japanese success in the Orient. Will you, therefore, permit an occasional contributor of yours, who claims the honor of putting up (in 1874) the first prize offered at a Creedmoor competition, to intrude herewith his ipse dixit?

From all the cumulative testimony which critical investigation has been able to procure, it would seem that the Russian efficiency was most seriously impaired by the service of the old-time grog ration, which was primarily given out to inspire courage, but whose value, if any, was more than counterbalanced by causing inaccuracy of aim in firing. There can be no doubt that alcoholic stimulants not only quicken the heart action, but blur the vision. Note the eyeball inflamed by spirits, how sufficed it is with blood, and say if the aim of the piece can be accurate under such conditions? Mark the cardiac rhythm when the arteries are surcharged, and say if a heavy sea is not more steady than the human breast against which the gun is pressed?

It used to be an open secret at the butts in long range rifle shooting that the best shots were made after inflating the lungs by a long-drawn breath; and, although in naval gunnery the weapon is not in contact with the body in a way to be affected, there can be no doubt that the eye which directs the range finder, and the hand which presses the electric button to effect its discharge, are both pathologically disordered and deranged when put out of normal by an exciting agent.

C. HALLOCK.

### Ontario Deer Winter Mortality.

JOHN KELLY, of Lindsay, tells the Watchman Warden, that he saw a thousand dead deer during the past winter while bush ranging in the French River district for a Saginaw firm. The habit of the deer is to keep to the runways and browse along them, but in this long, severe winter, the fodder close to the runways gave out, the deer could not travel through the deep snow, and then the animals starved. "I have traveled the woods a good deal in winter," said Mr. Kelly, "but I never saw such a depth of loose snow, nor such mortality among the deer before. I came across their dead bodies everywhere. Often they had waded out into the deep snow toward other trees, and overcome by weakness, sank down and died where they were. The lumbermen saved hundreds of deer. Hunger drove the animals right up to the camps, where they were not molested, but allowed to feed at the haystacks. I never saw a lumberman try to hurt one of them, but have often seen deer lying beside the stack chewing their cuds. This treatment and the horse feed littered along the cage and draw roads have been a great help to the deer. Sometimes, however, even that help came too late. I have seen where deer had come across the oats left where horses had been fed in the snow. The starving deer had eaten the remaining oats, but died on the spot, because the big feed of grain was too much for it."

### Quebec Moose Reports.

AYLMER, Que., June 22.—*Editor Forest and Stream:* The following extract of a letter from Mr. Halstead Scudder, Mineola, N. Y., June 3, 1905, may be interesting to your readers: "I personally saw last fall on the Maganasippi River and tributaries twenty-nine moose, and a gentleman I had with me, who was north six weeks longer than I, saw fifty-seven. We have carefully preserved the game on our territory, and the killing has been limited to six or seven bull moose a year."

On June 9 Mr. Archie McLean, lumberman of the township of Eardly, P. Q., reported to me that he had traveled timber limits on the Kipawa country with two men for two months and they say that during that time they had seen at least 150 moose. He (Mr. McLean) is an old bushman, and he says that he never saw anything like it in his life.

The moose, red deer and bears are very plentiful in the counties of Ottawa and Pontiac, including the Height of Land. The latter is a very good country for caribou. The game laws, as will be seen by the attached letter, has not been amended last session. N. E. CORMIER, Provincial Game Warden and Fishery Overseer.

All communications intended for *FOREST AND STREAM* should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

## An Outing in Michigan.

MONTHS of pleasant anticipation and a week of active preparation, found me quite ready to board the evening train of the Pennsylvania line on Aug. 5, in company with a friend whose destination was the same.

As the morning dawned, we found our train arrived at Reed City, in what had formerly been the heart of the pine forests of Michigan ere fire and ax had swept all away. We were interested in noting the great changes made in this section of the State since last over the route years ago, and ere we anticipated, found ourselves in Petoskey, with its steady population of about 5,000 augmented to over 10,000 by the influx of summer visitors. It has become quite an important business place, as the source of supplies to the villages and summer resorts of quite an area. Our train circled around the beautiful Little Traverse Bay, upon whose entrancing shores are located Bay View, Menonaqua, Roaring Brook, Wequetonsing, and Harbor Springs, with their pretty summer homes of thousands overlooking the waters of this charming bay, and having reached the last-named, then returned to Keweenaw, near Bay View, and then northward, passing Round Lake, small, but pretty, the head of the chain of lakes that constitute the famous "inland route," and in a few minutes we were at Conway, our destination, and our train sped onward toward its terminus at Mackinaw City, while we were gathering our belongings and having them sent, my friend's to his summer lodge on the south shore of Crooked Lake, two and a half miles distant, and mine to Conway Inn, pleasantly located on the shore at the head of the lake, where I had engaged quarters for the season. From the porch one gets a fine view down the lake. On the right are the neat cottages of Messrs. Jewell and Anspaugh, of Cincinnati, and on the rising ground further back the Lake Home Hotel, and farm of the veteran Hastings, who was one of the pioneers of this region—then the handsome point covered with natural forest growth of maple, beech, birch, balsam, cedar, mountain ash, and a few lordly white pines. This is known as Cincinnati Point, having been purchased about twenty years ago by a party of Cincinnati gentlemen on recommendation of Captain Barnes, and upon which the club built six small cottages, which they and their successors have occupied every summer since. They also have a commodious dining hall and good boat house. Beyond the point are located several neat summer houses, with the woods in the background. On the left is moored a family houseboat, which is occasionally towed to other localities. Beyond this the neat cottage Wildemere, belonging to Mr. Stallman, of Columbus, O. Further along a picturesque log house in a cedar grove at the mouth of the pretty trout brook known as Town Line Creek; then, after an interval of another half mile, come in view the nearest of the row of pretty summer homes that occupy the entire lake front up to the steamboat landing at the village of Oden.

Looking beyond Oden, a distant view is had of Poshawaing and thence across to the eastern shore of rising ground, with a few cultivated farms. Across from and beyond Oden is seen the large island of that name, the only one in the lake, the southern extremity of which is near the mouth of the Minnehaha, a famous stream for trout, and whose headsprings are some five miles distant in the hills, and following from thence the southern shore eastward about a mile, is found the outlet of Pickerel Lake. This outlet has been dredged so that small steamers and launches can easily go through. Between Crooked Lake and Pickerel Lake is this handsome thoroughfare of about a mile and about midway is a small oval pond of deep water, and quite well noted as a good fishing place. Pickerel Lake is quite a handsome body of water, almost entirely framed in wooded shores, and about one and a half miles by three in extent. Cedar Creek flows in at its eastern extremity, and is a good trout stream. From the head of Crooked to the head of Pickerel Lake is a good eight miles.

Crooked Lake is five miles long by two and a half miles in width at its widest part, about opposite Oden. Its outlet is Crooked River flowing northeasterly from near Poshawaing by a very devious way through the forest some six or seven miles until it debouches into Burt Lake near the mouth of the famous stocked trout stream known as Maple River, and about two miles from the handsome Colonial Point Hotel on the northern shore, and about three miles from Sager's Buckeye House on the westerly shore, and about six miles from the Columbus Beach resort and Indian River Village at the foot of the lake. Burt Lake is over nine miles long and five miles at its greatest width, and is a very charming body of water, with generally high wooded shores, and is a famous resort for many from Columbus, Ohio, Pittsburg, Pa., and other localities. Its outlet is the Indian River, which, after five miles' run through the good duck marsh, discharges into Mullet Lake, the largest of the chain, and which is about twelve miles long and about five miles at its greatest width, and has a number of noted resorts on its beautiful shores, which are in the main, forest-covered, with here and there a cultivated farm. At the foot of the lake, where it debouches into the Cheboygan River, excellent bass fishing is found, as well as in the river which runs through about seven miles of attractive country, and after receiving the waters of Black River, the outlet of Black Lake, is quite a respectable river, emptying into the south channel of the Straits of Mackinac, at Cheboygan.

The appearance of the country through which this chain of lakes and connecting rivers pass, together with the fact that Round Lake is separated from the eastern extremity of Little Traverse Bay by sand dunes

of only a half mile, indicates that all of both Emmet and Cheboygan counties that is north of this valley must have been an island at some time. The trip through—known as the inland route—by the regular little steamers Topinabee and Charles D. is very entrancing, and is well worth taking. A boat leaves the Oden pier every morning during the season, and goes through to Topinabee on Mullet Lake in time for dinner, and meets the boat there that started from Cheboygan at same hour, and after dining, each boat returns, reaching destination at 6 o'clock in the evening, thus affording an opportunity for passengers to transfer and go through, or to return by same boat. Many take this charming recreative trip several times during the season, and unite in extolling the beauty and variance of scenery of lake and river.

The best lake for fishing is Mullet, and the next best is Burt. In Crooked and Pickerel lakes the fishing is only fair, except for small varieties, although occasionally some good bass, wall-eyed pike and pickerel are the reward of the persistent fisherman.

Having ascertained that to hire a rowboat would cost \$2.50 per week, and as my outing would cover about ten weeks, I concluded that I preferred to have one of my own and be more independent, and had therefore scanned closely the advertising pages of FOREST AND STREAM to determine which to select. Having had considerable experience years ago with my canvas boat Wanderer, accounts of cruises in which were given in your pages, I was inclined to the advertisement of the King Folding Canvas Boat Co., and having sent for a catalogue, finally ordered a 11-foot special, with oars and single paddle and named Wanderer, to be sent by express to Conway, and two days after my arrival there it came to hand, and was soon put up and in the water and found to be quite satisfactory. During my ten weeks' stay, I was on the lake nearly every day, and would row with ease from six to twelve miles; and for a change of exercise would run ashore at some woodland road or path and walk from three to five miles, enjoying thus to the fullest extent the scenery of both water and land. Among the cottagers about the lake were a number of Cincinnati acquaintances whose invitations to call were frequently accepted, and an hour was thus often passed in pleasant converse and reminiscence. Twice every week the necessity of a barber required a row over to Oden, and then a stroll in that vicinity was always a pleasant episode. Nearby is a famous orchard that produces the finest and fairest of choice apples, and so prolific was the yield that they were sold at 20 cents per bushel at the orchard, or 25 cents delivered within two to three miles, and were shipped in carloads barreled. It is asserted that the hardest and best fruit is produced by grafting on the stock of the native mountain ash. During the season the two good-sized hotels at Oden were well filled with summer guests, and the wharf was active with launches and rowboats, starting out and arriving from different directions. The New Oden was discovered to be on fire at about 11 o'clock one night near the close of the season, and notwithstanding every effort made to save, was totally destroyed. It will undoubtedly be rebuilt in readiness for the coming season.

There is almost daily a good sailing breeze on Crooked Lake, and very frequently the wind comes up very strong and somewhat unexpectedly, and with its wide sweep causes considerable commotion, and the white-capped waves are very much in evidence. I was caught out on several occasions when it required hard pulling to make any progress against wind and waves, as the Wanderer was so light—55 pounds—and drew so little water, but by keeping her well headed up she rode the waves like a duck and shipped no water whatever. Occasionally I would vary the exercise in good weather by taking my single paddle, and after putting a sandbag in the bow for ballast, would seat myself astern and spend a couple of hours in paddling, Adirondack style, from one side, with occasional change over, somewhat to the surprise of those who had never seen it done until then.

The water of this lake is clear and cold, and numerous are the spring rivulets that feed it. There are beds of water plants in several localities that afford habitats for fish and anchoring places for the still-fisher, and are almost always well occupied. Launches of many kinds are getting quite numerous, nearly every cottager having one for rapid transit, and for towing their rowboats when out on fishing excursions, and on fine days the lake has quite a gala appearance. Mine host Blackmer, of the Conway Inn, has quite a fleet of good row and sailboats for rent, and hardly a day passed but there came parties from Petoskey to spend a while upon the water in rowing or fishing. Another great attraction is the supply of pure and cold water obtained from numerous flowing wells that have been driven at both Conway and Oden, and is so much prized that it is taken in quantities to Petoskey and elsewhere, and the sign "Conway Spring Water Used Here" is not uncommon in the cities on the G. R. & I. line at restaurants and hotels. It is said to be absolutely pure, and is certainly very fine, and as cold as should be drank; and the amount that runs to waste would be greatly appreciated could it be piped to some city where it could be used in place of yellow Ohio River water.

I was asked to accompany a couple of gentlemen on a trip to Black Lake, southeast from Cheboygan, to be gone a week or ten days, during the latter part of August, and being ever ready for adventure or exploration into unknown localities, I gladly accepted their invitation. We took the early morning train to Oden, and there embarked on the steamer Topinabee, and were soon meandering through the crooked ways and the wild scenery of the tortuous Crooked River,

enjoying every rod of the devious trip of from six to seven miles through to Burt Lake, and were then soon steaming up to the dock at the beautiful Colonial Point, and thence across to Sager's, having in the passage a handsome view of this fine body of water and its changing shores, and then a rapid run to Indian River Village in time for a very good dinner at the Alcore. After dinner we engaged Mr. Shafer with team and double-seated spring wagon and started on our thirty-five mile ride across country to the head of Black Lake, or, as named on some of the maps, Cheboygan Lake. At Indian River is the mouth of Sturgeon River, augmented near by the waters from Little Sturgeon River, and which are noted trout streams, and easily accessible. Our road northeasterly across the sandy pine barrens or plains soon brought us to the crossing of Pigeon River, a goodly stream, which empties into Mullet Lake, near to where debouches the Indian River, and has enjoyed the reputation of being prolific of trout and also for an occasional grayling. It certainly had an inviting look, and we regretted that we had not time to give it a trial, especially so inasmuch as neither of our party had ever had the good fortune to fish for or take a grayling. We passed on, but at least one of us made a resolve to visit the locality at some future time, and give it a fair trial.

For some miles our route was over sandy soil, with only gray pines to be seen, until, having crossed one or two promising looking trout streams flowing toward Mullet Lake, we entered a rolling country with fine hardwood timber, and with here and there a cleared farm; and after passing en route a couple of small hamlets which in due time will unquestionably be good towns, as the country becomes more settled, we reached the flourishing little city of Onaway, a railway town, just at dusk, and stopped at one of the hotels for supper for ourselves and team, and then continued our journey to the little hotel at the head of the lake. On inquiry, we found that a firm of wealthy lumbermen had rented the place outright for two weeks, and with their families and friends it was filled, to the exclusion of any others, and we could not be accommodated. Somewhat discouraged, we drove back to where the cross road ran parallel with the lake, and drove westerly until, coming to a lumber camp, we made inquiry, and were told that a Mr. Stewart, who had a farm near the lake, about a mile further on, might take us in, and arriving there at about 9 P. M., we finally induced them to do so, and during our stay of three days were much pleased that our lot had been cast with these pleasant people. The next day was spent on a nearby stream known as Stony Creek fishing for trout, and with fair success. A game of whist in the evening swiftly passed the time, and was followed by a good night's rest.

Next day, we took a boat and did some trolling and more exploring about the lake, catching some fish and enjoying the scenery. The following day we pulled down to the foot of the lake, and stopped for dinner at the neat log hotel kept by Mr. McKinnon and situated between where Black River enters and also makes its outlet. Here we found quite a number of fishermen guests, who had made very good catches of pickerel, wall-eyed pike, bass and perch. We engaged the little gasoline launch that is run in connection with the house, to take us with rowboat in tow to a point about five miles up on the northerly side of the lake, where we fished for a time, with poor luck, as the bass were not biting, notwithstanding that many were seen, some of good size. We caught some pickerel, and then went on an exploration tour of the shore and strolling through woods roads and paths at various points, and gradually worked down and returned to the hotel for a late supper. Next day we had the launch take us up to Stewart's landing, and we got our luggage and bade our hosts good-by, with assurances that they would be glad to have us come again; and went back to McK.'s and spend the afternoon in exploring the outlet.

The day following, a party of four having been brought in from Cheboygan, we arranged with the driver to return with him, and enjoyed very much the trip of fourteen miles down the Black River Valley, which we found entirely cleared up and occupied by prosperous farmers, with good buildings, and whose orchards were loaded with fine-looking apples. We passed Long Lake, about midway, which has a good hotel, and has been well-stocked with bass, and is bound to be quite a resort. Its outlet runs into Mullet Lake. Arriving at our destination, we put up at the New Cheboygan Hotel, remaining until 8 o'clock next morning, and then embarked on the Charles D. of the Inland Route Line, and steamed up the Cheboygan River, enjoying the scenery of this interesting waterway all the way through to Mullet Lake. Our trip through Mullet was very enjoyable, the high wooded shores and beautiful points being interspersed with an occasional farm and hotel and cottage pleasantly located, all adding to the attractiveness of the varied scenery. Parties angling from boats took pride in holding up for view their strings of fish, and withal the time swiftly passed, until our arrival at the wharf at Topinabee. Here we disembarked for dinner at the hotel, charmingly located, and tree-embowered, and then re-embarked on the steamer Topinabee, now making its return trip. We enjoyed the scenery throughout Mullet Lake, and Indian River, and then re-entering Burt Lake, passed on, and again through Crooked River, arriving in due time at Oden, and thence by train to Conway, well-satisfied with our tour.

While the season was still open, in September, a party of five planned for a day's trouting up the Minnehaha, and taking our lunches along, we pulled four miles down the lake to the mouth, and then up the winding course of the river for about a mile to "the head of navigation," and leaving our boats, separated

and went to different points upstream, some taking one side and the others the opposite. Some distance up and we strike a clearing, where a party has a herd of about two hundred Angora goats, that appear to thrive on the browse found in the forest, and which return regularly to the ranch every evening and perch picturesquely on the stumps about. Further up, the cedar thicket is left behind, and the stream passes through a hardwood district easier to traverse. Returning, near dusk, upon comparing notes, we found about fifty trout of the legal limit of seven inches and upward had been retained, as the result, and the tired party were glad to again take boat and row back to the inn, where a good supper refreshed, and an evening at whist and pinochle entertained until retiring time. At breakfast the trout were nicely served, and all felt repaid for their exertion. At the hotel during the greater part of the season was a pleasant company, hailing from Ohio, Indiana and Pennsylvania, several of whom had made this their resort for years. It was my first season here, and as it proved a panacea whereby I escaped asthmatic hay-fever, with which I had been afflicted the three preceding seasons, I arranged for storage of my boat and fishing equipment, and engaged quarters in advance for the next season, and on Oct. 15 took train for Cincinnati, after having had a very enjoyable outing.

E. S. WHITAKER.

CARTHAGE, Ohio.

## New England Fishing.

BOSTON, Mass., June 24.—Mr. C. A. Taft has just returned from a trip to Rangeley, where he says he found the fishing good. He tells me that Rangeley Lake is proving more prolific of fish for the last two seasons than the other big lakes. He succeeded in landing a 7½-pound salmon and a number of smaller fish.

Admiral J. K. Cogswell and wife, in company with Mr. Wm. A. Pierce and wife, of Portsmouth, N. H., enjoyed an outing of ten days at this lake and took fifty-eight salmon besides twenty-one trout, saving only as many as they wished for the table. The ladies of the party took several fish from 3 to 4 pounds in weight.

Dr. and Mrs. W. C. Halleck, of New York, have been taking their share of salmon, Mrs. Halleck securing one that weighed 4½ pounds. Miss Sophia M. Freedman, of Boston, with Gard Hinckley, guide, had the good fortune one day to net a 3¾ and a 5-pound salmon. Another Boston lady, Mrs. W. K. Corey, with Eben Harnden, guide, took a 4½-pound salmon. An automobile party from Newton, Mass., that has been doing the lake region, consists of Frank E. Stanley and wife, Mr. and Mrs. George Hall and E. M. Hallett and wife.

Mr. C. P. Stevens, of Malden, mentioned in a former letter, continues to enjoy the fishing, and has made a computation from the records by which he finds that seventy-four fish entered give a total weight of 284 pounds, an average of 3⅞ pounds each.

Mr. J. J. Brigham, of Springfield, Mass., with E. Hinckley as guide, has taken a 6½-pound salmon.

Several successful Boston anglers are Mr. Samuel O. Lunt, C. A. Hubbard, H. H. Chandler, Alexander Jackson, G. T. Howard and two sisters.

Dr. C. W. Packard, of New York; Prof. Wm. A. Packard, of Princeton, and Dr. Charles A. Packard, of Bath, are enjoying their annual outing.

Ed. Grant's stories and good fly-fishing are drawing many to Kennebago and Beaver Pond. In one of the parties at Grant's are some half dozen police captains and inspectors from the Hub. Just out from these camps is V. F. Prentice, of Worcester, with his guide, Bert Herrick. Charles W. Porter, of Lynn, has just gone into his camp at Dodge Pond, accompanied by his daughter and her husband, Mr. L. M. Atherton, of Boston.

Anglers from many cities are moving from point to point among the score or so of favorable locations made easily accessible by the extension of the railroad to Oquossock.

Our old friend, Hon. H. O. Stanley, who deserves to be remembered with gratitude by every devotee of the rod, has visited Moosluckmeguntic Lake. Mr. Clement R. Hoopes, of Philadelphia, takes home a 9-pound salmon with smaller ones. Billy Soule has had my esteemed friend, Col. C. E. Billings, of Hartford, at Pleasant Island camps for several days, and right sorry I am not to have been there at the same time. His visit calls to mind a few delightful days at Billy's two years ago, while the genial Colonel was there. A 7-pound salmon will give the guests something to talk about, and the Colonel something to recall with pride.

A 6½-pounder fell into John Fraser's net. Minnows prove more tempting than worms just now. As usual, when the Colonel left Billy's he made for Tim Pond, where trout, though not large, are never scarce. Two skillful fishermen from Brattleboro, Vt., W. H. Childs and C. W. Dunham, have taken a good number of trout from B Pond with flies. Some of your readers know this pond is accessible from Middle Dam and from Lakeside on Umbagog Lake. At Square Lake two Boston anglers are Messrs. W. E. Blodgett and N. A. Norcross. This resort is in great favor with anglers of eastern Maine. Many guests are there now from Houlton, Caribou and Bangor. Mr. McClellan, of Newark, N. J., recently had a novel experience on Cross Lake. Thoroughfare, the result of which was when he returned with his guide after a day's fishing he had something besides fish to show, viz., a large lynx. A lad thirteen years of age, son of Dr. Boone, of Presque Isle, recently took a 6-pound square-tail from Square Lake, one of the favorite resorts in Aroostook county.

From Kineo, the "dramatis personæ" are somewhat changed, but the events are the same as for the last few weeks, the only difference being that fly-fishing is now the prevalent method. The Snyder and Mead party in a stay of ten days at Mr. Snyder's camps recorded 150 trout.

Messrs. F. W. Tufts, J. B. Thomas, F. B. Allen and J. L. Sneckner have been the representatives of New York anglers. Dr. F. H. Jenckes, of Woonsocket, R. I., has taken toge weighing 8 and 10 pounds. Several Bostonians, Messrs. John Riding, George C. Brooks and H. E. Raymond, members of the Moose River Reform Club, have had good sport, taking many large trout and toge.

Mr. C. W. Whiting, of Holyoke, and Mr. Lawson Ramage, of Monroe Bridge, have been to Cancongmock Stream where they got a good string of brook trout weighing from 3 to 4 pounds. They report seeing many moose and deer. They came so near one big bull moose they said they could have touched him with a fly-rod.

Mr. F. G. Crane, of Dalton, and Mr. H. A. Francis, of Pittsfield, have gone into the woods on their annual camping trip. Other visitors are Thomas F. Stoddard and bride, of Cohasset, Mass., on a honeymoon trip; J. W. Whepley, of Washington, D. C.; C. P. Russell, of Greenfield, Mass., and Mr. J. F. Russell, of New York; also A. F. Hanson, of Boston, and Fred S. Parker, of Bedford.

Another lake in high favor with the few who have visited it in years gone by and which is likely to become more widely known in the near future, is Onowa. From its waters Wm. A. Bradley, of New York, has recently taken a laker of 13 pounds.

CENTRAL.

## Fish and Fishing.

### After Salmon and Ouananiche.

EARL GRAY, Canada's new Governor-General, like his predecessor, the Earl of Minto, is quite a sportsman. In fact, there have been very few Governors of the Dominion, in recent years, who have not at least been followers of Izaak Walton. All, with the possible exception of the Earl of Aberdeen, made the acquaintance of some of Canada's salmon streams, while Lord Dufferin, the Marquis of Lorne and his wife, the Princess Louise, and Lord Stanley, now the Earl of Derby, were skillful anglers. Few of them ever tempted the ouananiche, however. This is what Earl Gray proposes to do next month. First, he intends to have a few days' salmon fishing with Mr. Price, of Quebec, and early in July will try his hand for the first time upon the leaping ouananiche. On his way to Lake St. John, His Excellency and party will stop over at Lake Kiskisink as guests of the Metabetchouan Fish and Game Club, to enjoy the hospitality of the beautiful club house there, and the splendid trout fishing in the adjacent waters. The invitation of the president of the club, ex-Governor Chamberlin, of Connecticut, was extended for him to His Excellency by Gen. W. W. Henry, United States Consul at Quebec, who will probably accompany the vice-regal party to the club limits and look after their comfort on behalf of the president and members of the club.

All the members of the Metabetchouan Club who were in camp some time ago have returned home, fully satisfied with their sport, which was of a very high order this spring.

The same report as to the quality of the fishing comes from nearly all the northern waters this year. Mr. A. W. Hooper, of Boston, killed a number of trout between 3 and 5 pounds in weight in the early part of June on the limits of the Nonantum Fish and Game Club. He reports that the early fishing above and below the new dam at the outlet of Lac des Commissaires was very good, and that he also killed very heavy fish in Big Ear Lake.

Lake Edward is so much the vogue this year that there are nearly fifty guides out at present upon the lake and surrounding waters with angling parties, all of whom are having good sport, the usual proportion of 4 to 6-pound fish having already been reported.

Mr. Walter Scott, of the Quebec Bank, Quebec, has been giving the lie to the indolent anglers who excuse the ease with which they take the big trout of Lake Edward with trolls and bait by the plea that it is not possible to catch them in any other way. Mr. Scott spent an evening in fly-fishing on the lake last week and returned to camp with a dozen beauties in his creel.

Salmon fishermen are hurrying down to their rivers on receipt of telegrams from the guardians to the effect that the fish are in the rivers. The height of the water in the early part of the month induced the belief that the fishing would be fairly early this year, and this has proved to be the case in most of the rivers. The nets are doing remarkably well along both coasts of the gulf, too well perhaps for the good of the rivers and of angling with rod and line, and salmon is cheaper on the Canadian markets at present than it has been for some seasons past at this time of the year. Montreal dealers quote it in their circulars at fourteen cents per pound.

### Salmon Fishermen en Route.

Mr. Walter Brackett, of Boston, and Mrs. Brackett passed through Quebec on the 16th inst., en route for their camp on the bank of the Ste. Marguerite. Mr. Brackett was joined here by Mr. Hooper, who is sharing his salmon fishing this year.

On the branch of the same river fished by the Ste. Marguerite Salmon Club, several members, including Mr. Gard, Lyon, of Oswego, N. Y., are in camp, and at latest advices from the stream, were daily expecting the arrival on the river of other members, including Senator Proctor and the Rev. Dr. Henry Van Dyke.

Several members of both the Ristigouche and Cascapedia salmon clubs are already on their respective rivers, but the list of names has not yet reached me. Nor have any reports as yet of the nature of the fishing.

The commodious and elegant camp of Lord Mountstephen at Grand Metis, and the splendid fishing of the Metis River, which have been shared in past years by so many different members of the royal family of England, are at present being enjoyed by a party of New York financiers, including Messrs. John W. Sterling, H. E. Gawtry, George R. Sheldon and J. C. Bloss.

The first steamer crossed Lake St. John to the ouananiche fishing grounds of the Grand Discharge on June 20, the day upon which the Island House was opened for the accommodation of anglers. I have been told briefly that the fish in the Discharge are very plentiful, but that no very large ones have yet been taken. This fishing ought to be at about its best by the time that these lines appear in print. Dr. Watson, the well known Boston surgeon, and Mr. and Mrs. Cunningham have taken up their summer residence in their fishing camp by the side of the Grand Discharge. Among the first of the casual visitors this season to the Discharge was Mr. Geo.

Donaldson, of Harrisburg, Pa., counsel for the Pennsylvania Railroad.

### Salmon River Possibilities.

Considering the many unsatisfied demands for salmon fishing that come from every part of the United States and Canada, it has rather surprised me that there has been so little comment upon the Maine salmon proposition contained in the letter of March 15 last addressed to FOREST AND STREAM by Dr. Robert T. Morris, of New York. Do not the American anglers of means, who have sought in vain for salmon fishing in Canadian waters, realize the opportunities which the doctor has brought to their notice? Personally, I am unacquainted with the rivers to which Dr. Morris refers, but I have friends who know at least some of the streams in question, and I know enough of the general plan proposed by the doctor, and of the satisfactory manner in which a somewhat similar one has worked in the case of well known Canadian waters, to feel perfectly satisfied that there is "a good thing" in both speculation and salmon fishing, in the suggestions of Dr. Morris.

For the sake of emphasizing let me briefly recapitulate the contents of his letter. He tells us that the first six rivers to the west of the St. Croix River in Maine are all natural salmon streams, and that a few salmon ascend as far as to the dams every year still, in spite of sawdust and slabs. As an illustration of the fact that the country has been lumbered so thoroughly that the mill properties can now be bought at rates which would allow salmon fishermen to take charge of both the mills and the streams, the doctor declared that he had the offer of one mill property, together with control of all of the salmon water and several thousand acres of culled timber land that will become valuable again, for about \$20,000.

He tells us that he would have seized the opportunity himself, were it not that he has so many other interests that it would have been impossible to give the time to the development of this stream.

For those who are totally ignorant of the character and cost of salmon fishing—like the party who recently wrote to a friend in Canada asking for a list of salmon rivers for sale, and saying that a party of his friends, twenty-five in number, desired to buy one at once so that they could erect a camp on it in time for the fall fishing—\$20,000 may seem a good deal of money. To anglers who know something about salmon fishing and its present cost, the sum mentioned will appear quite moderate, even without the value of the land and mill and growing timber. Mr. J. J. Hill pays \$3,000 a year for the lease of a river that is so far away from Quebec down the Gulf of the St. Lawrence that he goes down to it in a steam yacht. I have a friend in Quebec who pays \$2,500 a year for a defective title to the fishing of another river, which he has not been able to visit for some years. As much as \$25,000 in one case and \$30,000 in another have been paid for single pools of the Ristigouche. Close upon \$9,000 annually is received by the Government of Quebec as rental of only a portion of the fishing in the Grand Cascapedia; and a single share in the Ristigouche Salmon Club, carrying with it the fishing of only one rod, has a market value of from \$10,000 to \$12,000. I know a Boston angler who has refused an offer of \$75,000 for the riparian rights to the fishing of a river controlled by him.

Outside of the Penobscot there is scarcely a river in the United States that can rank to-day as a first-class salmon stream. The rivers referred to by Dr. Morris—one of the leading authorities on the subject—can be made excellent salmon streams. I know what protection has done for certain Canadian rivers—the Jacques Cartier, the Murray and the Ste. Anne des Monts, among others—and I know that what has been accomplished upon this side of the international boundary, can be done just on the other side of it, too, under the conditions mentioned by Dr. Morris.

I had a letter the other day from Mr. Charles Hallock which recalled this matter to my attention. Mr. Hallock has knocked about the neighborhood of the rivers in question quite a bit since 1859, and appears even more enthusiastic about the matter than the doctor it. He tells me that he has eaten salmon out of the Denny's River all summer long, and no longer ago than 1898, and that he also knows something of the other five rivers referred to.

There are many men of wealth and affluence paying inordinate sums for Canadian salmon fishing, who might, at a comparatively small cost, control excellent fishing of their own after a few years of protection; and such opportunities can be had upon both sides of the international dividing line. But I know of no present proposition to compare with that of Dr. Morris, and it is sincerely to be hoped that a few men of ample means will be found to come forward and undertake the great achievement of restoring these streams to their original beauty and value and of accomplishing so desirable a project of rescue and rehabilitation.

E. T. D. CHAMBERS.

### Capt. Gregg's Shark Story.

TARPON SPRINGS, Fla., June 24.—*Editor Forest and Stream:* I was greatly interested in Captain Gregg's shark story, told in your issue of June 24. That is a true story. I know it, because I have heard it, with thrilling variations, ever since I first went to sea, in 1848. I believe in survival of the fittest, and the story that has lasted as well as the one in question must be true. Besides, I have met scores of men who had been eye-witnesses, also a great many who had turned the identical grindstone. For further proof I have seen the very jack-knife myself. It had had some half a dozen new blades and several new handles, but it was the same knife all right. Tell us another one, Captain Gregg. How are you off for weather in New York? We have a surplus here, hot and moist, but the fish bite well. TARPON.

### Texas Tarpon.

TARPON, Tex., June 15.—The one-day tarpon record is now held by Mr. L. G. Murphy, of Converse, Ind., who, on June 13 (Tuesday), succeeded in bringing to gaff twenty-four. The tarpon catch to date for this place is 960. J. E. COTTER.

## The Spirit of It.

SALMON fishing is indeed a passion, and the appetite once implanted almost invariably grows rapidly to the end on the very little indeed that it nowadays has to feed upon. Look at that otherwise sensible person, standing midway in the gelid Tweed (it is early spring or latest autumn, now the only seasons when there is a chance), his shoulders aching, his teeth chattering, his coat-tails afloat, his basket empty. A few hours ago, probably, he left a comfortable home, pressing business, waiting clients and a dinner engagement. On arriving at his "water," the keeper despondingly informed him that there is "nae head (shoal) of fish," although at the utmost "there may be a happenin' beast." But in his eagerness and ignorance he knows better than the keeper, and there he is at it still, in his seventh hour. The wind is in his eye, the water is in his boots, but Hope, the charmer, lingers in his heart. To many this is a marvel, considerably greater than that which Byron stated and explained:

"Though sluggards deem it but an idle chase,  
And marvel men should quit their easy chair  
The toilsome way and long, long league to trace,  
Oh, there is sweetness in the mountain air,  
And life that bloated ease can never hope to share."

For surely it is still more marvellous that men should quit not only their easy chairs, but their native element, in pursuit of something which they very seldom obtain, and which is to be got at home for a twentieth part of the money and no trouble at all. It has been maintained, though not perhaps in cool print, by men of sense and sobriety, that the thrill of joy, fear and surprise (nowadays surprise is the predominant emotion) induced by the first tug of a salmon, is the most exquisite sensation of which this mortal frame is susceptible—whether he comes as the summer grilse, with a flash and a splash; or like a new-run but more sober-minded adult, with a dignified and determined dive; or like a brown-coated old inhabitant, with a long pull and a strong pull, low down in the depths. But this is a satisfaction with which the angler must often dispense; and after having toiled all day and caught nothing, he turns, soaked and shivering, to his hut, seeing in his mind's eye his disapproving wife, his unanswered letters, and especially his vacant chair at the board of the friend whose good opinion and better dinner he has recklessly forfeited. For a moment the inclination seizes him to say with Touchstone in the forest, "When I was at home I was in a better place." But it is but for a moment, and then follows a complete reaction. Everything he sees or tastes near the riverside seems better than better things at better places—bad whiskey than the best claret, braxy mutton than the choice of Leadenhall, the conversation of an unintellectual boatman than the best *mots*, and the repose on the pallet of straw sweeter than often visits beds of air or down. Come how it may, come it does, that the memory cherishes and chuckles over the discussions, the jokes, the incidents of times like these through many dreary years, when multitudes of things, doubtless much less worthy to fade, have been utterly forgotten.—Quarterly Review.

## Pennsylvania Fish Commission.

THE Board of Fishery Commission met at Bellefonte Hatchery on Tuesday and received Commissioner Meehan's report of the work done by the Department for the six months ending May 31. According to the report a vast volume of work was accomplished. From Dec. 1 to June 1 there were hatched and distributed from the five hatcheries 145,157,918 fish, with probably several millions more eggs hatching after that date. From all appearances, at the end of the calendar year the output will exceed any year in the history of fishculture in Pennsylvania, and exceed by many millions the best efforts of any other State last year. Of the fish hatched and distributed the last six months 124,079,000 were whitefish, lake herring, wall-eyed pike, and blue pike; 8,950,000 pickerel, 8,800,000 brook and lake trout, and 3,326,900 shad. The remainder were fish transferred from one water to another. The shad were hatched from eggs gathered by the United States Bureau of Fisheries, and in the Terresdale hatchery, under a joint agreement between Pennsylvania, New Jersey and the United States, each doing a share of the work. The United States withdrew on June 1 and subsequently Pennsylvania, with the co-operation of New Jersey, hatched about 1,000,000 shad, which are not included in the above figures.

The fish wardens were as vigilant and active as the superintendents of hatcheries. During the six months they made 202 arrests and secured 185 convictions, and the imposition of fines amounting to \$3,920. Seventeen cases were discharged and seventeen defendants went to jail, nine in lieu of payment of fines. A number of cases were appealed to the county courts during May, and are as yet undecided. One case which went against the Department in a county court has been appealed to the Superior Court.

Of five cases appealed from the lower to the Superior Court during the year 1904 two have been decided, and both in favor of the Department of Fisheries.

For the first time in the history of fishculture pickerel have been hatched at the Wayne County hatchery, and the Department has apparently completely succeeded in rearing frogs and breeding therefrom. The success was achieved by Superintendent William Buller.

Preparations are being made for greatly increased work next year. Extensive repairs are being made to the Corry hatchery, and about two dozen nursery troughs are to be constructed. About thirty trout ponds, 36 feet by 15 feet, are to be built at Bellefonte, besides about fifty nursery troughs. Six trout ponds, a large-mouth black bass pond and a frog pond have been built at Wayne. A large pond for Oswego bass is projected, and between fifty and seventy-five nursery troughs are to be built. At Terresdale there will be built this summer two large ponds and at least ten nursery troughs. The nursery troughs named each have a capacity of from 20,000 to 30,000 small fish.

The Board of Fishery Commission on hearing the report of the work accomplished in hatching fish, unanimously adopted a resolution expressing its high appre-

ciation of the services rendered by the various superintendents. The Board also confirmed the appointments of William Haas and W. H. Safford as superintendents of two of the three new hatcheries authorized at the last session of the Legislature.

## Vermont Fish and Game.

SHELDON, Vt., June 19.—*Editor Forest and Stream:* It is some months since I sent you any fish and game items. It is perhaps just as well, as your space has been taken up by younger correspondents who look on us "old fellows" as old fogies. We may have forgotten more about these subjects than they will ever know, though it may be hard to make them believe it. If we could only get these young friends to take up the experience of our lives as we arrive at the end, it would in many instances be of benefit to them. But no. They must get the experience themselves and in after years arrive at the point where we were long before. It makes us smile to hear them come out with, to them, some new fact, one that we have known all about for years.

As for general items of fish and game here in northern Vermont, we would say that some good catches of trout have been made in waters where there is no sawdust. Very many of our best trout streams are now but a thick solution of water and sawdust, and the shores a mass of rotten, reeking, disease-breeding filth. How long will our Board of Health allow this? Typhoid fever is in many localities becoming a more common disease than consumption ever was, and it will continue to increase until this contamination of our waters is stopped.

Deer are to be found in every neighborhood, and also fox hounds that have learned to run deer, though the local game wardens are thinning out the numbers, and will continue their good work until the owners of these dogs learn to keep them confined during the spring and summer months. Most of the does seen are barren, which is caused by being run by dogs when heavy with young.

The cold, wet season will undoubtedly make the crop of ruffed grouse a short one. So far we have seen but very few broods of young grouse. Saturday we found a grouse sitting on a nest of twelve eggs, a most unusual circumstance for this season of the year, June 17.

We saw numerous coon and mink tracks in that vicinity, also fresh bear signs, and also saw an old moose track. A caribou has been seen in the Diggings woods in Lamoille county.

Public opinion is gaining ground in this State in favor of more stringent laws for fish and game protection, and at the meeting of our next Legislature there will be more stringent laws passed to help on the cause of fish and game propagation and protection.

STANSTEAD.

## Some Big Fish.

WHAT is the record for big fish taken with rod and reel? There are some data of recent exploits. At Key West, Fla., Feb. 26, 1905, Maj.-Gen. H. C. Merriam, U. S. Army, retired, took with rod and reel a sawfish which was 14½ feet in length and weighed 420 pounds. The time taken to subdue the fish was 2½ hours.

Another notable Florida capture was that of a shovel-nose shark by Mr. Thomas Henry Burchell, of New York, at Palm Beach, in March, 1903. As told in the Palm Beach News of the following day, this was the story:

"Something remarkable occurred off the pier yesterday, which was the spectacular catching of a shark with rod and reel by Mr. Thomas Henry Burchell, of New York. The shark weighed nearly 600 pounds, and measured 8½ feet. When the fish first took the hook Mr. Burchell thought it was a jewfish, and he worked to get it in, but had to go from the pier and worked with it as far as the Styx and back again, playing the line in and out. The line was only 21-strand, and great skill was used in handling the line, which was considered by the large gathering on the beach one of the finest pieces of work ever seen. It just took 70 minutes to land the fish, and it was then perfectly dead from overwork. Mr. Burchell's reel has a 70-pound drag attachment, which was a great aid in tiring the shark. It is not necessary to say that this is the first time a fish of that size has ever been caught with rod and reel. There were 150 people watching the exhibition."

Mr. Burchell himself adds these particulars: "I believe this was the biggest catch on record without the assistance of a boat. The shovel-nose was hooked at the extreme end of the pier, which is 1,006 feet long, and worked in and finally landed on the beach about 500 feet from the pier. The line was a Cuttyhunk 21-thread, tarpon rod and Julius Vom Hofe reel, 600 feet, with Rab-beth handle drag. The Styx mentioned in the article is a small village about one-fourth of a mile up the beach from the pier. The shark was landed in one hour and ten minutes, completely played out. Weight about 600 pounds; eight feet six inches."

In September of the same year Mr. H. C. Dodge, of this city, while fishing off Plum Island, with rod and reel, and 15-thread bass line and gut-snelled hook, hooked a six-foot shark in fifteen fathoms of water, and, after playing it thirty-five minutes, brought it in close to the boat where Capt. Lee Beebe got a noose on its tail and towed it ashore.

## American Fisheries Society.

APPLETON, Wis., June 7.—The thirty-fourth annual meeting of the American Fisheries Society will be held July 25, 26 and 27, at White Sulphur Springs, W. Va., a cool and comfortable summer resort. The place of meeting, aside from being historic, affords a quiet place, giving full opportunity for discussion of the various subjects brought up before the Society. The objects of this Society are "to promote the cause of fishculture; to gather and diffuse information bearing upon its practical success, and upon all matters relating to the fisheries; the uniting and encouraging of all the interests of fishculture and the fisheries, and the treatment of all questions regarding fish, of a scientific and economic nature."

GEO. F. PEABODY, Secretary.

## Black Bass vs. Bluefish.

COMMENTING on a recent claim that there is no fish so lively and full of gameness as the bluefish, a fresh-water angler writes:

It is quite true that the bluefish is lively, and as the Sun says, the angler who gets hold of him may think he has the devil by the tail. But it is also true that with relatively strong tackle, the angler who gets a river black bass of the small-mouth variety will, perhaps, think the devil has him.

It cannot be admitted that the bluefish exceeds the black bass in gameness. Here are some facts: August, 1900, off Fire Island, a ten-ounce rod, with 400 feet of line, landed bluefish after bluefish, each weighing from 4 to 6 pounds. The rod was of split bamboo, by a well known maker, all gaffed within five minutes of hooking. September, 1890, at Black Jim's Eddy, near Narrowsburg, on the Delaware River. The same angler who landed the bluefish, using split bamboo rods by the same maker as the one who made the rod with which the bluefish were landed, had two rods smashed and ruined by two small-mouth black bass. The rods used were five-ounce and the fish leaped and were seen and weighed about 2 pounds each, not over that.

Each of these bass took out over 100 feet of line, and then came toward the boat, faster than the reel could recover the line. Then there was a leap and a shoot and surge that broke the rod where the tip was jointed to the second section. Note that tackle relatively lighter brought bluefish to gaff, and that relatively heavier tackle failed to land either of two black bass.

The hook used in taking the bluefish was relatively heavier, as the teeth and bony mouth of the bluefish make a stronger hook relatively imperative. But the size of the hook has no bearing on the question of the relative strength of the fish.

## Chicago Fly-Casting Tournament.

THE Chicago Fly-Casting Club will hold an international fly and bait-casting tournament on Aug. 18 and 19. Fly and bait-casters throughout the world are earnestly invited to attend this tournament. Contestants will find every effort made to arrange contests in conformity with those forms of casting with which they are familiar.

Among the events scheduled will be long distance fly, delicacy fly and distance and accuracy fly, together with long distance bait (½ ounce weight), distance and accuracy bait (½ ounce weight), and delicacy and accuracy bait (¼ ounce weight), and a large number of prizes will be awarded.

The rules of the Chicago Fly-Casting Club will prevail but exceptions will be made, where deemed advisable, in behalf of visiting anglers—the desire being to make this tournament as nearly representative as possible of expert angling at large and suggestions from anglers contemplating attendance at the tournament are earnestly requested and will receive careful consideration if received in time.

The tournament is open to either representatives of clubs or unattached individuals. A nominal entrance fee will be charged in each event. Handsome souvenirs, illustrated, historical programmes will be provided, and no expense will be spared to make this the most successful tournament in angling annals.

All anglers contemplating entering the tournament and all clubs proposing to send representatives, are urged to communicate at the earliest moment with the secretary, B. J. Kellenberger, 52 St. Clair street, Chicago, Ill.

## Pennsylvania Fisheries Association.

ONE of the very active concerns in Pennsylvania is the State Fisheries Association of Pennsylvania. It is composed of representatives of fish protective associations, rod and gun clubs and of the bodies affiliated with fishing and fishculture in Pennsylvania. At its annual meeting in Bellefonte, Center county, on June 21 and 22, besides visiting the State fish hatchery near Bellefonte and fishing, the Association transacted a large amount of very important business, which, if carried out by the various clubs and organizations, will render the present admirable fish protective laws even more widely enforced. The most important action taken was a resolution, recommending each county organization to request the Commissioner of Fisheries to appoint at least three of its members special fish wardens for the county in which the organization is located. Also that each member of said organization do pledge himself to report to the wardens named any case of violation of the fish laws, which he may observe and to appear as a witness before the justice of the peace after warrants have been served on the offender.

It adopted another resolution to recommend the county clubs to work for the passage through the next Legislature of an act empowering the Commissioner of Fisheries to designate small mountain streams in trout counties as nursery streams in which it shall be unlawful ever to fish.

## Mr. Hallock on Swift River.

THE Messrs. Hitchcock handsomely entertained the veteran sportsman, Charles Hallock, on Tuesday last at their home by the riverside, on the occasion of his first outing in these parts after his long absence in California. Vernon Hitchcock took the active old gent (he was the founder of FOREST AND STREAM as long ago as 1873) with his trout rod through the difficult intricacies of the Swift River gorge, which forms such a notable feature of our rugged landscape, while Hitchcock, pere, prepared a 1 o'clock menu of beefsteak, fried trout, hot coffee, cold spring water and Porto Rico cigars, against their home returning. A large number of fingerlings rewarded these expert anglers' quest, but only a regulation few were basketed, the individual counts being generously merged in the common score. Meanwhile, Vernon's record still holds to the fore. Mr. Hallock's vigor holds out well, and his comrade insists that he scrambled over the marginal rocks between the trout pools like a village school boy, in a way that would shame the professional mazzamas. We all feel like giving this old-timer a warm welcome on his annual visitations to the home of his ancestors, several generations of whom are buried in Goshen and Plainfield.—Northampton Gazette, June 17.

# YACHTING

## Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

### JULY.

1. Atlantic, Havens cup No. 2 and Underwood cup.
1. Bristol, ocean race.
1. Beverly, club.
1. Seawanhaka Corinthian, club.
1. Knickerbocker, cruise.
1. Knickerbocker, one-design power boats.
1. Seaside Park, ladies' cup races.
1. Royal Canadian, Queen's cup race.
1. New Rochelle, annual.
1. Boston, club, Marblehead.
1. Corinthian, club, Marblehead.
2. New Rochelle, cruise.
3. American, annual.
3. Seawanhaka Corinthian, club.
3. Eastern, M. Y. R. A.
3. Bensonhurst, Childs trophy.
4. Lakewood, Gardner cup.
4. Atlantic, open.
4. Corinthian, M. Y. R. A.
4. Eastern, M. Y. R. A.
4. Eastern, power boat races.
4. Knickerbocker, one-design power boats.
4. Edgewood, club.
4. Wollaston, club championship.
4. Seawanhaka Corinthian, club.
4. Seaside Park, club.
4. Hampton Roads, cruise.
4. Jamaica Bay Y. R. A. races.
4. Beverly, sweepstake.
4. East Gloucester, club.
4. Hartford, annual.
4. Larchmont, annual.
4. Sea Side, club.
- 5-12. Atlantic, cruise.
7. Eastern, cruise.
8. Knickerbocker, one-design power boats.
8. New York, Glen Cove, cups.
8. Royal Canadian, cruising race.
8. Wollaston, club championship.
8. Seawanhaka Corinthian, club.
8. Edgewood, club.
8. Quincy, M. Y. R. A.
8. Rhode Island, cruising race.
8. Seaside Park, club.
8. Beverly, club.
8. Corinthian, club.
8. Unqua Corinthian, Williams cups.
8. Riverside, annual.
8. Sea Side, open.
8. Bensonhurst, Bellows challenge cup.
9. Canarsie, open.
9. Morrisania power boat race.
10. Seawanhaka Corinthian, ocean race.
11. Lakewood, series race.
12. Seaside Park, club.
12. Sea Side, open.
15. Royal Canadian, club.
15. New Rochelle, club.
15. Knickerbocker, one-design power boats.
15. Seaside Park, club.
15. Country Club, Detroit club.
15. Edgewood, club.
15. Bensonhurst, Bellows challenge cup.
15. Keystone, club.
15. Atlantic, Underwood cup.
15. Beverly, club.
15. Boston, cruise.
15. Corinthian, club.
17. Edgewood, N. B. Y. R. A., open.
18. New Brunswick Y. R. A. regatta, Prudence Island.
18. East Gloucester, club.
19. Seaside Park, club.
19. Rhode Island, N. B. Y. R. A., open.
20. Rhode Island-Sachem Head, team race.
20. Royal St. Lawrence, Seawanhaka cup.
21. Fall River, N. B. Y. R. A., open.
22. Knickerbocker, power boat race to Marblehead.
22. Knickerbocker, one-design power boats.
22. Winthrop, M. Y. R. A.
22. Bristol, N. B. Y. R. A.
22. Rhode Island, cruising race.
22. Seaside Park, club.
22. Royal Canadian, Canada's cup trials.
22. Beverly Y. C., club.
22. Marine and Field, second championship, Y. R. A. G. B.
22. Unqua Corinthian, Molineux cups.
22. Corinthian, club.
26. Seaside Park, club.
27. Eastern, power boat races.
27. Sea Side, club.
28. Eastern, power boat races.
28. Seaside Park, Bay Head and Island Heights, cruise.
28. Sea Side, open.
29. Eastern, power boat races.
29. New Rochelle, ladies' race.
29. Chicago, race to Mackinac.
29. Country Club of Detroit, race to Mackinac.
29. Seaside Park, open.
29. Edgewood, club.
29. Knickerbocker, one-design power boats.
29. Hampton Roads, cruise.
29. Rhode Island, cruising race.
29. Royal Canadian, cruising race.
29. Beverly, club.
29. Corinthian, club.
29. Boston, club, Marblehead.
29. Indian Harbor, annual.
29. Bensonhurst, Childs trophy.

**FLEETWING NOW A MISSION SHIP.**—Within a short time three famous yachts have been purchased by religious societies and converted into mission ships. The last to make the change is the famous old schooner Fleetwing, which vessel was purchased by the American Baptist Home Mission Society, and she will be used to do temperance and missionary work among seafaring people. Some time ago the schooner yachts Coronet and Wanderer were acquired by the Holy Ghost and Us Society of Shiloh, Me. This society will not work among our seamen at home, but will make long cruises to foreign lands.

\*\*\*

**Y. M. C. A. CHARTERS YACHT.**—The New York Young Men's Christian Association has organized several classes on nautical training. In order to give the members practical experience a yacht has been chartered through Messrs. Maccornell & Cook. Each class will be given a cruise along the coast of several weeks' duration. The boat chartered is the schooner Amazon, which was built at Bayville, L. I., in 1899, from designs by Mr. W. M. Walker by Mr. M. Wright. She is 60ft. waterline, 108ft. over all, 21ft. breadth and 10ft. draft, and was built for Mr. J. C. Abbey.

## Restricted Class for Lake Michigan.

*Editor Forest and Stream:*

The Macatawa Bay Y. C. is doing its utmost to further good, wholesome racing classes suited to the waters of Lake Michigan. I inclose a copy of our 21ft. restricted class, based on the Long Island Sound Y. R. A. 21ft. raceabout class, with additions and restrictions tending toward a more seaworthy boat with better accommodations. Starting with the wider type of less displacement, we have found the raceabout type weighing 5,900 pounds, with easy wholesome lines and fine bow; the fastest as well as the most seaworthy boat for our waters—which are rather unprotected. The seas are sometimes large and long, but often short, and steep, and choppy. Under which conditions these boats have always beaten the 21ft. cabin class actual time, although carrying 200 or more feet less sail.

The class has been adopted by the Lake Michigan Y. R. A. and accepted by the Milwaukee Y. C. as a substitute for their previous raceabout class. In the two clubs are at present eleven boats, the latest addition being Hobo, one of the American Y. C. one-design class brought West by Commodore Hompe, of the Macatawa.

For the good of the sport we wish to do everything possible to promote this class and lead as many as possible away from the dish-pan sieves of the 21ft. cabin class—a boat entirely unsuited to Lake Michigan, and of no use anywhere except for racing.

To promote interest in the class, a magnificent silver trophy has been presented to the club for this class by ex-Commodore Miller, M. B. Y. C., for which a series of three races will be sailed each year on points. The cup will be the property of the boat winning three series, the races being open to all boats of this class on the lakes.

FREDERIC L. BAXTER, Treasurer.

### Definitions and Limitations of the Lake Michigan Yacht Association 21ft. Raceabout Class.

**Type.**—A boat of this class is intended to be a seaworthy boat of the ordinary shape, with fair cabin accommodations.

Double hulls, hollow keels, double rudders, bilge boards, metal fin keels are prohibited.

**Bow.**—A square-ended, snub-nosed or square-sided bow is prohibited. The beam, measured on deck at a point midway of the forward overhang, shall not exceed 45 per cent. of the greatest waterline beam. The deck line shall not run at a greater angle with the center line than 35 degrees.

**Length and Overhang.**—The over all length shall not exceed 35ft. The length of the load waterline, with full equipment but without crew aboard, shall not be more than 21ft. nor less than 20ft.

A boat originally eligible for this class, which has been sailed at least one season, shall not be barred merely because of a natural lengthening of her load waterline of not more than 6in.

Neither forward nor after overhang shall exceed 8ft.

**Load Waterline Beam.**—The beam at the load waterline in keel boats shall be at least 7ft., and in centerboard boats at least 7ft. 9in.

The load waterline beam at a point 1ft. aft of the forward point of waterline shall not exceed 30 per cent of the greatest waterline beam.

**Freeboard.**—The minimum freeboard shall be 20in. for the minimum beams above specified. A reduction of 1in. in the freeboard will be allowed for every increase of 4in. in the beam over the minimum. The freeboard shall be measured from top side of covering board to the surface of the water. Any excess of freeboard over the minimum required may be deducted from the required height for cabin trunk.

**Cabin and Cockpit.**—The cabin trunk shall be at least 7ft. long, with a minimum width of 60 per cent. of the greatest beam of the boat, a minimum height at forward end of 7 in., and at after end of 9in.; with flat and vertical sides.

Cabin shall have a door, transverse bulkhead at after end and two transom berths at least 6ft. long.

The cockpit shall be above the load waterline with scuppers draining outboard.

**Displacement and Draft.** For centerboard boats draft shall be not less than 3ft. for at least 5ft. length of keel.

A boat having a draft of more than 4ft., exclusive of centerboard, shall be considered a keel boat.

All boats shall weigh, when rigged and equipped, but without crew aboard, not less than 5,900 pounds.

The affidavit of the designer shall be accepted as evidence of the weight of the boat. If through protest, the weight of a boat shall be questioned, the Race Committee, to whom the protest is made, shall cause such boat to be weighed or displacement figured under the supervision of the measurer, who shall see that nothing is on board when the boat is weighed, except what these rules prescribe, and that the boat is in every way in a normal condition. The cost of weighing shall be paid by the owner if the weight is found to be less than 5,900 pounds; otherwise it shall be paid by the person making the protest.

**Scantling, Planking and Construction.**—The keel, stem, frames, house and deck-beams shall be of oak or its equivalent in strength.

The frames shall be not less than 1 sq. in. section; deck beams not less than 1 1/3 sq. in. section; house beams not less than 3/4 sq. in. section.

The maximum spacing of the frames and deck beams shall be 9in. between centers.

The planking, including deck and the side of the house, shall not be less than 3/4in. thick; the top of house shall not be less than 1/2in., finished.

Deck clamps and bilge stringers, of yellow pine or its equivalent in strength, shall run from stem to stern, with a minimum cross section of 4 sq. in. for at least one-half their length.

Diagonal steel straps of at least 1/2 by 2in. section, shall be worked across over the deck beams from sheer strake on one side to sheer strake on the other, crossing just forward of mast, and running as far aft as possible, securely fastened at each end and to every deck beam.

Hanging and lodging knees shall be worked about main beams at mast, after end of cabin, after end of cockpit, and at transom.

A steel or bronze rod of at least 3/8in. diameter shall be worked just aft of mast from deck through keel, with diagonal steel or bronze braces at least 1/2 by 2in. section from deck beams to bilge stringers, the whole to form a truss to support deck and frame at mast.

**Sails.**—Only mainsail, jib or staysail and spinnaker may be used. The actual sail area shall not be over 600 sq. ft., and not more than 480 sq. ft. shall be in the mainsail. The measurer shall be provided with a correct sail plan of any boat to be measured and, previous to measurement, the owner shall cause distinguishing marks to be placed on the spars as follows:

On the mast at the tack and at the throat of the mainsail; on the boom at the clew of the mainsail; on the gaff at the peak of the mainsail.

No part of the mainsail shall be allowed to extend beyond these marks. The marks shall be black bands painted around the spars in a manner satisfactory to the measurer. The inner edges of the bands shall be the limits of the sails.

The actual area of the jib shall be measured.

Wide flat spars, or any method to gain extra sail without measurement is prohibited.

Spinnaker boom shall be carried on the mast when in use.

The distance from mast to end of spinnaker boom when in position shall not be more than 15ft.

The spinnaker sheet shall not be carried forward of the head stay nor outside of the leeward shroud. The forestay shall remain fixed at both ends during a race.

**Equipment.**—There shall be carried in racing an anchor weighing at least 35 pounds; not less than 30 fathoms of 1/2in. rope; bucket, pump, compass, fog horn, lantern and five life preservers or life buoys.

**Crew.**—The crew shall be limited to five persons, including the helmsman who must be a Corinthian, and not more than one shall be a professional.

**Existing Boats.**—Any cabin knockabout or raceabout in existence or in process of construction on January 1, 1905, complying with these restrictions as to cockpit, over all length, weight and sail area, may race in this class.

The Elvira and Madcap, of the Macatawa Bay Y. C., shall not be barred from this class for failure to comply with the restriction as to weight.

## Boston Letter.

**PURITAN UNDER HAMMER.**—The old cup defender, Puritan, now a schooner, built by Lawley in 1885 from designs of the late Edward Burgess, is to be sold at auction in Boston on Tuesday, her owner, Mr. C. H. W. Foster, having purchased a houseboat. Puritan is in very good condition, having been thoroughly overhauled at Rockland, Me., two years ago.

**EASTERN Y. C. CLASSIFICATION.**—Classes have been arranged and prizes determined upon for the Eastern Y. C. special series of open races, to be sailed on July 3 and 4 and Aug. 8. The boats are to be measured under the new uniform rating rule. As all the 22-footers would not fit in one class under the new rule, a special class is made for them by combining the two into which they would measure. The same thing was done for the 18-footers. The 22-footers will come in a class to be known as N-O, over 25ft. and not over 33ft. rating. The 18-footers will come in a class known as O-P, over 18ft. and not over 25ft. rating. It is understood that the 22-footers will rate from 31 to 33ft. under the rule, and the 18-footers will rate about 22ft. The largest class in these races will be Class M, over 33ft. and not over 40ft. rating. This is the regular classification under the new rule. The prizes are considerably larger than previously offered, and are calculated on this account to interest owners of the Y. R. A. classes in the special races. The prizes are as follows: Class M, \$60, \$30 and \$20; Class N-O, \$50, \$25 and \$15; Class O-P, \$50, \$25 and \$15. There will be no first prize unless two or more boats start in a class, no second unless four or more start, and no third unless seven or more start. The boats are allowed one man for each 200 sq. ft. of sail.

**ENTRIES FOR HALIFAX OCEAN RACE.**—The Eastern Y. C. has received nine official entries for its ocean race from Marblehead to Halifax, starting Aug. 21. Several more entries of large yachts are expected. Those received are as follows:

Schooner Invader, Roy A. Rainey, Larchmont Y. C., 95ft. waterline.

Schooner Corona, A. F. Luke, Eastern and New York Y. C., 86ft. waterline.

Schooner Undercliffe (aux.), F. L. Clark, Eastern Y. C., 68ft. waterline.

Schooner Agatha, W. S. Eaton, Eastern Y. C., 46ft. waterline.

Yawl Vigilant, Stephen Peabody, New York Y. C., 86ft. waterline.

Sloop Mineola, William Ross Proctor, New York Y. C., 70ft. waterline.

Sloop Doris, S. Reed Anthony, Eastern Y. C., 56ft. waterline.

Sloop Gloria, James Ross, Royal Cape Breton Y. C., 49ft. waterline.

Sloop Dorel, G. L. Batchelder, Eastern Y. C., 30ft. waterline.

At the suggestion of New York yachtsmen a class will shortly be offered in this race for the large auxiliaries. It is said that Idler, Vergemere and Invincible are ready to enter.

**THREE-MASTED SCHOONER HOUSEBOAT.**—The three masted schooner Lillian Woodruff, which was purchased some time ago by Mr. C. H. W. Foster, of the Eastern Y. C., has been made into a houseboat, and left Chelsea, where she has been fitting out, for Marblehead last Thursday. There has been built a long house extending from the quarter-deck forward, in which there is full head room from the deck level. It contains several rooms which will be used by Mr. Foster and his family. Although the superstructure has been raised, the schooner still carries her full rig. Her owner expects to make occasional cruises along the coast in her.

**EDITH SOLD.**—Mr. C. D. Wainwright has bought the 40ft. auxiliary cutter Edith from Mr. W. Starling Burgess, of the designing firm of Burgess & Packard. Power was installed in Edith two years ago, and she has been used since as a houseboat. Edith is of English design, the lines being by Ratsey & Co. She was built by D. J. Lawlor at East Boston in 1880.

**WAIFF CHANGES HANDS.**—The 33ft. sloop Waif, owned for a number of years by Mr. C. D. Wainwright, has been purchased by Mr. J. W. Dodge and Mr. Dexter Wainwright. A seven horsepower engine has been installed and Waif will be used as a houseboat at Marblehead, making occasional cruises.

**SEAWANHAKA BOATS TRIED.**—The two Seawanhaka cup challengers, Manchester and Tunipoo, were given a trial off Manchester on last Saturday. The air was light and more or less fluky. The boats were together nearly all the afternoon, but there appears to be some difference of opinion as to which had the better of the argument. Manchester was sailed by Messrs. R. D. and Reginald Boardman, while Tunipoo was sailed by Mr. E. A. Boardman, who designed both boats. They will be shipped to Montreal Tuesday, where the trials will be continued.

**NEW WRINKLE IN MEASURING.**—It is said that a new

wrinkle is being used to get the best of measurers. This is said to be in the use of oil spread on the hull at the fore and aft points of waterline measurement. It is said that in this way as much as four inches can be gained on a 22-footer on account of the grease repelling the water. It is not known that any specific charges have been made of such practice, but it is known that the official Y. R. A. measurer is very particular about the 22-footers.

JOHN B. KILLEEN.

**British Letter.**

**THE 52FT. CLASS.**—Class racing began on May 27 with the regatta of the Orwell Corinthian Y. C., at Felix-towe, Harwich, when the four 52-footers which will represent the class during the season all took part in a plain sailed race in a light breeze and smooth water. The fleet includes Moyana, designed by Mylne for Mr. J. W. Lenchars, in 1903; Maymon, a Fife boat, built last year for Mr. S. Butler, and two new boats, Britomart, another Mylne effort, for Mr. W. P. Burton, to replace Lucida, and the Herreshoff Sonya, which is the property of Mr. Turner Farley, a new-comer into the class. Of course great interest centered in the performances of Sonya and Britomart, but it was unfortunate that the Herreshoff boat was handicapped through having to carry a solid mast, as she sprang her hollow spar the week before, and the new one had not arrived from the States. The course gave a short turn to windward to the first mark, a reach to the second, a reach back to the first mark, and a short run to the line. Three rounds were sailed, or twenty-four miles in all. Moyana, the oldest boat of the fleet, was first at the start, and remained at the head of affairs throughout, though hard pressed by Britomart at the close. Sonya was second boat in the short beat on the first round, but even so ought to have been passed by Britomart, which met her on the starboard tack, but was put about by the Herreshoff boat because she could not come around herself owing to a yawl which was at anchor. As soon as sheets were checked, however, Britomart went right away, and hunted Moyana all around the course, while Sonya and Maymon had a race to themselves. Moyana finished 24s. ahead of her younger sister, and both were some three minutes ahead of the other pair. Sonya beat Maymon by 15s. Maymon has a new skipper this season and is probably not yet doing her best, but there is little doubt that Moyana has been much improved by having half a ton of lead taken off her keel, and a new suit of canvas would make her a more formidable opponent for the others than she already is. Sonya's appearance is certainly not pleasing. Her high freeboard, straight sheer, short overhang and boxy counter are the very reverse of graceful, while it seems already apparent that her designer has allowed himself to be unduly fettered by the elements of the rating rule, and has sacrificed speed to obtain large body, small girth and great sail spread. Sonya stands up to her stuff well, and holds the other boats to windward, but directly sheets are eased she throws a quarter wave and drops back.

On June 3 the four boats met again in the Channel race from Southend to Harwich. It was a paltry day at the start, but the breeze came later on and Maymon led the fleet to victory. Britomart showed great speed on a reach, and romped through Moyana's lee, but Sonya lagged behind as soon as she got on an easy bowline, finishing up a bad last. In justice to her, it should be stated that she was still carrying a solid mast, although, as she was even then stiffer than any of the others, it is difficult to account for her poor performance on that ground alone. That hollow spars are by no means an unmixed blessing, has already been abundantly proved. The 52ft. class has had further proof thus early in the season of the unreliability of these spars, and their race on the opening day of the Royal Harwich Y. C. regatta was deprived of much of its interest owing to Britomart's mast showing such signs of weakness that Mr. Burton deemed it advisable to withdraw her from the race soon after the start. Sonya was absent, having her new spar fitted; so the contest was limited to a duel between Moyana and Maymon. In a hard-sailed race the old Mylne boat kept ahead of last year's crack and won by about half a minute. Moyana's victory was probably due to good judgment at the start, she carrying a sharp-headed top-sail, whereas Maymon started with a jackyarder, which she had to shift.

On June 6, the second day of the Royal Harwich, the weather was so dirty that the race was abandoned.

On June 12 the Royal Corinthian Y. C. gave a race for the 52ft. class at Port Victoria. Only Moyana and Sonya started, the former winning by about 1½m. Of the four races sailed, Moyana, a boat in her third season, and with an old suit of sails, has won three first prizes, and the next oldest boat, Maymon, one. Up to date, therefore, the new boats have not done anything startling, but it is too early yet to form any definite opinion as to their respective merits. It is a pity that hollow spars are not barred by legislation; they are a mischievous innovation, adding enormously to the expense of racing, and the spars are apparently no more reliable now than they were when they were first introduced; in fact, the tendency to reduce their diameter seems to have increased their weakness. Unfortunately the saving in weight is so great that if one boat has a hollow mast, the others are bound to follow suit; but if they were disallowed altogether, the difficulty would be gotten over, and much needless expense saved.

**THE BIG HANDICAP CLASS.**—Neither the New Thames nor the Royal London Yacht Clubs gave any river matches this year; but the big class, as usual, made its debut in the races from Southend to Harwich, which are organized in connection with Harwich regatta. Seven boats started, but progress was very slow at first, as they had but little wind and a strong tide against them. It was a curious day's sailing, for the 52-footer Maymon which started 5m. after the big boats, reached Harwich half an hour before White Heather, the smaller class being able to cheat the tide by working along the edge of the sands. White Heather, which was scratch boat, sailed well, but failed

to save her time from the Fife yawl Rosamond, the scratch boat taking second prize. During the winter White Heather has had her keel deepened, which has stiffened her considerably. She is also in charge of Charles Bevis, who had the 52-footer Maymon last year, but who is really a "big ship" man, and this change will mean a great deal for the handsome yawl, which was never done justice in her first season. At Harwich, in a fresh breeze, White Heather went remarkably well, and fairly disposed of Brynhild and Valdora. The big schooner Clara carried away her maintopmast, but she was out of the running. The old 40-rater Creole, now in her sixteenth season, sailed in a manner worthy of her very best days. She was fourth boat home, and had the honor of leading the modern Fife yawls Rosamond and Moonbeam, the schooner Sunshine, of 118 tons, and the yawl Betty. Creole held a better wind than any boat in the fleet, except Valdora, and for such an old stayer to be beaten only 1m. per mile by the big modern yawl White Heather, a boat three times her tonnage, speaks volumes both for the old Watson craft and for the way she was handled. The second day at Harwich came to nothing on account of the bad weather. On June 9, when the Royal Thames had its river matches, from Southend the weather was still so bad that only White Heather and the schooner Clara started in the big race. The yawl was soundly beating Clara, but she went the wrong course, and was thrown out of the race. The next big event is the Nore to Dover race of the Royal Thames Y. C. on June 17.

**CLYDE REGATTAS.**—The opening races of the big Clyde yacht clubs have been much interfered with by the weather, rain, calms and storms doing much to mar the sport. The Royal Clyde was, perhaps, more fortunate than the other clubs. However, the early part of the season is frequently unsettled as regards weather in Scotland, but it is expected that the Clyde fortnight will be a great success this year, owing to the stiffening the Scotch contingent will receive from the fleet of six big vessels entered in the race of the Royal London Y. C., from Cowes to the Clyde on June 22, and the quartette of 52-footers.

E. H. KELLY.

**YACHTING NEWS NOTES.**

For advertising relating to this department see pages ii and iii.

**EELIN SOLD.**—The British cutter Eelin has been sold by Mr. F. L. Rodewald, New York Y. C., through the agency of Mr. Frank Bowne Jones to Mr. C. W. Gillett, of Chicago. Eelin was designed by the late A. E. Payne and was built at Southampton, England, in 1899. She is 84ft. over all, 58ft. 6in. waterline, 15ft. 8in. breadth and 11ft. draft. The boat will be used on Lake Michigan in the future.

**NECKAN SOLD AND LAVINAN CHARTERED.**—The steam yacht Neckan, owned by Mr. Joseph S. Whiteside, has been chartered by Messrs. Macconell & Cook to Mr. R. S. Marvin, of the Columbia Y. C. The same agency has sold the 75ft. gasolene yacht Lavinan for Mr. G. W. Cook, of Philadelphia, to Mr. George Deming, of Cleveland. She is being placed in commission and will be taken to Mr. Deming's place, on Pamlico Sound.

**CLUB BOOKS RECEIVED.**—We are indebted to Mr. Geo. A. Cormack, Secretary of the New York Y. C., and Mr. Geo. R. Branson, Secretary of the Columbia Y. C., for copies of their club books.

**THREE STEAM YACHTS CHARTERED.**—Messrs. Tams, Lemoine & Crane have made the following charters: The steam yacht Sultana, owned by the estate of J. Montgomery Sears, to Mr. C. Oliver Iselin; the steam yacht Columbia, owned by Mr. J. Harvey Ladew, to Mr. Walter G. Ladd, and the steam yacht Sagamore, owned by Mr. Howard Barnard, to Mr. R. Livingston Beeckman.

**STEAM YACHT CRESCENT SOLD.**—The steam yacht Crescent, owned by Mr. George Rose, has been sold through the agency of Mr. Henry J. Gielow to Mr. Elziar Bailargeon, of Quebec.

**VERITAS LAUNCHED.**—The high speed launch designed by Mr. Henry J. Gielow for Mr. Alexander Stein, Indian Harbor Y. C., was launched from Montell's yard, Greenwich, Conn., on Thursday, June 22. She is 56ft. 10in. over all, 54ft. 4in. waterline, and 7ft. breadth. Veritas is of light construction and has three water-tight compartments. The engine was built by James Craig, Jr., and is of 250 horsepower. When the boat is in condition it is expected she will do about 30 miles. Veritas will make her debut in the Indian Harbor Y. C.'s power boat races on July 4.

**SALES AND CHARTERS.**—Auxiliary ketch Kamoor has been chartered by Harrison B. Moore, Atlantic Y. C. to Mr. Hunter Wyckes, New York Y. C., through the office of Stanley M. Seaman.

Cape catboat Hobo has been sold through the same agency by Mr. R. S. Peabody to Mr. W. B. May, New Rochelle, N. Y.

The steam yacht Orienta, chartered by the Panama government, left for Colon, Panama, on the 12th inst.

**Knickerbocker Y. C.**

College Point, Long Island Sound—Saturday, June 24.

THREE of the one-design power boats raced twice over a 4-mile course on Saturday, June 24. No. 5 won, and No. 4 was second. The summary:

No.	Finish.	Elapsed.
No. 5, A. L. Kerker.....	5 11 10	0 38 10
No. 4, J. C. Schaefer.....	5 11 15	0 38 15
No. 9, J. Sulsbach.....	5 13 15	0 40 15

**Brooklyn Y. C. Ocean Race.**

Six boats will surely start in the 250-mile outside race from Gravesend Bay to Hampton Roads for the Brooklyn Y. C.'s cup. The start will be made at 10 A. M., on Thursday, June 29, and it is expected that all the boats will reach their destination by July 3. The official entries, issued by the Regatta Committee, follow:

Boat	Length.
Gauntlet, L. D. Huntington, Jr., New Rochelle, sloop.....	27.7
Mopsa, F. C. and W. S. Sullivan, Harlem, cutter.....	35.9
Anna, C. L. Johnson, Chesapeake, yawl.....	36.5
Tamerlane, Frank Maier, New Rochelle, yawl.....	38.0
Bonito, Haviland Bros., Brooklyn, sloop.....	39.0
Lila, R. D. Floyd, Newark Bay, yawl.....	40.0

**Club Classes.**

Wayward, Colonel David E. Austin, Brooklyn, schooner.....	68.0
Gaviota, G. C. Gillespie, Brooklyn, yawl.....	55.0
Sunshine, S. S. Fontaine, Brooklyn, schooner.....	45.0
Perie, John Lewis, Brooklyn, sloop.....	39.0

The sailing directions governing the race follow:  
Start—One gun; preparatory, 9:50 A. M.; time of start ocean race fleet, 10 A. M.; time of start club classes, 10:10 A. M. Race will not be delayed on account of lack of wind; gun will be fired and race started, even if boats cannot sail.

Course—From Gravesend Bay to Willoughby Spit, Hampton Roads, Va. Yachts may pass to sea by any channel, leave lightships on either hand, excepting Cape Charles light vessel No. 49, and light vessel on tail of Horseshoe No. 46, which must be left on the starboard hand.

Starting line—Between White Anchorage Buoy and committee boat.

Finish Line—Off Ripraps (Fort Wool). Marked by anchored vessel carrying black ball in daytime and three blue lights vertical at night. (See chart furnished by committee.)

Finish—Yachts must pass close to station boat and report to watchers the name; also, skippers are requested to take their own time of crossing; 75th meridian time will be used both at start and finish.

Anchoring—Yachts may enter any port and anchor, if necessary, through stress of weather.

Abandoning Race—Captains are requested to at once notify the committee upon reaching port, if they have abandoned the race. Wire Hampton Roads Y. C., Norfolk, Va.

Two Club Classes—Boats under 50ft. racing length and boats over 50ft. racing length.

Club Class Racing Length and Allowance—Racing length: The length over all plus one-half the overhang. Allowance: Gravesend Bay Association table; no allowance for rig. Distance for calculations, 250 miles. Boats in cruising trim.

Pilots—No paid pilots or navigators allowed on any yacht. After passing finish line, watchboat will put a pilot on board to take vessel into the anchorage behind the Spit. High-water mooring June 29, 11 o'clock.

Log—Captains must keep a log containing entries made at least every four hours, giving course, distance sailed, weather and time of passing prominent objects. Copy of this must be handed to committee within twenty-four hours after completing race.

Protests—Protests must be made in writing six hours after the last boat is in.

Numbers—Will be furnished by committee.

Inspection—Boats must be at Brooklyn Y. C. anchorage not later than noon, June 28, for inspection and measurement.

The Hampton Roads Y. C. are making great preparations for the visiting yachtsmen, and on July 4 a large regatta will be held.

**Atlantic Y. C.**

Sea Gate, New York Harbor—Saturday, June 24.

LIGHT weather conditions ruled in the first of five races to count on the class championship of Gravesend Bay, which was held under the auspices of the Atlantic Y. C., on the afternoon of Saturday, June 24. Twenty-three craft started, and the winners were Bobtail, Lizana, More Trouble and Beta. Sandpiper scored a sailover. The class honors of the year go to the boat securing the greatest number of points in the series, one event of which is given by each of the prominent clubs on the bay. A craft gets one point for starting and one for every competitor defeated.

According to the new rule of rating all boats launched prior to Jan. 1, 1905, are entitled to time allowance resulting from their racing measurement, others being figured at the limit of their respective classes. Only the new Class Q boats on Gravesend Bay are thereby obliged to compete without allowance. This state of affairs makes rating measurement quite necessary for the accurate determination of the different positions obtained on corrected time.

Trouble is being experienced in securing accurate data of the old boats, whose lines are not available, displacement figures being the greatest stumbling block. Several incidents have cropped out to aggravate the difficulty even when designs have been at hand. In more than one case the length of waterline and the consequent displacement when afloat have been found to differ materially from results aimed at by the architect. No two measurers' figures seem to agree. Until absolute rules are laid down for the work, trouble will continue to exist, and corrected times be more or less uncertain and incomplete.

In the light S. wind, blowing at the start of the first championship race, there was much luck in getting away, which, no doubt, has some effect on the showing of the different boats. The victory of More Trouble in Class Q, however, was clean cut in every way. She passed Cockatoo II on the second round of the course, when both were reaching, again demonstrating herself to be a wonder on that point of sailing.

More Trouble beat Cockatoo II by exactly 2m. in a little over 7½ nautical miles. Ojigwan was third boat, 4m. 1s. away from the leader. Saetta was defeated by 4m. 26s., while Quest was 5m. 53s. away. Of the old Class Q boats Ogeemah sailed an excellent race and should get second place on corrected time. Miss Judy, crack of 1904, made her first appearance after alterations, with poor success. Edgar F. Luckenbach's Bobtail had no difficulty in winning in Class N from Vivian II., and Lizana carried off the honors in Class P, sailing on almost even terms with the larger Bobtail throughout the race.

The regular Association courses were covered, leaving marks to port. All classes sailed the first three legs, the first being from Sea Gate to Ulmer Park, the next from there to the Marine and Field Club and the third from the last named mark to a boat anchored off Fort Hamilton. There was nothing but reaching on this part of the journey. From Fort Hamilton Classes Q and under went to Sea Gate, which many of them made in one long close-hauled board. The larger racers went across the channel and turned the bell buoy off Craven Shoal, more reaching being their lot. The next race to count on the championship will occur at the Marine and Field Club on July 22. The summaries follow:

Sloops, Class N—Start, 3:50.		
	Finish.	Elapsed.
Bobtail, E. F. Luckenbach.....	5 52 01	2 47 01
Vivian II., S. E. Vernon.....	5 54 52	2 49 52
Redwing, J. B. O'Donohue.....	Did not finish.	
Corrected time of Bobtail, 2:46.54.		
Sloops, Class P—Start, 3:05.		
Lizana, D. S. Wylie.....	5 52 38	2 47 38
Anona, Menton Bros.....	6 07 44	3 02 44
Bonito, Haviland Bros.....	6 25 35	3 20 35
Corrected time of Lizana, 2:43.12; Bonito, 3:16.43.		
Sloops, Class Q—Start, 3:10.		
More Trouble, W. H. Childs.....	4 55 34	1 45 34
Cockatoo II., Hendon Chubb.....	4 57 34	1 47 34
Ojigwan, George E. Reiners.....	4 59 35	1 49 35
Saetta, George H. Church.....	5 00 00	1 50 00
Quest, F. J. Havens.....	5 01 27	1 51 27
Ogeemah, Alfred Mackay.....	5 04 04	1 54 04
Miss Judy, D. D. Allerton.....	5 08 31	1 58 31
Mary, Max Grundner.....	5 11 19	2 01 19
Trouble, W. A. Barstow.....	5 14 12	2 04 12
Wraith, Calvin Tompkins.....	5 16 30	2 06 30
Careless, Richard Rummell.....	5 18 00	2 08 00
Karma, J. C. Erskine.....	5 24 02	2 14 02
Ianthe, F. W. Robertson.....	Did not finish.	
Sloops, Class R—Start, 3:15.		
Sandpiper, W. W. Redfern.....	5 19 50	2 03 50
Sloops, Class RR—Start, 3:15.		
Beta, Snedeker & Camp.....	5 40 28	2 25 28
Gamma, A. H. Platt.....	5 42 19	2 27 19
Delta, J. J. Mahoney.....	5 57 34	2 42 34

Seawanhaka Corinthian Y. C.

Oyster Bay, Long Island Sound.

THE Seawanhaka Corinthian Y. C.'s three days' racing which commenced on Thursday, June 22, was rather spoiled by trying weather conditions.

The Race Committee, composed of Messrs. Henry H. Landon, Clinton H. Crane, Howard C. Smith, Victor I. Cumnock and Francis G. Stewart mapped out a very complete and interesting programme, and had the weather favored a little the series would have been the most satisfactory given on the Sound this season.

THURSDAY, JUNE 22.

The first of the three days' racing was spoiled by a vicious thunderstorm that broke in the midst of the race. Five classes were provided for, and four filled. There were sixteen starters, and all but four finished.

Boats in the 30ft. class and the one-design 30-footers covered a 7 1/2-mile triangle twice, a total of 15 1/2 miles. A triangle of 6 1/2 miles was sailed over twice by the raceabouts. The same course was covered once by the 15-footers. At the start the wind was about N.E., and very light. The first leg was a reach, the second a beat and the third a reach.

The warning signal was given at 1:45 from Vice-Commodore Matherson's steam yacht, Lavrock, which was used as a committee boat.

When the 33-footers were sent off at 1:55, Nike was in the lead and the other three followed, as named: Mimosa III., Regina and Snapper.

Nautilus led her six rivals over the line, when their signal was given at 2 o'clock. Then came Atera, Cara Mia, Alera, Phryne, Minx and Carlita.

The breeze was dropping fast, and the raceabouts and 15-footers barely had steerageway when their respective signals were given. Nora led the raceabouts across, Mystral was next, while Opossum brought up in the rear. Imp showed the way to Chipmunk.

Nike was leading Mimosa III. at the end of the first round, while Nautilus was ahead of Phyrne, which boat had moved into second place.

The thunder squall that had been making for some time broke as the larger boats started on the second round. It came out of the N.W. and made things lively for a time. Phyrne and Mystral were the only boats that did not lower away everything during the squall. These two boats set reefed mainsails and kept going.

After the squall it was very flat. The wind finally came in from the S.E., which gave the boats more windward work. Later it shifted again to the S.W., from which quarter it blew with more strength.

The 15-footers finished first with Chipmunk leading. Imp was beaten 2m. 19s.

Nike was the next boat to finish, she beat Regina 1m. 25s. The other two boats in this class did not finish.

Phryne won in the N. Y. Y. C. one-design class, defeating Alera by 29s. The latter boat has done well this season, finishing every race well up with the leaders. It seems difficult for her to get a first, although she has a number of second prizes to her credit. Mystral beat Nora 35s. Opossum did not finish. The summary:

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sloops, 33Ft. Class—Start, 1:55—Course, 15 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes N. Y. Y. C. 30Ft. Class—Start, 2:00—Course 15 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Raceabouts—Start, 2:05—Course 13 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Seawanhaka One-Design 15Ft. Class—Start, 2:30—Course, 6 1/2 Miles.

FRIDAY, JUNE 23.

The second day was spoiled by the light and baffling airs. Two of the "seventies" started which added a little more to the interest of the event: The winners were Mineola, Nike, Minx and Rana. Okeo and Opossum took sailovers as they had no competitors in their respective classes.

The courses were as follows: Course No. 1.—From the starting line N.N.W. 1/2 W. 4/4 miles to and around Red Spar "B 24 1/2" thence E. 1/2 N. 2 1/2 miles, leaving buoy off the Cows on the port hand, thence E.N.E. 2 1/2 miles to and around Red Spar "C 20 1/2," thence S.S.W. 5 1/2 miles to the starting line, distance 15 1/2 nautical miles, all marks except the Cows to be left to starboard.

Course No. 2.—From the starting line N.N.W. 1/2 W. 2 1/4 miles to and around mark boat No. 1, thence E.N.E. 2 1/2 miles to and around mark boat No. 2, thence S.S.W. 3 miles to the starting line; distance 7 1/2 nautical miles, all marks to be left to starboard.

Course No. 3.—From the starting line N.N.W. 1/2 W. 2 1/4 miles to and around mark boat No. 1, thence E. 1/2 N. 2 1/2 miles to and around mark boat No. 3, thence S.S.W. 2 1/2 miles to the starting line, distance 6 1/2 nautical miles, all marks to be left to starboard.

The 70-footers covered course No. 1. The 33-footers and the N. Y. Y. C. one-design boats sailed over course No. 2. All the other boats went over course No. 3.

None of the boats were sent twice over the courses, as was the Race Committee's intention, as they were barely able to get around once.

It was 2:10 when the "seventies" got away with Mineola slightly in the lead. Mr. Frank Bowne Jones sailed Mineola, while Mr. Clinton H. Crane was at the wheel on Virginia. Mr. Maxwell intended starting Yankee, but the wind was so light that he was unable to get from his anchorage at Glen Cove to the starting line at Lloyd's Neck.

The wind was N.W., and it was a beat to the first mark. Mineola made a big gain on this leg and rounded nearly 7m. ahead. On the second leg spinnakers were set to starboard. The third leg was a reach, as the wind had shifted to the S.W. Mineola won by 26m. 50s., which gives one an idea of how absolutely unsatisfactory the racing was.

In the 33ft. class Nike repeated her performance of the day before and won handily, beating Tito by a good margin. Mimosa III. came in third.

Dahinda, nicely placed, led the other seven starters in the N. Y. Y. C. one-design class over the line. She held her lead until the last leg, when she struck a soft spot, and there lost the race to Minx. While in the doldrums she was passed by Minx and Alera. Minx won by 6s. from Alera, which boat was 9s. ahead of Dahinda. Cara Mia was 1s. behind Dahinda.

This proved a lucky day for Mr. Howard Willets, as both his entries took firsts. In the N. Y. Y. C. one-design class his boat Minx won, and Rana, another craft that flies his colors, got a first in the raceabout class. Nora was second and Mystral was third.

Okeo and Opossum had sailovers, and Imp and Chipmunk were not timed. The summary:

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sloops, 70Ft. Class—Start, 2:10—Course, 15 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sloops, 33Ft. Class—Start, 2:15—Course, 7 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes N. Y. Y. C. 30-Footers—Start, 2:20—Course, 7 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Raceabouts—Start, 2:25—Course, 6 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sloops, Class P—Start 2:30—Course, 6 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes S. C. Y. C. 15-Footers—Start, 2:35—Course, 6 1/2 Miles.

SATURDAY, JUNE 24.

Saturday's racing programme embraced practically all the Sound classes, as it was the Seawanhaka Corinthian Y. C.'s annual regatta. There were forty-two starters, and the winners were: Yankee (subject to decision of protest), Nike, Snapper (sailover), Neola II., Cricket, Vaquero II. and Rogue.

The wind was light from the S.W., and the boats went once over the triangles. The first leg was a run, the second a reach and the third a beat.

The rules stated that in the annual race all helmsmen should be amateurs. Another clause read as follows: Should a winning yacht in the annual race have been manned by a Corinthian crew, the club will present a Corinthian crew prize to each member of that crew, and to the owner of the yacht a prize handsomer than the usual class prize.

In the 70ft. class Mineola was sailed by Mr. Addison Hanan; Virginia, by Mr. Clinton H. Crane, and Yankee, by her owner, Mr. J. Rogers Maxwell. The 70-footers were sent off at 1:55, and the start was a very equal one. Balloon jib topsails were broken out as they crossed and spinnakers were soon set to port. At the second mark Mineola and Yankee came together. Mineola had established an overlap on Yankee before reaching the mark, and there was a call for room which was not given, and Mineola hit Yankee's starboard quarter. No damage was done, but both finished flying protest flags. Yankee wins by 1m. 4s. subject to the Race Committee's decision on the protest. Virginia finished 14m. 50s. behind Yankee.

Nike took her third consecutive win in the 33ft. class, beating Mimosa III. 1m. 36s. In the light weather that has prevailed the past three days Nike has proven herself too smart for Mr. Park's newer production. Mimosa will show up better when she gets more wind. The other two starters in this class were disqualified.

Snapper had no competitor in the 27ft. class, and was forced to take a sailover.

Neola II. distinguished herself in the New York Y. C. one-design class by winning her first race. Carlita was second, Nautilus third and Alera fourth. Neola II. beat Carlita 22s. Nautilus was 10s. behind Carlita. Alera wins the series prize in this class and Phryne, Minx and Neola II. tie for second, and third places. Ibis fouled Nautilus and was disqualified.

Cricket beat Jolly Roger 47s., but Mystral gets the series prize. In the Larchmont one-design class Vaquero won. The summary:

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sloops, 70Ft. Class—Start, 1:55—Course, 15 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sloops, 33-Footers—Start, 2:00—Course, 7 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sloops, 27-Footers—Start, 2:00—Course, 7 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes N. Y. Y. C. 30-Footers—Start, 2:05—Course, 7 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Raceabouts—Start, 2:10—Course, 7 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Larchmont 21-Footers—Start, 2:15—Course, 7 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sloops, Class O—Start, 2:20—Course, 7 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Seawanhaka One-Design 15-Footers—Start, 2:25—Course 6 1/2 Miles.

Beverly Y. C.

Wing's Neck, Buzzard's Bay—Saturday, June 24.

THE Beverly Y. C. sailed its 364th regatta on June 24, starting from its club house. During the morning there was practically no wind, and the boats were unable to get to the line at the usual starting time, 1 P. M. The race was, therefore, postponed until 3 o'clock. At this time a very light wind came in about S.W., and gradually hauled a little to the S. of this.

The 21-footers, in which class there were six entries, were sent over a short course, going first to Bird Island and then across to Scraggy Neck buoy No. 8, and then home. Terrapin, last year's champion, got a good start, and at first drew away from the rest of the fleet rapidly. Mr. Crane in his new boat, Amanita III., after staying with the Terrapin for a short distance tacked off to the Wing's Neck shore, while Terrapin and the other boats stood across to the Marion shore. When the boats came together at Bird Island buoy, which marked the windward point of the course, the Terrapin was only a short distance ahead of Amanita III., and the new boat gradually gained on last year's champion until she succeeded in passing her a short distance from the finishing line, winning by 44s. This is only Amanita's second race, and Mr. Crane is certainly to be congratulated upon having won it. Barnacle, which won on the Saturday previous, maintained her reputation as the slowest boat in the bay in light weather and finished 11m. behind the leader.

The 18ft. one-design class, in which there were only two entries, Margaret, and the new addition to the class, Wanderer, were sent to Bird Island and back. Margaret won by about 2m.

In the 15ft. one-design class there were also only two entries, both of which were sailed by ladies. Miss Dabney, in Fiddler, won. The judges were Messrs. Charles Whittemore and L. L. Dabney. The summary follows:

Table with 3 columns: Boat Name, Finish, Elapsed. Includes 21-Footers—Course No. 16, 8 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes 18-Footers—Course No. 18, 8 1/2 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes 15-Footers.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes 15-Footers.

Old Mill Y. C.

Jamaica Bay—Sunday, June 25.

THE first association regatta was held under the auspices of the Old Mill Y. C. on Sunday, June 25. The winners were Baby Roger, Diana, Bill Nye, Boozie, Charlie D., Naome and Florodora. Boats measuring over 17ft. covered a course from the bulkhead, just off the club house, to and around the Red Spar buoy off Barren Island and return. The smaller craft sailed a triangular course from the starting line to a stakeboat off Howard's Landing, thence to a mark off the main channel and back to the starting point, twice around. The summary:

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Class A, Cabin Sloops—Start, 2:40.

\*Wins on corrected time.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Class B, Cabin Catboats—Start, 2:50.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Class C, Open Catboats Over 20ft.—Start, 2:55.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Class D, Open Catboats Under 20ft.—Start, 3:10.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Class E, Sharpies—Start, 3:15.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Class G, Launches—Start, 3:15.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Class H, Launches—Start, 3:20.

Hudson River Y. C.

Hudson River—Sunday, June 25.

THE thirty-first annual regatta of the Hudson River Y. C. was sailed on Sunday, June 25. Three classes filled, and there were fifteen starters. The start was made off the club house foot of West Ninety-second street. The first mark was off Weehawken on the Jersey shore, and the second mark was up the river near Fort Lee, thence back to the starting line. All the boats covered this 5-mile triangle twice, making a total of 10 miles. The wind was fresh from the N.W., making the first leg a beat, and the other two reaches. In the cabin sloop class Hope withdrew and Rea finished alone. We're Here beat Nora 4m. 34s. in the class for auxiliaries.

Victory made a good showing in the class for launches, and at the end of the first round had the race well in hand. She beat Anaconda, the second boat, 2m. 20s. corrected time. The summary:

Table with 3 columns: Boat Name, Finish, Elapsed, Corrected. Includes Cabin Sloops.

Table with 3 columns: Boat Name, Finish, Elapsed, Corrected. Includes Auxiliaries.

Table with 3 columns: Boat Name, Finish, Elapsed, Corrected. Includes Launches.

Table with 3 columns: Boat Name, Finish, Elapsed, Corrected. Includes Launches.

Rhode Island Y. C.

Narragansett Bay, June 17.

THE annual ladies' day club regatta of the Rhode Island Y. C. was held in a stiff S. breeze that necessitated single reefs at the start, although the wind moderated before the finish. The entries were few in number and several withdrawals were caused by breakdowns. The winners were Pandora, Micaboo and Elizabeth.

The new 30ft. cat, Wanderer IV., owned by Messrs. H. J. and D. W. Flint, made her first appearance and presented a fairly good showing, although she had not been tried out sufficiently to stand any chance in a race. The parting of a side stay in the second round caused her withdrawal from the race. The old cat, Emeline, finished first in the class, but was disqualified for not carrying a racing flag, and the prize went to Elizabeth. Little Rhody started in the 25ft. sloop class, but was disabled and obliged to withdraw. Pandora had a walkover in the first class, finishing soon after her only opponent had completed the first round. The summary:

Table with 3 columns: Boat Name, Finish, Elapsed. Includes 36Ft. Sloops—Start, 2:10:15—Course 14 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes 25Ft. Sloops—Start, 2:14:15—Course, 14 Miles.

Table with 3 columns: Boat Name, Finish, Elapsed. Includes 30Ft. Cats—Start, 2:24:15—Course, 14 Miles.

\*Disqualified—no racing flag.

Seawanhaka Corinthian Y. C.

Oyster Bay, Long Island Sound—Saturday, June 17.

THREE of the 15-footers raced over the inside course on Saturday, June 17. The wind was a little W. of S. Sabrina won. The summary:

Table with 3 columns: Boat Name, Finish, Elapsed. Includes Sabrina, C. W. Wetmore.

Rhode Island Notes.

BRISTOL Y. C. OCEAN RACE.—The circulars for the forthcoming ocean race for the Bristol-Montauk cup have just been issued by the Regatta Committee of the Bristol Y. C. The race will start at 5 P. M. Saturday, July 1, and the event is open to all yachts under 31ft. length waterline, measured without crews aboard, and enrolled in any recognized yacht club. In brief, the requirements are as follows: All yachts, of whatever rig, will race in one class for a specially designed silver cup to be known as the Bristol-Montauk cup, which will become the property of the owner of the winning boat. Second and third prizes will be given if the number of starters warrant. Suitable pennants will be awarded to all yachts that complete the course.

The race will be sailed under the racing rules of the Bristol Y. C., and the yachts will be so measured and rated for time allowance. In addition to the time allow-

ance as thus determined, all yachts, except those of the most pronounced racing type, will receive an arbitrary handicap, to be fixed by the Regatta Committee.

All entries are to be made in writing on blanks furnished by the committee, and must be received not later than June 24, to enable the yacht to receive the full handicap to which it is entitled. Yachts should be presented for measurement either Saturday, June 24; Friday, June 30, or before 9 A. M., Saturday, July 1. No boat will be allowed to start which has not been measured or has not presented a satisfactory certificate of measurement.

Each yacht will be allowed to carry only the sails allowed by club rules for that rig, and shall not have on board more than one man for each 5ft. of racing length or fraction thereof. Each yacht must carry a moderate cruising outfit, but no tender need be taken. The course will be from starting line off the club house, down East passage, to and around black buoy on Great Eastern Rock about 1 3/4 miles east of Montauk Point, leaving mark to starboard, and back to starting point by same course, a total distance of 88 nautical miles.

The time of all yachts will be taken from the starting signal. All entries should be addressed to Wallis E. Howe, Secretary Regatta Committee, Bristol Y. C., Bristol, R. I. F. H. Young.

## Canoing.

### Officers of A. C. A., 1905.

Commodore—C. F. Wolters, 14 Main St. East, Rochester, N. Y.  
Secretary—H. M. Stewart, 85 Main St., East Rochester, N. Y.  
Treasurer—F. G. Mather, 164 Fairfield Ave., Stamford, Conn.

#### ATLANTIC DIVISION.

Vice-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N. J.  
Rear-Commodore—F. C. Hoyt, 57 Broadway, New York.  
Purser—C. W. Stark, 118 N. Montgomery St., Trenton, N. J.  
Executive Committee—L. C. Kretzmer, L. C. Schepp Building, New York; E. M. Underhill, Box 262, Yonkers, N. Y.  
Board of Governors—R. J. Wilkin, 211 Clinton St., Brooklyn, N. Y.  
Racing Board—H. L. Quick, Yonkers, N. Y.

#### CENTRAL DIVISION.

Vice-Commodore—Lyman T. Coppins, 691 Main St., Buffalo, N. Y.  
Rear-Commodore—Frank C. Demmler, 526 Smithfield St., Pittsburg.  
Purser—J. C. Milsom, 736 Mooney Brisbane Bldg., Buffalo, N. Y.  
Executive Committee—F. G. Mather, 164 Fairfield Ave., Stamford, Conn.; H. W. Breitenstein, 511 Market St., Pittsburg, Pa.; Jesse J. Armstrong, Rome, N. Y.  
Board of Governors—C. F. Forbush, Buffalo, N. Y.  
Racing Board—Harry M. Stewart, 85 Main St., East Rochester, N. Y.

#### EASTERN DIVISION.

Vice-Commodore—D. S. Pratt, Jr., 178 Devonshire St., Boston, Mass.  
Rear-Commodore—Wm. W. Crosby, 8 Court St., Woburn, Mass.  
Purser—William E. Stanwood, Wellesley, Mass.  
Executive Committee—Wm. J. Ladd, 18 Glen Road, Winchester, Mass.; F. W. Notman, Box 2344, Boston, Mass.; O. C. Cunningham, care E. Teel & Co., Medford, Mass.; Edw. B. Stearns, Box 63, Manchester, N. H.  
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

#### NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 James St., Montreal, Can.  
Rear-Commodore—J. W. Sparrow, Toronto, Canada.  
Purser—J. V. Nutter, Montreal, Canada.  
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto, Ont.  
Board of Governors—J. N. MacKendrick, Galt, Ont.  
Racing Board—E. J. Minett, Montreal, Canada.

#### WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, O.  
Rear-Commodore—Charles J. Stedman, National Lafayette Bank, Cincinnati, O.  
Purser—George O. Hall, care of Bank of Commerce, Cleveland, O.  
Executive Committee—Thomas P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.  
Board of Governors—Henry C. Morse, Peoria, Ill.

### How to Join the A. C. A.

"Application for membership shall be made to the Treasurer, F. G. Mather, 164 Fairfield Ave., Stamford, Conn., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

## Across Nova Scotia in Canoes.

(Concluded from page 463.)

Fish were scarce below the dam, so we spent some time taking photographs and inspecting the "fish ladder" built to allow fish to pass up stream, all the while keeping a sharp lookout up stream for the missing members of the party. H. N. T. had found by telephoning to Liverpool that the Senlac was due to arrive at 2 A. M. the following morning and the last train left at 3 P. M. this afternoon. Two o'clock came and still no sign of them, and we commenced to feel anxious, remembering their previous misfortunes in the rapids and the difficult one they had to pass just above us. We made up our minds to hike back along the shore with paddles and poles to see what had become of them. First, however, we loaded the boat and duffle on the flat car by the mill so that it would go on down to Liverpool that afternoon, and while the Scribe was shacking the last of the stuff down from the canal embankment Arthur ran up to the dam to take one last look for the others. A few minutes later his mate, putting the finishing touches to the things on the car, was interrupted in his work of wedging the sloping ends of pulp logs under the boat, by a shrill "coo-e-e" from the skipper, and looking up, saw with a great relief the missing two disembarking at the end of the canal.

From that moment all was bustle. A short three-quarters of an hour was all the time we had to load the rest of the stuff on the car and get some lunch. Chocolate had come in very acceptably during the few hours previous, tobacco also, in warding off the pangs of hunger. A camp site was found under a clump of pine trees on a slight rise beside the track and water was gotten from the brook, a short distance below. Time did not admit of an elaborate lunch, but we baked cornbread, and made tea, sharing the former with some of the residents of the village who gathered around to see the fun.

Enthusiastic comments were made about the cornbread, and we got our first scraps of news of the outside world we had been away from so long. They told us of a great disaster in New York Harbor—the loss of the General Slocum by fire, killing some nine hundred people. Carl

asked about the fate of Port Arthur, and learned that it was still holding out. The Scribe asked the present price of pig iron at Pittsburg, but this was too much for them.

After a jolly lunch and hearty farewells to our brief acquaintances we were called hastily off by the whistle of the ridiculous little locomotive standing with the train a short distance down the track. This train was made up of two flat cars, a baggage van and a passenger coach, the latter a metamorphosed trolley car set on railroad trucks—we traveled on the flat car with our belongings. We went jolting off with shrill toots of the engine, across wooden trestles spanning ravines, through deep gorges and pine forests, following first the creek and then the Liverpool River, which we picked up again a mile or two below. Just as we crossed the river on a rough log trestle we caught a glimpse of a magnificent view up stream. The gorge above was very rocky and deep, the current dashing down the narrow, steep channel and under the bridge; far up stream, about a half mile away, was a high fall, the entire volume of water tumbling through a narrow space with high rocks on either shore. This was one of the finest bits of scenery we had run across, and a person would be repaid by taking the short trip up from Liverpool just to see this spot. In fact, the entire ride all the way was a continuous panorama of fine views punctuated by quaint, picturesque villages, where the jovial conductor kept the train waiting while he chatted with his friends. Milton proper, about two miles below the mill, was a lumber town, with piles of lumber stacked about everywhere, and the river full of sawlogs. We saw several booms and log jams on the way down which confirmed the warning Louis had given us, namely, not to try to reach Liverpool by boat. One or two boats were anchored in the stream below the bridge at Milton, the fishermen trying for grilse. This used to be a famous place for them until the sawmills and the pulp mills ruined the sport with their refuse.

At Milton the conductor collected sixty cents from the crowd as the cost of the private car. Shortly afterward we were running into Liverpool, the harbor lying smooth and peaceful under the afternoon sunlight, its two light-houses on either side of the outer roadstead standing white against the dark green of the rocks and woods. We arrived there at 4 o'clock and set about carrying our boats and duffle over to the river, so as to drop down a quarter-mile to the steamboat dock. Charles O. kept watch over things in a little cove beside the drawbridge, while the other three ruffians went up into the town to the post-office and sent letters and telegrams to our various families, announcing our safe arrival out of the wilderness. This duty done, we returned to Charles O., and, leaving a small boy to watch our possessions, although with some misgivings as to "quis custodiet ipsos custodes," we crossed the drawbridge to a little store on the far side and had ice cream all around to celebrate our return to civilization. We also bought a few food supplies, among them onions—at last. This reminded us that we had saved a few onions the Scribe had secured at the Indian Gardens until too late to use them, a matter of great chagrin to the Philadelphia contingent.

Returning to the boats we put out into the stream and paddled vigorously (on parade) down past the various wharves to the steamboat dock. This was deserted and quite high out of the water, making it necessary to hoist our duffle up a steep stone embankment. We had decided to keep next to nature as long as possible, and no one wanted a civilized supper that evening, so we sorted out the duffle, taking only the cooking tools and dope bags, and leaving the rest by the dock. Then dropping into our canoes, we paddled across stream to a high, rocky slope, topped with pine trees and evergreens, overlooking the harbor entrance. The Scribe unlimbered his camera and took some photographs of the beautiful view seaward. It was shortly before sunset, and the ruddy light tinted the white sails and lighthouse, and threw deep shadows from the huge rocks clustered around the shore at the base of the slope. On a point of rocks extending out a short distance into the harbor was the skeleton of an old wreck, and we had no trouble collecting an ample supply of drift wood for our last camp-fire. The shores around the harbor were heaped with sawdust to a point far above the waterline, making a very curious beach, although soft and clean. This sawdust was responsible for the ruin of the fishing in that part of the river, below the lumber and pulp mills.

We very quickly had our camp-fire started and set about cooking our last supper. The Scribe had charge of the long expected dish of friend onions, and everyone hovered around the fire in anticipation of the feast, appetites whetted by the fragrant aroma. Unfortunately, in his anxiety to have them just right, the Scribe over did them slightly, so that the best results were not secured. We baked two batches of cornbread in anticipation of our vigil on the steamboat wharf until the boat arrived, which we had learned would be some time early the following morning.

After a hearty supper we cleaned things up leisurely and sat around the camp-fire until twilight, when we packed up the bags and embarked again for the steamboat wharf. The tide had gone down considerably, and we had to dodge the sunken rocks and the sawdust shoals until we got out into the stream, and there we encountered long, smooth swells rolling in from the sea, which swung the boats easily up and down as we paddled slowly across. The whole western sky close down by the horizon was a deep ruby color, and somewhere out in the water to seaward of us somebody was playing an accordion, and singing. Sounds carried very distinctly across the water, and we could hear laughter from the direction of the lighthouse, possibly half a mile away, and from somewhere up in the town came sounds that resembled a merry-go-round or a hurdy-gurdy. We slipped in ghostly fashion close up under the steamboat dock in the half light, our voices echoing strangely among the piling, and dragged our boats one after the other up on the inclined gangway, which sloped down to within four feet of the water. Our boats left the water for the last time here, and we pulled them up under the lee of the warehouse on the deck, and stacked all our duffle underneath them.

We had not yet been able to find the exact time of sailing on the Senlac, so the four of us decided to ramble up through the town and look up the steamboat agent. This we proceeded to do, after returning a borrowed tin bucket to a housewife at the shore end of the dock. We were an uncouth looking crowd as we strolled through the

main street of this pretty little town, and some of the more respectable looking citizens regarded us with suspicion. H. N. T. had ventured up into the town just before leaving for the supper camp, and had had numerous encounters with dogs who resented his appearance. An attractive looking drug store furnished soda water for all hands, and we spent some time looking over the things for sale. Arthur bought a costly bit of jewelry, showing the Nova Scotia emblems, but had the misfortune to lose it later on. The Scribe laid in a supply of English cigarettes at a neighboring tobacconist, as Arthur's supply of Rameses II. had been exhausted. We then ran across the town constable resplendent in uniform, badge, and a strong English accent, who finally located the steamboat agent in a saloon, learning from him that the boat left at 2 A. M. Tuesday. We had before us the prospect of a cheerful wait somewhere during the next six hours, and as all hands vigorously opposed any idea of stopping at a hotel, we returned to the dock, finding a stiff breeze blowing in from the sea, almost uncomfortably cool.

We sat around and talked for a while and then unpacked our sleeping bags and turning our canoes over so as to shelter us from the wind, we crawled into the bags and were quickly asleep. About 11 o'clock in the night Arthur and the Scribe, who were sleeping the sleep of the just under the Mic-Mac, were awakened by somebody roughly turning the canoe over. With the quick instinct that comes of close contact with nature, both sleepers were instantly wide awake, and discovered the startled face of the agent peering down on them. He had been spending his time in the convivial company of his cronies at the café, and was evidently just a little uncertain of himself by this time. The apparition, therefore, of two apparent corpses, hidden underneath a boat on his dock, was thoroughly alarming to his befuddled wits. We quickly reassured him that we were not "dead ones," and he invited us inside the warehouse to make ourselves comfortable until the boat came along, a couple of hours later. This we did, and again slept soundly on the hard boards of the warehouse floor, being awakened about 3 o'clock by the whistle of the boat. Turning out at that time in the morning was a very painful operation, as we were pretty stiff and sore from our exertions of the previous day, and fairly drugged with sleep. We managed to get our things together, however, and haul them aboard the boat in the gray light of the early morning, cold, hungry, dirty, unshaven, and generally uncomfortable. The constant padding had made the joints of our fingers very stiff and cramped, and our feet were still wet from the day's work. We hastily bundled our things down to the cabins assigned to us and turned into a civilized bed for the first time in a week. It seemed a bit strange at first, but it was not long before we were sound asleep, and we finished out the rest of the night comfortably.

We rose in time for a hearty breakfast the next morning, and found the boat making slow progress through a dense fog, which kept with us all the way to Yarmouth. This trip around the South Shore occupied a day and a half—lost time, we thought, but we found clear weather at last on the run back to Boston over night from Yarmouth via the S. S. Prince George. Arrived at Boston our party lost no time in disembarking, and after passing customs inspection went their various ways—the two captains to work, and the two fishermen to Plymouth, there to have a try at the bass and trout for a few days.

[The author of "Across Nova Scotia in Canoes", Mr. Hollinshead N. Taylor, of 308 Chestnut street, Philadelphia, Pa., has very kindly consented to answer any queries that our readers might wish to ask regarding the trip. A letter addressed to Mr. Taylor will receive his prompt attention.]

Atlantic Division—Charles M. Van Kleeck, New York city, by E. T. Keyser.

## Rifle Range and Gallery.

### Fixtures.

July 24-29.—Newark, O.—Second annual of the Ohio State Rifle Association.  
July 26-Aug. 1.—Creedmoor, L. I.—Second annual of New York Rifle Association.  
Aug. 7-8.—Springfield, Mass.—New England Schuetzenbund.  
Aug. 11-18.—Fort Des Moines.—Iowa Rifle Association annual meeting.  
Aug. 24-28.—Sea Girt, N. J.—National rifle and revolver matches.  
Aug. 29-Sept. 9.—Sea Girt, N. J.—National Rifle Association and New Jersey State Association.

### Union Sportsmen's Club.

BROOKLYN, N. Y.—The rifle team of the Union Sportsmen's Club, of Brooklyn, met and defeated the well-known team of the Tanawadeh Outing Club, at Scarsdale, New York, on Saturday last.

After a series of defeats during the last two years the Union Sportsmen's Club has finally gotten together a team that will be dangerous in any event they enter.

Under the able guidance of the captain and coach, Wm. E. Tufts, the team has developed from practically green men into a first-class rifle team. The scores were as follows:

Union Sportsmen's Club.		Tanawadeh Outing Club.	
Lodge	114 1-5	Hanf	93 4-5
Dalton	103 1-5	Gillen	124 4-5
Dumont	145	Ridder	105 3-5
Harper	90	Case	106
Tufts, captain	130 4-5	Steph, captain	144 3-5

In addition to winning a cup from the Tanawadeh Club, Mr. Lodge won a Marble hunting knife, Mr. Tufts a paddle and Mr. Dumont a medal for the high score.

Mr. Humphreys acted as referee, and Mr. Nammack as field marshal, and through their valuable assistance, the affair was expedited in a most satisfactory manner.

**Providence, R. I., Revolver Club.**

SATURDAY, June 24, was a busy day, and our range was productive of some good scores. Major Eddy in particular putting up a 50-shot total of 425 out of 500 points with the military revolver. The small-bore rifle shooters put in a good afternoon's practice, but few scores were turned in.

Mr. Henry D. Merrit, the well-known expert trapshooter, visited us, and catching the rifle and revolver fever, has joined with us. If he handles the single bullet gun as well as the scatter arm, he will make some of our regulars hustle to keep at the head of the line. The following scores were the only ones which our secretary secured during the afternoon:

Revolver, 50yds.—Maj. Wm. F. Eddy, .38 military, 84, 85, 83, 87, 86—425; Arno Argus, .38 officer's model, 73, 78, 83, 89, 78; A. C. Hurlburt, .38 officer's model, 77, 87, 83; W. C. Pixley, .38-44, 67, 73, 67.

Revolver—Military Count—50yds.—Wm. F. Eddy, 47, 49, 48, 48, 48; A. C. Hurlburt, 45, 47, 49; Arno Argus, 43, 45, 48, 49, 45.

Rifle on 50yd. Pistol Target.—C. H. Jeffers, Jr., 32-20, 88, 89, 91.

**Trapshooting.**

If you want your shoot to be announced here send a notice like the following:

**Fixtures.**

- July 1.—Sherbrooke, Can., Gun Club annual tournament. C. H. Foss, Sec'y.
- July 4.—Dickey Bird national team contest of the W. S. Dickey Clay Mfg. Co., Kansas City, Mo., of whom entry blanks and conditions may be obtained.
- July 4.—Montclair, N. J., Gun Club silver shoot. Edward Winslow, Sec'y.
- July 4.—Owego, N. Y., Gun Club all day shoot. Philip S. Farnham, Sec'y.
- July 4.—Castleton Corners, S. I.—Castleton Gun Club shoot. J. A. Howard, Sec'y, 140 Nassau St., New York.
- July 4.—Jeffersonville, Pa.—Penn Gun Club 100 target match and sweepstakes.
- July 4.—Shamokin, Pa., Gun Club tournament. S. C. Yocum, Sec'y.
- July 4.—South Framingham, Mass.—Second annual team shoot; \$50 in cash.
- July 4.—Springfield, Mass.—Midsummer tournament of the Springfield, Mass., Shooting Club. C. L. Kites, Sec'y.
- July 4.—Brockton, Mass.—Montello Gun Club shoot. H. Windle, Sec'y.
- July 4.—Syracuse, N. Y.—Messina Springs Gun Club target tournament. F. N. Potter, Mgr.
- July 4.—Montpelier, Vt., Gun Club tournament. Dr. C. H. Burr, Sec'y.
- July 4.—Monongahela Valley League of West Virginia fourth tournament, under auspices of Mannington Gun Club. W. C. Mawhinney, Sec'y.
- July 4.—Richmond, Va., Gun Club annual tournament. J. A. Anderson, Sec'y.
- July 6-7.—Traverse City, Mich., trapshooting tournament. W. A. Murrell, Sec'y.
- July 11.—Bergen Beach, L. I., Gun Club monthly shoot.
- July 11-12.—Eufala, Ala., Gun Club tournament. C. M. Gamage, Sec'y.
- July 11-12.—New Bethlehem, Pa.—Crescent Gun Club second annual tournament. O. E. Shoemaker, Sec'y.
- July 12.—Brooklyn, L. I.—John Wright's merchandise shoot; added money. John Wright, Mgr., 318 Broadway, New York.
- July 12-13.—Manning, Ia., Gun Club second annual amateur tournament. R. A. Rober, Sec'y.
- July 12-13.—Menominee, Mich.—The Interstate Association's tournament, under the auspices of the Menominee Gun Club. W. W. McQueen, Sec'y.
- July 12-14.—Berterton, Md.—Malone's eleventh annual summer tournament; \$200 added. J. R. Malone, Mgr., 2671 Pennsylvania avenue, Baltimore.
- July 17-18.—Charlottesville, Va.—Charlottesville and University Gun Club sixth annual money and merchandise shoot. G. L. Bruffey, Mgr.
- July 22.—Rutherford, N. J.—Tournament on grounds of the Boiling Springs Gun Club.
- July 24-28.—Brehm's Ocean City, Md., target tournament. H. A. Brehm, Mgr., Baltimore.
- July 28-29.—Newport, R. I.—Aquidneck Gun Club tournament.
- Aug. 2-4.—Albert Lea, Minn.—The Interstate Association's tournament under the auspices of the Albert Lea Gun Club. N. E. Paterson, Sec'y.
- Aug. 8-9.—Morgantown, W. Va.—Monongahela Valley League of West Virginia fifth tournament, under auspices of the Recreation Rod and Gun Club. Elmer F. Jacobs, Sec'y.
- Aug. 8.—Bergen Beach, L. I., Gun Club monthly shoot. H. W. Dryer, Sec'y.
- Aug. 8-10.—Grand Rapids, Mich.—Consolidated Sportsmen's Association fourth annual tournament.
- Aug. 10-11.—Carthage, Mo.—The Missouri and Kansas League of Trapshooters. Dr. C. B. Clapp, Sec'y.
- Aug. 16-18.—Ottawa, Can.—Dominion of Canada Trapshooting and Game Protective Association. G. Easdale, Sec'y.
- Aug. 15-16.—Chattanooga, Tenn.—Mountaineers' Gun Club tournament.
- Aug. 16-18.—Kansas City, Mo.—The Interstate Association's tournament, under the auspices of the O. K. Gun Club. C. C. Herman, Sec'y.
- Aug. 17-18.—Dalton, O., Gun Club tournament. Ernest F. Scott, Sec'y.
- Aug. 17-19.—Chicago, Ill., Trapshooters' Association fall tournament. E. B. Shogren, Sec'y.
- Aug. 22.—Somerville, Conn., Gun Club individual State championship tournament. A. M. Arnold, Sec'y.
- Aug. 22-25.—Lake Okoboji, Ia.—Indian annual tournament. Frank Richl, Sec'y.
- Aug. 29-31.—The Interstate Association's tournament, under the auspices of the Colorado Springs, Colo., Gun Club; \$1,000 added money. A. J. Lawton, Sec'y.
- Sept. 4 (Labor Day)—Fall tournament of the Springfield, Mass., Shooting Club; \$50 added money. C. L. Kites, Sec'y.
- Sept. 4, Labor Day.—Fairmont, W. Va., Gun Club sixth regular monthly tournament of the Monongahela Valley Sportsman's League of West Virginia. W. A. Wiedebusch, Pres.
- Sept. 4.—Lowell, Mass., Rod and Gun Club Labor Day shoot. E. J. Burns, Sec'y.
- Sept. 4-6.—Lynchburg.—Virginia State shoot. N. R. Winfree, Sec'y.
- Sept. 5-8.—Trinidad, Colo.—Grand Western Handicap. Eli Jeffries, Sec'y.
- Sept. 15-17.—San Francisco, Cal.—The Interstate Association's Pacific Coast Handicap at Targets, under the auspices of the San Francisco Trapshooting Association. A. M. Shields, Sec'y.
- Sept. 18-20.—Cincinnati Gun Club annual tournament. Arthur Gambell, Mgr.
- Oct. 3-5.—New London, Ia., Gun Club shoot; \$500 added. Dr. C. E. Cook, Sec'y.
- Oct. 10-11.—St. Joseph, Mo.—The Missouri and Kansas League of Trapshooters. Dr. C. B. Clapp, Sec'y.
- Oct. 11-12.—Dover, Del., Gun Club tournament; open to all amateurs. W. H. Reed, Sec'y.

**DRIVERS AND TWISTERS.**

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Silver shoot of the Montclair, N. J., Gun Club will be held on the afternoon of July 4.

E. J. Burns, Secretary, writes us that the Lowell, Mass., Rod and Gun Club will hold a tournament on Sept. 4.

The tournament of the Consolidated Sportsmen's Association will be held on Aug. 8-10, instead of Aug. 29-31, at Grand Rapids, Mich.

The Mount Kisco, N. Y., Gun Club has started actively again, and welcome visitors to their club shoots, which are held on Wednesday of each week.

The New London, Ia., Gun Club will hold a shoot, Oct. 3-5, to which there is a pleasing attraction in the way of \$500 added money. Dr. C. E. Cook is the Secretary.

The Owego, N. Y., Rod and Gun Club announces a shoot for July 4, commencing at 9 o'clock. Targets, one cent. Shooters are cordially invited. Mr. Philip S. Farnham is the Secretary.

The phenomenal run of Mr. W. R. Crosby, 419, on Wednesday and Thursday, at the Ohio Trapshooters' League tournament, at Canton, O., was a phenomenal performance. But is it not proof that modern ammunition, guns and skill are too good for the old 16yd. mark?

C. L. Morrison, Secretary, informs us that, "The Mountaineers' Gun Club will hold a tournament on Lookout Mountain on Aug. 15 and 16 next. The tournament will be held on the same grounds on which we held our shoot two years ago. The mountain being 2,500 feet above sea level it will ensure a cool and enjoyable occasion, and we are expecting a large attendance."

Mr. Hugo Brugmann, 62 Reade St., New York, writes us that: "We inclose you herewith proof sheet of programme of our tournament, to be held July 22, on the grounds of the Boiling Springs Gun Club, Rutherford, N. J. Our hope is to revive that old organization. The writer has donated the money for the prizes to help the shoot along, and from all indications we should attain our purpose."

Twelve events, at 10, 15, 20 and 25 targets, \$1, \$1.25, \$1.50 and \$1.75 entrance, constitute the programme offered by the Springfield, Mass., Shooting Club for their shoot on July .. Totals, 190 targets; entrance \$15.50. Shooting begins at 9 o'clock. Six high average prizes, of which first is \$5, will be given to amateurs shooting through the programme. Guns and ammunition, shipped to the Secretary, C. L. Kites, 416 Main street, will be delivered on the grounds free.

The programme of the tournament given by the Interstate Association for the Albert Lea, Minn., Gun Club, Aug. 2-4, has a similar programme for the three days, namely, one at 10, six at 15, two at 20 targets, and one at ten pairs. To each event, \$10 are added. Entrance \$1, \$1.50 and \$2. Targets, 2 cents. Aug. 1, practice day. Class shooting, 40, 30, 20 and 10 per cent. Guns and ammunition, prepaid, sent care Henry A. Morgan, Albert Lea, will be delivered on grounds free.

Mr. Geo. Borst has donated a cup for competition under the auspices of the Rochester, N. Y., Gun Club. The first contest took place on Wednesday of last week. Conditions, 25 targets; re-entry contest; moneys divided 50, 30, and 20 for second, third and fourth. A win, the highest score each day, scores one point, and the greatest number of points determines the winner. Ties score a point each. The contests will take place on each Wednesday to July 26, inclusive, except that the shoot of July 5 will be held on July 4.

The programme of the Montpelier, Vt., Gun Club amateur tournament, July 4, has a total of 160 targets, total entrance \$16. The events are at 10, 15, 20 and 25 targets, and one, the merchandise event, open till 5 o'clock, is at 12 targets, 18yds. rise, entrance 50 cents, re-entries 25 cents; prize \$10. Shooting commences at 9 o'clock. Rose system. To club members, highest average, Mullerite medal. Open events, high average, \$25 gun and ammunition, prepaid, sent care of the Secretary, Dr. C. H. Burr, will be delivered on the grounds free of charge if received on or before July 1.

The tournament, at Thomasville, Ga., July 4, will be held under the auspices of the Cracker Gun Club, whose officers are W. S. Brown, President; C. W. Cooper, Secretary and Treasurer, and A. M. Watson, Theo. Titus, J. W. Peacock, H. W. Hopkins and C. W. Cooper, Board of Governors. A State five-man team match between Florida and Georgia will be a feature. Conditions, \$50 per team, \$25 added, 100 targets, three or more entries to fill. The other events at 10, 15, 20 and 50 targets, \$1, \$1.50 and \$2 entrance, \$5, \$7.50 and \$10 added. Medals and merchandise prizes are devoted to special awards.

The programme of the Boiling Spring Gun Club shoot, at Rutherford, N. J., July 22, provides seven events in the forenoon, six at 20 targets, \$2 entrance, and one a consolation event at 25 targets, entrance \$2.50; and five special all-silver prize events in the afternoon, each at 10 targets, 75 cents and \$1 entrance; class shooting. Ten per cent. of forenoon programme set aside for average money. Rose system governs purses, 4, 3, 2 and 1. Targets 2 cents. Lunch and coffee free. The managers are Messrs. Hugo Brugmann and Jay F. Dayton. The forenoon programme begins at 10:30. Afternoon programme at 1:30.

Nine events constituted the programme of the Aquidneck Gun Club tournament, to be held at Newport, R. I., July 28-29. On the first day events 4, 5, 6, and 7, and 8, total respectively 50 targets, which are merchandise prizes. Events 7, 8 and 9 are also a team sweepstake. Distance handicap. Shooting begins at 11 o'clock. There are ten events on the second day, three of which, at 50 targets, are a merchandise shoot, and three, at 50 targets, are the team contest. Shooting begins at 1 o'clock. The merchandise prizes represent a cash value of \$160. Guns and shells shipped to the Secretary, J. S. Coggeshall, No. 9 Ayrault street, will be delivered free on the grounds.

Mr. John S. Wright announces that he will hold an all-day shoot on the grounds of the Brooklyn, N. Y., Gun Club, on Kaiser's Farm, July 12, commencing at 10 o'clock. There are eight events on the programme, at 10, 15, 20 and 25 targets, entrance 70 cents, \$1, \$1.40 and \$1.75 entrance. Totals, 150 targets, \$10 entrance. No. 2 is merchandise prize shoot, handicap allowance. Nos. 3, 4, 7 and 8 also are handicap allowance, and have a total of \$16 added, the latter being contingent on twenty entries. To reach the grounds, take Kings County Elevated to Crescent St. Station, thence by hack to the grounds. Lunch furnished free to shooters.

It appears there is trouble brewing in connection with the decision to abolish pigeon shooting at the Hurlingham Club. A large number of shooting members threaten to resign, and legal proceedings are contemplated. The contention of the oldest shooting members of the club is that the recent resolution is ultra vires, as the club was originally formed for pigeon shooting, and the rules state: "The club is instituted for the purpose of providing a ground for pigeon shooting, polo, and other sports." On the other hand, the members who voted in the majority for the abolition of pigeon shooting say that the legality of their action cannot be questioned, as the resolution was passed by the necessary two-thirds majority according to rules. The resolution does not come into force until the end of the year, and by that time some way out of the difficulty may be discovered.—Shooting Times.

Mr. J. R. Malone's eleventh annual summer tournament, to be held at Berterton, Md., July 11-14, like many of its predecessors, is designed to combine an outing by the sea shore with trap competition. To reach Berterton from Philadelphia, take steamers at Pier No. 3, S. Delaware Ave., foot of Market St., 7:30 A. M., Sundays 8 A. M.; night boat at 5 P. M., except Sunday. July 11 is preliminary practice, eight events, alternately 10 and 15 targets, 50 and 75 cents entrance. July 12, there are twelve events, eight at 15 targets, four at 20 targets, entrance \$1.30 and \$1.40. Five 20-target events, \$1.40 entrance, and a five-man team race, 50 targets per man, entrance price of targets, constitute the programme of the second day; \$20 to first, \$10 to second, \$5 to third, and a handsome gold medal to high individual score. July 14 has a programme similar to that of July 12. Added money, \$150. Competition open to all. One cent for each target thrown during the three days will go to a special purse for the amateurs who shoot through the programme and do not win their entrance. The surplus, after reimbursing for the actual losses of the amateurs, will be given to the high guns, one money for every \$10. Sliding handicaps, 16 to 20yds. Tournament Committee, L. J. Squier, H. E. Lupus, J. W. Chew, and L. S. German. Mr. J. R. Malone is the manager.

BERNARD WATERS.

**IN NEW JERSEY.**

**Montclair Gun Club.**

MONTCLAIR, N. J., June 24.—To-day was the regular contest, June event, for the members' silver cup. Mr. H. F. Holloway was the winner, score 38, plus 12 handicap, 50.

On July 1 the club will shoot for a Charles Daly gun, and on the afternoon of July 4, the club will hold a silver shoot.

EDWARD WINSLOW, Sec'y.

**Rochester Gun Club Tournament.**

ROCHESTER, Ind., June 15.—The tournament held here Tuesday was a great success from every point of view. There were fifty-eight shooters present, and all went home feeling well repaid for their trip to this city.

The club will have money in the treasury now, and will use same to improve the grounds, so that visitors at the next shoot will be the better entertained.

As the tournament came to an end many expressed themselves as wishing that the shoot would last over another day, as they were so well pleased with the courteous treatment received at the hands of the good people of Rochester.

The lake and the fishing it afforded was much enjoyed, and many of the shooters spent morning and evening on its waters casting for the wary bass.

Rochester boys were not in form, and most of the prizes went to the visitors. The best shooting by amateurs was that of Evert Brown from Rensselaer, as he made 152 out of 200. Hugh Clark, of Wabash, was next with 177 and Kit Shepardson, of La Grange, 176.

In the professional list there were T. Bill Crosby with 193, Chas. Young, Springfield, O., 186, and W. D. Stannard, Chicago, and Rolla Heikes, of Dayton, O., 180 each.

As a side issue, E. Tripp, E. Brown and S. Anderson had a match with Anderson, the winner.

There will be a rush for Rochester, when the next tournament is announced.

**Castleton Gun Club.**

The appended scores were made at the monthly shoot of the Castleton Gun Club, at Castleton Corners, Staten Island, on Saturday, June 17. The day was all that could be desired for this sport, and although the attendance was not large, those who were present seemed to enjoy themselves. The next shoot will be held on the Fourth of July. Shooting will begin at 10:30 A. M. There will be prizes for several of the events; targets 1 cent each; visitors will be cordially welcomed. The ground is located at Castleton Corners, and is reached by Silver Lake trolley line from St. George, Staten Island. Scores:

**Raleigh Gun Club.**

RALEIGH, N. C., June 22.—Our club gave one of our midsummer barbecues to-day, and while the attendance was very good, very few were willing to try their hand at the trap. Every one was delighted with the spread, and were unanimously in favor of having several more before the season closed.

The following scores were made, with Mr. Jas. I. Johnson in the lead with 47 out of 50, winning the Hunter Arms trophy for the week. He has won it more times than any other member, and now holds it for the best record made last season.

Monongahela Valley Sportsman's League.

GRAFTON, W. Va., June 21.—The third regular monthly tournament of the Monongahela Valley Sportsmen's League, of West Virginia, was held to-day, on the grounds of the Grafton Rod and Gun Club, at Blueville Park, and was participated in by thirty-five sportsmen from the various clubs of the league.

The day was very cloudy and lowering, with very bad light and frequent rain squalls, making the shooting difficult and clean scores very scarce.

The Peters silver loving cup, emblematic of the five-man team championship of the League, was won for the month by the Recreation Rod and Gun Club, of Morgantown, with the Fairmont Gun Club a close second.

The Laffin & Rand silver loving cup, emblematic of the individual championship of the League, was won for the month by Mr. A. H. Donally, Fairmont Gun Club, with a score of 19 out of 20.

The Webber shooting jacket for high expert average, was won by Mr. E. H. Taylor, with 80.6 per cent. Amateur averages were won by the following League members: First high average, W. N. Dawson, Recreation Rod and Gun Club, 96.3 per cent.; second high average, John M. Cobun, Recreation Rod and Gun Club, 85.1 per cent.; third high average, T. A. Neill, Fairmont Gun Club, 80.6 per cent.

The next tournament of the League will be held July 4, on the grounds of the Mannington Gun Club, and programmes may be had on application to the secretary of the Mannington Gun Club, Mr. W. C. Mawhinney.

The Mannington Gun Club has secured new grounds, and is now installing an additional trap, and will have two in commission throughout the day. They now expect to trap twelve to fourteen thousand targets, and entertain sixty to seventy-five shooters. A special feature of this shoot will be the raffling off of a high grade Young gun. The scores:

Table with columns: Shot at, Broke, Name, Score. Lists scores for various shooters like W. H. Dawson, J. M. Cobun, etc.

Team contest table with columns: Team, Captain, Score. Lists teams like Recreation R. & G. C., Fairmont G. C., etc.

League individual championship race, 20 targets per man: Donally 19, Dawson 17, Long 15, Gaines 13.

ELMER F. JACOBS, Sec'y-Treas. M. V. S. League.

Atlantic City Tournament.

ATLANTIC CITY, N. J.—There were forty shooters who participated in the different events of the Seashore Gun Club on June 22-24. The weather was bad during the whole three days. On June 23 it rained all day.

On the first day Mr. W. S. Smith, a member of the Ligonier Gun Club, of western Pennsylvania, won a handsome cup, donated by the Seashore Gun Club. Councilman Edward S. Johnson was high man for the day.

On the second day, Councilman Johnson won a gold medal donated by the club, and was again high man. Mr. William Loder, of Egg Harbor, N. J., won the Hunter Arms Co. medal.

On the third day, Councilman Johnson was again high. Mr. Chas. Mink, of Philadelphia; Mr. C. L. Aurmack, of Vineland, N. J., and Mr. D. Hackett, of the Seashore Gun Club, tied for the beautiful loving cup presented by Councilman Edward S. Johnson. The cup is emblematic of the championship of the State of New Jersey. In the shoot-off, Mr. Aurmack and Mr. Hackett again tied. In the final shoot-off, Hackett won.

The shoot was held in front of the Speedway Hotel, which is located about one hundred yards from the Board Walk, and was an ideal spot for a tournament. The local shooters turned out well, considering the weather.

There was a noticeable absence of paid professional shooters. The trade representatives present were Messrs. G. F. Hamlin, T. H. Keller, Jr., and Frank Lawrence. The latter rendered the management valuable assistance in handling the shoot.

Fairbury Gun Club.

FAIRBURY, Ill., June 21.—Yesterday the Fairbury Gun Club held another one of their popular shoots, and indeed it was very well patronized. The shooters came to shoot, and they shot through with very few dropping out. This may be accounted for by a change that was made in the divisions of money. The programme specified three moneys, but that was changed to the Chicago system, that of putting all the winners on an equal basis.

This division seems to please all, especially if there is average money. In this particular case there were three prizes, though not very large ones, and this stimulated the three best shots to what turned out to be a hot race. Ide Harris ran the whole 200 shots to a finish with but eight "goose eggs," while Mr. Blumershire finished with but nine.

Cadwallader finished with 95 per cent. and McDonald came next with 184. Stauber and Clark Harris both finished with 90 per cent. Young Harris will soon be as good as the "daddy," as he made a run of sixty-five straight.

The grounds used were the infield of the race track. Nothing could improve it, save the absence of the trees that loom up in the background. The club is not large, but its officers and working members constitute a force that can handle a shoot well. The refereeing, scoring, cashing and management all passed off in the best of order.

Those present were H. W. Cadwallader, Ward Burton and W. Tramp Irwin, manufacturers' agents; Ide Harris, Clark Harris, F. J. Moran, Ed. De Moss, T. D. Karnes and A. Brown, of Fairbury; A. R. Smith, Goodview, Ill.; Jack Neal, Rantout; August Ferris, Crescent A. J. Stauber, Streator; R. D. Keene, Watska; A. M. Duncan, Eureka; H. L. Bloomershire, Washington; E. R. Bube, El Paso; Ayde Hayes, Eureka; T. J. Fortier, Piper City; C. A. McDermid, Bloomington; H. Rosalens, Gilman; W. C. Blumershire, J. W. Hart, W. H. Morgan, J. M. Pratt, Mr. Wood, and O. E. Crouch, members of a new club at Colfax. The scores:

Table with columns: Events, Targets, Name, Score, Broke. Lists scores for Fairbury Gun Club.

Limited Gun Club.

INDIANAPOLIS, Ind.—The scores made at the shoot of the Limited Gun Club, June 16, are appended:

Table with columns: Events, Targets, Name, Score, Broke. Lists scores for Limited Gun Club.

Bound Brook Gun Club.

BOUND BROOK, N. J., June 22.—Among the successful shooters at the regular club shoot of the Bound Brook Gun Club was W. D. Pardoe, of Princeton, who won high amateur average with the score of 59 out of a possible 65 targets. He also won the fob and a sterling souvenir spoon of the Bound Brook Gun Club. Mr. Keller, Jr., made a straight in the second event.

Mr. Martin won the Shakespeare fishing reel and a pair of pictures. Mr. Nicol won the loving cup, handicap, in the second event. Mr. Bishop won the badge.

The club cups were won by Dr. Pardoe, first; Mr. Martin second, and F. K. Stelle third.

The event for the Hunter Arms Co. medal was an interesting event, and was won by F. K. Stelle.

Table with columns: Events, Targets, Name, Score, Broke. Lists scores for Bound Brook Gun Club.

Bradford Tournament.

BRADFORD, Pa.—This is a list of all shooters at the Bradford Gun Club tournament, June 21 and 22.

Mr. Glover won the cup awarded to high two-day score, professionals. Mr. P. Kelsey, Pittsburg, Pa., won the first high average money, \$25. Mr. J. T. Atkinson, New Castle, Pa., won the second high average money, \$15; Mr. J. Nelson, Gerard, Pa., won the low average money, \$10.

Rain fell both days, and the number of shooters participating shows the amount of interest that shooting has in this section. The event was a successful one, and no dissatisfaction appeared. The visitors were treated to a trolley ride to the famous Bock City, in the mountains, and at 10 in the evening sat down to a banquet at the Option House. Mr. Frank J. Collins, of Bradford, acted as toastmaster.

L. E. Mallory, Jr., of Bradford, was third high amateur. Totals at 165 targets for the two days follow:

Table with columns: Name, Score, Broke. Lists scores for Bradford Tournament.

New London Gun Club.

NEW LONDON, Ia.—The eleventh annual tournament, June 20-22, passed very satisfactorily, the weather being good and the attendance fair. Barto won the invitation on a score of 100 straight, including tie. Burmister won the grand target handicap on 50 straight. Gilbert won the third day handicap on a straight score. Thus all the handicaps were won on straight scores.

Garrett was high amateur and Klein second. Taylor was entitled to be, as he had a good lead, but the load he was shooting was entirely too stiff for him, and after leading every one for the first two days, he was forced to drop back on account of too much powder. The next shoot will be held here Oct. 3, 4, 5, and \$500 will be added in cash. C. W. Budd will again manage, and the amateurs that are in this section will have a good chance to get even, as everything will be in good cold cash, and should prove an attraction.

Table with columns: Name, Score, Broke. Lists scores for New London Gun Club.

Fayette Gun Club.

LEXINGTON, Ky., June 23.—At the regular weekly meeting of the Fayette Gun Club, of this city, on yesterday afternoon, just twenty-four shooters participated, not so bad for a city of this size; but then that number is only a fair average attendance every week, and say, they begin to shoot at 3 P. M. and shoot the programme through, and then wish more shells were obtainable. In the gathering twilight a squad will be on the line making good their efforts to beat the other fellows.

The shoot yesterday, a miss-and-out for a fine knife, was interesting. Every shooter present, twenty-four, lined up and shot in turn, and to miss meant to leave the platform amid the cries of the crowd present. This event proved to be quite spirited, and was finally won by Mr. Woolfolk Henderson, who had to fail to miss just 19 times before he was left alone for the presentation speech, which accompanied the knife.

The fourth of the series in the contest for the Parker gun was shot, and the standing of those who have finished the first 100 of the 300 which comprises the series, is given as follows:

Table with columns: Name, Score, Broke. Lists scores for Fayette Gun Club.

Chicago Gun Club.

CHICAGO, Ill., June 17.—The 100-target handicap, \$2 entrance, resulted as follows:

Table with columns: Name, Score, Broke. Lists scores for Chicago Gun Club.

WESTERN TRAP.

Cincinnati Gun Club.

Cincinnati, O.—The weather on June 24 was fine, though a trifle too warm for very active exercise. There was a good attendance of shooters and spectators. Among the visitors were Harold Money, who always makes a bee-line for the club grounds when in Cincinnati, and Capt. du Bray, who was present for the first time in many weeks. These gentlemen are on their way to the G. A. H.

In the Schuler prize shoot Roll was high in actual breaks with 45, Linn second with 43. Supt. Gambell is expected to arrive home early next week, and will be here to take charge at the July 4 shoot. The boys will be more than glad to see him next Saturday.

The scores: Schuler prize shoot, 50 targets, added target handicap: Buller-dick (10) 41, E. Althier (19) 36, Roll (3) 45, Linn (5) 43, Money (0) 45, Andrews (9) 35, F. Althier (13) 31, Ackley (22) 20, Farmer Jones (6) 35, Williams (0) 40, Keplinger (8) 32, Tuttle (5) 34, H. Oscamp (0) 37, Medico (2) 35, Jones (0) 33, Du Bray (0) 33.

Rohrer's Island Gun Club.

The third annual tournament of the Rohrer's Island Gun Club, of Dayton, O., was held on June 20. The day was extremely hot and threatened rain all the forenoon, which affected the attendance, which was much below what had been expected. However, about one hundred people, including several ladies, were at the grounds, and thirty shooters took part in the programme events. The programme called for eight events at 15 and four at 20 targets; a total of 200, with entrance at the rate of 10 cents per target; money divided 40, 30, 20 and 10 per cent.

Chas. F. Miller, treasurer, and M. K. Huffman, assistant secretary, did the office work in a way which pleased the shooters. Capt. George C. Rohrer was squad hustler.

H. Lockwood and W. Oldt were matched against each other for the day, the former winning by 5 targets, with 169 to 164. Lindemuth shot in his usual good form, breaking 93 out of 100. G. Hodapp, president of the club, is a new man at the game, having started in less than a year ago. He shoots in excellent form, and promises to make one of the best shots in the club. Capt. Ben Downs, of Springfield, usually a stayer, was suffering from rheumatism and was forced to stop after the third event. The scores:

Table with columns for Events, Targets, and Shooter names with scores. Includes names like Cain, Rhoads, Faran, Oswald, Trimble, Peters, McConnell, Barker, Kirby, Poole, Lockwood, Alkire, Oldt, Carr, Lewis, Karnehm, Hanauer, Lindemuth, Smith, Smythe, Hodapp, Frank, Starke, Ike, Anderson, Izor, Potter, Downs, Matthews, Wertz.

Phoenix Gun Club.

The first annual tournament of the Phoenix Gun Club was held on June 21 and 22, and was a decided success in every way. The club has only been in existence a few months. The officers and members deserve great credit for the way in which they carried through their initial tournament.

The club owns grounds within a couple of blocks of the principal hotel. The programme consisted of twelve events, at 200 targets; entrance \$20; money divided 50, 30 and 20, on the first day. Nine events at 150 targets, entrance \$15, same division of money; and the matches for the five-man teams and for the individual championship trophies.

In the office were J. D. Poorman and Mrs. G. W. Morgan. Their work was done to every one's satisfaction. Miss Poole, sister to Mrs. Morgan, was the official scorer. These ladies are daughters of the well-known shooter, Wm. Poole, of Springfield, and must inherit their love of the game, as they are enthusiastic over everything relating to trapshooting, and Mrs. Morgan makes an ideal cashier.

The trade was represented by R. L. Trimble, J. R. Taylor, H. N. Kirby and Mr. McNeil. The first day was very hot and uncomfortable. Stan. Rhoads was high gun with 191. A. H. Hill and R. L. Trimble second on 188. A. W. Kirby third, 185. The scores:

June 21, First Day.

Table with columns for Events, Targets, and Shooter names with scores. Includes names like R S Rhoads, A H Hill, R L Trimble, A W Kirby, F Alkire, H H Good, H N Kirby, J Karnehm, D Karnehm, Brubaker, Losh, McConnell, Batdorf, Bell, Foley, Shields, Busch, Fisher.

June 22, Second Day.

The second day was cool, a much better day than Wednesday. A strong wind nearly all day made the targets soar, and fooled several of the shooters. Thirty shooters took part in the programme events, Rhoads being high gun with 142 out of 150. Trimble second, 139; A. W. Kirby, third, 138, and A. H. Hill fourth, 137.

The team race for a silver cup, and the championship of Logan, Union, Champaign, Clark, Shelby, Madison and Miami counties, was won by De Graff with 200 out of 250. Troy Gun Club second with 195. The individual cup, emblematic of championship of same counties, was won by Holding with 47 out of 50. Holding was also high man in the team race, breaking 49, making 96 out of 100 targets in the two races. Scores:

Table with columns for Events, Targets, and Shooter names with scores. Includes names like R S Rhoads, R Trimble, A W Kirby, A Hill, F D Brubaker, H Good, W Poole, McConnell, D Karnehm, D W Smith, Batdorf, J H Smith, J Karnehm, W L Augspurger, H P Runyan, G E Lockhart.

Table with columns for Individual names and scores. Includes Holding, Brubaker, Karnehm, Haines, Augspurger, Losh, Brunner, Shaffer, Batdorf.

Notes.

At the medal shoot of the Welfare Gun Club, Dayton, O., good work was done. The medal was won by C. H. Cord after a hot contest, five shoot-offs being necessary to decide the winner.

Most of the members of the Rohrer's Island Gun Club, Dayton, O., got their fill of shooting at the tournament, and only five took part in the medal contest on June 21. Wm. Oldt won the medal after shooting off a tie with Miller and Carr.

At the shoot of the Greenville, O., Gun Club, on June 19, Ed. McKeon captured the Class A medal with 41, making his third consecutive win in the series of twenty contests for prizes. This places him in the lead with W. Kirby for the gun which is offered as first prize. In Class B, Kimbert and Hartzell tied for the medal.

A very good attendance marked the shoot of the Dayton, O., Gun Club on June 23, eleven men taking part. Craig was high gun, with 125 out of 150. Cord did some good work, breaking 90 out of 100.

Garfield Gun Club.

Chicago, June 24.—The appended scores were made on our grounds to-day on the occasion of the third trophy shoot of the second series. McDonald and Goetter tied for Class A trophy on the good scores of 24 and 25. T. L. Smedes won Class B on 23, and George won Class C on 19.

In the Dupont cup shoot which followed, Dr. Meek, Eaton, McDonald and Keck all tied for Class A on 19 out of 20. T. L. Smedes won Class B on 17 and George Class C on 13.

After the cup shoot was finished, T. L. Smedes and Dr. Reynolds captured two teams formed by choosing sides. In the first match, Dr. Reynolds' team won by 3 targets. In the second match Smedes' team won by 5 targets.

The day was an ideal one for target shooting, being pleasantly cool and but little wind. Good scores resulted. Out of sixteen shooters in trophy event, only four broke less than 20, and two of those made 19 each, while twelve made 21 or better.

Table with columns for Events, Targets, and Shooter names with scores. Includes names like Kampp, Horns, Dr Meek, Thomas, Eaton, Dr Reynolds, Davis, McDonald, Ferd.

No. 4, Dupont cup. No. 5, trophy. Team shoot, Dr. Reynolds and T. L. Smedes captains:

Table with columns for Shooter names and scores. Includes T L Smedes, Dr Meek, Eaton, Goetter, Kampp, Ford, Dr Reynolds, McDonald, Davis, C Einfeldt, George.

In Other Places.

At the shoot, given by the Missoula, Montana, Gun Club, Richie won the Woodworth-Ward medal, an event at 15 singles and 5 pairs. He also won a point on the Bell and Vincent spoon. The regular shoot of the Fergus Falls Gun Club was held Saturday last.

The Blue Ribbon Gun Club, Flint, Mich., has elected A. L. Jones, President; Fred Kitchen, Vice-President; H. J. Shatto, Secretary; Frank Meyers, George Sherer and H. Alexander, Handicap Committee.

The Paducah, Ky., Gun Club held a shoot Thursday last, the medal being won by Ambrose Mercer after a shoot-off with Weille and Beyer.

H. G. Thomas made 49 out of 50 at the Bluefield, W. Va., shoot. The members have improved very much since the opening shoot.

W. D. Stannard met with the North Side Shooters at Milwaukee, Sunday last. He donated a silver cup, for which a contest will be held July 4. On June 25 the return match with the Parker Gun Club will be held.

On July 16 the North Side, Milwaukee, Wis., Gun Club will hold its seventh annual tournament.

The Cleveland, Ohio, Gun Club had a wet day to celebrate their twenty-fifth anniversary, which occurred June 17. The Willow Lake Rod and Gun Club has been formed at Belleville, Ill. The officers are: President, Jacob Bollman; Vice-President, Fred Lichmert; Secretary, Charles Rubleman; Treasurer, Henry Peters.

The Cedar Springs summer resort is now quite popular as a shooting place. Last week the members of the Eaton, Ohio, Gun Club spent the day at this point. They were accompanied by families and friends.

The Swansca Gun Club, Belleville, Ill., held its first shoot on the new grounds, Sunday, June 25.

At last Sunday's shoot at the St. Paul, Minn., Gun Club grounds Wood won the Bazille trophy. The Holmes trophy went to Figge who shot out Karmirsky on the shoot-off.

On the shooting days set apart by the Freeport, Ill., Gun Club the public are invited to be present, either to shoot or to look on.

The Janesville, Wis., Gun Club will hold a big tournament open to all shooters in Southern Wisconsin on July 3.

When the Infalible Gun Club, of Buffalo, N. Y., met last, William Hines scored another win for the Weed trophy. This club will hold a shoot July 4, at which time some valuable merchandise prizes will be put up.

The prize for which the Columbus, Ohio, Gun Club will contest with a series of twenty-six shoots will be an \$80 double hammerless trap gun. The first shoot will be held June 30 and every week thereafter for six months. Just as soon as the new grounds are complete there will be an opportunity for practice daily.

While Dr. A. B. Langshane, an enthusiastic member of the Shamokin, Pa., Gun Club, was arranging the trap for their tournament, he was badly hurt by being struck in the forehead with the trap arm.

The monthly shoot of the Lexington, Mo., Gun Club was held Wednesday at the club grounds. D. O. Heathman was the trophy winner with 23 out of 25.

Columbus, Ohio, Gun Club will give a shoot on July 4. Inter-

state rules will govern, and the targets will not be thrown over 50yds.

An interesting team shoot was held at Port Gibson, Tenn., June 13, the home team winning over Hermantville. Sam H. Bagnell won prize for best individual score.

On Tuesday last at the Great Northern Hotel, Chicago, the new Illinois Athletic Gun and Rifle Club was organized. William F. Church is President, and Chas. F. Zeller Secretary. There will be rifle and revolver ranges constructed at the new club house.

The Celestial Gun Club met last evening at the headquarters in Pekin and adopted a constitution and by-laws, including handicap rules. The membership is increasing, and some good shoots will be held in the near future.

The members of the Austin, Texas, Gun Club chose the cool of the evening for their gun club meets, as the time for meeting is 5 P. M.

F. A. Noland, of the Fond du Lac, Wis., Gun Club, is high individual. On July 8 there will be an exhibition shoot at which Herman Hirschey will show what may be accomplished with the shotgun and rifle.

There was a team shoot last Sunday at Menominee. The Milwaukee clubs were defeated by the home boys, 297 to 284. The Menominee team has issued a challenge to any team in Wisconsin or Michigan to shoot a race consisting of five or ten men on a side.

The Creston, Ohio, Gun Club has been incorporated with \$200 capital, O. C. Robinson, J. H. Smith and others are the incorporators.

The Bloomington, Ill., Gun Club will hold a tournament on July 4. They are holding regular shoots that are well attended.

The Langton Gun Stock Company, Peoria, Ill., will enlarge their plant and have increased facilities for turning out gun stocks.

Down in Indiana the report of the shoot held by the Crown City Gun Club, Dunkirk, Ind., comes thus: "At the regular shoot, held Friday, it was impossible to get the scores. The secretary stated that he was being watched by the entire club with a view of making him keep it a secret. It has leaked out that the members who shot were ashamed of the word 'Lost!' which was recorded on the score card with great frequency during the afternoon.

The thirteen members were all present last Friday, when the Crescent Club, of Belvidere, Ill., held its annual outing at the Big Slough. George Rose set up a good dinner, as well as supper, and all spent the day shooting targets.

That the Omaha, Neb., Rod and Gun Club will soon have a club house is now assured. One hundred men have subscribed \$5 each. The State fish hatcheries has placed 50,000 young bass in the lake.

At a meeting held in Hazlewood, Pa., last Friday a new gun club was organized with 26 new members. It will be known as the Greater Pittsburg Gun Club, the officers being, B. J. Hamm, President; W. H. Johnson, Secretary; J. G. Douglas, Treasurer. Shooters joining before July 1 can get in as charter members for \$3. It is the intention to make the accommodations and equipment of this club the most complete and attractive of any in that part of the State.

At the annual meeting of the Niles, Michigan, Gun Club, the officers elected are: President, W. C. Cantrell; Vice-President, Fred Zimmerman; Foreman, H. Wertz; Secretary and Treasurer, Gordon Ulrey. It is the intention of the club to hold several tournaments this season.

Hans Carstensen, of Exira, Ia., visited Elkhorn, and there won the first prize in a shooting contest.

A business meeting for the members of the Iola, Kansas, Gun Club has been called with the intention of bringing together all the gun clubs of the surrounding towns for a contest.

The Grinnell, Ia., Club last Thursday journeyed to Brooklyn, and there defeated the home team in a club contest. With ten men on a side, each at 50 targets, the score was 361 for Grinnell and 354 for Brooklyn.

The gun clubs of Neodesha, Altoona, Benedict and Fredonia, Kansas, are now engaged in holding team shoots, scores: Neodesha 89, Altoona 88, Benedict 83, Fredonia 76. This was the way the teams finished last time they met for a contest.

The Owosso, Mich., Gun Club were put to the necessity of postponing their shoot for last week on account of the grounds being overflowed.

At the Des Moines, Ia., shoot the gun club will put up loaded shells as prizes.

For the old Peoria, Ill., Gun Club "Tramp" Irwin purposes to get the use of the race track for trapshooting.

J. J. Erding, Plainview, Wis., won the loving cup, losing but 10 targets out of 150. W. A. Schultz, of Tomah, won second with 133. The shoot for the La Crosse Chronicle cup did not fill, and Winona won by default.

Dr. N. G. Yagley, who made a record of 48 out of 50 was high man at the Red Lion Gun Club, York City, Pa., on Thursday last. The club proposes to hold a tournament soon.

The Sunny Side Gun Club, of Cambridge, Ind., will hold a shoot each month of the summer. It is good news that comes from Grinnell, Ia., as the club is conducting team shoots. F. M. Card team won the last race with 226 to 211. Waddington, a traveling man, made high score with 63.

Ottawa, Ill., Gun Club awoke from the winter slumbers and held a shoot on last Saturday.

The Houghton, Mich., Gun Club have received their loving cup. This has put the boys on their mettle, and they are now oiling up their guns, getting ready for much shooting.

George Hughes, of Fonda, one of the oldest men in the shooting, made a good showing at the Sioux Falls meeting. At the annual meet of the South Dakota State Sportsman's Association there was a good attendance of cracks. The State trophy was won by Dave Nelson, of Alcester, with H. G. Taylor, the noted State crack, second. Gilbert missed two for the day.

The gun clubs of Lancaster county, Pa., have formed a league for trapshooting purposes, viz., The Bob White, of Lancaster; Pequea, of Willow Street; Excelsior, of Columbia; Elizabethtown and Christiana. John F. Andrews, of Strasburg, was chosen President, and Geo. W. Westorf, of Elizabethtown, Secretary. The opening shoot will be held June 24, on the Bob White grounds.

The South Side Gun Club, of Milwaukee, Wis., defeated the Parker Gun Club, of same city, in a contest by the score of 212 to 189. On June 25 there will be a return match on the Parker's range at Lyton Park.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., June 21.—In the first contest for the Borst cup to-day, 25 targets, handicap allowance, re-entries unlimited, high scores to count a point, and in case of a tie, each tie in high score to count a point, the result was as follows: Borst, Shoemaker, Stewart, Sterling, Adkin and Stoddard each scored a point.

Table with columns for Shooter names, Score, Hdep., Total, and other scores. Includes names like Coughlin, Rickman, Borst, Shoemaker, Adkin, Clark, Weller, Rickman, Coughlin, Stoddard, Adkin.

Warwick Gun Club.

WARWICK, N. Y., June 17.—The second monthly shoot of the Warwick Gun Club was held on Friday, June 16. There was a strong wind blowing across the platform, making high scores impossible. Following are the scores:

Table with columns for Shooter names and scores. Includes names like Stever, Ogdon, Ackerson, Rogers, Coe, Hendrickson, Wood, Tims, Stever, Kendig.

\*Events Nos. 13 and 15 were miss and outs.

JOHN B. ROGERS.

Grand American Handicap.

INDIANAPOLIS, Ind., June 24.—Herewith is a complete list of regular entries, together with the handicaps as allotted by the Handicap Committee, for the sixth G. A. H., at targets. You will find 305 in all.

ELMER E. SHANER, Sec'y-Mgr.

Table listing names and addresses of participants in the Grand American Handicap, including names like Alkire, Frank, Williamsport, Ohio, and many others.

Table listing names and addresses of participants in the Indianapolis Gun Club, including names like Lawrence, Edward P., Lincoln, Ill., and many others.

Table showing scores for the Indianapolis Gun Club, including names like Le Noir, Finch, Snow, and Cheesman, with columns for targets and shot counts.

Indianapolis Gun Club.

Table showing scores for the Indianapolis Gun Club, including names like Dickman, W. J., and many others, with columns for targets and shot counts.

PUBLISHERS' DEPARTMENT.

System Run Mad.

From The Joseph Dixon Crucible Co.'s "Graphite."

Oh, isn't it great to be "up to date" And live in this year of grace, With a system and place for everything, Though nobody knows the place!

We've an index card for each thing we do And everything under the sun; It takes so long to fill out the cards We never get anything done.

We've loose-leaf ledgers for saving time, The Lord knows what they cost, When half our time is spent each day Hunting for leaves that are lost.

Stenographers who spell like h— And make us swear and cuss, When we are not dictating to them, Why, they are dictating to us.

And sectional this and sectional that, (We'll soon have sectional legs); I dreamt last night that I made a meal Of sectional ham and eggs.

I dreamt I lived in a sectional house, And rode a sectional "hoss," And drew my pay in sections from A sectional "section-boss."

Oh, isn't it great to be "up to date" And live in this year of grace, With a system and place for everything, Though nobody knows the place!

Reduced Rates to Baltimore.

Via Pennsylvania Railroad, Account International Convention United Society of Christian Endeavor.

FOR the International Convention United Society of Christian Endeavor, at Baltimore, Md., July 5 to 10, the Pennsylvania Railroad Company will sell round-trip tickets to Baltimore, at greatly reduced rates, from all stations on its lines east of and including Pittsburg, Erie and Buffalo.

The rate from New York will be \$6.30, Newark, N. J., \$6.10, with corresponding reductions from all other points. Tickets will be sold on July 3, 4 and 5, good for return passage leaving Baltimore until July 15, inclusive. On payment of \$1 to Joint Agent at Baltimore an extension of return limit to August 31 can be obtained.

Tickets via Philadelphia permit stop-over within limit, if deposited with the ticket agent at Broad Street Station.

Special excursion tickets are on sale every Saturday and Sunday from Baltimore to Washington and return at rate of \$1.25 for the round trip. These tickets are good for return passage until the last train Sunday night, affording ample opportunity for delegates to visit the National Capital.—Adv.

Toilet Powder.

There is no toilet article in the selection of which greater care should be used than a toilet powder.

In these days of imitation and substitution, there is so much of inferior goods on the market that it is necessary to be continually on one's guard. Be sure to insist upon a trade-marked product of recognized merit. With toilet powder, as with most other lines of goods, it is safer to trust an old established house with years of experience and a reputation for making only the best. Mennen's Toilet Powder is a trade-marked article, which has for years been recognized by physicians as the best preparation made. The absolute purity of its ingredients and the exercise of the greatest care and skill in its manufacture have given the product of the Mennen Company a quality of uniform excellence. That is why your physician recommends it.

All first-class dealers carry Mennen's Toilet Powder, and will supply it if you insist. It is supplied by the Government for both Army and Navy.

Springfield Shooting Club.

QUITE a number of shooters turned out at the practice shoot of this club on the afternoon of June 17. A hard wind blowing interfered with the shooting, but some good scores were made. Shooters were present from Somersville and Tompkinson, Conn., besides our local shots. During the afternoon 1,365 targets were trapped. The club prize put up at each shoot (a hunting coat this time) for high gun in a 15-target event was won by Chapin. The three club prizes and Peters cup contest are to be shot for during the season. Added target handicap in cup contest, and in the prize event the shooters are divided into classes. Prizes of equal value. Scores in these events follow: Event No. 6, 15 targets, club prize of a hunting coat—Chapin,

So far as genuine realism is concerned, the Boer War at Brighton Beach is a great success. The field covers twenty-seven acres, ten of which are devoted to military and native camps. The arena is backed by a finely painted scene, representing the Drakensburgh Mountains, with the quaint Boer homesteads and churches in the foothills. These form a background for a most realistic reproduction of two of the most decisive battles of the Boer war—the Boer victory of Colonel and the surrender of Cronje at Paardeberg. In these battles eight hundred British troopers, veterans of the contest they now rehearse, and three hundred and fifty Boers, led by the commanders whose names are found in history, take part.

## THE PROBLEM OF THE COYOTE.

THE coyote used to be a characteristic feature of the plains. In the old days of the buffalo he was often a cheerful, friendly, not to say impudent, companion of the traveler, but of late years, since the white men have come into the country, have destroyed the old-time food, and replaced it by a multitude of other, strange but not less palatable, animals, his nature has somewhat changed. He has become modest, almost shrinking, and the unthoughtful people who catch a glimpse of him as he slips out of sight with head hung low and tail depressed are apt to call him "sneak." But who, we should like to inquire, would not shun observation, if he knew that every man that he encountered stood ready to throw a charge of shot, or half a dozen bullets at him?

Among the new inhabitants of the West the coyote can hardly be called popular. He is an athlete—of small size it is true, belonging to the midget class—yet keeping himself constantly in the best of training and thus requiring an abundance of food. If he does some good by a faithful destruction of mice, ground squirrels, gophers and prairie dogs, he does much harm by killing the game birds and breaking up their nests and by destroying domestic fowls, lambs, pigs and calves. There are many places in the thickly settled West where it is impossible to raise turkeys on account of the coyotes.

Of all the wild animals of North America the wolves—which are only wild dogs—are the most intelligent, and of the wolves the coyotes are by far the smartest. The old-time trapper appreciated their wisdom, for he saw them do many curious things. But long before the trapper had come the Indian had already acknowledged the coyote's cunning and had invested him with an atmosphere of mystery, had come to regard him as sacred, and considered him as possessed of supernatural power, almost a god.

The Biological Survey has recently been investigating the coyote in its economic relations, and the results of this inquiry have been published in a bulletin by Mr. David E. Lantz. The dozen species of coyotes which extend from Mexico to British America have all of them similar characteristics, and, as a rule, what is true of the habits of one will be true of all the others, subject only to special conditions of environment, which may give those of one district greater or less wisdom than those of some other section. In many parts of the well-settled West coyotes are still abundant, and notwithstanding the fact that bounties are offered by the States and often added to by the ranchmen of certain localities, the number of coyotes on which bounties are paid fluctuate but little from year to year. In Kansas from July 1, 1903, to June 30, 1904, bounties were paid on 19,514 coyotes.

The paper referred to has in it much that is interesting. Mr. Lantz, however, appears to have overlooked the very good chapter on the coyote which appeared in the volume of the Boone and Crockett Club entitled "Trail and Camp Fire." The various methods of destroying the coyote, such as poisoning, trapping and running with dogs are briefly alluded to, but by far the most interesting point brought out by Mr. Lantz is that the prairie coyote does not willingly jump over a fence more than thirty inches in height. It is well known that the coyote is a good climber, and that he can squeeze through a very small hole, but it is perfectly easy to understand that the animals brought up on the plains may not jump a fence of very moderate height, just as in old times we used to be told that an antelope would not jump a two-foot fence. On the other hand, we have seen an antelope which had become accustomed to a fence, sail over one four feet high with the grace of a deer.

In Cape Colony, Africa, it was found that for a year or more a fence of wire netting two feet six inches in height served to keep out the jackals from the inclosed flocks. In the same way years ago the coyote, with his usual suspicion, would not crawl under an ordinary barbed wire fence. It took only a short time, however, for both the wild animals named to become accustomed to these fences, and when they found that they were harmless—were not traps—they crossed them without the slightest concern. Mr. Lantz gives accounts of a number of simple and inexpensive fences which may be used to keep out the coyotes, and the Survey's experiments will be continued.

Extermination of the animal is difficult, while fences are extremely expensive, and we venture to predict that

for quite a term of years our old friend the coyote will continue to trouble the ranchman and stock raiser of the West.

## AFRICAN GAME PICTURES.

THE astonishing progress made within the past few years in reproducing scenes of nature by photography is familiar to us all. It is nothing uncommon now for photographers to capture on the dry plate the wildest and most unapproachable creatures, and for these photographs to be reprinted for the benefit of a tremendous public that never has the opportunity to see the animals in nature. Examples of this are so numerous that it seems almost invidious to mention any particular one; nevertheless Mr. Wallihan's "Camera Shots at Big Game," Mr. Herrick's "Home Life of Wild Birds," and Mr. Chapman's extraordinary contribution to the natural history of the flamingo may be named as noteworthy examples of what has been done in this branch of the photographic art—or of nature study, whichever one may please to term it.

This work has by no means been confined to America. In Great Britain books are constantly coming from the press, which contain half-tones of greater or less excellence, showing the birds and mammals of those islands in their native surroundings, and some of these books are very charming. It was reserved for Germany, however, to make the most striking contribution to literature of this description.

For a number of years Mr. C. G. Schillings has been engaged in collecting specimens of the African fauna for museums of central Europe. He has brought back splendid collections, including some species and subspecies hitherto unknown, and it is said that through his efforts not less than seven of the museums of central Europe have been greatly enriched. Not content with what he had already done, Mr. Schillings, on his last trip to Africa, carried with him a large photographic outfit, including telescopic cameras and flash-light material. It was his purpose to supplement the superb collections that he had made by a series of pictures of the living animals in the big game country of Africa, and to give true pictures of the animals of the wide treeless plains, the tangled jungle and the silent forest.

In many cases it was impracticable to approach these animals near enough to secure effective pictures with an ordinary camera, but his telescopic lens, effective at a great distance, gives clear detail of a multitude of the operations of the daily life of these wild creatures. Here we may see the zebra, the antelope and the gnu feeding undisturbed on the plains, the giraffe cropping the foliage from the trees, the elephants tearing off the branches and the rhinoceros drinking at the water hole. The animals of the open plain and the daylight presented fewer difficulties than the carnivorous animals of the forest, where light is much less and where often the exposure had to be made at night and by flash-light. With this method also Mr. Schillings was very successful, though at the cost of many weary nights' watching within a zareba of thorn bushes; nights which sometimes yielded nothing or again gave some splendid picture which repaid this hunter without a gun for all his toils.

It is difficult to speak with moderation of the interest and scientific value of these photographs, which show the animals in their natural surroundings and give the circumstances of their daily lives. No written description can tell the story so well as a picture, and there is much to be learned from these of Mr. Schillings. One of his photographs shows a giraffe and two elephants which, during the three weeks that Mr. Schillings saw them, seemed to be constantly together. The gnus and the zebras are also constantly found together, and frequently appear on the same plate. The picture of the elephants and the giraffe, besides its interest as an example of the association of different species, with its context, seems to indicate that these African mammals are as local in their habits as are those of North America.

Within a few years many of the species which Mr. Schillings has photographed are doomed to become extinct, and we shall have of them only a few museum specimens, melancholy caricatures of the beautiful creatures whose innumerable hosts once covered the wide African veldt. But in the photographs are found representations of these animals in life and in nature, which will help to preserve forever the memory of what these species actually were.

## THE AMERICAN HANDICAP.

THE Interstate Association's Sixth Grand American Handicap at Targets, held in Indianapolis last week and fully reported in other pages, was one of the most remarkable events in the trapshooting annals of America. The meeting was record breaking, both as to the number of participants and as to the scores made. The entries numbered 352, and of these 335 actually took part. The Handicap was won by a score of 99 out of a possible 100; and there were several scores superior to the 96, which was the best achievement in 1904. Thus the winning scores of former years were the losing scores of this year.

The growth of the Handicap has been phenomenal; and yet it has been only what we might have looked for, when we consider that the enterprise has been under the auspices of such powerful trade institutions and has been promoted by talent of a very high order. The competition, moreover, is one which has appealed to the very best class of shooters; the annual lists of competitors have been representative of the type which has given the sport of trapshooting its high place among outdoor recreations. As conducted by the Interstate Association, trapshooting is a gentleman's recreation; and we use the word gentleman in its best sense, not necessarily denoting wealth or poverty or social exclusiveness, high or low, and least of all that caddishness which sometimes manifests itself as a mistaken substitute of the characteristics we all recognize as those of a true gentleman. The meeting at Indianapolis last week, both in the participants and in the gathering of friends and spectators, was of a complexion which reflected the highest credit upon trapshooting, and one result of the success of 1905 will be further to popularize a sport which is growing in public favor by leaps and bounds.

The list of entries shows that the Handicap is truly national in scope; competitors were present from all parts of the country, from Maine in the East to California in the West, and from Minnesota to Louisiana. It was a notable assemblage of the shooting talent of the continent.

POLAR exploration still holds out its lure. Commander Robert E. Peary has come to New York with his new ship, the Roosevelt, built especially for work in the far North, and in which in a few days he will set out for another effort to accomplish the undertaking which has baffled the adventurers of centuries. The new expedition, has been planned for with much care, and the ship and the equipment of the party embody the fruits of Colonel Peary's extensive polar experience. The vessel has many peculiarities of construction which it is believed will fit her for the work. A wedge-shaped bow, raking stem and a form of side which cannot be grasped by the ice are features of the model. The bow is filled in almost solid where it meets the impact of the ice; the rudder post is strongly reinforced to prevent twisting, and the rudder is so arranged that it may be lifted out of the water to prevent damage by ice. The short bowsprit can be run inboard when the ice of high elevation makes this desirable. Bow and stern are heavily armored, and screw tie-rods bind the ship together. From New York the Roosevelt will proceed to Sydney, C. B., for coal, thence to Davis Straits, along the west coast of Greenland through Melville Bay to the Whale Sound regions and Cape Sabine, where the Eskimo contingent will be taken aboard; thence through the Kennedy and Robeson channels to the north shore of Grantland. From there the party—three white men and the Eskimo sledge drivers—will start about the 1st of February, 1906, on a dash to the Pole.

THE sport of hunting, whether it be a trip to a remote wilderness in pursuit of big game, or an afternoon's quail shooting on the home farm, is an experience of so many varied and complex elements, that no one of its constituent phases may rightly be singled out as that which always constitutes the attraction, the enjoyment or the pleasurable recollection. For this reason no one who has not himself been a field sportsman can write of field sports intelligently, or concerning them express views based on an information which would give his views intelligence or importance. What some of the writers of the day who denounce sport and sportsmen actually know about the things and the men they discourse upon amounts to about as much as the old writers on witchcraft actually knew about the simple and inoffensive girls and old women they denounced as witches.

## THE SPORTSMAN TOURIST

### Putting the Sally in Commission.

It was that best of all hours in the hotel on the Halifax, when weary with the day's doings and satisfied as to the inner man, we gathered in the smoking room to burn our nightly incense to Lady Nicotine, and tell of the day's sport.

Good times and many of them we sportsmen have, but the only time and place where every effort is crowned with perfect success, and all is exactly as we wish it to be, is that witching hour in the cozy corner, when the easy chair and pipe is lulling mind and body into that beatific attitude of charity to our brother sportsmen which permits us to believe wonderful stories, and tell even more wonderful ones.

Marvelous stories, for years past, have been told in that same snug little smoke-dimmed room, for it is near one of the most celebrated fishing grounds of all the East Coast of Florida; but this year the stories of good times began with "Last year," or "Year before last," instead of "This morning" or "This afternoon," for the oldest inhabitant said, as he invariably does when elucidating: "That it was the worst winter he had ever known as to weather and sport."

If it was not the unprecedented rush of northern visitors that carried so much northern weather to Florida last winter, no one knows what did it. We guessed at it many times, with this guess leading. The day had been cold and windy, with only an occasional glimpse of sunshine, but every one had been out, shivering and trying to fish. "Nothing doing" was the unanimous report, so no man was the envy of another.

"It's played out," said one disgusted sportsman. "They have caught all the fish. I have been over half the State and fished as industriously as a cormorant, and haven't caught, in the whole time, what I had thought I could catch in one day."

"Well, you see, we have never had anything like this before," said the hotel-keeper. "Three weeks ago ice formed on all still water, and dead fish floated down the creeks and rivers in shoals. Not since early in December has our water been in condition to fish. Now last winter it was different, for at this time you could catch all the fish your boat would carry anywhere about here, on the right tide."

"Explanations like that are what is going to cause me to assault some one before I leave here," said another of the party, as the landlord left the room. "I am constantly assured that the conditions for sport were perfect here last year, year before last and year before that, and for many, many years past; but now, when I have schemed, planned, devised and maneuvered for years to get a few weeks off from business to enjoy a real good 'time of my life' fishing trip, and am having about as much comfort as an arctic explorer, and less sport, and am entertained on all sides with accounts of how delightful it was last year, year before—ad infinitum—with a grand chorus 'we never did have it so before' following each such song, I get mad. If things do not improve soon, I am going to Canada for the rest of my vacation, where I can shiver with a clear conscience."

"Well, gentlemen, it is unusual," said the Colonel, an old-timer. "I have spent many winters here, and this is the worst in all my experience. What is your experience, Professor?"

"Nine years at this place, and no such winter or fishing have I seen in all that time," was the testimony of the Professor. "Of course the fish are not always fulfilling the exaggerated expectations you fellows bring down here with you, but in past years I have seen sport here that ought to satisfy any one. By the way, Colonel, our friend the Doctor will be here Friday, and when he puts the Sally in commission, we will have fish coming in."

"He will get them if any one can," said the Colonel. "He has fished the old historic Halifax at this point for eighteen years, and knows—as few men—the water and the way."

"The poor old Sally has shed tears of oakum until every seam is open," said the Professor. "I threw a handful of sand into her to-day, where she lay under the house, and it poured through in streams. There will be a bit of work to do to make her seaworthy, and I hope all will lend a hand. The Doctor is a most delightful Kentucky gentleman, who appreciates a kindness, and reciprocates when the opportunity offers."

"That is true," assented the Colonel with conviction. "We must all lend a hand where we can to get the Doctor afloat. He is one of the best fellows in the world."

Not generally of a suspicious nature, I nevertheless fell to speculating, while preparing for bed an hour later, upon a significant look that passed between the Colonel and Professor while singing the praises of their friend, and urging all to lend a hand in getting the Sally afloat, and concluded, like Fritz, to, "Look me out a leetle bit alretty."

Friday came, as did the Doctor, "and the next day it snowed," or at least felt as though it could, if low temperature were the only essential. The Doctor proved a delightful addition to our party, and when the norther blew itself out, after giving us a week of discomfort, he was in the class heretofore monopolized by the Colonel and Professor.

We grumbled and longed for good weather, through that dreary week of cold wind and colder rain; but there

was many a pleasant hour round the fire in the smoking room, that will be long remembered by all. The Colonel, Professor and Doctor played much solitaire. The Professor would manipulate the cards, and—in base ball parlance—the Colonel would "root" for the Professor, and the Doctor would lay magnificent wagers against their success, while many of us, and at times all, would share the fun, and lend a hand.

Then from a wonderful store of interesting adventures and experiences one or another would entertain us with stories. One never to be forgotten afternoon, the Professor unpacked and exhibited to us his unsurpassed collection of fishes of the East Coast, done in oil. An ardent and successful sportsman, the Professor had made several cruises, extending from the upper Halifax as far down as Key West, taking specimens with his own rod, and transferring them to canvas—wonderfully true to life—with all those delicate and elusive tints and shades which no artist ever sees who depends on subjects procured otherwise.

The first attempt of the sun to shine brought us, en masse, to the front porch to welcome it. Rather anemic, and lacking in ardor was Old Sol, but in any condition he was more than welcome.

"We must now prepare to put the Sally in commission," announced the Doctor.

"Yes, yes!" said the Professor. "Pipe all hands to man the Sally and clear for action. Everybody must get in on this game and share the glory."

Again I noticed the significant glance pass between the Professor and Colonel, and determined to watch with care for the explanations which I felt sure would be forthcoming in the near future.

Bill, the colored man of all work, who stood leaning on his ax gazing in hopeless dejection at the small pile of wood cut, and the great stack awaiting his ministrations, was the first one actually mustered in.

"Where can I get a man with a horse, to haul the Sally down to the water, Bill?" shouted the Doctor.

"I don-no, suh," said Bill, dropping the ax, and strolling in to the porch.

"I told the Doctor that you and Tom could drag her down for him," said the Professor, "but he says it might hurt your back, as you are getting along in years, and he would not let you take any chances now you are getting old."

"Who, me? I gittin' old?" straightening up and squaring his shoulders. "W'y, Doctah, you ain't been list'nin' to somebody tellin' tales on me, is you? Whah is dat boat? Dis you show her to me, and pint out de spot you want her put. I 'low I show you if I is too old to tow a little old yawl boat dat little way. Neb min' 'bout Tom," he protested to the Professor, who was now shouting for the other sable assistant, "I kin haul the Doctah's boat, widout Tom or anybody else to help me."

So wrought up was Bill, by what he considered a reflection upon his physical condition, he positively declined to allow any one to assist him, until assured by the Professor that Tom was only wanted to push behind to ease the strain and prevent him from pulling the boat asunder if an obstruction was encountered.

Half hour later the Sally lay at the water's edge, and the vindicated Bill and exhausted Tom sat by on a log fanning themselves and recovering breath. A little later the Doctor and Professor descended upon the Sally, carrying two empty boxes, a lot of oakum and caulking tools. Seating themselves upon the boxes they lighted cigars, and to all appearances proceeded to enjoy themselves; but showed no disposition to actually commence operations upon the Sally's repairs.

Watching from a safe distance, I at last saw a young man of our party approaching along the water edge. The gentlemen at the boat were so interested in conversation they did not see him until he accosted them. Diving down, they each snatched up oakum and tools.

"Yes, yes," said the Professor. "Fine day indeed, I was just telling the Doctor that we would have to wait until some of you who really knew something about boats came along and showed us how. We want to caulk her, you see, and neither of us know how to go about it."

"If you will twist one strand of oakum for me, and show me how to hold my wedger, I believe I can do it all right, without troubling you," said the Doctor, making awkward motions with first one and then the other hand in which he held his tools.

Five minutes later—minus coat and collar—the expert was pounding oakum into gaping seams for two volubly appreciative gentlemen, who had never, so they earnestly and repeatedly assured him, seen any one so skillful. So appreciative were they that not until compelled by complete exhaustion did the young man leave off work, and stagger, weak and trembling, to the house, and more than half the work was done.

Exhausted by the exertion of superintending this work the two elderly "Tom Sawyers" sat resting and smoking until another victim appeared. Him they appealed to for an opinion as to whether or not they should have soaked the Sally before proceeding to caulk her, and begged him to be so good as to examine the work done (neglecting to tell him it was not their own) and tell them if it was done right, and if not kindly show them the right way. When the slaughter of this innocent was completed, the Sally was ready for tar, and with fresh cigars lighted, the two amiable

gentlemen in charge sat at ease waiting for a fresh victim.

"What's up?" inquired a man living nearby, who had just landed from his boat and strolled down to see what was going on.

"The Sally, upside down," said the Professor facetiously.

"Ready for her tar, ain't she?" he said, drawing near and looking the boat over.

"Well, I don't know" said the Professor hesitatingly.

"No!" said the Doctor in the most positive tone.

"She does not need tar."

This statement of the Doctor's started a spirited discussion which continued until the newcomer had convinced the Doctor and Professor that it would be eminently proper to give the Sally a good coat of tar. So gracefully did they yield to his eloquence, and superior knowledge, that they not only admitted the necessity of tar as he urged, but went so far as to allow the gentleman converting them to donate the tar, lend them his bucket to heat it in, and his brush to apply it with. I saw that they were on the eve of surrendering completely, and allowing him to put the tar on for them, but before this beatific condition of mind had fully developed, the man was called away. The afternoon being well advanced, the two weary laborers concluded to call it a day and quit, and although I had caught but few fish, I felt fully repaid for my day on the dock, from which point of vantage I had observed—thus far—their method of putting the Sally in commission.

It was pathetic to hear the Doctor and Professor relate to the Colonel, who had been absent all day, the story of their strenuous labors, and it was a beautiful exhibition of loyalty to hear the Colonel's (apparently) perfectly sincere expressions of sympathy.

Work was resumed early next morning, and the vindicated colored man was once more the victim. The Colonel had proffered his services, and was on hand with his box and cigar. There was no waiting for some one to happen along.

"Bill!" shouted the Doctor, as soon as they had settled comfortably.

"Yas, suh," said Bill, dropping his ax, and trudging down to where they sat. "Heah I is, w'at kin I do fo' you, Doctor?"

"Why, Bill," said the Professor, "the Doctor, Colonel and I cannot decide whether it would be best to tar the Sally or not, and we have agreed to leave it to you. Examine her carefully now, and see if you think it would really be the best thing to do."

For a moment it looked as though Bill would surely have a fit, he was so overcome by the honor done him; but recovering himself, he proceeded with the air of a physician examining and diagnosing a patient, to examine the boat, even going down on his knees and peeping under to see the inside of her, while the three dignified gentlemen waited his decision in interested silence.

His thorough and exhaustive examination having qualified him to speak advisedly upon the important matter, he proceeded to render his verdict with a judicial air, embellished with every high-sounding word in his vocabulary, to the effect that a coat of tar would be an advantage to the Sally. So grateful were the three friends to him for settling the vexed question for them, that they became immediate and enthusiastic converts to his opinion, and as a reward allowed him to build the fire, heat and apply the tar, commending and complimenting until he had used the last drop, which was only after the boat had received an entire second coat, besides several extra touches along the newly caulked seams.

As nothing further could be done until the tar dried, I felt it a safe time to pay a visit to the committee in charge. They received, with becoming modesty, my compliments upon the quality and quantity of work done, but assured me, with great cheerfulness, that the worst was yet to come, as the bow and stern seats were both broken, and would need some repairing, if not renewing.

"We cannot get a carpenter," the Doctor explained, "and have no tools but a dull saw and broken hatchet, and only heavy heart pine plank to work with. I do not know what we will do."

I did not know myself just what, or whom, they would "do," but had seen enough of their methods of doing to have no fears as to their entire ability to meet this emergency. Determined to know whom they would not do, I concluded to make no more visits to the Sally's dry dock, until the work was completed.

Believing that the next day would be the best of the show, I was early on the dock. The three friends soon appeared, carrying some bits of plank, and the tools they had described as their whole available stock. These they placed carefully upon the ground and, lighting up, proceeded to smoke and rest.

They had been sitting around for some time, when suddenly, as though moved by a common impulse, they sprang up, each one snatched up materials or tools, and ranged themselves around the boat, which still lay bottom side up. I was at a loss to account for this sudden show of activity, until I discovered two young men approaching. The trio around the boat were, to all appearances, wholly unaware of their approach, and when they drew near and accosted them, showed only polite surprise and preoccupation.

## A Friendly Hunt for Indians.

I STARTED on Christmas morning, 1878, from the camp of our cavalry troop on Wolf Creek, sixty miles west of Camp Supply—Fort Supply it is now—in the Indian Territory. I was sent out to hunt up the different bands of Indians who were west of this, hunting. There were no buffalo in the country and these Indians were reported to be starving, and I was told to send all I could find into Camp Supply, where they could get rations, then they could go home.

It was thought that this trip would take me about eighteen days to make, but I managed to string it out to about six weeks before I got home again. I found a band of Comanches on my way home and attached myself to them, making an excuse to our officers that I wanted to see that this chief did go home; any excuse was better than none at all, and mine went. I got no court-martial for disobeying orders, but did get a blowing up from my captain.

I started on this trip with a young northern Cheyenne Indian as a companion, but he deserted me while we were in the cañon of the Canadian River; he was afraid of a big band of Pawnee Indians I was then hunting for. I told him the Pawnees would not molest him while he was in my company, but he still thought they would, so I told him to take the trail home; he was of no use to me anyhow, I would rather go alone.

I had a Springfield rifle and two Colts pistols. I took an extra horse with me instead of a pack mule, the horse would follow and not have to be led or driven. I knew every foot of this country and needed no guide; that was why I had been sent. We first traveled about west, then in a day or two turned southwest. I wanted to send in any Indians I found in this country, then strike the Canadian River up near the Adobe Walls. I expected to find the Pawnees and other Indians up there. We would start each day about sunrise, travel about thirty miles, then go into camp, get our saddles off, stake our horses out and cook supper, then spread down one of our saddle blankets to lie on, covering ourselves with the other two and using the saddles for pillows.

This young Indian spoke very good English for a Cheyenne, and when we had been out several days and were now almost in sight of the Canadian River, we were riding along one afternoon when the Indian, pulling up his horse, said, "Look! Heap antelope over there, you see them?" I saw them now, but had not he called my attention to them I should not have noticed them at all. We were not going in their direction; they were off to our left, on the side of a small hill, or rather a high roll in the prairie, off which the grass had been burned lately leaving a black surface, and I estimated them to be 1,200 yards away.

I had not had my rifle long; our Springfield carbines had lately been taken from us; they did not carry far enough; the Indians had better guns and could get behind sand hills and stand us off. I had given my carbine up when it was called for, without any regret at losing it. I would not give ten cents a dozen for them and use them to shoot with; they might be worth more as scrap iron. I was never quite sure of being able to hit an object smaller than a barn door or a hay stack with it, but with this rifle I could hit what I aimed at.

In the twenty years that I was in the cavalry I had had about all the guns that the Government put out to try us on, about a dozen different ones from first to last. They were continually experimenting with guns—good, bad and worse ones—but they never thought to give us a Marlin or Kennedy, we might hit something with them.

I should have had a .45-90 Marlin of my own long since, but I would not be let carry it; I might hit an Indian with it; I would if he got in my road less than a quarter of a mile away.

The last gun I ever had must have been sent us by mistake; it was the Hotchkiss carbine. While I never tried to split a ball on a knife blade with it (that can be done easier in story books than it can anywhere else), nor did I ever snuff any candles with it (I have done that with a pistol, and so can anyone if they try). I could lie face down at 500 yards and make 23 or 24 out of a possible 25, then repeat it with the next five shots. The target reports of Troop F, Fourth Cavalry, for the year 1884 at Fort Lowell, Arizona, will tell, if they still exist, whether I could or not.

But the antelope are waiting to be shot all this time. I had forgot all about them. I drew my rifle out of its case on my saddle, put a load in it and put the sight up to 1,200 yards. The antelope were not that far off I now thought, but I had found out that the rifle dropped above 500 yards; how much it would drop at a thousand I did not know.

"No good; too far; you can't shoot," the Indian told me.

"You wait, maybe so I can shoot. You look now." I took steady aim, at the whole bunch, of course, then fired. The antelope stood still for a minute then began to run around, and next disappeared across the rise they had been on.

"You shoot one," the Indian says.

"Did I hit him?"

"Yes, me see him. I go get him."

"No, you stay here. I want to see how far; you come when I say come."

I had no tape line but we had been drilled to estimate distances, and I could guess them very closely now. Riding off what I thought was a hundred yards, I might have made it two or three hundred and got through with it sooner, but I wanted to be sure. I called the Indian down, then let him stop there while I rode another hundred, and at the end of the tenth hundred I was still sixty yards from the antelope. I'll allow that sixty for possible errors, I thought, and call it a thousand yards; it is not a foot less.

I had hit the antelope in the flank and the ball had not gone clear through; it had no doubt ranged forward or it would not have killed him so soon, but I had no time now to hunt for it. The river was still several miles away and it was down in a cañon. I might have to hunt an hour for a place to get down to it. I cut off the hind quarters, leaving the skin on. The Indian wanted to take all, but I did not want to overload my pack horse; I might have to jump these horses over rocks to get down to the river. I knew that cañon pretty well now.

"How far you shoot?" the Indian asked.

"Half mile," I told him. That was as near as I could tell him. He knew nothing about feet or yards.

"How far your gun shoot all the time?"

"Two miles, maybe, no more."

It would not, but those Northern Cheyennes had to be kept down where they were now by force. They belonged up in Nebraska and were always trying to get up there again. They had gone only a year ago and we had had to go after them; and I wanted this young fellow to have a high opinion of the distance I could "shoot" if I had to shoot at them again.

We got to the cañon an hour before sunset and struck it not a hundred yards from a place where I could get down into it. The descent was like a giant stairway; there were regular ledges of rocks, each about five feet wide and about two feet above the next one below. We led our horses down, jumping first on each step ourselves, then letting the horse follow. I went first and had the Indian bring up the rear, the pack horse between us. I did not know if he would follow here without being driven, but he did. Getting down on the floor of the cañon we rode about a mile straight across to the river and went into camp along with some men and a wagon. They were down here from Kansas after cottonwood sprouts to plant timber claims. They had a two-horse wagonload of them now, about 5,000 sprouts they said. These sprouts were a foot or two high and not many of them larger than a lead pencil. They grew here in the sandy soil and can be pulled by hand. A thousand could be got off an acre.

I found a few lodges of Cheyennes and gave them their marching orders. I had already turned several bands of Indians that I overtook going west and told them to go into Supply and get chuck-a-way. The Indian ate about half of what venison we had brought with us for his supper, he would most likely have eaten more had we brought more. I told him to eat it all. I did not want it.

He left me the next day and had to depend on his Springfield carbine for his rations on his way home. If he could not do better shooting with it than I could, and I don't think he could, he went home hungry.

Next day we kept on up the river and about noon I met the second white man I had seen since I had left the troop. This man told me where the Pawnees were likely to be found. I had to laugh at the first man I had met. I gave him a bad scare. We saw him early in the forenoon of the day before, we were riding west then across a level prairie when we saw him a mile or more away, coming east.

He saw us, and turning around, went back at a gallop. I wanted to speak to him, so leaving my pack horse and the Indian, I went after him. I rode a horse that was not in the habit of letting cow ponies run away from him. I let him out now and the cow pony might as well stop; he did. The man, seeing that I was going to overtake him, got off his pony and getting behind him threw his Winchester over the saddle. I was going to have a fight. I was about 500 yards from him and pulled up. I began to swing my hat in a circle to my right. "D— a man," I thought, "who can't tell an Indian from a white man fifty feet away. Why don't he go back east and stay there?" Some of these fellows had Indian on the brain and were expecting to meet one or a dozen ten times a day.

The man came from behind his pony now and mounting him started to meet me. "I thought you were Indians," he said, when he came up to me. "Is not your companion an Indian?"

"We both are. He is a Cheyenne, I am a Comanche, but we are not on the warpath now. There are plenty of Indians out here, but most of them are as harmless as we are. Don't run when you see an Indian. It would be labor thrown away on that pony of yours, and you will only let the Indian know that you are afraid of him. Let him come up. It will do no harm, though, if you keep your Winchester where you can get it when he does come up."

Late in the afternoon to-day I saw a smoke rising among a bunch of trees across the river, and as I was now within a few miles of White Deer Creek, there might be Indians here.

I tied my pack horse here, then rode across toward the smoke. There were bushes on that side near the water, and a path had been cut through them lately, but a squaw had not cut it, I knew that. They may be cowboys, I thought, but there were no cattle in this part of the cañon. I followed the path into the camp in among some post oaks. A big fire was burning and a dozen saddles lay about, while every tree had halters, bridles, or lariats hung on it, but not a man was in sight.

"Hello, the camp!" I called out, but got no answer.

"These are no cowboys," I said. "I guess I know what they are. I don't need them," and turning around I got out of that. I had made up my mind now that they were "rustlers," that is, horse and cattle thieves.

I got to White Deer Creek where it falls into the Canadian River, just before dark, and could see the Pawnees' camp-fires ten miles away up this creek. It was too far to go after dark, so I went into camp here, gathered a big lot of dry wood from the drift piles, and got supper after I had started a big fire. I expected to have a visit from those rustlers before morning, but I need not stand guard. My horse would do that and notify me when they came.

I had a hammer-headed sorrel horse which looked as if he hardly knew enough to eat when hungry, but his looks belied him. I never had a more intelligent one. I had been riding him for four years and rode him another year after this, and then turned him in only because I was leaving the troop. I had taught him to do about everything except speak, and he would try to do that sometimes, when I sat in camp talking to him. He and I had put in each winter for the last four years going it alone, as we were doing now. For the first two I had him with me along with a band of Comanches on their hunt. The past two winters we had not sent details out with most of these bands, but our troop had watched them from a central camp, while I had been kept going alone most of the time carrying dispatches or watching the Indians. I was sent because I knew the country, but I need not have gone alone, I could have got as many men and any particular man I asked for, but I would

"Yes, I guess it will be best for me to go to the store and try to find some men," said the Doctor, as though continuing a conversation.

"That is the only thing to do," said the Colonel, as though adding a last word to a lengthy argument.

"Going to launch her?" said one of the newcomers.

"Oh, no!" said the Doctor, "we want to turn her over to mend some broken seats."

"Well, why don't you turn her?" inquired the other young man.

The three friends shook their heads and smiled, as though mildly protesting against ill-timed levity, and the Professor said: "Get about three good men, Doctor, and we can put her over all right."

"Three men beside yourselves to turn that boat?" said the first young man. "Why, my friend and I can turn her by ourselves."

The three older men laughed good-naturedly at this extravagant statement, and the Doctor laid down the hammer and nails he had been holding and made as if to start on his quest for assistance.

I got busy just then with a fish, and when again at leisure to resume espionage of the boat repairers, was not surprised to see that the young men had been allowed to make good their boast, and the Sally lay right side up.

"Your kindness is only equalled by your magnificent strength, young gentlemen," said the Doctor as they stood recovering breath.

"Indeed, yes," chanted the others in grateful chorus.

"And now," said the Professor, as the young men picked up their coats, under the delusion that they had done all that could reasonably be expected of them, "how would you proceed to measure this plank to make new seats. We have figured it every conceivable way and it puzzles us completely."

A little later the two shorn Samsons—one at the bow, and the other at the stern seat—were hard at work practically demonstrating the hard problem (which they had tried in vain to explain to the trio), while the three friends, with freshly lighted cigars, sat by admiring and frankly commending their skill.

The seats duly marked out, and the young men cordially thanked, the trio now frankly admitted that not one of them could use a saw well enough to saw a straight line, and again began to discuss the advisability of sending off for help. Instead of taking to their heels, and not so much as looking back, the young fellows began to offer suggestions and advice, and in three minutes they were again at work, with dull saw and maimed hatchet, repairing the broken seats. What else could they do with such kind, appreciative and helpless gentlemen as the three friends.

That evening after supper, when we all gathered in the smoking room, the Doctor announced: "Owing to a little assistance kindly given by our friends to-day, we are able to announce that the Sally will be ready for launching by to-morrow afternoon." We all applauded, with the exception of the two friends who had rendered the "little assistance." They—over a lamp in the corner, with a borrowed needle—were lending each other little assistance in opening blisters on their hands.

Bright and early the next morning the three friends resumed (the farming out of) their work. Venturing a little too near, after it all appeared completed, I had the honor of hunting up, putting in shape and properly attaching in position, a twenty-pound stone for anchor. It was very thoughtless of me to admit that I knew where there was a suitable one, after the Doctor had suggested that one was wanting, and I am thankful to say I made no useless fight against fate, after the admission was made, but found and fashioned it with all the expedition and skill of which I was master.

When we gathered for dinner the launching of the Sally was announced for 2 P. M. Everybody attended and lent a hand to set her afloat, the three friends consistently continuing to the last their role of aiders and abettors by word of mouth alone, and without delay or accident to mar the occasion, the Sally was duly launched.

As soon as she floated, the Doctor and Professor sprang aboard, and the Colonel took up his position at the water's edge. The Doctor pounded the gunwale with an oar and sang lustily; the Colonel shouted and clapped his hands vigorously, while the Professor—using the tin bailer as a tambourine—did a stunt that would have been the envy of a high-class burnt-cork artist. It was all funny enough to make even the men with unhealed blisters laugh, and we wished that the three dignified performers had other boats to launch.

That night in the smoking room, the amiable Master of the Sally, in a few well chosen words, apparently sincere, returned heartfelt thanks to all, assuring us that never before in the twelve years he had owned her, had he had less trouble and labor in putting her in commission. To which the Colonel added, sotto voce: "Nor more, if the whole truth be told."

LEWIS HOPKINS.

## Belle the Beauty Killed.

BELLE THE BEAUTY, the splendid Russian wolfhound who had long been an attraction at Staak's saloon, at Ninety-sixth street and Columbus avenue, was killed yesterday by Policeman Snyder, who, with many others, thought that the dog had gone mad. Apparently she had not.

Belle became the mother of nine fine little puppies yesterday. Leaving them snug in a champagne case, she ran up stairs to the barroom, barking noisily. The crowd, frightened at her show of excitement, fled to the street. The dog ran out, too. The bartender also ran out, locking the doors to balk thieves.

Belle, after running about a while, tried to get into the saloon again to see her babies. Failing, she barked frantically and began tearing at a door with her long teeth. Snyder ran up and with two shots made the little puppies orphans.

Half an hour later the puppies were drowned to save them from starvation. Then the crowd that had shouted "Mad dog!" acknowledged that they felt ashamed.—New York Times.

not have them. I wanted to go alone; then if I took a notion to go where I had not been sent, after I had been where I had been sent, I went there. I had no men to look after and see that they did not get lost.

This horse had a trick that I had not taught him. It was of more use to me, though, than all I had taught him. When in camp this way, I tied him out on fifty feet of rope, taking care that he always could reach me where I slept; and if anything alarmed him he would walk over to me and punch me with his nose, then if I did not get up soon enough to suit him, he would catch some part of my clothes in his teeth and shake me; then when I had got up and said, "All right, Billy," he went to grazing again.

In the daytime, if I wanted to know if everything was all right in camp, I just looked at the horse. If he was quietly grazing everything was all right. If he stood with his ears stuck forward, something was coming. No rustler could get into our camp and he not know it. I would know it soon after he did, and the rustler would know that we knew it as soon as I could reach my rifle. But I slept undisturbed to-night, no rustler came.

The next morning I rode up to the Pawnee camp. The whole tribe was here. A sergeant of our regiment, but who belonged to a different troop from mine, and ten of his men were here as an escort. I had a written order for him telling him to take his Indians home, and gave it to him, then told him about the rustlers' camp, warning him to look out for his horses. He did not, though, and on his way home, when in camp in the cañon fifteen miles from the rustlers' camp, he lost part of his horses and mules. He took his men and a party of Indians the next day, and went where I had told him the camp was. The camp was there all right, but his horses and mules and the rustlers were not, they had left.

Leaving the Pawnees I came down as far as my last night's camp. I had now sent off all the Indians I could find in this upper country. There were just two ranches at that time on the Canadian River in a distance of about 100 miles, and they were eighty miles apart. It is probably thickly settled now; it ought to be, for it is a beautiful country. One of the ranches was just across from the mouth of White Deer Creek. I wondered why the Indians let it stay there. I think I found out why. The men were probably carrying on a trade with the Indians that the Government knew nothing about. I crossed over to his place to take a look at him. He had a general store, most of his goods, though, were of the kind that only an Indian wants, or at least gets. He generally wants the earth.

"Have you any fire water?" I asked.

"No, he dare not sell it here."

I knew that, did I not? I knew it and I also knew that they sold it right along, but I did not say so. I did not want it and hardly ever used it. I would not use it here if it were given to me. I had need to keep my wits about me when out this way. I only asked him to see if he would sell it. Had he any tobacco? Yes, he had plenty of that, and brought out the kind that Indians buy, long, flat plugs of natural leaf; they use it to smoke. A cowboy would not have it; he wants black navy. I got a pound of tobacco for any Indian friends I might meet.

The man began to question me now. He wanted to find out who I was. I might be a spy on him; he seemed to suspect me. I looked to be a cross between a soldier and a cowboy, I wore very little of the uniform, only a blouse and a blue vest. Was I with those Indians up the creek yonder?

"No, sir. I have nothing at all to do with them, just now."

Was I out here on duty, or just hunting?

"A little of both, I have been sent out here to look around, and I also spend some time hunting. I have a sort of a roving commission and can suit myself in what I do."

Was I an officer in the cavalry? He saw that I had a cavalry horse and saddle and probably noticed that I had one too many pistols for an enlisted man. I had two, and that gun in the saddle did not prevent me from being an officer. Most of our men carried a gun when in the field.

"No, sir, I am not. While I would have no particular objection to being one, the War Department has. At present I am only a sergeant. How much do I owe you, sir," I asked him.

"Nothing, sergeant; you are welcome to the tobacco, and I might let you have a bottle of Hostetter's Bitters if you care for it. I have some."

"No, thank you, sir, I don't like them very well." And I left.

These bitters are but little else than whiskey under another name. I had known them since when a boy, about 1852. I had worked for old Dr. Hostetter in the first little laboratory he ever had, on what is now Penn avenue, in Pittsburg. He put out there in a year about as much of them as his successors now put out in two hours. Since then I had drunk them in New York, saw them in San Francisco, ran across them in Honolulu, met them again in Valparaiso, Chili, and going ashore at Hobart Town, Tasman's Land, found them there. They had got pretty well around the globe and now they reminded me of home. They had turned up here again on the Canadian River to cure the Indians of chills and fever.

Next morning I kept on down the river, making easy marches each day and camping early. It was the middle of winter, but there is very little winter here unless a norther is blowing; the nights even were not cold.

There were plenty of deer in the cañon here, and when I had got farther down I began to pass through large herds of cattle. They did not belong here, but had been driven in off the prairie to the south of this. The grass had all been burned and they had to be sent in here to keep them from starving. The deer had come in for the same cause. I had plenty of rations and would not shoot deer to feed wolves; I would sooner shoot the wolves. I met them from time to time, the big timber wolf, but he kept out of range, I was at war with him. Late in the afternoon I noticed several Indian lodges about two miles below me; they were the first I had seen since starting to come down, the ones I had met on my way up had obeyed my orders and had gone home.

I was riding through a big bunch of cattle and saw a number of deer among them quietly feeding with the

cows. Getting off my horse I shot two of them, taking care not to hit a cow. The deer were so close to some of the cows that had I not had confidence in my rifle I would not have fired at them. Letting them lie here I kept on down to the Indian camp and found them to be Cheyennes. Had they been Comanches I would not have found these deer where I did, the Comanches would have had them long ago, but these Cheyennes were too lazy to hunt unless they were hungry. I sent them up after the deer; then seeing a ranch just below rode down to it. The ranch was just being built and was the only one in here below the one at White Deer Creek. The men were complaining about the Indians; they did not want them here.

"They won't be here longer than to-morrow morning," I told them. "I'll send them off."

"Did I think I could make them go?"

"I am here to make them go. I don't need to think about it at all. They will go. Don't fret."

I wanted forage for my horses, they had a pile of corn in the ear at the ranch and told me to help myself. I took enough for night and morning, then went up to the Indian camp and told them to go in to-morrow. The head man wanted to wait a day or two and hunt deer, he said.

"No. I told him it is not good. You go in to-morrow, I stop and see."

I knew about how anxious they were to hunt deer, when they let the deer come to camp hunting them. They wanted to stay here and beg beef if they could, if not then steal it. They were not lying awake at night studying how they could get deer; they let the deer get close enough to bite them, then wait for someone else to shoot him.

I camped with the Cheyennes that night. I was a Comanche, but they did not know it. I did not have my feathers on, though I had them with me in a buckskin bag in my saddle pocket; I always carried them. They were about three inches long, each feather half white and half black, the Comanche colors. They were tied with a buckskin string that had some figures on it. A Comanche would look at these if he did not know me, then say, "Wano"—[Bueno]—very good. I was not a counterfeiter; I spoke their language, and nearly every Comanche knew me now as Cobia Blanco—White Pony, the name they had given me. The feathers, had I put them on now, would have had the same effect on those Cheyennes that a red rag has on a bull. The Cheyennes and Comanches don't love each other a little bit.

I got the Indians started next morning, then kept on by myself and camped at night just where a trail crosses the valley. It ran north and south and was called Custer's Trail. He may have made it; he was down here more than once. I left the valley on this trail next morning. I meant to go north now and go into Supply. I debated with myself whether to take this trail or keep on south and go into Reno by way of the Wichita River. I had not been given any orders as to what route I should take going home, and I thought I knew why. The captain probably thought it would not be worth while. If the route he laid out did not suit me I would take my own. He had given me so many orders in the past four years that I had not obeyed but always had a good reason why I did not obey them, that he had about quit giving me orders. He was so kind as to tell me at one time that he might as well give my horse our orders as give it to me.

"Yes, sir, but you generally get your object accomplished if I don't carry out the orders to the letter," I told him. "That, I think, is what we are both here for."

I camped that night on a small creek on the trail and got up next morning to find it snowing hard, and I started to look for timber. I knew where to find it. Just before I had got to it about noon, I saw a smoke rising out of a cañon on my right a mile away, and went for it at a gallop. There would be Indians there. A big band of Comanches was in camp down there, and I was at home now; it might snow now until it got ready to stop. I need not stay out in it.

I got down into the camp, and riding up to the chief's lodge got off my horse, took the rifle off the saddle, piled it on a pack at the lodge door, then taking off my pistols laid them on top of it. I was a friend here and must not go into that lodge with arms on; the squaw would carry them in for me. A squaw now came and took my horses, she would get their saddles off, then stake them out; I need not look after them unless I chose, if I staid here a month.

I looked now to see if the chief had a stick or piece of brush across his door. If he had, he did not want any of the band in here. I would not try to go in, but he would soon get that stick out of the way. It is only a sign that he is at his meals or is busy. He would not keep a stranger out. There was no stick, and pulling the flap aside, I walked into the lodge. The chief was seated on the floor eating his dinner.

"I have come to see my brother," I told him.

"My brother is very welcome. Let him sit down and eat."

I sat down and ate. The chief was going west. He had not got the order.

"I have been to the west as far as the Adobe Walls. There are no buffalo in all that country. I have looked and seen it. But the Great Father has meat for his children at Camp Supply. Let them go there and get it."

He said that he had plenty of meat in camp now, his people were not hungry; they generally were not. If there was nothing else to be got the white man's cattle were here; and if I were to find them killing a beef I would not kill my horse trying to get to them in time to stop them. I might do as they do when they see a friend doing wrong, "look the other way."

The chief did not want to break camp until the weather moderated.

"Any time is good," I told him. "There is plenty of time. I will stop and go in when my brothers go. I am in no hurry."

In a day or two the weather cleared up, then we started and got into Supply in two days. Here the chief got beef on the hoof, he could kill it himself. He got flour also, but no sugar or coffee. I got what I could buy of that for them. The commissary here was an open one, a soldier could buy anything they had here at the cost price without an order. A citizen could buy nothing, and if a

soldier were caught buying anything for a citizen he would be court-martialed; but there was no law to prevent me from buying stuff and giving it to these Indians. That commissary officer certainly knew that I did not want fifty pounds of coffee and 150 pounds of sugar for myself. I might have drawn all the rations I wanted for myself here on my traveling order, a paper I carried to tell who I was and what I was doing out here alone; but Troop I of ours was stationed here and they piled all the rations and forage on my pack horse that I would take on him.

We pulled out again now, and two short marches (we were in no hurry now, or else one march would have done it), took us to a big turkey roost called Sheridan's Roost. Here we went into camp and the chief proposed to stop here and hunt turkeys. He had an old muzzle-loading shotgun that looked as if it had been new about the year 1800, but it must have left a blacksmith shop. I think that is where it had been made, the maker had forgot to put his name on it. Later than that, as it was a percussion lock, it had been probably given to the chief by some white man to get rid of the gun and the chief at the same time. The stock had been broken and mended with rawhide.

I went after turkeys with a rifle and got two in a small park by creeping up on them through the brush to where they were feeding. We kept on next day and at last got to Fort Reno, and went into camp across the river from the post. Then I and the chief went over to see the commanding officer, the chief to beg chuckaway (anything that can be eaten is chuckaway) while I wanted to report my return.

I should have done that to my captain, but had an idea that if I reported to this commanding officer here he would tell me to get these Indians out of this, they were not wanted here. That is what he did tell me, and his orders went, he ranked the captain. He said I seemed to be able to do more with these Comanches than some others could, for me to go home with them and see that they got there in some reasonable time. He did not want them ranging all over the country, he said. I took them to their reservation now, taking our time about going to it also. Then we held a dance to celebrate our safe return home again.

I could not strike up any more excuses to keep me out here longer now; I had about exhausted them all, so I went home to Fort Reno and reported to the captain and got a blowing up from him. He wanted to know if I thought that when he sent me out last Christmas he had sent me to stay all summer. CABIA BLANCO.

## Touring the Adirondack Lakes.

If you would hear of the pleasures of Adirondack touring you must prepare for eulogy and not for apology, for the Adirondacks suffer not by comparison with all the master works of nature. Our Canadian border is studded with many a sylvan lake and trackless forest. The mountains and wilderness of our great West are wild and grand and the charm of our Sierra Nevadas is never exhausted. Nature's beautiful scenery lures the traveler into the wilds of Oklahoma or delights him as he seeks refreshment in the orange groves of Southern California. The woods of Maine with their myriad ponds and rugged camps fascinate the man who loves to rough it, roaming in a wilderness far from civilized restraints. But the great body of us cannot avail of such enjoyable outings; we can but read and think of them with longing.

There is a field, however, for the realization of the peculiar pleasures of the woods, accessible to the busy people of the East, a field free from the primitive inconveniences which delight the hardy, but which deter the many from seeking the enjoyments of woods life. Marvel not when you hear that this field is in the famous Adirondack region of New York State. If you are ignorant of the charms of Adirondack touring, you but belong to the vast majority. Touring the Adirondack lakes in a guide-boat is the best substitute we have for the various pleasurable outings famed in song and story. Nay, it is more than a substitute, for it has an individuality about it which makes the trip attractive even to those who can indulge in what the world calls better things. And but a brief few days is required, so that the trip can be compressed into the busy man's fortnight of vacation.

The Adirondack Mountain region is remarkable for the diverse characteristics of its eastern and western sections. The eastern half is filled with lofty mountain peaks, rising in rugged outline from the valleys that lie amid these surrounding barriers. Loftier ranges aspire in vain to equal the magnificence, the impressive grandeur, of the range about Keene Valley. The western section, so unlike the eastern, is a high plateau, dotted with innumerable ponds and pretty lakes, joined by the intertwining of winding streams and little rivers.

It is in this lake region of the west that the guide-boat comes into use, for long distances can be traversed almost entirely by water. A chain of lakes so well adapted for touring is rarely formed. The trip is not a journey to a distant point. The lakes lie in circular location, so that the tourist may start from where he may and reach always the starting point, seeing new country at every turn. The whole lake section is embraced in three distinct circles. All three can be covered easily in less than two weeks, making one continuous trip of about 212 miles.

Let us accept an imaginary starting point, and let it be Blue Mountain Lake, for more attractive spot and one more convenient to the trip could scarce be found. There is a station at Racquette Lake, reached by the New York Central lines, where a small steamer is boarded that continues the journey through Racquette Lake and thence through Utowana and Eagle Lakes to Blue Mountain Lake. At one of the hotels about this lake we may be accommodated for the few days that are useful for resting and for becoming acclimated and making various preparations. Another way to get to Blue Mountain Lake would be by the Adirondack division of the Delaware and Hudson Railroad to North Creek, whence, by the famous North Creek Stage Route, we drive through thirty miles of a beautiful wilderness, to the country of Blue Mountain.

But it matters as little how we get there as it does whether we start at Blue Mountain Lake or at some other lake in the circle. If we do, however, make this lake our starting point, it will be enjoyable to go in by the stage route and out by the boat, or vice versa. Then a day can be given to climbing Blue Mountain, from which a splendid view of the lake region is attainable, and all this time is most enjoyably spent, without reference to the trip before us. A good guide must be procured. The guides are members of an association. They may be engaged at the rate of \$3 a day, besides their board and lodging. The guide furnishes the guide-boat without extra cost. The best arrangement calls for one guide for each member of the party, thus allowing two people to each boat, although two people may accompany a single guide with but slightly less comfort.

From Blue Mountain Lake, a start is made by a six-mile drive, with the boat along on the wagon, to Long Lake, to the dock at the Grove House. Put the boat in the water here, yourself and luggage in the boat, and you are off for the water trip. Long Lake is twelve miles in length and empties into the Racquette River. Mid-day should find you midway upon the lake, traveling north. Lunch is eaten from the pack-basket, as it is best to push on rapidly through this thinly settled country. You should get eight miles up the Racquette River by nightfall, where the guide shoulders the boat for a mile and a half on land, around the falls, to the Racquette Falls House. This is the only house within a ten-mile radius and affords a welcome haven for the first night out.

The second day takes us to the famous Saranacs. Let us not go into too much detail. We turn east across the foot of Upper Saranac Lake, row through Round Lake and the length of Lower Saranac. Nightfall overtakes us here, and we may find it convenient to stop at one of the hotels in the village, a short distance back of the lake. The Ampersand at the head of the Lake welcomes us, if we care for its magnificence.

If time allows, an interesting diversion for the next day may be arranged by leaving our boat behind and taking the train to Lake Placid, where we may hire a boat, explore the lake and climb Whiteface Mountain, to enjoy the commanding view of faraway Keene Valley, and of the high range of the Adirondack Mountains. Lake Placid is one of the most beautiful of all lakes, and its neighboring heights command the grandest of mountain views. All of the high eastern peaks, including that noble trio, Haystack, Skylight, and cloud-splitting Marcy, and the rugged slides and lofty summits of the Gothics are unveiled by the uplifting clouds. If we do not need to hurry, we may well spend a couple of days at Lake Placid.

Upon returning to Lower Saranac Lake, place the boat upon the early train for Paul Smith's Station, and from there drive four miles over to the St. Regis Lakes in time for breakfast. A big day's journey is in prospect, so row quickly through the beautiful St. Regis Lakes and through Lake Clear. Here you will be met by a team and a boat-wagon, for which you must telephone ahead from the St. Regis Lakes. Four miles of an excellent road leads to Saranac Inn, at the head of Upper Saranac Lake. After dining here, board the Lake Steamer, for it is nine miles down the lake to Wawbeek Lodge, and advantage may well be taken of this quicker method. Wawbeek Lodge is at the foot of the lake just above where you first saw the lake two days before, on the way to Lower Saranac. Consequently, at Wawbeek Lodge the first circle of lakes is completed. Now branch off to the west upon a three-mile carry to the Racquette River, and follow it about eight miles toward Big Tupper Lake. A friendly farm house offers a night's rest, a welcome shelter indeed, for forty-seven miles has been traveled since dawn.

The next day is spent in rowing through the wild waters of Big Tupper Lake, the roughest lake in the whole region, in laboring under the short rows and longer carries at the end, and finally reaching Little Tupper Lake where it is necessary to spend the night. Here a kindly hospitality may be offered at the cottages of Mr. William C. Whitney; there is no other settlement within a half day's journey. The following day is pretty well taken up with getting back from Little Tupper to Long Lake by a route, due east, of lakes and carries. A five-mile carry must be made upon this trip, and lucky you are if you can get a wagon to help you out. At Long Lake is completed the second circle, in the wildest, least settled section of the Adirondacks.

From Long Lake the course lies southward, through Forked Lake and Racquette Lake, into the historic Fulton Chain, which is reached by a row of four miles in and out of the mazes of Brown's Tract Inlet. With carries between Lakes, proceed from Eighth Lake to Fourth Lake, where the night should be spent. The scenery of Big Moose Lake which is reached about noon the next day is so unusually beautiful that it will repay one to rest here a half day, preparatory to a long jaunt homeward. Doubtless there are prettier lakes than Big Moose, but we know not where to find them in this whole western half of the incomparable Adirondack mountains. The trip home by way of numerous ponds, stretches due east, to Racquette Lake. Well does memory recall the trip from Big Moose Lake to Racquette Lake. One of the carries is three miles long, over a mountain, and through a woods so thick that the boat can scarcely turn between the trees. Fallen logs to climb over and swamps to wade through add spice to the monotony of the carry. It is doubtless late when you finally reach Racquette Lake, and it may be well to board the steamer for Blue Mountain Lake, whence the start was made some eight days before.

Dry reading to the uninitiated is such a narravite. But does it not suggest some new ideas for vacation time. A man will take more kindly to such a trip than will a woman, although the gentler sex by no means find it a hard earned pleasure. No man who wants the real benefit of the trip should avoid the initial understanding with his guide that he intends to do his share of the work. Half the rowing and half the carrying are to be his share. The Guides' Association has established horse carries, and it is expected that they will be used.

Almost every long carry has upon it a boat-wagon and team. This is a great convenience to the traveler, although it adds to the expense of a somewhat costly trip. Perhaps ten to twelve dollars a day may be an outside estimate of the expense from start to finish of the tour of the lakes. So much is this Adirondack region patronized by tourists that all of the hotels have separate houses for the accommodation of guides, who pass through for half rates. Not so with the tourists. We recall entering the beautiful dining room of Saranac Inn, in our mud-stained clothes and flannel garb and feeling quite at home, so used are the guests to the unconventional attire of tourists.

A hint or two as to how to prepare for the guide-boat trip may not be amiss. To be unburdened, carry no clothing excepting perhaps a woolen sweater. The guide's pack-basket is taken along to hold little articles, a few compact provisions for emergencies, and a few yards of rubber or oil-cloth sheeting to throw over one's self in case of rain. So conveniently are the hotels situated among the lakes that articles likely to be needed may at the start be mailed to hotels en route, self addressed and marked "to be called for." It is very important that hardly anything else should be carried along excepting a small kodak. Better leave everything else behind, but by all means carry a kodak.

There are numerous trips a little different where luggage is necessary. If the intention were to camp out, stopping a few days at each of various places, or to spend time in fishing, it would be necessary to carry more baggage. Fishing in the Adirondacks is not much pleasure late in the season; June is the last month for good fishing. And fishing on a touring trip is only availed of by those who have much time. Camping may be enjoyable, but it is much apart from touring and would be only a hardship if not an absolute impossibility, where there is so much ground to cover. It is because camping is unnecessary in the Adirondacks that our trip is so admirably adapted to afford pleasure to those who do not wish too much to rough it. However, every method has its advocates, and each may suit himself.

H. C. G. BARNABY.

NEW YORK CITY.

EXPENSE incurred in a trip actually made by the author, starting Saturday morning and returning the following Saturday evening—one man and guide:

Guide .....	\$24
Hotel bills .....	28
Boat carries .....	20
Carriage rides over carries.....	6
Extras .....	7

\$85

The cost would be greater if a circle were not completed as the guide would have to be paid for his time and the carries in returning.

The distance covered was 215 miles, of which 128 miles was traveled by rowboat and we carried our boat twenty-five miles. Of the balance, we used horse carries for twenty-seven miles, the steamer on Upper Saranac for nine miles and the railroad from Lower Saranac to Paul Smith's for twenty-six miles.

T. C. G. BARNABY.

## Floating Down the Mississippi.

### The Ice Run Out.

WHEN I reached Rosedale most of my revolver cartridges—38-40—had been used up in practice, of which some river tales had made me feel in need. My companions were individuals about whom there might be said to exist, as the judge says in an excise case, a "reasonable doubt." They were perfectly friendly with me, but with each other they were on vicious terms of intolerance. They agreed to separate at Rosedale, but the boat was in both their names. The Medicine Man had no money, and complained to me that the Gambler had beaten him in purchasing the boat at Paducah. The Gambler was reticent in regard to the deal, saying that it was a matter of business with him, as an explanation of the Medicine Man's open accusations. The Medicine Man claimed to have furnished the money which went into the boat and its furnishing. This was denied by the Gambler. It was at Rosedale, when I learned these details, that I heard some further things in regard to my companions. My notes heretofore were superficial as regards the hearts of the river people, and all that I knew of them were fragments of the "home" and of the "present." I had not been close enough to any of them to get their confidence, and hear the details of their plans. They would talk freely in response to questions, but not spontaneously—Mrs. Haney told me she had a hundred dollars or so on her boat, but she was uneasy the moment she spoke of her past life, and of her family she said nothing. I had to learn weeks later that one of her daughters was a noted river girl of the most independent and bravest sort—a girl adapted to her environment of river pirates, desperadoes and storeboat folks. No river man, drunk or sober, would venture to impose on that daughter of Mrs. Haney. She was of the Amazon type, of which type many stories are told regarding their taking unloving husbands by the nape of the neck and slack of the trousers to throw them overboard.

However, I was getting an insight of river life, traveling with a gambler and a confidential medicine man. So I went up town at Rosedale and bought a box of cartridges and kept my revolver handy on my hip during most of the next two weeks, because appearances indicated the wisdom of the precaution. It was a mile up town, most of the way along a levee, on one side of which was a lumber yard and a public highway was on the other. I bought the cartridges of Rice, a burly big man, who said he couldn't see much of interest for a man to write about there. Two minutes later he was pawing the air vehemently as regards politics and negroes.

The Gambler wanted to get into a game of cards in town, and half an hour after going up he located the "club room." Finding that it was a swell affair he invested \$15 of his \$90 in a new suit of clothes and bought a No. 14 celluloid collar with an opening in front like a "policeman's solid comfort." As his neck was four inches long, and a No. 11 collar would have surrounded

it, the weather beaten cowboy was a remarkable looking "swell" to say the least.

"What do you think of this?" he asked me, kicking out one bony leg in its flapping cover. I said, truthfully, that it changed his appearance marvellously, after the river corduroy garments. He bought a hat, too, and went jauntily up town to the club to make an impression. He succeeded.

In the meantime the river ice was coming. Day by day we heard that the ice flow out of the Ohio had come down to Hickman, New Madrid, Memphis, Helena and Friars Point. It was a remarkable thing to know that a vast mass of broken ice was swooping down the river hundreds of miles up stream, but would inevitably come to Rosedale. The cabin boaters ran into the eddies, and hugged the banks, tying in, and studying the drift, trying to make out whether the stuff would strike the boat heavily enough to damage it. We did as the others did. Our boat was run into a sort of pocket, into which the drift could not come.

The river was rising steadily, and each morning we took in the slack of the lines, and pulled the boat further into the pocket, and were finally safely sheltered among some small tree tops, over submerged brush. In mid stream a snaky line of drift gradually widened into a wonderfully broad mass of timber, brush and other flotsam. This was flecked with white—the advance of the ice. It was awe-inspiring to see the amount of ice increase hour by hour, and know that it would continue to increase to an unimaginable fleet.

On the afternoon of Feb. 1 there was a cessation of the drift flow, scarcely any appearing. Night came on with the river almost clear. I wondered if it was the end of the pack, and felt disappointed, thinking the ice which had been tearing coal barges and steamboats loose of the upper river must have melted. I went to sleep early that night. Toward morning I was awakened by a dull roar. It was a strange sound, broken by intervals of sharp rasping noises while the boat quivered and jarred heavily at times.

Only half awake I did not know what was the matter, The sounds were not ominous to me, and I soon went to sleep. Later one of my mates awakened me by stepping over my hammock, going to the stern of the boat. He said something in a low voice and the Medicine Man answered by springing out of bed. Thereupon I struggled out of the canvas hammock bag and went to the stern to see what was the matter.

A gray mist was over the river, and the gloom of night enshrouded all but the near scene. The surface of the water was slightly luminous, and the down-stream current was only twenty feet distant. On this we could see gray masses darting past, while in the eddy were whirling chunks equally gray and ghastly. The air seemed dragged by the floating stuff, for we could feel currents as though the jagged onrushing surface was tearing the still atmosphere. We took a look at the side of the boat, whence came the scraping noises and found that the stuff was banked against it, but not dangerously. Returning to bed we awaited daylight, which came an hour or so later.

A marvellous change had taken place. The gray mass was a river full of ice. It reached almost from bank to bank, and, because the mass was involatile, the spectacle was one of irresistible power. Hard, grinding, gloomy and rushing on at the rate of six miles an hour, I can imagine no more impressive spectacle than this of the running ice in the Mississippi. The sounds it made were thunderous. There were constantly appearing evidences of the terrific force being exerted. Trees went by which had been torn in two. Fragments of barges and cabin boats were visible from the bank with the naked eye. Moreover, the edges of the ice cakes were rounded off and the rims forced up so that they were saucer-shaped on top.

Out in the center of the floe there were visible the effects of the awful crushing to which the whole mass was being subjected by its own power. The edges of ice cakes heaved up and vast beams sometimes were cramped and made to stand on end like logs in a broken jam.

Tragedy was there, too. We were told that an old fisherman had started to cross the river up the stream a few miles on the previous night. After a time his cries were heard off Rosedale, and still more cries. Apparently he was being carried down stream. He disappeared and, although we were at Rosedale for many days afterward, no word came from him. The cabin boats, four of which were seen passing in one day, may have contained the corpses of whole families for all we knew. Many a river man has lost his life in the Mississippi ice and drift—and no one knew the difference until the buzzard-mangled corpse was found thrown up on a sand bar, if it was known at all.

There was one break in the flowing of the ice which lasted several hours. It was then said that the "ice had sunk," but it resumed, with the size of the cakes larger and the steadiness of the flow more regular. With the second mass fine logs began to appear close to the bank, and the Medicine Man turned drifter for a time, catching a few logs which he swung in by means of a small rope and a skiff. A short, lean and sharp wedge tied to the rope was driven into the top of the log and then violent rowing toward the shore brought the log slowly to the bank, where it was tied to other logs or to big ropes. I helped get a couple of logs in this fashion, and found the work exceedingly exciting, for at times the ice crowded around us, and once nearly swept us against the side of a cabin boat, threatening to crush our skiff.

The cabin boat belonged to a widow and her daughter. She had been a widow nearly ten days, and she was penniless. The boat was only a foot clear of the current, and every once in a while a projecting log or cake of ice would pound along the boat in a fashion that was frightful. The Medicine Man and I, having escaped, rowed up past the boat in an interval of open water, going to our boat. We had little more than landed when there was a scream from the landing below, and ten seconds later half a dozen of us were fighting to save the widow's cabin boat from the ice that a shift in the current had hurled against it. We succeeded, and when a lull came, towed the boat up to a safer eddy.

A trapper had left a little boat in charge of the widow with injunctions to sell it if possible. The little boat was fifteen or sixteen feet long and seven wide, but it was a

substantial affair and dry. The price asked for it was \$15. The minds of the two with whom I was stopping were a unit on one question—they were sure they must separate or something would happen. The Gambler was losing money playing craps, and the Medicine Man didn't have a dollar. One day they were wrangling, for there was nothing else to do. Their voices and temper kept getting up and up until the Gambler was on the point of leaping at his partner when there was a hail by two men from the bank. Instantly the row quelled. The two men were invited to enter. One was florid, thick-set and blue eyed; the other was dark, thin and Hebraic.

"Hello, boys!" they greeted. "Thought we'd come down and see the ice—right sharp up yere on the bank."

"Come in and warm," invited the Gambler, and they came in.

A little talk about the ice followed, and then the Jew drew a pint flask from his pocket.

"Take a smile," he said. My partners smiled. Soon they emptied the flask, and then the Jew drew a dollar from his pocket.

"I want it filled up again," he said. The Medicine Man seized the bottle and the dollar eagerly, and started for the rear of the boat. The florid man followed closely, while the Jew edged toward my shotgun which was standing in a corner. The Medicine Man went to the stern, jumped into the skiff and pulled rapidly to a big whiskey boat which was anchored there by connivance, for it was a "dry town," close to the shore a hundred yards down stream. He returned in a few minutes with the bottle full and drank heartily. Then came a surprise which took the breath of the three of us river men.

"Do you know, gen'lemen," the florid man said, "I'm deputy sheriff here—my name's Hunter, an' I was sent yere to 'rest you fellers fer sellin' licker. We 'lowed you all was a whiskey boat, an' we 'lowed to catch you, we did. An' didn't we do hit slick. Look a-yere! Yere's mah gun, a forty-five—"

"Hell!" said the Gambler, who had recovered himself. "We all has guns, too."

With that he drew his revolver and twirled it on his thumb and fingers as he talked.

"Do you s'pose you all'd ketched us if we'd been lick-erin'?" he asked. "Look at these gray hairs—I'm from Indian Territory, I am."

With that he twirled the gun some more, and shoved it into his pocket again. He had created an instant and vivid impression. The deputy sheriff and his friend watched the revolver go out of sight with a breath of relief, and fell to talking about the suspicions which our appearance had roused up town. After a time the visitors went up the bank and then the Gambler turned on his partner.

"If that had been in Indian Territory they'd nailed you the minute you took the bottle."

"Just think of it," the Medicine Man exclaimed with a shudder, "we'd gone to the fahm, shore."

The experience seemed to breed a further feeling of unrest and distrust in the two. The Gambler determined to break loose and he bought the little cabin boat from the widow. He moved all his things on to it, and took the big skiff as well. When he was gone the Medicine Man said to me:

"I'm glad of hit! I ain't felt safe at all for weeks. I know that Gambler. You hearn him tell how he was gone from home for ten years? Well, that was after he'd killed a man down in Georgia. He killed him with a pen knife. I tell you he's a bad man. Why, up to Paducah on this yeah trip, jes' foh we started, we was into a hotel when the landlord had reason to suspect that man. The landlord took a gun and come up to outh room an' he aimed at that Gambler."

"Ah'm gwint to kill you all!" the landlord said, an' with that the Gambler ducked under an' run in on the landlord an' grabbed that revolver out of his hand. The landlord he turned jes' white. The Gambler jes' stepped back a minute, then he give the gun back to the landlord an' said:

"Take yer gun," he said. "Now shoot ef you all want to."

"Well, sir, that landlord he 'pologized, an' the Gambler havin' just been insultin' to his'n's wife, too. I tell you that Gambler is a bad man."

The Gambler told me that he had escaped from a jail in Georgia by means of a key which he whittled from an elm chair splint. With another condemned murderer he reached a mountainside, and followed a run or brook to escape the trained bloodhounds which were put on their trails in the morning. Night after night, for two weeks, they traveled by the North star, when they could see it. One night they traveled under the clouds. In the morning they made camp in dense brush, and when daylight came they found themselves in the place they had left on the previous evening. They had walked all around a mountain in the dark, and happened to make camp within a few yards of the one of the day before.

They stole chickens and ate green corn and picked fruit for their sustenance. Once, early in the evening, they ventured to hail a negro cabin and purchase a little corn pone, but they never ventured to show their faces by a fire-place. They traversed a third of Georgia, crossed all of Tennessee and finally entered Kentucky, having spoken to but one person in over two weeks, and did not travel a mile by daylight.

In Kentucky, the native State of both men, the two separated and went to work as farm hands. At the end of the summer a "smart Aleck" deputy sheriff came and asked the Gambler's employer numerous questions. The employer came to the hired man and said:

"If you all hain't done nothin' stay right yere," the man said to the Gambler, "but if you all's done some meanness down in Georgia you all betch cl'ar out. I got a brother ten-mile away—you all and me'll go to his'n's place."

"I call that kind of a man a true, honorable person," the Gambler said to me. "I said I'd have to cl'ar out. I sent word to mah partner to hike, and I went down to my boss's brother's, and then I lit out for Texas. I lived in Brownwood, Tex., two years, and old Bill Adams, who was sheriff there, began to ask me if I'd like to go to Kentucky? I knowed he suspected me of some meanness and I started that night, but he got me next day out to a place where my brother was working. I was

with him three days, and then I got him drunk. He let me pull my freight, being good natured when he's drinking. Adams he wasn't sure about me anyhow, and he was going to let me go without a chase, but I had an uncle who said to him:

"He—he! You all ain't so smart after all—let a man what's wanted for a hanging crime git out like that!"

"I'd only been gone twenty-four hours then, and there was twenty Texas rangers in town that day. Well, Adams set them after me. I was as good as gone back to Georgia. I hadn't any horse; it was sandy and prairie. They could a followed my track at a gallop, but it come up a rain, and while it rained I walked. The water washed my tracks out, and in three days I made eighty miles. I tell you, I've thanked God for that rain many a time since then. Why they'd taken me back to Georgia in no time, if it hadn't been for that storm, they shore would. I was in Indian Territory eight years, and then I staked a lawyer and come clear on a new trial in Georgia."

The Medicine Man and I awaited the passing of the ice for what seemed an age—seven days in all—and then we started down the river with the boat, while the Gambler in his little tub came along, for company's sake. The Medicine Man wasn't enthusiastic about the company. He said over and over again that he hoped the Gambler wouldn't get to liquoring, for if he did something would surely happen. We floated for Arkansas City, and reached it after dark, rowing nearly three miles down the long eddy above the city, lighting our way by an acetylene gas lamp which was in my outfit. The lamp threw a brilliant light, and as we came in sight of a cabin boat, half a mile or less from the post office, great commotion was discernible thereon. They waved a lantern at us.

"Hullo!" they screamed.

"Hullo, yourself!" was our answer.

"What are you, anyhow?"

"Cabin boat, huntin' a landing."

"Huh! Thought you was a lost steam packet—come in yere."

We ran in, and were boarded by the three men from the green cabin boat which we had seen up the river at Scrub Grass Bend. They were overjoyed, we weren't.

"Now we'll have some goose shooting—" they began at once to me. It was late when they finally got out, and we turned in. In the morning we dropped down to a cabin boat town and had a view of Arkansas City, of gambling and man-killing fame. A levee, a couple or three steam sawmills, some brick buildings, many wooden ones, some distant negro cabins, a rag town for levee workers, and a couple of acres of logs in rafts were the conspicuous features of the place. I went after my mail and found what I went after. Then I took a stroll around to see the place. It differed little from Helena, except that it was smaller and that the white population was a little grimmer in appearance on the average—and well they might be, if the stories one picks up about this river town's life are true.

Here we waited a couple of days. The weather was cold and the wind blew bitterly cold. We visited around at the cabin boats, and one night—the last there—we went to Crites' photograph boat and had a musicale. Probably it was as remarkable as most river musicales. Crites played a violin, the Medicine Man played a banjo, Crites' assistant played a guitar and I played a mouth organ. There were no gaps in the music which other instruments could have filled. It was a wonder that the levee didn't roll in on us. The Gambler was up town somewhere, we didn't know where, nor did we care. About 10 o'clock there was a rap on the door and then in came the Gambler. He had an ugly leer on his face, and he gazed over the outfit with ironical amusement. I offered him my French harp, and he said "Hell." Crites offered him the violin, and he seized it angrily, and then sat down on a proffered chair with a twitch. He yanked the bow down the strings with a rasping jerk, and sent it up with a gentler inflection. Then he fell to playing, a fragment of one of those Indian Territory operas which he had learned when he was a troupe fiddler. Gradually the notes grew softer, and as they became gentler the player's face lost its ugly, drunken leer. In half an hour he was sociable and sleepy. We started for our homes.

The Gambler's boat was fifty yards distant, and ours only half as far. When we stepped out doors we found the gale sweeping down over the city, and my gas lamp showed that our boat was riding the eddy safely. The Gambler's, further out, very close to the current, was bobbing on the wavelets. Out on the river we could hear the rasping chop of waves, flung up in the current.

"It's an awful night," the Medicine Man remarked, and Crites said it was more than awful. The Gambler staggered into his skiff, seized the oars, and we entered our skiff. My lamp was most useful then, for our boats were dark, and invisible on the water, which was the more gloomy on account of the distant electric lights. We found it difficult making our boat, for the wind flung the skiff toward the current in a fashion that required our skill and strength to overcome. We boarded our boat finally, and then I turned my light on the Gambler's little craft so that he could see to get to it. I watched him run alongside, make fast and climb aboard, and then turned to enter our boat. As I did so I turned the light toward the Gambler's little craft to take a farewell glance at it. I caught a flicker of the gas light on the boat, and though I noticed that the position of the boat seemed to have changed, I supposed it had simply swung on its anchor line and gone a little further from us.

The Medicine Man and I went to bed and the Gambler to one of the wildest adventures it is possible for a river man to have and survive. When we awakened in the morning the Gambler's little tub was nowhere in sight. It was rather late, and the day was so clear and the river so smooth, the wind having laid, that we presumed the Gambler had run in shore. We looked up and down the wharf and saw that the boat was not there. Then we shouted over to Crites' boat and they hadn't seen the boat since dark of the night before. The postmaster hadn't seen the Gambler up town, nor had any cabin boaters seen him that day. We wondered if the boat had sunk. The Medicine Man was inclined to hope that it had, and the Gambler with it.

Having nothing else to do we pulled up our own anchor

and started on down the river toward the "Sunny South," about which the Medicine Man was growing more and more enthusiastic.

"We'll go to Lake Providence and to Vicksburg," he said. "There's money down thataway, they shore has hit."

We went around Yellow, Georgetown and Rowdy bends, I scanned the trees under the caving banks, thinking to see the wreck of the Gambler's boat, but my glasses did not reveal anything till we came to the chute of Island 82. Here we saw a bit of craft moored to the left bank of the chute. As we drifted past, without recognizing it, a man darted out of the boat and untied. It was the Gambler and his boat. He shoved out to us, and tried to speak. He was wild-eyed, and so hoarse that his voice was a whisper. He was sallow, and he trembled from head to foot violently. He went to bed on our boat, and hours later he was able to tell his story.

He had boarded his boat safely enough, and struck a match to light his lamp. Then he took a drink of whiskey and sat down to undress. He was in his underwear when he noted that the boat was joggling a good deal. The rocking of the boat increased in violence, and at last he looked out the front door to see what was the matter. He found himself looking into a dense, black gloom.

"Where's them electric lights?" he asked himself, and then, by way of answer, he saw a distant white haze above a few white sparks. His anchor, on a taut line, had worked out of the mud and he was a couple of miles from the city, his boat pitching in the waves of a freezing gale. With that he grabbed up his whiskey bottle and drained it to the last drop, then got into his skiff, bare headed and in cotton underwear, tied a line to the cabin boat and to the skiff and began to row.

He didn't know how long he rowed, but the first he knew he heard a roar louder than any previous ones of waves and growing louder. With a dismay he saw that he was being driven into a caving bank, among the gray snags of a thousand plunging trees. One jabbed at the skiff and this the man seized.

"I shore thought the strain would pull me in two," he said. "Hit pulled my wrist till hit swolled up now."

The cabin boat was swung into a sort of dead water, and eased the strain somewhat, and then he took a turn around the branch he had gripped and went to bed, from which he was routed at intervals by the scend of drift hitting the sides of his craft. In the morning he dropped down to the chute, and tied in there, a sick man. Now he was with us again. "And he's liable to die with us, too," the Medicine Man said privately. "It'd be jes' my luck to have him die on to my hands. I had a woman die on to me one time when I was in the lower river. It just seems though I can't have no peace nor comfort no more. I wish I'd gone down the river nor, stid of down that chute."

RAYMOND S. SPEARS.

## The Deity of the Woods.

Look! ye young men and maidens! summer girls and vacation ramblers! collectors of autumn leaves, and all who love to rove in the by-paths and recesses of the forest. The earth is full of beauty! Go forth and see. It is our own fault if we fail to appreciate its charms.

Even the laborer who works in the public and private parks ought to get enjoyment out of his shovel. Thereby he learns to be content with his lot. He will have no "grievances." He makes the best of his occupation while it lasts; and should he see an opening at any time to higher grades of employment, he looks forward to the realization, as the hopeful in this life look forward to the promised joys hereafter. He receives a perennial uplift from the whispering leaves and waving branches around him, and draws lessons from their falling and unfolding.

Woods reflect the character and features of the Creator just as the handiwork of friends who love us, be they maiden, wife or mother, reflects the spirit which animates their deft and busy fingers and lights up their kindly faces with pleasant smiles. Soulful expression of regard—in color, pattern, lines of usefulness, and suggestion—are they not exquisite? Did we but notice a moiety of the natural beauty around us we would dwell consciously in the Creator's presence all the time. We are bound to discover in due course that the God of Nature is the God of Love. Otherwise we shall flinch when he shakes the earth with tremors and splits the clouds with his lightnings. We shall "have fear where no fear is." The "works of the Lord are glorious and mighty in operation." Those who trust in Him can always feel the warmth of His sympathetic hand, even when the grip is painful.

It is because we are drawn to nature's heart, to the Deity of the Woods, that we are moved to plead for forest reservations. Men who undertake to "subdue the wilderness" are apt to destroy more than they can restore or compensate for. They may, indeed, enhance the beauty of a circumscribed area like a public park by artificial embellishment, but it is always at the expense of larger plundered or devastated areas. If we denude the mountain sides in wanton avarice, we may reap no small advantage for a season; but a grievous reprisal comes when the floods destroy the cultivated low lands and fill up the navigable waterways and harbors. Could men but learn to respect, not only the deities of the woods, but the rights and claims of the many lesser denizens, furred and feathered, who occupy their leafy precincts, they would become conservative by impulse and inoculation, and not continue to wantonly destroy.

Then, forsooth "would all the trees of the woods rejoice!"—Ps. 96:12.

CHARLES HALLOCK.

PLAINFIELD, Mass.

Take inventory of the good things in this issue of FOREST AND STREAM. Recall what a fund was given last week. Count on what is to come next week. Was there ever in all the world a more abundant weekly store of sportsmen's reading?

# NATURAL HISTORY

## Familiar Insects.—I.

BY CLARENCE M. WEED.

### Black Flies.

TO A LARGE proportion of the readers of this journal the black fly is only too familiar as an insect that has made life a burden when otherwise it would have been a delight. In this article I want to tell something of its life-history and of an experiment in destroying it in its breeding grounds.

Like most other insects the black fly goes through certain stages of life which are commonly referred to as transformations. These stages are first the eggs, second the larva, third the pupa, and fourth the adult. The eggs are laid upon rocks in the rapids of small streams, especially at the edges of the water ripples. They are laid in the shallowest places and are especially likely to be deposited where the water runs in a broad sheet over a large expanse of flat rock. Soon after being laid the eggs hatch into larvæ, which have the curious ability to spin a silken web over the rock to hold them in place in the running water. The surface of the rock is often thickly matted by this web with millions of small blackish larvæ entangled in its meshes. They continue to develop for several weeks before they change to pupæ, after which they soon change again to adult flies. These flies are often so abundant that as one writer has said, they "drive the fisherman out of the woods, torment the cattle in the pasture, and pester the farmer in the field."

Larva of Black-fly. Magnified.

Pupa of Black-fly. Magnified.

Black-fly. Greatly magnified.

From the point of view of reducing the numbers of this pest the fact that they usually develop in any region only in comparatively limited areas in sunny parts of small streams is of great importance. If the larvæ can be destroyed in their breeding grounds, the appearance of the flies will, of course, be prevented.

Some two years ago, when my official position was that of entomologist at the New Hampshire College Experiment Station, I undertook, with the aid of my assistant, Mr. A. F. Conradi, to determine whether the suppression of black flies in a region favorable to the experiment was practicable. The locality chosen was the Dixville Notch region in New Hampshire. This was peculiarly favorable for such an experiment, as it is a comparatively small area, surrounded by mountains over which no flies from other localities would be likely to come regularly. Much of this inclosed region is occupied by a beautiful lake.

A reconnaissance of the general locality showed that the black flies which for many years had been a serious pest to summer visitors, were breeding in abundance at the wasteway connected with the dam and in a small brook which led from the Notch toward the river.

After the determination of these breeding places the problem became that of finding some practicable method of destroying the larvæ in the water. Two ways of doing this were tried; in the places where there were broad, flat rocks on which the larvæ were developing they were swept away by stiff brooms, a method which was effective to a very general extent; where sweeping was not practicable a small quantity of an oil heavier than water, such as is manufactured for exterminating mosquitoes under certain conditions, was applied. This oil proved very effective in destroying the larvæ. The chief objection to its general use is the danger of injury to fish, but in very many localities black fly breeding places may be found where the oil may be used to advantage by temporarily diverting the small stream from its regular channel until the oil has flowed away.

A record of these experiments may be found in Bulletin 112 of the New Hampshire Experiment Station, which may be had by applying to the station at Durham, N. H. It seems to me that they show that great relief from the annoyance of black flies may readily be obtained in many localities in most northern regions. It

should be easier to exterminate black flies than it is to get rid of mosquitoes.

We quote from Bulletin 112, referred to by Mr. Weed: "Upon his arrival Mr. Conradi made a careful survey of the entire locality, finding no flies breeding in the swiftly-running shaded streams along the mountain sides, but finding vast numbers breeding in the shallow, sunlit waters at the wasteway from the lake and in two or three other places. His notes upon the first experiment with the oil treatment are as follows:

"At the wasteway, near the lake dam, where the stream is approximately five feet wide, one-third of a gallon of phenol oil was applied at 4 A. M., June 22. The effect was at once noticeable. At 2 P. M., the same day, most of the larvæ were dead, while the remainder were sluggish. On the afternoon of the next day, the conditions were carefully investigated, and all the larvæ were found to be dead, not only where the oil was applied but for ten feet or so ahead as well.

"The oil was applied by simply pouring it over a shingle, thus scattering it somewhat. It sinks and rises and lingers long about the place. Stones in the water picked up forty-eight hours after the application had a thin film of oil still on them."

"When Mr. Conradi reported the results of his trip, it seemed to me that the problem was in part at least solved, the chief perplexing feature being the possible deleterious effect upon fish of the application of the oil in quantity. From the similarity of the breeding-places he found to the one I had been observing, it occurred to me that a little work with stiff brooms in sweeping free the masses of larvæ, and then catching them down stream on wire netting stretched in the water might be helpful where the oil could not be applied. Accordingly, I sent to Dixville Notch a barrel of phenol oil and a supply of stiff stable brooms. When these arrived Mr. Conradi went again with specific directions as to the use of the brooms and the application of the oil, especially in the latter case, as to the effect upon fish life. He found that the sweeping method was entirely practicable and offered in some breeding grounds, a simple means of destroying the pests. He also found that in a brook three feet wide, where in June the flies were breeding in vast quantities, and in which he had poured one gallon of phenol oil, the young stages of the flies had been killed off for a distance of one-eighth of a mile from the place of application. As regards fish, he found that they swam rapidly down stream as soon as it was applied, and apparently were able to escape with no evil results to themselves.

"Shortly after the treatment the adult black flies became so scarce that the hotel manager discarded the smudges which for the past twelve summers had been in daily use for the protection of the guests.

"The Phenol Chemical Company, New York city, furnished in the spring of 1904 two grades of oil for experimental use. One is called soluble oil, and the other is the insoluble oil used last year. On mixing with water the differences between the two are readily seen. The former mixes at once, while the latter sinks to the bottom and gradually rises. I tried both sorts in the water at the outlet to the college reservoir, where the black fly larvæ were abundant. Both appeared to be effective in killing them, but further experiments are necessary to determine which is the better. Very likely under some conditions one may be better, and under others, the other. It is probable that the insoluble oil would be less likely to injure fishes.

"It is unlawful in this State to kill fish by the use of any poisonous substance. Consequently care must be taken in the use of oil against black fly larvæ. An amendment to the law by which town authorities might exterminate the black flies on their breeding grounds is desirable. There need be little if any injury to fish, through an intelligent use of the oil remedy. With the sweeping method there is no danger whatever."

### Pleading for the Buffalo.

From the New York Times, June 30.

FOREST AND STREAM declares that "during the next session of Congress a strenuous effort should be made by all the people who have a respect for things American to induce the Government to acquire and care for all the remaining specimens of the American buffalo now alive and not in zoological collections." Execution of this plan would require the setting aside of several tracts of wild land in the Indian reservations, each large enough to support from sixty to seventy-five of the animals. The cost of fencing would be considerable, and each park would have to be guarded by about four men, employed the year round. The buffalo are now on the very verge of extermination, and the lives of those in private hands, as was recently shown by the Ranch 101 episode, hang by the slenderest of threads. The largest herd, of about 250 animals, is owned by Michel Pablo, a mixed-blood Indian on the Flathead Reservation, who is soon to lose his range by the opening of these lands to settlers, and he will then have to sell his buffalo, alive or dead, for what he can get. As FOREST AND STREAM admits, the question is wholly one of sentiment. The buffalo is of no practical commercial value, and its fitness for longer survival in the wild state was long ago thoroughly disproved, while in domestication or semi-domestication the cost of its maintenance will always be far beyond any possible money return. It is, however, a creature legitimately interesting in various ways, all legitimate, and there is no doubt that the country can well afford for many years to come to utilize in the preservation of a few hundred of these distinctively American mammals the amount of land requisite for showing them

in an approximation to their natural condition. A good deal of sloppy nonsense has been written about the "ruthless" warfare that in ten or fifteen years robbed the plains of countless herds, to the very small profit of a very few men, but it really was a piece of bad and stupid business, to say nothing of its moral and sentimental aspects, and the display now of a little intelligent regard for the survivors of the massacre, a little consideration for the pleasure and instruction of our successors in the land, would be a seemly manifestation of regret for the irreparable. The buffalo had to go under the working of a great natural law of which the reckless hunters were only the unconscious instruments of application, but we can get around this law, in a small way and for a short time, just as we get around others of its kind—in seeming, that is—and to do so would be diversely creditable to the country.

### The Great Horned Owl.

OAKLAND, Cal., June 19.—I know of no source of information more satisfactory than the FOREST AND STREAM in its own particular field. In the multitude of its readers are to be found many sportsmen of the highest class, whose knowledge is for the most part derived from their own experience. It is true that even the experts differ sometimes on quite important matters. See the clink of steel-shod poles and Old Angler on artificial salmon hatching, and I have never forgotten nor quite forgiven the wag who some years ago wrote in such glowing terms of the edible qualities of the glossy ibis; but for all that the evidence deduced, either editorially or from contributors, is usually so intelligent and minute that the reader has no difficulty in arriving at conclusions that are at least satisfactory to himself. Therefore when I wrote the owl letter of inquiry I felt fairly sure it would elicit a satisfactory solution to the whole matter, and I was not disappointed—the editorial furnished the general details required; Mr. Hardy, who, with his amiable and gifted daughter, I rank with the most reliable of your contributors, gave his personal experience; and Mr. O. H. Hampton, a very interesting incident of their surprising strength that came under his own observation.

The conclusions are that while there is no larger owl in the sections under discussion than the great horned species, he is capable of deeds of strength that can hardly be surpassed by any bird of his weight, and must be able to fly away with a load as heavy as himself.

FORKED DEER.

### A Ruffed Grouse Eats a Snake.

WEST CHESTER, Pa., June 27.—Mr. Arthur Chapman, of Doylestown, Bucks county, Pa., is an experienced naturalist who has hunted ruffed grouse and quail for thirty-five years. Mr. Chapman has often examined the crops and gizzards of game birds.

On one of his shooting trips in early autumn he shot several pheasants, the stomachs of which he examined and was surprised to detect in one the remains of a reptile. Concerning this unexpected food of the bird named Mr. Chapman in a letter to the undersigned says:

"Finding the snake in the crop of the pheasant was so unexpected that it has been easily remembered. The snake was one of the little green fellows about eight inches in length. There were no visible signs of decomposition, it was intact with the exception of about an inch below the head and then for the space of another inch it had been pinched or mashed, the same as would have resulted from pounding between stones. I have always been of the opinion that the bird killed the snake, as it had every appearance of life, excepting as above stated."

B. H. WARREN.

### An Old Cock Partridge in Charge of a Brood.

WHILE trout fishing a few days ago I started a flock of young partridges (ruffed grouse). As soon as they began to fly the old one attacked me, as usual, but I was very much surprised to see that the bird in charge of the flock was a very large old male. There could be no mistake, as he was very near me, without a bush or tree between us. He strutted round me with tail spread and neck ruffs erected till the young had time to hide. I have seen flocks of young partridges for sixty years, but this is the first case where I ever saw an old cock in charge of a brood. Whether the hen had gone to a club meeting or to play bridge whist is more than I know, but she certainly was not with the chicks.

M. HARDY.

### Just Plain Rabbit.

SOME hunters there are of the superfinned and dudish sort, who deny to the rabbit any position among legitimate game animals; and there are others who, while grudgingly admitting rabbits to the list, seem to think it necessary to excuse their concession by calling them hares. I regard all this as pure affectation and nonsense. I deem it not beneath my dignity and standing as a reputable gunner to write of the rabbit as an entirely suitable member of the game community; and in doing so I am not dealing with hares or any other thing except plain, little, every day plebeian rabbits—sometimes appropriately called "cotton-tails."—Grover Cleveland, in Independent.

"No music is so sweet to the angler's ear as the whir of the reel, for it announces not only the triumph of his individual skill in tempting the fish to forget their habitual caution, but it promises the pleasure of, and the happy issue to, the coming contest."—Henry P. Wells.

# GAME BAG AND GUN

## At Dawn with the Capercaillie.

Editor *Forest and Stream*:

I was on a short hunting trip after the capercaillie a couple of weeks ago, and, as it might interest some of your readers, will write a short account of it. The capercaillie, or tiur as it is called here, is found all over Norway, where there are large areas of pine woods, even in the interior of Lapland I have found them very plentiful, in the valleys. Their numbers have, however, in the last few years diminished rapidly, especially in the more settled portions of the country. The open season is now besides the fall shooting, two weeks in the spring—May 15 to 31—and then only for the male bird. This spring shooting of the male is a rather peculiar way of hunting, and by hunters who know the tricks, is enjoyed very much, although there is much hard work and roughing it in connection.

The capercaillie has certain spots called "lek" or play-grounds where he retires in the spring to mate. These play-grounds are used year after year, and as long as there are any birds left in the district and the trees not chopped down, will keep using the same place.

The play-grounds are generally located on the edge of a marsh, where there are some large, scraggy pines, away back in the woods or mountains, away from people and civilization. Early in the season the birds, as a rule, play on the crust of the snow, strutting like a turkey cock with tail spread fan-shape and acting in a very dignified manner. Later, when the snow is gone, they generally choose the limb of a pine tree.

It is during the "play" the hunter, who knows the tricks, has the "bulge" on the wary old rascal. The "play" is in three periods. (1) The "knepping"—sounding like rapping a pencil sharply against the teeth. The bird is then very alert. (2) The "klunck," which follows immediately after the "knepping," and sounds like pulling the cork out of a bottle. (3) The "sawing," a hissing sound lasting six to eight seconds, and not very loud, during which the bird shuts his eyes and seems completely deaf.

The hunter generally hears the "knepping" first and advances carefully until the "klunck" is heard, which is the signal for him to run, as a rule, three steps, while the bird is "sawing." When the "sawing" is over he must stand perfectly still and not move as much as a finger or, when near the bird, look at him, as he will notice even the winking of the eyes. In this manner the hunter can approach very close, right underneath the tree sometimes in which the bird sits, and by putting the hand on the trunk the whole tree can be felt to be quivering from the bird's motions.

The above will give a little idea of the mode of hunting, only it is not so easy as it may seem. There are many things to contend against, the rippling and gurgling of the streams and brooks are a great source of trouble, as the bird cannot be heard for any distance, or you may strike a bird who knows a "thing or two." He will give the "klunck" and then stop to listen, while you innocently advance thinking everything all right, but you will soon find out your mistake.

The hen that coyly trips around in the brush is probably the worst of all, as her warning "zok" will make her lord and master depart in a hurry.

I have a certain place up in the mountains, far from any settlement, and where I am pretty sure of not meeting any rival hunters. Here the cock repairs to fight and court the favor of the fair ones. To this place I generally go, when the season opens, and have a little hunt by myself. The 15th of May this year found me at sundown as usual under the big pine, where I've made camp for the last few years, gathering firewood, chopping down some fir boughs for a bed, and making things shipshape generally.

After having a cup of coffee and a bite to eat, it was getting dusk, so I took the gun to have a look around. (The birds come to their places about dusk and "play" till dark, at the first streak of dawn commencing again.) I had gone about 300 or 400 yards when the faint "knepping" of a bird was heard. It was very difficult to locate the direction, but thought I had him on a ridge a short distance off, in which direction I walked carefully until the "klunck" was heard, when the stalking commenced—three long steps at first and later, when nearer, only two. I knew he was not far away, but by this time it was getting pretty dark and I could not catch sight of him to save my life, so I started crawling on all fours. This crawling in the dusk is by the way a rather dangerous proceeding when there are other hunters around who might be stalking the same bird and by mistake send you a charge.

A little distance ahead was a big stump for which I was aiming, thinking when I got there to take a good observation. The play was very puzzling; sometimes very plain and then again faint; but I knew the bird was right by and as I came to the stump I laid the muzzle of the gun up on the edge. It happened, however, to slide a little and scrape against the bark, when up rushed a big capercaillie and disappeared in the darkness before I had a chance to shoot. He had been sitting right on the other side and was probably an old fellow, as they are not so loud voiced as the youngsters. I made a bee-line for camp feeling rather "hot" but a cup of mountain coffee, black and strong, followed by a pipe, soon smoothed down my ruffled feelings.

As daybreak would come about 1 A. M., there was no time to sleep, so I lay dozing and smoking by the fire until the first call of the ptarmigan cock was heard and the first faint streaks of dawn showed in the east. After a bite to eat the start was made in the opposite direction from last evening, along a ridge bordered on one side by a marsh. I had not gone far before a bird was heard,

very faintly at first, but presently I got the direction of it and started running, three steps at a time, and had not gone far when I suddenly caught sight of him against the sky, sitting on the branch of a big pine with head and neck extended swaying slightly up and down. Aiming low along the barrels—it being too dark to see the lights—the trigger was pressed, and at the report he came to the ground with a gratifying thump—a nice fellow tipping the scales at a good 10 pounds.

After hanging him up in a tree I proceeded in quest of more but without success, and was back to camp about 3 A. M., when it felt very cozy to crawl into the reindeer-skin sleeping bag, for the night was cold, thick ice forming on every water puddle.

I woke up about 8 o'clock with the feeling of being cooked and found out that I was lying right in the sun, which was shining out of a sky cloudless and blue as it only can be in the mountains. During the day I went over the ground thoroughly and found by the droppings that there were quite a number of birds.

At dusk I was at them again, stalking one who "played" very irregularly, stopping sometimes five minutes at a time and acting mean all around. The result was that it got so dark it was an impossibility to see him, although standing right close by.

It is strange how difficult it is to see such a big bird, when it is a little dark. If he can't be gotten against the sky it is almost useless to look for him. He was sitting there still when I left for camp with the resolve of coming again in the morning, and when I came around again about 1 A. M. he was going like clock-work. When within fifty yards he was heard to fly up, but immediately began again and kept on for a few moments, when a rush of wings was heard and he came flying toward me, giving me a pretty side shot that sent him down like a load of bricks.

He proved a little smaller than the first, weighing about nine pounds. It was something unusual for him to fly off so early in the morning, but he was probably chased by some old fellow who did not want any young ducks around putting on airs. As there now were two birds besides sleeping bag and gun to tote, I decided I had had enough, and, after a bite to eat, started to do the ten miles with a railway station at the end of it. CHR. G.

HAMAR, Norway.

## Points of View.

What shall he have that kill'd the deer?  
His leather skin, and horns to wear.  
Take thou no scorn to wear the horn;  
It was a crest ere thou wast born;  
Thy father's father wore it,  
And thy father bore it;  
The horn, the horn, the lusty horn,  
Is not a thing to laugh to scorn.

—As You Like It.

Editor *Forest and Stream*:

Recently your correspondent, Cecil Clay, urged that it would be good to flush or start something to arouse the entertaining contributors to *FOREST AND STREAM*.

In my opinion Flint Locke, in your issue of June 10, has put up quarry worthy the attention of the best men in the field.

Alluding to antagonistic criticisms of President Roosevelt's sportsmanship, Flint Locke, very commendably sees in them an attack upon the most conspicuous representative of modern sportsmen. Flint Locke does not keep to the main track constantly, but is inclined to caper and break at intersecting trails or cross-scents. Nevertheless he is bellowing on the right course and very likely a little encouragement will send forward the pack in full cry,

"Crook-kneed and dew-lap'd, like Thessalian bulls."

"But," says Flint Locke, "one's point of view changes, and now I question seriously the moral right of man to kill without necessity any other living creature." This right to kill, is then, the essential question for discussion, and it is a very old problem.

For the purpose of argument I side with F. L.; even to going a step farther to say that there is no morality in killing any creature—without necessity. Necessity is the only warrant. Define necessity and you have the humane principle.

Adversely, point to point, I oppose his stand that it is "fantastic hypocrisy to demand the enactment of stringent laws for the preservation of game in order that we may have always something to kill."

I can cite nothing of more antiquity, nor more generally accepted, than Scripture, giving man dominion over all the earth. Lord of creation, he has subsisted by destroying life, as far backward into the abyss of time as we can trace history or tradition. While man is the most destructive of animals, I do not believe it possible for any animal to subsist without preying upon or destroying other animals. Even the herbivorous must destroy plant life and animal organisms. Whether it is more immoral to destroy an elephant than a microbe let some one determine.

It would seem that this is one of the immutable, inexorable laws of nature.

The natural world in its entirety is an inconstant condition, or state, of perpetual dissolution and recreation. Where man, with his destructive instincts, attributes and powers desires, he can and does obliterate anything and everything endowed with life. Just as the civilized usurpers of North America could, with little effort, exterminate the pitiful remnant of the great throngs of buffaloes, or the last of the American Indians, so, by united effort, the powerful element of organized mankind might destroy any other order of animals, including his own.

But man may be constructive and productive as well

as destructive. It is certain that he can restore nothing once extinct, but he can and does, by proper methods, encourage, multiply and increase whatever he wishes, under ordinary natural conditions.

It seems to me that the chief virtue of civilized man, his distinguishing trait above the barbarous, is the degree to which he labors to restore something of that which he destroys. He may do this through the selfish desire to protect himself, but it implies forethought for the future and often care for his posterity, or his estimate of what may be of benefit to his family, his country or the world.

Where man has found other animals of service to him he has domesticated, reared, and improved them in certain of their qualities. Some of our animal friends have been cherished and protected since the first glow of enlightenment and humanity. Whether Romulus and Remus were or were not suckled by the she-wolf, the Senate and people of Rome, in the full glory of their power (or the full power of their glory), honored the female canine with statue and monument, and with the credit of nurturing the founders of the great republic. If the Romans did not extend protection to the wolf tribe, by the enactment and enforcement of laws, perhaps they domesticated some of them and passed down to us some good dogs. If they did neither I'd rather be a dog, and bay the moon, than such a Roman.

Many creatures die that men may subsist; many men die that other men—or animals—may survive. In the eternal alternation of life and death, as to types or individuals nature seems passive, indifferent, unconcerned. Forests that have been centuries in reaching grandeur and strength, together with animals in myriads, are swept away by conflagration in a few hours. The floods, famines, pestilences—all devastating agents of nature, are un pitying, implacable, indiscriminate. If a man is caught in a forest fire, or if he is inundated by the Mississippi, he may be Christian or pirate; he may pray in Latin or lingo. To save himself he must make tracks rapidly or swim like a cork. If he perishes, neither fire, flood nor nature give a token of regret. No; the fire roars in triumphant indifference, the waters boom on, insolent and invincible. Nature does not send him a stick of driftwood when she has forests to burn.

Fine sentiments are fine things. Snug churches with sky-piercing steeples are often, perhaps, quite harmless; but there is neither virtue nor policy in man's deceiving himself with fancies and superstitions where they are constantly disproven by material and tangible evidence. This clouds his best faculties. Law and legislation become more and more wonderful. Pity it is that it is not less so, but somewhat simpler. In this connection, it may be fantastical hypocrisy to enact game laws, but the very best thing the sportsman can do is enforce the preservation and protection of game and fish, and, above all, forest reservation and kindred measures as best he may. Heaven help the country that is completely tamed and laid off into square fields and town lots, but let me live in some other.

As to the "Heroic Pose" that's a false scent. Let the real man be proud of manly achievements and honest trophies. Pride is not a bad thing. It depends upon the man. One may be proud of slaying a deer or two or a wild beast. Such achievements often require more commendable zeal, exertion and energy than the doing of smart tricks in a thousand other matters. If President Roosevelt's critics would go upon a bear hunt, even they might be no more ferocious than they now are. I have known bear hunters, who, after finding a bear, were about the least ferocious people I ever saw. They had fine guns, too, which they sometimes mislaid or dropped in their solicitude to restrain their ferocity. But I agree with Flint Locke, to the extent that I consider the glory of killing things greatly reduced by modern engines. I would rather have hunted deer with Robin Hood than with the meat hunters of 1900. I would rather have gone to war with the knights of King Richard than with the victorious Japanese this year. Modern engines of destruction are infernal machines. Gunpowder is an attribute for the devil and belongs in hell. It smells of brimstone.

The problem as to man's moral right to kill wild animals is rapidly adjusting itself. In a score or so of years there will be no game animals worth powder outside the limits of such parks or refuges as can be wrested from vandalism—incorporated and independent. The sportsmen of California, like those of other parts of the world, are little more than vandals, destroying angels of civilization. They are degenerating into hordes of petty poachers, the greatest of whom haunt summer hotels in the mountains and the least of whom dynamite fish and shoot turtle doves and robins. The latter class delights in trespassing upon private lands, or in lying in ambush near springs and water-holes to assassinate small creatures. The heroic day of Kit Carson and Fremont was a little less glorious than the era of Daniel Boone or Lewis and Clark. Rifles should be prohibited where railroads are established, and no guns should be allowed within 500 miles of a city restaurant, unless as auxiliary to settling a bill.

Railroads advertise and exploit the game as if it were part of their stock in trade or equipment. The inns and hostleries for summer tourists do the same thing. Newspapers and sporting journals lend themselves as a purely business policy to the inevitable period. There are those who ridicule every attempt at game and fish protection with the worn phrases—"there will be game and fish when we are dead," "forests will flourish after we are gone," and any amount of such venal logic.

All of the above-mentioned commercialists must either trim their sails or suffer in their turn. The consequences are obvious and inevitable. The rifles of many sportsmen rust in their racks, or in the junk shops. The guns are following faithfully, the large bores rustiest. The

### Tennessee Game for Tennesseans.

HON. OVERTON LEE, of Tennessee, writes of the new game law of his State, which requires game dealers to be licensed:

"Honest dealers will strongly favor this feature of the law, but it will naturally be opposed by those who have made it a practice to collect our game in cold storage and ship it to the Northern and Eastern markets. What has tended more than anything else to deplete our State of game is exportation from the State. The underlying principles upon which our game law rests is the preservation of our game for the benefit and use of our own citizens. This can never be effectively accomplished until such restrictions are thrown around dealers in game as render the violation of our non-export law well-nigh impossible. The license is a wise step in the right direction, and has proved more effective in other States as a restriction upon export than any other class of legislation. It enables the department and the various wardens to 'get a line' on those who are handling our game, and in this way to better confine its sale to our own people and not permit it to be shipped to the great cities of the East and North, where prices obtain that our people cannot afford to pay.

"The evil of exportation of game from Southern and Western States to the Eastern markets has grown so great of recent years as to cause serious alarm among the well informed. A great game trust, with headquarters at Chicago and branches throughout the South and West, seeks to control the game supply for the rich cities of the North and East and to evade the non-export laws of the different States, every device that money and able legal talent can secure is employed. Some States have, in the hope to stop a traffic that threatens to soon entirely destroy all their game, passed laws absolutely prohibiting the sale of any game even within the State. This is wrong in principle. Game is the property of the people of the State and should be preserved for their use and benefit. The rights of the consumer within the State should be considered and respected.

"The principle upon which our Tennessee game law is framed is the preservation of our game for the use of Tennesseans, and by confining its sale exclusively to the home market, our own people are enabled to obtain it at reasonable prices. The price of game, like any other article, is what it will bring in the highest market less

the expense of getting it there and commissions for handling. Not many years ago quail, our principal game bird, could be bought at from five to ten cents each, but after the trust took charge the price rose to twenty-five cents, and so great was the Northern demand, where the price is forty and fifty cents, that local consumers found it difficult to obtain any quail in the home market. The profit to the game dealers is so large that they take long chances to evade the non-export law. All sorts of ruses are resorted to. Game is often shipped out of the State marked rabbits or domestic fowls. In a recent case at Chicago a shipment from Tennessee was marked eggs, and in another, as I am informed, the skins of rabbits were stuffed with quail to conceal the real nature of the shipment."

### Sportsmen of Northern Iowa to Protect Fish and Game.

SPORTSMEN of the State who visit Clear Lake and vicinity yearly have formed a club for the protection of game birds and fish of Clear Lake. Several rumors which might be called facts have come to the attention of sportsmen as to the matter of the slaughter of ducks now nesting about the lake shore. Many fishermen are also using young bass for bait, which is against the law, and should be prevented. The club has raised a fund and undertaken to stop all such illegal work and to bring about the prosecution of guilty parties. Deputy Fish Commissioner Waterbury, of Nora Springs, Ia., heartily approves of the acts of the club, and has been at Clear Lake investigating the situation. It is most sincerely hoped that he can bring about some change that will protect our native game.

Iowa has only a few lakes in the northern part as compared with the large number of lakes in Minnesota and Wisconsin. Many people from Des Moines and other parts of the State go to these small lakes each season, and they could be made much more valuable to the citizens of the State if some little attention would be paid to the regulating of hunting and fishing. It is hoped that other clubs like this one formed at Mason City will be formed at Okoboji, Spirit Lake, Swan Lake and others, so that many of the sportsmen who now go to Wisconsin, Michigan and the West may remain in our own State.

H. P. BAKER,  
Forester Iowa State College.

.56 express, the .44 and buckshot have essentially left our field to the .22 peashooter and mustard-seed shot. Doves, robins, peewees and snowbirds! Truly it is a shame to deprive the people of that which is theirs. Game laws are monarchical and tyrannical. They are made so that the sportsman can get the game away from the people. Tolerate fools and dunces, but there is no creditable reason why they should govern the United States. This is a supremely optimistic declaration.

The journals of the rod and gun twenty years hence will be devoted to the maintenance of forest reservations, if there are any, game refuges and protection, the encouragement of parks, public and private, wild animal and bird propagation, the establishment and improvement of lakes, ponds and waters for fish; and the supervision of wild birds and all the numerous creatures that make nature worthy praise and a land habitable to enlightened or unenlightened people. Without such journalism to encourage and support the right kind of legislators and laws, let us all go to Germany and look at the Emperor's parks, or reside near the zoological gardens in London or New York.

I live in the sequestered shadows of the Shasta Mountains, where there is little left to shoot and little to fish for. I therefore sometimes discharge words and toss bait at random.

Yours, without qualification,  
RANSACKER.

SHASTA MOUNTAINS, California, June, 1905.

### Fresh and High Game.

In the Year Book of the Department of Agriculture, George K. Holmes writes:

"The epicure goes to certain high-priced hotels and restaurants, where he pays well for the birds which he says have at once that peculiar gamy flavor and tenderness which he can get nowhere else, but he rarely knows that such game has, by order of the steward, been retained in storage until it has become partially decomposed and has an odor before cooking which would prevent many people from eating it if seen and smelled in this condition."

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

### The Record Salmon.

#### The Story of How we Saved Him.

"WELL, yes, he's a noble fish, and I guess about the record salmon for this season anyway, but what's puzzling me is how you managed to save him in all that riot of wind and water," said a veteran in the group of fishermen about me as I laid out the big fish on the grass before the camp.

"Come inside about the fire-place, for I'm drenched with spray, and I'll try to describe what happened."

So you, my readers, if you are interested, had better draw up, too, and get the story while it's fresh and (to so critical an audience) has retained at least some suspicion of probability in the narrating.

I must go a little into preliminaries to get you in touch with the situation. The fishing had been good, unusually good, but it was by trolling entirely, and though some very fine fish, both trout and salmon, had been taken, yet many of the party at the Upper Dam were, by preference, fly-fishermen and had been longing for a week to get at the connecting stream between the Great Lake and Upper Richardson and try a cast for some of the grand fish that would assemble there if the water ever dropped to the proper pitch.

But it was a hopeless wait. With a favorable wind for towing, boom after boom of logs was brought down the Great Lake and an immense quantity collected above the dam, with fifteen or more large booms still to come. The gates were all up and a night and day crew constantly sluicing, with the result that the river below the dam was a raging torrent of white water and logs, where not even a salmon could have held his own a minute without a power anchor. So as that was the only water easily accessible for the purpose, fly-fishing under such conditions was, naturally, impossible.

Consequently every one had to resort to lake trolling, if he wished to fish, and if it was rather *infra dig* for some of the more eminent exemplifiers of the art, it was nevertheless Hobson's choice—that or nothing.

The Upper Richardson was the favorite rendezvous for trollers, both because it was right at hand and again because the logs after passing the dam and river were collected there in booms for towing to the Middle Dam. About these booms, which were right off the mouth of the river, the fish congregated in large numbers for feeding on the grubs and worms from the logs, and preparatory to running up into the quick water when they could get the chance.

The trolling therefore in the lake, outside of and quite close to these booms, was bound to be prolific in results, and it was. Good fish, four, five and even six pounds, were by no means rare and the favors were pretty fairly distributed, but no one had actually captured anything very unusual, till the Bemis steamer one day brought in an applicant for honors, whose general air and equipment instantly suggested the genus *novus homo* in a pronounced degree.

He arrived by the afternoon boat and after supper gave us a very elaborate exploitation of the scientific as well as practical methods of successful angling. It

was not an opportune occasion for inaugurating a kindergarten, but the array of past masters in the art, to whom he was addressing his theories, listened courteously but without audible comment, and all unconsciously, with the usual results when "Fools rush in, etc." he got into very deep water, tangled up, so to speak, in his own tackle. It is hardly necessary to say that in the next half hour he succeeded in thoroughly convincing his listeners that he "knew an awful lot of things that weren't so," and the display of his rod and tackle outfit when he started out next morning dissipated any lingering doubt on the subject that might have weathered the night.

If his pretensions had been characterized by even a trace of modesty, or toleration for others' opinion, I think he would have readily been forgiven his absurdities of theory; but his unbounded conceit was repelling to any attempt at well intended suggestion, consequently no one offered advice relative to his projected programme for the day. Well, to accord him simple justice, perhaps he did not need it. However that may be, he came back to camp four or five hours later with a magnificent 8-pound salmon and three smaller fish, one a 5¼-pound trout. It was evidently a legitimate capture and accomplished, as was subsequently known, within the observation of the occupants of another boat who were trolling over the same water, and, except in handling the boat and net, his guide had no part in it.

The astonishment and chagrin of the P. M.s aforesaid was really pathetic. Their facial expression was very eloquent of their thoughts. The loss of prestige as authorities on the art piscatorial, with the ruthless annihilation of their pet dogmas, was humiliating and unbearable, and must be regained by an effort heroic, otherwise, as the irate Queen of the Gods soliloquized in an equally trying situation, "If my purpose now falters, who, henceforth will supplicate Juno, or bow at her altars."

The N. H., however, was wonderfully self-possessed. He exhibited but very pardonable and moderate enthusiasm, and still less of braggadocio, received the congratulations of the lesser lights with a rather well-assumed air of conscious merit, announced that he had accomplished his purpose satisfactorily, should return to New York immediately, and departed, as he had come, by the afternoon steamer that day, having been in camp just twenty-four hours. At the evening symposium, the *rechauffement* of this incident was the one topic, naturally, and the resultant consensus of opinion of professors and laymen alike, might have been entered on the records as a general proposition to which all could subscribe, thus:

Any novice may possibly rise and hook a salmon (and it's the proverbial luck of tyros to fasten on to the big ones); but the handling, fair killing and capture of a powerful fish, whether with light or heavy rods, is never a matter of chance or accident (trust the wiles and vagaries of a big salmon to avert that climax), but of patient, experienced skillful method. I have a well grounded suspicion that the N. H. was masquerading. If I am correct in that, his portrayal of an assumed character was sublime.

But to get back to that fish I left laid out on the

grass. For two or three days after this incident it was very uncomfortable weather. The wind was easterly and northerly most of the time and it was cold, wet and dispiriting. The few of us who ventured to leave the coziness of the fire, didn't desert it for long at a time, and very few fish were taken.

On the third day, as we returned from the lake, I said to my guide: "I'm infernally tired of lying about camp so much, and to-morrow we'll put in the whole day, whatever the weather, go up to Mill Brook and try the trolling about the head of the lake. Have a luncheon put up and we'll start breakfast."

By 6:30 next morning we got off. The sky had cleared, but it was cold and the wind northwest. With the gates up at the dam for five successive days, such a volume of water had come down river that the pitch of the Upper Richardson Lake was fully six feet above its usual level. This rise of water had floated old logs, windfalls, dead timber and the indescribable debris that line the shores of a lake in a densely wooded country, and the east wind of the preceding days had driven it far out into the lake and well clear of the usual fishing grounds. The change of wind into the northwest was now driving it all back, and it would interfere seriously with the trolling, unless we struck directly across the lake and worked the windward shore.

This plan was open to two objections—it would take us five miles out of our direct course to Mill Brook, and if we crossed we should eventually have to re-cross probably in a heavy wind, if it should come on to blow as hard as it seemed to promise at that time. So to avoid unnecessary risks I decided to hug the leeward shore, trusting we should reach the head of the lake and shelter, before the wind increased.

As far as we could see up the lake, the water was littered with great patches of the floating driftwood that was rapidly breaking up and singling out for our entertainment a little later. It was anything but pleasant attempting to troll in that tangle, but by dodging and cutting corners we got over about three miles of the course without having my tackle hung up more than twenty times with the necessity of backing up to free it. I had not struck a fish thus far and the prospect, with the ever-increasing wind and snags, was dismal.

We had been running about fifty feet off shore and a little quartering to the eye of the wind, whose force was so strong that Twitchell had quite enough to do to keep us off the rocks, and the seas dashing against the sides of the boat were drenching us with spray. It had grown somewhat warmer as the day advanced, but the wind was chilly and the water decidedly cold, and everything considered, the weather conditions were not exactly ideal.

This, however, did not annoy us unduly, but the snags did. We were on excellent fishing ground that had not been visited much of late, and that should ordinarily have afforded good sport.

The disappointment of encountering such a bar to success as these derelicts offered, did not diminish as my allowance of patience ran out, but I kept on trolling and fighting the driftwood while Twitchell fought the wind and sea. Twitchell is not an athlete of celebrity, is a little undersized, but muscular and wiry, particu-

larly good at the oars, possessed of good judgment, and is remarkably quick to act in emergencies. Half a mile further on we succeeded with some trouble in making a landing under the shelter of a point, got the water out of our boat, had a short smoke and a council of war.

Retreat found no advocate—instead, we concluded to abandon fishing for the time being and push on for the head of the lake as rapidly as we could. We had two miles more to cover and worked the passage with oars and paddle and unhampered by the troll, at a little better pace, but not much. A mile an hour for the two of us was as good a record as we could make with that fearful sea and wind dead ahead, so with some narrow escapes from ramming by those submerged floating terrors, and a barrel of water in the boat from shipped seas, we finally ran into Mill Brook Cove and under the lee just before noon.

Great Scott! but wasn't it a welcome relief to get out of that hurricane. We found some dry stuff, got a good fire going on the ledge at the mouth of the brook, partly dried out our clothes, warmed up the coffee and had lunch. I put together a light fly-rod that I had brought along, and went to casting for trout, for which this is a famous rendezvous. I didn't accomplish much, however, it was not at all a good day for fishing, and the time—mid-day—was the worst that could have been chosen. Toward evening, especially if the wind should subside, would be much better, although, as it was, half a dozen small trout ( $\frac{3}{4}$  to 1 pound) rewarded my efforts. All of these I returned alive to the water. We should not need them, provided we made camp that night, and there was neither apology nor excuse for killing them.

Meanwhile, the return trip was occupying our thoughts. The wind tempest had not abated at all and the voyage would be very rough and wet, and as to what other elements of mischance might be thrown in to give it plenty of incident, we could only speculate. It would be a wise precaution to give ourselves ample time to make the run in daylight, or if the boat should come to grief, to find the land trail through the woods and reach camp before dark, and we adopted it. As we rounded the point of the little bay and got a view ahead down the lake, we discovered, much to our satisfaction, that the wind had driven the driftwood well ashore and that, for a mile or two at least, by keeping off eight or ten rods we should have comparatively clear water, and though it was a forlorn hope, I put on a fresh minnow and let out the trolling line. There was no need now of working the oars to propel the boat. Twitchell used them to direct the course and be ready to give way quickly should a big sea threaten to board us astern. By keeping a sharp lookout against swamping, we ran down two miles to the point where we had landed coming up, with some degree of comfort. Here we had to round up a bit to weather the point, bringing the wind on our quarter for a moment, and the boat in the trough of the sea.

It was ticklish business, with great risk of swamping, but Twitchell was equal to the occasion and handled the oars so well that we quickly rounded off before the wind again without accident. I had had no signal from the minnow since we left the head of the lake and thought I would reel in and see if it was spinning well, when a rapid glance ahead showed that we were running into a lot of driftwood. That settled the fishing for me, and I said to Twitchell: "It is perfectly useless to try for a fish any longer. We couldn't land one in that inferno ahead, except by a miracle, if I could raise him, and I'll just reel in and quit for to-day."

"I guess it's the only thing to do," said he, "but it's too bad to go in without a fish, after such a stiff day's work as this, and we the only boat on the lake that has dared to face the music."

"I feel a good deal that way myself. It's only half past two, we're nearly half way back and have plenty of time to spare. We'll make a landing here and tie up for an hour and the wind may decrease, in which case we'll go to fishing again with some small show of a strike."

"Good idea; let's do it."

I had just twisted around to straighten out the rod and make the line run free in reeling in, when there came a sharp, quick strike at the troll, that sent a thrill through me like an electric shock, and instantly the reel was screaming like a calliope.

"No snag this time, Twitchell, it's a fish sure. Come about into the wind quick and put to sea if you can."

"All right, I'll try."

"Remember those derelicts to leeward, and push her into the wind for all you're worth. It's our only hope or chance."

He just nodded assent and, leaving him to manage the boat, I gave my whole attention to the fish. The line had suddenly slackened and I was reeling in very fast, but I couldn't feel the fish and knew he must be running up on me. I doubled the speed and in three seconds had him in hand again, and to my unspeakable joy, I saw from the angle of the line that he was deep down and making out into the lake.

He swam slowly with a strong steady movement, entirely unchecked, though I had a good strain on him, and knew he was securely hooked. His occasional jig-jig on the line indicated a good sized fish and an ugly one.

What I had hooked was something of a mystery, though from the vicious strike he made, I should have thought it was a salmon, except that he didn't leap, and it is my experience that nine out of every ten, either landlocked or sea salmon, will leap when they first feel the hook. They again a salmon is as much more alert and agile than a trout as "lightning is quicker than a six ox team," to use the local vernacular. Of these characteristics my fish had thus far given no indications, but if it was a salmon, I should very soon be relieved of any doubt about it. My greatest interest for the moment was not so much in the species, but as to whether he proposed to choose the open water or the snag area for the battle ground.

Every foot of advance now was a remove from the lurking perils behind us, and I said to myself: "Keep up that pace and direction three minutes more, old man, and if this treacherous sea doesn't swamp or capsize us, we'll give you the fight of your life."

"How do you size him up?" from Twitchell.

"Salmon, I suspect, but acting queerly—we'll mighty soon know—6-pound fish anyway—probably better."

The suspicion was growing on me every second that he was a very much heavier fish than I had stated to Twitchell, and visions of the long struggle to come before I could hope to land him, if ever, flashed through my brain, with a numerous following of pessimistic forebodings in their train. I was mentally running over the pros and cons and debating the outcome with myself, and it is strange what singular association of ideas brings to mind, especially in moments of excitement and peril, the most incongruous and often frivolous subjects. I recalled the old deacon's fight with the bear, with only a clasp knife for a weapon, and the long odds against him, and his fervent appeal to Deity: "If you won't help me, O Lord, don't help the bear," and thought I'd rather like to have known the deacon.

I also wondered if, with the line-up of the forces in this fight, it was quite fair to the salmon for me to invoke the aid of the powers supernatural. There was the salmon and his mighty allies, the gale, the angry sea, and the driftwood, arrayed against a well-trusted green-heart rod, Twitchell, my Fidus Achates, and myself. To be sure there were two intelligences against one for the salmon, but the preponderance of the combinations of natural and physical forces was immeasurably in his favor, under present conditions—but possibly superior strategy might modify the too effective interference of wind and sea, and more nearly equalize the rush lines.

Then I fell to speculating as to whether the rapidity of transitions of thought would ever be measured in time space, and what was the connecting link that brought such ideas to mind, when the attention was supposed to be intently fixed in a diametrically opposite direction.

Through these ramblings I know my attention never left the fish that I was distinctly conscious of every tremor and move, and on the alert for any change of tactics.

The salmon had zigzagged about during my soliloquizing (which hadn't probably occupied two minutes), but his general course was still out into the lake. He had 100 feet of line out, but I couldn't recover an inch of it. In fact, I had all I could do to hold him to that, while keeping the line taut all the time. Presently he came to the surface, but did not show himself. Instead he turned tail and made a quick dash right for the boat.

I was on my feet in a second. I could not have helped it had the danger of capsizing in that sea been ten times as great. I must stop or circumvent that rush, and I couldn't do it sitting. Throwing the tip well back of my head and working the reel very fast, I prevented his getting a slack line on me, but there was no such thing as stopping him and, as he was heading, he would pass directly under the boat, which was broadside on to him.

If he had had any sort of a show to do it, Twitchell, who was as keenly alive to the risk of breaking the rod as I was, would by two or three sharp quick strokes have sent the boat a length ahead and averted the danger, but the handicap of wind and sea was too heavy. He attempted it and gained a couple of feet. I swung the rod hard astern with every ounce of strain I dared put on it, swerved the fish a little from his course and just as he passed under the boat, quickly threw the tip across and to the other side of the stern, thereby doubling the line under the boat, and instantly the line was clear.

I dropped into my seat and breathed more freely. As the fish passed under us I got a glimpse of a silver side and knew then for a certainty that it was a salmon, and also a very large one. This latter discovery was not particularly comforting, for my regret would be all the more harrowing if I should fail to land him. Twitchell couldn't have seen him from his position and I was glad that he did not. My nerves were on about the same tension as my leader, but I felt that I could hold myself together to the finish, if Twitchell didn't get rattled. He was not likely to do so, but the sight would not act on him as a sedative, when the fish should show himself.

The latter had sounded again after passing the boat and was now to leeward and directly astern of us, making shoreward, and for that infernal driftwood, which was, however, 200 feet away. Oh how I longed for plenty of clear sea room. Only give me that and then let Æolus loose all his war dogs if he had any left. I wouldn't have asked for quarter if they had driven us high and dry on the rocks. I think we would have saved our fish even then, but the irreparable disaster of fouling the line in one of those floating windfalls, some of whose branches might extend twenty feet under the surface, and from whose entanglement there was no escaping, was enough to induce heart failure in a graven image.

Well, speculation as to the future and the overture to the opera ended abruptly right there, and the business proper was on for certain.

With one of those glorious mad rushes that only a salmon can make, he spun a hundred feet off the reel in a twinkling, and six feet into the air went a magnificent 12-pound salmon.

I lowered the point of my rod instantly as he made the leap and he was back in the water again without having broken away, and tearing along on a limited ticket right up the wind.

Twitchell expended some precious breath in one exultant shout, but got down to work again in a second. There was intense suppressed excitement in his eyes, as we exchanged glances after that leap, but a most reassuring do or die determination about the mouth that was both eloquent and prophetic of his staying qualities.

But the salmon was not allowing anything to call off my attention for a moment from himself. He occupied the center of the stage just then, and proper respect for royalty was not only expected and demanded, but was most willingly accorded, since it was surely up to me to keep on as good terms with him as he would permit—at least for the present.

There was no doubt that he would have it all his own way for some time yet, but every minute the struggle was prolonged multiplied the contingencies that threatened from every quarter, and I must force the fighting with all the tactics at my command, and prevent, if possible, any attempt at sulking to renew his wind and strength. It was now twenty-five minutes since I struck him and,

though he had been under a heavy strain all this time, and had never rested for a second, he was apparently as fresh as when he started in.

He had got down deep in the water again, moving very slowly and jiggling at the line. I threw my wrist back sharply, bringing the line up very taut and struck the butt of the rod four or five quick light blows with my knife handle. I could feel the vibrations run through the rod, and the fish seemed to be aware of some sensations out of the ordinary, for he started like a shot out of a catapult, made a short, sharp rush, another fine leap, was down and off again like a motor car on a long run, ending with still another leap, and then he sounded. Down into the depths he went, but now my innings was commencing, and he had to work so hard for every foot of line I reluctantly gave, that he yielded to the heavy drag and slowly rose to the surface again thirty feet away from the boat. He rested, rolling in the heavy seas, for just one breath, during which time I fancied he was looking us over critically and especially taking in the position of the boat. Whether his conclusions were reached by logical deduction from his observations, or by a sudden impulse, he had evidently perfected his plan of campaign instantly; for, scorning any sparring for wind, he was off again like a bullet, without a sign of warning, heading shoreward and straight for the snags.

Well, the gage was thrown in my face then for the combat à l'outrance. Reach that "Devil's Hop Yard," as Twitchell had christened it, he never should, if the rod and the guide stood by me. I felt as sure of one as the other. Both had been often called on in critical situations and had loyally responded and, though we were facing the hardest combination of opposing forces we had ever encountered, with very desperate chances of success, yet the trio would accept the challenge.

Twitchell had maneuvered so well that we were fully a hundred yards off shore and 200 feet outside and to windward of the nearest snags, which extended from the leeward shore about a hundred feet out into the lake. But how long could he keep that welcome gap open? His arms and wind had been severely tried in the last half hour, and the violence of wind and sea had not abated a bit. Game as he was, there was still a limit to his endurance. Never mind, the limit hadn't been reached yet and we would cross that bridge when we came to it—meanwhile to head off this rush for the snags.

I had the salmon close hauled with about thirty feet of line out when he started, but though I snubbed him hard, the best I could do was to hold him down to a hundred feet when he stopped. He didn't leap nor did he sound. The sharp work of the last five or six minutes was telling on him and he was getting tired.

I told Twitchell to let the boat drift slowly astern while I recovered my line and got closer to the fish, but to be prepared to check it instantly if occasion required, and in this way I picked up what line he had run off, holding him so hard that he couldn't get a foot nearer the snags. He was more submissive for the moment and inclined to sulk, but though it seemed rather unchivalrous to take advantage of the noble fellow's momentary weakness, I couldn't afford to let up a particle and he must be kept going.

I had discovered a little while back that telegraphing him produced a decidedly enlivening effect, so I sent him another and more imperative message.

Then ensued a series of gymnastics, hand springs, trapeze work, and ground and lofty tumbling, lasting five minutes of continuous performance, during which the now half-frantic fish was on all sides and everywhere about us, and culminating in a flurry of fireworks, one more rush and another grand leap.

After that he was pretty well done up. Without giving him time for a breath, I had Twitchell run a little quartering to the seas and row farther out into the lake. This was a very rocky wet trip for a few minutes, but it materially widened the gap between us and the snags. It didn't take very much persuading to make the salmon follow the boat, so I had him close reeled when we came up into the wind again. It was now evident that within another ten minutes we would secure him, if ever.

The most critical moment of all—the netting—was close at hand, and how that very delicate and hazardous operation was best to be managed had been occupying my thoughts for some time. It was taking too big a risk for me to attempt to manage the rod and the net too. It would have been an easy task with a smaller fish in quiet water and I had often done it, but with the boat pitching and careening as it was, and a large and powerful fish to control and guide, my handling the net was too hazardous to be thought of, especially as in that wild sea it would be jeopardizing everything for me to get on my feet, where alone I could work both rod and net to any advantage, if at all.

On the other hand, how was Twitchell, whose prerogative it naturally was, to do the netting. He would have to drop the oars to do it, and leave the boat to take care of itself, which meant that she would almost inevitably broach to, with an infinite risk of swamping.

I was between Scylla and Charybdis and, whichever of the two not very inviting alternatives I adopted, I should be likely, when regrets were unavailing, to wish that I had chosen the other. I was satisfied that we should have but one chance to secure the salmon. The first attempt to net him would be successful or totally disastrous. There would be no second chance.

Now I had seen a good many fine fish lost through bungling and unskillful work in the netting, when there was no excuse for it. Twitchell was unusually good at this work—quick and at the same time deliberate and sure, and I determined on this plan:

I would allow the salmon all the time I dared to give and, unless forced to it by some unforeseen happening, not attempt to net him until he was thoroughly drowned. Twitchell should keep the boat's head right in the eye of the wind, and just hold her from going astern. When I should give the signal that the opportune moment had come, he was to drop both oars (leaving them to swivel alongside the boat) seize the net, quickly pass it under the fish, lift him aboard, recover his oars, and right the boat. I calculated that if he was equal to the occasion and the dire necessity, he would execute this programme in just five seconds, in which time the boat's head would not fall off enough to bring her into the trough of the

sea. I explained my idea to him, including the time limit. "I think I can do it all right—and I know I must," he said, "but I'd give a month's wages if the salmon was safe in the boat."

Meanwhile, the salmon was moving slowly about fifteen or twenty feet from the boat, and not more than three feet down in the water. I doubled the rod on him once more and he came to the surface and allowed me to float him along on his side toward the boat within easy reach of the net. Twitchell's eyes begged for the word, but I shook my head. He had still some reserve strength, and though the suspense was agonizing, we must wait. He was motionless, except for the seas, for the space of a minute, then rolled over lazily and went down, but not very deep.

I rapped him up lightly once more, and off he started dragging forty feet off the reel and just breaking water at the end of the rush. I had a very heavy strain on him and with wrist and reel forced him back, though resisting half way to the boat. Then, cautioning Twitchell to be ready for the word, I reeled him steadily a dozen feet more and then his great heart broke and he gave up.

I drew him gently alongside, nodded to Twitchell, and in less than the allotted time the grand old monarch was at last safe in the boat.

The boat's head fell off the wind a point or two during this maneuver and a sea struck us diagonally across the bows, sending a shower of water over us and careening the boat very suggestively, but we smiled in derision.

What had we longer to fear! No tempest or waves could wreck us now—for we carried Cæsar.

With tired muscles, but with such dignity and pomp as our battered condition and the very general humidity of surroundings would permit, we bore him in triumph down the lake, with a quiet repressed elation of soul befitting the grandeur of the storm, the battle and the stanch old warrior; while the shrieking of the gale, the roar of the surf and the moanings of the bowed forests chanted his requiem in a sublime symphony of nature's minor chords.

It was a red-letter day that we shall never either of us forget, for we are never likely again to encounter so large and gamy a fish under all the tremendously exciting perils and uncertainties that made this capture so memorable to us.

It was fifty-five minutes from the strike to the finish, but, considering that the rod was a 9-foot, 7-ounce green-heart casting-rod and that the weather conditions and general obstacles could hardly have been worse, it was a quick kill. W. E. S.

## Fish Chat.

BY EDWARD A. SAMUELS.

### Salmon in Mid Summer.

Now most anglers have noticed that in the hot months of summer the salmon rise far from freely, and do not begin to give such play as they do early in the season, when the water is very considerably cooler.

In those warm days, they are lethargic to a degree, and if they are finally persuaded to take the lure, they do it in a listless manner, indicative of an indisposition to make much, if any, exertion; in fact, I have found it difficult at times to move a fish even when dozens were lying in the pool before me; they settled to the bottom and remained quiescent, no matter how patiently I worked my lure above them; and I have arrived at the conclusion that the stale salmon, those brown, spotted fellows, which have been in the river a long time, refuse the fly, not because they are over-cautious, but because they have become thoroughly inoculated with laziness, imbibed from the high temperature of the water in which they are living, for I have invariably found on thrusting my hand beneath the surface of the pools that it felt almost tepid to the touch. It may not always be indolence that keeps them aloof from the angler, but it frequently is, I am quite certain.

### Unaccountable Vagaries.

Like other anglers, I have time and again seen salmon playing even in midsummer, leaping above the surface of the water, and having no end of romping. I was once traversing in a boat a small lake, which was the headwater of a famous salmon stream; in this lake the fish passed the summer months in very considerable numbers. On this occasion the skiff was lightly propelled by my guide, so lightly that the surface of the water was agitated but very little; but, although we moved so quietly we seemed to have aroused from their slumbers the salmon in the depths below.

Rushing to the surface, they darted high in the air and fell heavily back into the water, so close to the boat sometimes that the water was splashed in our faces. Dozens there were, and they were leaping and darting about as if they had all been seized with a sudden craze; but as for accepting my lure, they showed no inclination for it whatever, and I offered them a good variety of flies, both surface and sunken. In addition to these, I rigged up a phantom minnow, such as our British cousins use in salmon trolling, and trolled back and forth for an hour or more, but to no purpose.

The surface of the water was warm, but probably in the depths of the lake it was cold, and this perhaps accounts for their activity and sportiveness on that mid-summer day.

### Early Fish Give Little Sport.

I have already stated in FOREST AND STREAM that neither trout nor landlocked salmon give the angler such sport early in the spring or just after the going out of the ice as they do later in the season when they come to the feathered lure.

One would suppose that, hungry as they are, and keenly active in the pursuit of their prey they would, when hooked, struggle as vigorously as they do at other times; but such is not the case, without being actually benumbed, they do not offer to put up as gamy a fight as they do when the fervid rays of the sun have somewhat heightened the temperature of the water, and rarely at that early season come to the surface for the fly. I say rarely, for I, like every other angler, have seen the time when good trout fishing with the fly was

obtained when the water in the lake or pool in which we were fishing was barely above the freezing point.

### A Case in Point.

Forty or more years ago I, with two of my friends, made an extended pedestrian trip through the White Mountain country. It was then quite early in June and, of course, there was some snow left on the north sides of the mountains and in the ravines, and in the depths of the forest, for there were forests of timber there in those days of considerable size.

During this tour we traveled through the region which lies northwest of Berlin Falls, passing through Randolph, Jefferson, etc., to the Franconia Iron Works; thence we moved southerly through the notch until we reached that extensive range of interval land through which flows Baker's River and other streams of considerable size. Through this beautiful section we moved in an easterly direction, until we reached the then little hamlet of Thornton; from this point we ascended the Mad River, which was in those days an ideal trout stream full of rushing rapids and large, deep pools, the water being as bright and sparkling as is that of your typical mountain brook. This beautiful river we ascended until we reached an isolated farm away in the wilderness, not far from the headwaters of the river.

At this farm we learned that a trail had been partly blazed out across the mountains in a northerly direction, and in a spirit of adventure we started on what proved to be a most arduous undertaking, the crossing of the mountains, burdened as we were with knapsacks, shelter tents, cooking utensils and all the other impedimenta the camper-out has to transport in an outing in the forest. The trail over the mountains was very imperfectly blazed, and if we had not been provided with a compass we might easily have gone astray. But we plodded on persistently, climbing sheer cliffs, sliding down into ravines, swarming over windfalls and ledges which often seemed to offer insurmountable obstacles to our progress. We finally, however, succeeded in reaching the open country on the other side of the mountains, arriving at a point on the road about a half mile from the old Willey House, of landslide fame.

From this point we moved on until we reached that other magnificent trout stream, the Wild River, which we descended until we reached Gilead on the Grand Trunk Railroad, at which place we took the train for home.

Yes, that was a long tramp, one which taxed all our strength and endurance to complete; but we were full of enthusiasm and rather enjoyed the hardships we were called upon to endure. It was while crossing the mountains by the rough trail I have named that we had an experience in trout fishing such as we had never before enjoyed, and for that matter I doubt if either of us has, since that time, had a similar one.

### A Wild Trout Preserve.

We had descended into a basin, in the heart of the mountains in which lay the most beautiful little lake imaginable. I call it lake, although it could not have been a half mile in length or breadth. A mountain tarn would be the more proper expression. This small body of water was shut in by high cliffs, which sprang sheer from its borders on all sides.

In the forest on the north shore and among the ledges considerable drifts of snow were still lying. The water was icy cold, and instead of being of a brownish color, which one would expect in such an environment, seemed green almost to the verge of light blue; it was an absolutely perfect water, just as one would find in a huge spring.

Ever and anon we noticed ripples on the surface, caused by breaks of fishes which we believed to be trout, and thinking it might be possible to have a trout supper that night, we selected a suitable spot for tenting, and in a very brief space of time camp was arranged and we were ready to try our luck with the trout. We soon found, however, that fishing from the shore was entirely impracticable, for the forest extended down to the water's edge, and our prospects for a fish supper seemed to grow less bright; but, after a few moments' thought, it occurred to me that one or two of the dead trees, which stood near the shore, could be utilized as a raft, and soon our short-handled axes were making the chips fly right merrily.

The trees were felled, cut into suitable lengths and put into the water, where they were bound together with wits and a stout line we always carried with us, and then our rude craft was ready for the work we had laid out for it. Upon this raft was spread one of our shelter tents to prevent the trout, which we might catch, from falling between the logs, for we had no landing net; and stepping aboard with fly-rod in hand, accompanied by one of my friends, who had cut a long pole with which he was to push us about, I began casting. It is to be remembered that the water was almost icy cold, and its surface had not been heated for the reason that the rays of the sun, except during mid-day, had but little opportunity to fall upon its bosom. Under such conditions surface fly-fishing would seem to be almost futile. But the trout were feeding on the ephemera, which were then numerous, and when one of the delicate little insects fell upon the surface of the water it was instantly seized, not with the break the trout usually makes in capturing its insect prey, but by a quiet "sucking in," as it were, during which the fish caused hardly a perceptible ripple.

Slowly and very quietly we moved along the shore as far out as the length of the pole would permit, for the water was very deep, and I offered my feathered lures, which consisted of a grizzly-hackle and a gray-palmer. That was probably their first introduction to the artificial fly the trout in that sequestered lake had ever received, and at my first cast I hooked a pair.

Now, fishing from a raft such as ours requires no little gymnastic effort, for the logs were not very firmly fastened together, and they often rolled beneath my feet. An accomplished river driver would probably have had no difficulty in keeping a secure footing, but I am free to confess I slipped and floundered a good

deal before I succeeded in hauling my trout upon the canvas covering.

I did succeed, however, and the fish were put *hors de combat* in a trice to prevent their leaping overboard; and what beauties they were! Not far from ten inches in length, and as gorgeously colored as any that were ever seen in nuptial dress. "Good!" exclaimed my companion, "there's two for supper, anyway."

"Yes," I replied, "and we'll have some more, although I confess I hardly expect to do much in such deep, cold water as this."

Our raft was again set in motion, and in a few moments I successfully landed another pair, and before our craft was headed around for camp, I had a dozen or fifteen as beautiful fish as angler ever looked upon. They were not large, their average weight hardly reaching three-fourths of a pound, but they were high colored, plump and well conditioned.

This incident shows that the rule I have tried to lay down at the beginning of this paper in relation to the conditions of the water affecting surface fly-fishing is not an infallible one, and most anglers have, no doubt, met with exceptions to it in some of their outings.

### The Maine Association.

THE meeting of the Maine Sportsmen's Association at Mountain View Hotel on Rangeley Lake, June 28, was largely attended. The Fish and Game Commissioners, Hon. L. T. Carleton, Hon. E. E. Ring and Hon. J. W. Bracket, came in early. President C. A. Judkins was ably assisted in carrying out the details of the meeting by the efficient secretary, E. C. Farrington, of Augusta, who had taken great pains in arranging the trip. Among those who won prizes were Commissioner Carleton, who secured a steel rod for the largest salmon; Henry Whitman, of Augusta, second prize, 100 yards silk line. The president's prize, a steel rod for the largest trout, went to Gen. Selden Connor, of Augusta. The first and second ladies' prizes were won by Miss M. J. Haley, of Lewiston. The double prize, for trout and salmon, was won by A. R. Jennings, of Fryeburg. The children's prize fell to Master Fred Jones, of Augusta. Bert Herrick took the first guide's prize, Edward Lowell the second, and Frank Harris the third. Three members of the Governor's staff in attendance were Hons. C. A. Blanchard, of Wilton; George D. Bisbee, of Rumford Falls, and T. S. Burns, of Westbrook. There were many other prominent sportsmen of the State, some of whom were W. E. Berry, superintendent of hatcheries from Winthrop; D. L. Cummings, of Houlton, proprietor Squaw Lake Camps; M. C. Morrill, of Gray; Dr. F. W. Kinsman, of Augusta; Hon. F. G. Kinsman and party, Hon. C. L. Andrews and party, also of Augusta; E. M. Blanding, secretary State Board of Trade, and game warden of Bangor. In fact, every city and most of the large towns were represented by well known citizens and their families.

On Monday afternoon the commissioners held a meeting and adopted the following regulations: "Kennebago Stream shall be closed from the foot of the first falls to a point opposite the boat house of the Oquossoc Angling Association to all fishing, except fly-fishing, from July 1 to May 1 of the following year." In the evening the association known as the Inland Fish and Game Wardens' Association, held a meeting which was attended by the wardens from different parts of the State who had come to attend the meetings of the Sportsmen's Association. The president of the Wardens' Association is D. L. Cummings, of Houlton; F. M. Perkins, of Bradley, and W. T. Pollard, of Foxcroft, are the vice-presidents, and Mr. Blanding is secretary. The objects of the organization are to promote acquaintance and mutual aid among the members and the advancement of the protection of fish and game.

CENTRAL.

### An Anglers' Correspondence Circle.

ALBANY, N. Y., June 29.—*Editor Forest and Stream:* So much real pleasure have I had from chance correspondence with anglers in this and other countries, that I could wish for all of the Waltonian brotherhood an equal gratification. To this end I suggest the formation of a correspondence circle, national or international, as may seem best, to include all those who follow the example of the apostle of old and go a-fishing.

Collectors of various things have something of the kind, so I am told, and find both profit and pleasure from it. Why not fishermen? The details of such a circle could easily be worked out, and perhaps others besides myself have thought of it. Their opinions would be interesting to readers of your columns.

In the belief that fishing acquaintances as well as fishing friends are the pleasantest we make, and in the hope that the "Petri Heil" of the hearty German angler may one day be as familiar to English ears as it is to those of his own race, I am

Cordially yours,  
JOHN D. WHISH, Secretary.

### Black Bass in Texas.

TO ANSWER a correspondent, Mr. Charles Hallock states that the western limit of the black bass, which is more frequently called trout there, is found in Texas; and he adds that these fish do not seem to be caught west of the ninety-eighth meridian in any other State. They are not found in the Rio Grande, but are said to be abundant in Devil's River, which flows into the Rio Grande from Texas through a mountain region. They are also numerous in the Sabinas, which empties into the Rio Grande from Mexico some distance above Laredo, and in Toyah Creek, which is west of the Pecos and some fifteen miles of the town of Toyah, on the Texas Pacific Railroad. It is a very fine stream, with many large and deep pools. The Enchanted Lake, on Toyah Creek, used to be a famous fishing place twenty years ago, Mr. Hallock says. In 1883-'85 he was employed by General Manager Hoxie, of the Missouri Pacific, to write up the resources of the Lone Star State, and he found the native fish quite considerable of an asset, including mountain trout, *S. iridea*, as well as catfish and bass.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## The Log of a Sea Angler.

### The Tuna Season.

BY CHARLES FREDERICK HOLDER, AUTHOR OF "BIG GAME FISHES," "ADVENTURES OF TORQUA," ETC.

It is a question whether angling or archæological research is the most fascinating. On the way across the San Clemente Channel, Mexican Joe revealed to me a secret—he is the oldest inhabitant and has lived on Santa Catalina Island forty odd years. It appears that one Cabrillo, a captain of Cortez, discovered the fair island, so far as the Spaniards were concerned, in 1542 and named it. He found it inhabited by a sturdy race having canoes which held twenty men. In 1602 the islands were again discovered by Viscaino, who renamed them. The historian of the latter, Torquemada, left an account of the natives he found in possession; declared them to be worshippers of gods, and described a certain temple to the god Chinigchinich somewhere up in the mountains; but where? Mexican Joe confided to me that he thought he could find it just as Bob on the outer reef swore by all the gods that he would show me the robalo, and I fell into the illusive trap.

I have been on the quest of Chinigchinich ever since. When I am on the turquoise waters, fishing with Mexican Joe or some other delight-giver of these summer seas, I really believe I am on an angling trip; but the fishing is merely a subterfuge; I am roaming up the cañons that reach from the sea to the upper range, or scanning the winding rivers of verdure from the little bays upward, thinking of Chinigchinich and his temple, that, according to Joe and Torquemada, stood somewhere just over the divide or between the bend of some distant cañon.

I have more than a fondness for the St. Lawrence River. Between Quebec and the mouth of the Saguenay, the land rises in a splendid slope to the Laurentian Mountains—the oldest hills in this fair land. Near at hand they are clothed in green, but the peaks and ridges eight and ten miles ahead, are a most beautiful blue, an ineffable tint or tone that has no color name. When I first saw it, the pleasure in the anticipation of reaching it was a delight; but as we sailed on, I found that this glorious blue was a thing dreams are made of—was a fantasy of distance. There they stood, mountains garbed in all the glory of color, ever beckoning, and as I sailed on and on, I never gained an inch on these mountain Lorelei, new peaks and ranges, assuming the splendid tone always ahead, alluring, enticing nereids of color which drew one on and on into the very heart of this land of dreams.

Every land has this fetish. It is some big fish, some rare flower, some radiant gem, some forgotten ledge of gold or silver, and at Santa Catalina, at least to me, it is the temple of Chinigchinich; and I am breaking no confidence between Mexican Joe and myself when I enter in this log the expectation that some time when trolling by the rocky cliffs, he or I will sight it, perhaps stumble upon it after the quest of many years.

Orizaba is one of the highest peaks of Santa Catalina, 2,200 feet or so in height; and at its base, in a cañon formed by two of its divides, lies one of the fairest bays on the island. It is on the north coast, and consequently the lee, and off its shining sands we rounded to and cast anchor. According to Joe, it was in the very center of the best fishing, and the wildest views on the island reached away from the anchorage. Our tents were pitched under some cottonwood trees, and from it I could hear the love notes of the innumerable quail up the cañon, see a bald eagle circling in upper air, while the azure sea, here clear as crystal, smooth as a disk of steel, stretched away to the mainland, thirty miles distant, over which rose the snow peaks of the Sierra Madre. The bay faced the channel, nearly always smooth, a lee being formed by a rocky point which extended out two miles above. It was a singular fact that this point and the rocks of Avalon Bay, four miles to the south, formed the limitations of the tuna fishing ground; in other words, all the tuna are taken here.

We sent the men down to Avalon for the daily mail, and now had the luxury of papers, with the delights of civilization, in camp, and yet its charm of isolation. The third day Joe hailed us from the beach and pointed to the channel. Something had happened. There was no wind, the sea was perfectly smooth, yet an area covering possibly twenty acres was lashed into foam as though some submarine force was at work.

"Tunas!" shouted Joe.

"Tunas!" echoed up the cañon, and two anglers ran down the beach, tumbled into the boat, and shortly were running out of the little bay, one in the launch, and one in the rowboat—a division of chances. The tuna is a large mackerel, and a world-wide traveler. On the Pacific he comes inshore in May or June to feed upon flying fishes and squids, driving the former into the open bays, rounding them up with the skill of a general. In ten minutes I could hear the roar of waters, then the flying fishes began to go by, over and under the boat. Then, ah, then, the reel spoke, as I had rapidly paid out my line and had 60 feet out by the time we reached the school.

The maddened fishes were chasing a large school of flying fishes, and the roar and foam came from their rushes along the surface in pursuit of the game, and now and then one went hissing into the air to turn gracefully and drop into the sea of foam. The tuna took the bait in a rush and tore 200 feet of line from the reel so quickly that I hardly missed it, then bore down and jerked the rod with powerful blows—zip—zip—zip—with a tension that told on the thumb pressing upon the leather pad, and took all feeling out of it. Such a brake with an ordinary fish is a deadly thing, but it was a bagatelle to this fish, that gathered in the line by feet and yards. In vain did I brake it with the left hand, pressing the line upon the cork grip, making two brakes, and with the patent drag, three. Despite this, zee-zee-zee went the line, always going, and the boatman backing the launch after the fish and using his oars to keep me face to it.

Nearly four hundred feet were taken by the tuna before I stopped it; then it turned and came up like a rocket, swirled at the surface of the clear blue water, and dashed around the boat to head out to sea, towing us in a straight line, as though holding a course. I now gained thirty or forty feet by an herculean effort, and broke its course, forcing it to sulk again down somewhere in the heart of this great rift in the Santa Catalina Channel, really a vast cañon between the lofty island and the mainland. Now the tuna turned in, towing us at a four-mile-an-hour gait, and carried the boat determinedly inshore, while I pumped and lifted, reeled when I could, and all the time that seeming miracle was being enacted—a fish of unknown size towing a heavy boat by a 21-thread linen line 350 feet in length.

An hour slipped away, then another, and the launch was being towed in a circle and the tuna was 250 feet away, and apparently as strong as ever. My companion had lost a fish, and now rowed by, advising me to "go in and win!" How cheap is advice to the looker-on. Three hours slipped by, and I was still contemplating the space below, while that untamed steed still fought and swam. I soon found that when I rested, the fish gained twice as much, and the only way to end the game would be to fight to a finish without cessation. This was apparently easy, but to the angler who has been holding a dead weight on his left arm for three hours, and pressing his right thumb against a leather pad all that time, it is a forlorn outlook. But I rallied, and by mere good fortune brought the fish to the quarter. My boatman was about to gaff it, when it stopped struggling, rolled upon its side, dead, and was gaffed and hauled in, a fine fish that weighed 150 pounds. There was but one conclusion to so sudden a termination to the battle—the tuna had died of heart failure, and I have seen several such endings. I have had a fish struggling and fighting with a fierceness that threatened rod and line, at least 200 feet away, suddenly stop and doubtless die of the over-exertion. I have had the good fortune to take large fishes of many kinds, but for hard fighting and persistency, force and strength, I award the palm to this, one of the largest of the bony fishes.

The tuna presented an attractive appearance as it lay on the canvas; about six feet in length, trim as a privateer, well proportioned, of the bonito type, body stout, tail powerful, a little row of finlets between the sharp dorsal and the caudal, the side fins short, the eye bright and beautiful, jaw powerful, silver belly—altogether a most striking and attractive creature.

"Tunas mighty uncertain," quoth Joe, as he rebaited my line. "Sometimes they strikes in in May, then in June, and sometimes they jest about give the island the go-by."

"You mean they sometimes don't come at all in numbers?"

"That's it," replied Joe. "I dunno where they come from, but most of the men think they go out to sea and to deep water off the Cortez Bank, some sixty miles to the southwest; but I've caught them in winter, and some are around all the time."

"Once," he continued, "I was sailing a big boat from the island to San Pedro, and was trolling with a big hand-line with a red rag as bait. All at once the boat stopped, a big tuna had stopped her, as though she were anchored, and we were running before the wind at that."

Joe was baiting my hook as he spoke, and the delicate line was a source of wonderment to him. The hook was a No. 7, the line a 600 21-thread Cuttyhunk, the rod a 12-ounce greenheart, built to order, 8½ feet long, light, supple, but strong enough to lift a sulking fish. I had a leader 8 feet long, longer than the fish, so that it would not chafe off on the finlets when the fish was boring down; the bait was a big flying fish, 12 inches in length—the natural food of the tuna at this time.

There were half a dozen boats fishing now; two or three were fast to tunas and being towed hither and yon. Later I had other strikes and missed several. Upon examining the bait I found that the tuna had struck at the large black eye of the flying fish and crushed the head.

This was a remarkable day for tunas. An acquaintance, Mr. Wood, of Los Angeles, hooked a fish early in the morning and played it seven hours. He is a powerful man, but he never reeled the fish within sight in that time, and wisely gave it up. I had passed a few minutes before, and he was then five miles offshore, holding the rod that formed a perfect curve, his wife sitting by him, anxious and excited; the boatman, Harry Elms, keeping the craft stern to the fish, which was slowly but steadily towing them out into the channel. Word had been passed to Avalon, and various parties came out to see the man who had fought the "unknown" seven hours. One carried him some lunch, and everything was done to aid the heroic angler; but he had just recovered from the grippe, and the struggle was beginning to tell on him, and at the end of seven hours, indifferent to advice, he handed the rod over to Elms, a strong, sturdy fellow, who, being absolutely fresh, thought he could bring the fish in in a short time. But they had under-estimated the strength of this fish, as, despite the lifting and pumping, the hours melted away, and the big fish towed the gamy boatman out to sea. Ten hours from the strike, Elms was alone in the boat, hoping that he could still wear out the fish, but the eleventh, twelfth, thirteenth hour passed, and counting the turns in and out, it was estimated that he had been towed two miles an hour, or nearly thirty miles, and ten miles directly out into the channel. A sea had picked up, and Elms now found that he could gain by lowering his rod when the launch fell into the hollow of a sea, then by holding hard the next sea would lift the fish, and in this way he could gain a foot or two.

I doubt if an angler ever had a more strenuous struggle, and at the end of thirteen and a half hours, Elms found that he was gaining, and fourteen hours from the strike he shouted that he could see the fish. Several launches were lying by him, and as it was manifestly impossible for him to gaff the fish and hold the rod, an angler offered his services, and was put aboard.

The tail of the fish now appeared at the surface; the fish was boring down head first. The gaffer leaned down and struck home, but the hook did not take; it

scraped along the surface, alarming the fish, which gave a mighty rush, broke the swivel and disappeared, after having worn out two men. Such is fisherman's luck. From the size of the tail, those who saw the fish that was played fourteen hours fairly with a rod, believed it to have been a 600-pound or more fish. The fight doubtless killed the tuna, as the steamer Falcon passed a very large fish floating on the surface near the fishing spot the following day, doubtless the same tuna. A large reward was offered for the fish when the news was reported, and various launches went in search of it; but the sharks dined on the great unknown that made the gamiest fight ever recorded on these happy hunting grounds.

The best tuna fishing is in the large bay at Long Point. Inshore lies the white sandy beach, and from it reaches away the verdant river—the cañon rising to the Cabrillo Mountains—while along the shore rise rocky cliffs in reds and greens; the water, deep, in marvelous tones, reflecting the vagrant cloud flecks and the rocks and mountains, is filled with life. Fanciful shapes of jellyfishes, some minute, others giants, with long trains; while inshore and skirting the rocks are the wonderful hanging gardens of the sea. Not a breath of wind disturbs the surface, and in the morning, as the sun rises, this sea of delights takes on tints and colors indescribable and impossible to reproduce. If the waters could speak, what tales they would tell of savage life, of the galleons and packets of the Conquistadores of Cabrillo, Cortez, of Viscaino, Drake, Monterey and many more; and somewhere up there, in a deep cañon, overgrown, perhaps, by chillocothe, wild lilac or ironwood, is the temple of Chinigchinich.

I fancy I can see it as the launch moves slowly on, and I turn to Mexican Joe and ask him if he has ever hunted in that particular cañon. Joe laughs, and then my rod is jerked into the water. Zeeee-zeeee! and I am in the toils of the leaping tuna. I hooked this fish at once, and it towed me four miles, once up the coast to Long Point, then down to Avalon, where it was gaffed.

Never had such a tuna season been known, and it is sufficient for this log to give some of the most striking incidents in the season's catch. On July 3 I went out with Col. C. P. Morehouse and sighted tunas to the north. We thought a heavy sea was breaking on the Long Point rocks, but it was a school of tunas. We both had strikes at the same time, and both saved our fish. As it was manifestly impossible to play them from the same boat, we separated, and in an hour had both tunas aboard—150 and 130 pounds. The fish bit rapidly as we made a turn about the school, and in a short time we took two others. It was a strong temptation to see how large a bag we could make, and we agreed that we could have broken the record for numbers for a given day then and there; but we broke the record in the theory only, not wishing to waste the splendid fish, and not being able to use more than we had, which were in demand by the local taxidermist. We tried casting for them, with success, on another day. The tunas were not leaping, but were swimming in schools over the bay in a form like ducks swimming, with one in the lead. I found we could reach within thirty feet of the school and cast ahead of them. Evidently they thought that a flying fish had alighted among them. There would be a swirl of waters and the reel would give tongue as the frightened fish dashed deep into the channel, dispersing the school.

Those placid waters were the theatre of strenuous sport. Here I took the first large tuna, an 183-pounder, at the time the largest taken with a rod and 21-thread line. My boatman was Jim Gardner, an Englishman, who developed very clever qualities as gaffer and angler. This fish towed us ten miles, and in the fourth hour towed us straightaway four miles; during this latter period I was nearly beaten. I had fought the fish with all the strength at my command for three hours, and the continued drag on my left hand and arm began to produce violent palpitation of the heart, and gradual weakness. When the fish was not fighting or attempting to plunge, it was towing the boat by 200 feet of delicate 21-thread line, and after three hours and three-quarters I realized that I was in *extremis*, while the tuna appeared to be as strong as ever. I remember I endeavored to distract my attention from the fish, and as it towed me steadily to fix in my mind upon some foreign object, as I appreciated that the heart fag was to some extent the result of mental excitement consequent upon the struggle and the peculiar and unique tactics of this particular fish, it having repeatedly charged the boat on the surface, then, turning and rushing away when ten feet distant, a magnificent performance, a spectacle to arouse enthusiasm; but when repeated time and again I found that it wore on my nerves. I knew I had big game, and the fear that one of those rushes would end the play was disquieting. I thought of the temple of Chinigchinich, looked at the graceful outlines of the mountains; I even counted slowly in a vain effort to reduce the beating of my heart, but it was all useless; that strange pull, that strange vibration, coming up the line, the unknown fish towing us with unabating strength, forced itself deep into my mind and imagination, and twenty minutes before the end I expressed the opinion to Jim, quietly but positively, that the tuna had me, in what is known in sporting parlance as "on the run."

I had been fighting this fish steadily for nearly four hours, and collapse was staring me in the face. I felt that I had reached the limit of endurance. My arms were numb and my heart was giving all the symptoms of failure, and I remember, despite my agony of mind and body, that it occurred to me that it was an interesting physiological study, this effort to beat down the extreme exhaustion of the body. Whether it was the invocations of my gaffer behind my shoulder, or the encouragement of some friends who were following in a launch, or the desperate shame of failure before the lookers-on, I do not know; but in some incomprehensible way, I pulled myself together and again bent to the reel; and the splendid fish, ever circling the boat, came slowly in. It seemed an eternity; then we saw the full and complete outline of the fish for the first and appreciated the cause of the struggle; then, tell it not in Gath, the reel stopped. It was one of the best reels in the world—an Edwin Vom Hofe—but so great

had been the strain that the line had sunk into the coil and clogged; human power could not move it. Imagine the situation; its horrors! Walton might have sighed and quoted *Culpam pœna premit comes*, believing that he deserved it for attempting to kill so game a fish. But my boatman was not of this timber, far from it. He swore in vigorous English; he conjured all the gods in many tongues; he rose to the occasion, while I breathless, winded—but this is not a confessional, only the log of a lucky sea angler who proposes "*Credo quia impossibile est*," as the motto of sea anglers, for it was the impossible that happened. My last rally had demoralized the tuna, which swam slowly around, giving me time to hold the rod and overrun the reel several yards and reel it in again, and again the tuna began to come in. It reached the quarter, and as it was slightly tipped upward, I saw again the full outline of its splendid proportions against the blue water; then my boatman gaffed it.

Exactly what happened, no one knows, but the big gaff pole splintered in his hands at the tremendous bounds of the fish, and the tuna took fifty feet of line before I could stop it. Keyed up to the highest degree of excitement, I reeled vigorously, and in a few moments again had the tuna near the quarter, and held it while Gardner gave it the congé. The gaff slipped beneath it; a jerk, a struggle which enveloped gaffer and angler in foam and spray and flying scud, and the big head was held a moment hard against the rail, I standing with shortened line ready for the rush that might come, the gaffer grim, blinded with spray, his arms jerked beyond endurance. But the game was ours, the splendid creature in silver and yellow hung quivering as we stepped on the rail, bringing it down to the water's edge, and Gardner slid the tuna in, where it beat the boards with such ponderous blows that I fancied that it might stave the craft, while we doffed our hats and gave a rousing cheer over the victory. At this time, it was not supposed possible to take so active a fish with rod and reel and a 21-thread Cuttyhunk line; consequently the catch of 183 pounds was a notable one, and it was this fish, and the sportsmanlike conditions of fishing at the island which caused me to suggest the Tuna Club. The splendid fishes of the region, yellowtail, white sea bass and others, were being slaughtered by the ton. I had seen boats go out with five or six hand-lines rigged out astern, and return with forty or more fish none less than 15 pounds, running up to 25, each with the game qualities of a salmon. It was a shameful sight, as most of these fishes were fed to the sea lions and sharks. How to stop it was the question, and I conceived the idea of an appeal to the innate sense of fair play that is found among fishermen. I suggested the Tuna Club, "for the protection of the game fishes of Southern California," and a constitution and by-laws that would permit only the use of lines up to 24-thread and light rods, and conditions that every angler must land his own fish. Some of the best-known anglers in the country joined the club, and I was honored with the presidency. The result was remarkable. The example of these gentlemen was so potent that hand-lines were abolished, and I doubt if one can be found in use at Santa Catalina to-day. The boatmen will not permit their use, as it disqualifies their patrons from the prizes of the Tuna Club tournaments and records. With a rope-like hand-line, a 25-pound yellowtail can be landed in a minute or two; but with a rod and thread-like line, from 9 to 21, it is a matter of fifteen or twenty minutes, and 50 per cent. of the game escapes. Thus overfishing is practically impossible, and much more sport is obtained. The result is that to-day the waste of these fine game fishes is practically stopped.

To further still emphasize and make popular rod fishing, I suggested an annual angling tournament, to begin May 1 and end Oct 1, offering valuable prizes of rods and tackle, medals and cups in various classes to anglers who took the largest fishes of various kinds with the light rods and fine lines specified by the by-laws of the Tuna Club; and that few, if any, of the thousands who fish at Santa Catalina to-day take any of the game fishes found here unfairly or in any manner other than one that appeals to the highest sportsmanlike feeling, shows what the combined influence of anglers can accomplish. Nowhere in the world does a higher standard of sport hold than on the tuna grounds of Southern California. It happened that it was my suggestion as far back as 1886, that a tuna could be taken with a rod, and I was often laughed at for suggesting it, and while I did not take the first tuna, I took the first large one—a fish which in vigor and virility I would match against any tarpon it has been my good fortune to hook. I have never seen a tarpon that I could not kill in thirty minutes by continuous fighting, though I believe there are such fish; yet this tuna fought me four hours, towed a heavy boat, an engine and two men ten or twelve miles, the oars of the boatman being held against it, and sometimes pulled, to prevent the fish from towing us out to sea. There have been larger tunas taken since, but I venture to say that none of them when fairly hooked as this fish was, made a better fight. Size, in my belief at least, does not indicate fighting qualities. The hard-fighting tunas are the medium-sized fishes, and this holds with tarpon, amberjack, yellowtail, and others. I have taken yellowtails up to 45 pounds, but a certain 17-pounder gave me more trouble than all the giants. The account of the catch of the big tuna created much excitement, and as we rowed into Avalon to weigh the fish, the little town came down to give us welcome. Late in the afternoon I strolled down to the rock where a crowd of people were still admiring the big fish, and some young women, descendants of Ananias, bravely having their pictures taken standing by its side, rod in hand. Jim was rehearsing the catch, and a tenderfoot was listening with bulging eyes at the yarn, not even questioning the fact that the tuna towed the boat forty miles and leaped fifty feet into the air. Among the observers were reporters and correspondents, and I later saw myself pictured playing this leaping tuna—at least thirty feet in air. Another account in a magazine pictured me calmly swimming and playing the tuna. The Associated Press telegraphed the story all over the world, and the members of the

peaceful sea anglers association in London received the account the next morning in the papers and marveled at the big things in America.

As the tunas continued biting, we have devoted ourselves to this sport, and I find that about one tuna is taken for every twenty strikes. Newcomers—and they are here from various parts of the world—almost invariably miss the fish, due, I believe to excitement. They strike too quickly, or not quickly enough, and miss the psychological moment. I have fished with a number of anglers, or watched them, and having been in the toils myself, worn, as General Gordon said in one of his fights, "to a frazzle," hence could enjoy the trouble of other victims. Yesterday I was a guest on a friend's launch, and stood in the bow, where I could see the tuna's coming up astern. Evidently they would see the bait thirty feet distant, and two would charge it on the run; their fins, near the surface, often tossing the water high in air. I would notify the angler, then would come the strike—zip ze-e-e! and that there is tuna fever as well as the buck variety goes without saying. I noticed one young angler who became so nervous that he could not face the stern, could not watch the tuna as it came racing at him; so he turned back to, and as I shouted, "Here he comes!" he would turn all kinds of colors and strike, and the fish would pass on with fifty feet of line in tow.

Tuna fishing has an element of danger. I saw a man brought in this afternoon almost in a state of collapse, and he was assisted to his room at the hotel; the tuna had been caught, but had laid him low. Before the victim recovered, he was waited on by a committee of the Tuna Club, who presented him with the little blue button of the club, that certified that the wearer had taken fairly with rod and reel and 24-thread line or less, a 100-pound tuna. The committee reported that this did more to revive him than the physician, who fortunately was his partner on the trip.

Last night I was trolling for tunas near the rocks with Col. Morehouse, when, just at dusk, the tunas dashed in, chasing a large school of flying fishes, which rose all about us, some going over the boat, one striking me under the ear, so nearly knocking me out of my seat that Gardner, the gaffer and boatman, caught me. I had my revenge. Gardner hooked on the fresh bait that had selected me as a target, and I had a strike a few minutes later, but lost the fish.

Tuna fishing may be followed up to 8 o'clock at night with success, but later the fishes see the line, due to the remarkable phosphorescence; at least the biting stops when the phosphorescence is at its maximum display. The spectacle of large tunas dashing through this liquid fire is a marvelous one. Every motion is a blaze of light, and in Avalon Bay from the topmast the sight was one to be remembered.

[TO BE CONTINUED.]

### Lake Hopatcong Fishing Association.

THE fishing at Lake Hopatcong has been getting poorer and poorer every year, owing to the Fish Commissioners failing to stock same, and no one else taking an interest in it. The property owners and inhabitants around the lake have decided to form a club, to be known as the Hopatcong Fishing Association, the object of which is to either buy fish for stocking purposes, or to start a hatchery. They have an idea that by starting a small hatchery at the lower end of the lake, where the water runs into the Rockaway River, that they can secure enough fish to stock the lake with little expense. A meeting was held at the summer home of Mr. W. C. Hespy, on Saturday night, June 24, and an organization effected. Mr. Salto was elected president, E. C. Ross vice-president, G. Reinberg secretary and W. C. Hespy treasurer. The sportsman element was well represented and the outlook is promising. The dues will be \$10 a year without any initiation, and the membership is expected to reach 100 at least.

Most of the people frequenting the lake as well as property owners, are very enthusiastic over the plan, and it is believed that great good will come therefrom. An effort will be made to induce the next session of the Legislature to change the fishing law, which is now open May 20, to not earlier than June 15, as all fishermen report that what bass they are taking are full of spawn, and it is believed this early fishing and fishing through the ice has done much to deplete the fish in this lake.

It is to be regretted that the Fish Commissioners have not taken more interest in keeping this lake stocked, as it is the prettiest spot within 100 miles of New York, lying, as it does, in the mountains at an elevation of 986 feet above the ocean, and within an hour's ride of New York. The lake is about sixty-three miles in circumference and has a great many beautiful homes erected on its shores, and the water is pure spring water and probably the best adapted to the raising of bass of any in this locality.

### A Telephone Fishing Appliance.

AN English paper reports that a Norwegian has invented a telephone by which the noise made by fish in the depths of the sea can be heard. The instrument consists of a microphone in a hermetically sealed steel box. It is connected with a telephone on shipboard by electric wires, each sound in the water being intensified by the microphone. The inventor asserts that with its aid the presence of fish, and approximately their number and kind, can be recognized. When herrings or smaller fish are encountered in large numbers they make a whistling noise, and the sound made by codfish is more like howling. If they come near the submarine telephone their motion can be distinguished. The flow of water through the gills produces a noise similar to the labored breathing of a quadruped, and the motion of the fins produces a dull rolling sound.—Richard Guenther, Consul-General, Frankfort, Germany, May 15, 1905.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

### The Joke was on the Joker.

"It was early in June," said the story-teller of the party, "and the bluefish had not begun to run from the outside. Several wagers had been made as to who would land the first bluefish of the season, and we were all on the *qui vive*."

"It chanced one fine morning that a number of us decided to go for a sail on the bay, the party including a well known Scotch member of the club familiarly known as 'Hot Scotch,' and a prominent German physician dubbed by his fun-loving associates as 'that fool Dutchman,' and many were the jokes played at his expense, particularly by his Highland friend.

"On this particular occasion, however, the 'Dutchman' turned the tables on 'Hot Scotch' in a way ever to be remembered. After sailing about a bit, several lines were thrown out in the hope of luring the first bluefish. The Scotchman, ever on the alert for mischief, seized on what he thought was a favorable opportunity to play a joke, and quietly hauling in the 'Dutchman's' line, fastened to it an Apollinaris bottle about ten feet from the spoon, giving the line a smart jerk as he let go.

"There, you Dutchman, you've got a bite," he cried. The latter, unobserved, had watched the whole proceeding, and said not a word. A moment later, however, he cried out that he had a fish on his line, and promptly accepted the Scotchman's derisive wager of \$10 to the captain of the boat and a wine supper for the crowd that such wasn't the case. Then we all smilingly awaited his discomfiture.

"When he hauled in the line, however, we were all astonished to discover a fine bluefish—the first of the season—well hooked, and to see its captor fairly bursting with laughter. He had felt the fish hooked almost the instant that his line, with the bottle attached, was cast back into the water.

"Needless to say, our German friend won every wager on the event and has since been looked upon by his fishing comrades as a man never again to be trifled with."

### The Arbutus Lake Park Trout Waters.

NEWCOMB, N. Y., June 26.—The other day I had the pleasure of visiting the preserve of Archer M. Huntington, known as Arbutus Lake Park Preserve, situated in the town of Newcomb, county of Essex. The camps, superb in every particular, and most beautiful beyond description, are on the north shore of Lake Arbutus, one of the most beautiful lakes in the whole Adirondacks. While roaming over his vast domain one day last season Mr. Huntington chanced upon a small brooklet filled with speckled trout, and the thought came to him that the habitation of the trout might be materially improved. He thereupon engaged a noted surveyor and soon ascertained to his great delight that his theories were well founded. A large force of men were engaged during the winter, the brush, shrubbery and old logs were removed and burned. A beautiful road was built, ten dams were erected, and the result is to-day that there are ten most beautiful lakes, vieing in beauty with nature's own productions and not distinguishable from them, which seem to have grown up like a mushroom in the night time. When Mr. Huntington again visits his preserve and sees the beautiful improvements that have been made, he will find that his ideas have happily materialized, and that he is the fortunate possessor of an earthly paradise.

Mr. Huntington has shown a way by which the whole Adirondacks may be clothed here and there with artificial lakes, enhancing their beauty and giving unlimited fishing grounds.

C. A. BISSELL.

### Trout and Black Bass Near New York.

RECENT reports from points on the Erie railroad and branches, including the New York, Susquehanna & Western R. R., and Wilkes-Barre & Eastern R. R., concerning trout and bass fishing give the following records: Trout—at Woodbury, N. Y., eighteen were taken in one day in Woodbury Falls Creek, the largest weighing a pound, and the lot averaging  $\frac{3}{4}$  pound. In Shohola Brook and Halfway Brook at Shohola, Pa., there were catches of twelve and sixteen, the largest a pound and the average  $\frac{3}{4}$  pound. In Boushous Creek, at Lordville, one angler took twenty-five, averaging  $\frac{1}{2}$  pound, the largest a pound; and in Sands Creek, at Hancock, the best day's score was of twenty-nine running on the average of  $\frac{1}{2}$  pound.

Bass fishing has been good at Greenwood Lake, Sterling Forest station; in Mombasha Lake, at Monroe, N. Y. From Twin Lakes, at Parker's Glen, Pa., the biggest fish taken was  $3\frac{1}{2}$  pounds, and twenty averaged  $1\frac{1}{2}$  pounds. Narrowsburg, Lordville and Hawkins, N. Y., report good catches from the Delaware River.

### Canadian Trout Fishing.

MONTREAL.—There is no brook trout that will bear comparison with those to be caught in Lake Superior, and the streams running therein. The best trout section that I have been able to hear of nearer than that is in Otter township, near the Mississauga River, where the surveyors said that in every lake and stream brook trout were to be found. I have fished the bass lakes south of there, and know them to afford phenomenally good fishing. There is also good brook trout fishing on the Menjagossippi River running into the Timagami Lake system. That, however, is pretty far back. The nearest all-rail route to good trout fishing is from Nemegos Station. That, however, is considerably more than 100 miles from Toronto.

L. O. ARMSTRONG.

### The Fly in the Ointment.

PERTH AMBOY, N. J.—Editor Forest and Stream: In your issue of July 1 is a very readable story entitled "We Three in Canada." Attention is called to it editorially, at the top of the cover, as "An Unique Outing." And yet the writer calls brook trout "speckled beauties."

Goshalfishhooks! Is there anything unique about that? I certainly thought that that threadbare abomination, with some others, had been long ago placed upon your *index expurgatorius*. Am I wrong?

J. L. K.

# YACHTING

## Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

JULY.

- 5-12. Atlantic, cruise.
7. Eastern, cruise.
8. Knickerbocker, one-design power boats.
8. New York, Glen Cove, cups.
8. Royal Canadian, cruising race.
8. Wollaston, club championship.
8. Seawanhaka Corinthian, club.
8. Edgewood, club.
8. Quincy, M. Y. R. A.
8. Rhode Island, cruising race.
8. Seaside Park, club.
8. Beverly, club.
8. Corinthian, club.
8. Unqua Corinthian, Williams cups.
8. Riverside, annual.
8. Sea Side, open.
8. Bensonhurst, Bellows challenge cup.
9. Canarsie, open.
9. Morrisania power boat race.
10. Seawanhaka Corinthian, ocean race.
11. Lakewood, series race.
12. Seaside Park, club.
12. Sea Side, open.
15. Royal Canadian, club.
15. New Rochelle, club.
15. Knickerbocker, one-design power boats.
15. Seaside Park, club.
15. Country Club, Detroit club.
15. Edgewood, club.
15. Bensonhurst, Bellows challenge cup.
15. Keystone, club.
15. Atlantic, Underwood cup.
15. Beverly, club.
15. Boston, cruise.
15. Corinthian, club.
17. Edgewood, N. B. Y. R. A., open.
18. New Brunswick V. R. A. regatta, Prudence Island.
18. East Gloucester, club.
19. Seaside Park, club.
19. Rhode Island, N. B. Y. R. A., open.
20. Rhode Island-Sachem Head, team race.
20. Royal St. Lawrence, Seawanhaka cup.
21. Fall River, N. B. Y. R. A., open.
22. Knickerbocker, power boat race to Marblehead.
22. Knickerbocker, one-design power boats.
22. Winthrop, M. Y. R. A.
22. Bristol, N. B. Y. R. A.
22. Rhode Island, cruising race.
22. Seaside Park, club.
22. Royal Canadian, Canada's cup trials.
22. Beverly Y. C., club.
22. Marine and Field, second championship, Y. R. A. G. B.
22. Unqua Corinthian, Molineux cups.
22. Corinthian, club.
26. Seaside Park, club.
27. Eastern, power boat races.
27. Sea Side, club.
28. Eastern, power boat races.
28. Seaside Park, Bay Head and Island Heights, cruise.
28. Sea Side, open.
29. Eastern, power boat races.
29. New Rochelle, ladies' race.
29. Chicago, race to Mackinac.
29. Country Club of Detroit, race to Mackinac.
29. Seaside Park, open.
29. Edgewood, club.
29. Knickerbocker, one-design power boats.
29. Hampton Roads, cruise.
29. Rhode Island, cruising race.
29. Royal Canadian, cruising race.
29. Beverly, club.
29. Corinthian, club.
29. Boston, club, Marblehead.
29. Indian Harbor, annual.
29. Bensonhurst, Childs trophy.

## Brooklyn Y. C. Ocean Race.

THE Brooklyn Y. C.'s long distance race from Gravesend Bay to Hampton Roads is the second race of this character to be given this year for small craft. The race was scheduled to start on Thursday morning, June 29, and at 10 o'clock on that day five boats started on their long sail of 250 nautical miles down the coast.

The restrictions governing the race barred all boats of over 40ft. length on deck, and the requirements were made so as to prevent any but substantial and seaworthy craft participating. Time allowance is based on over all length and each boat receives 8s. a foot per mile.

The following is a list of the boats, together with their particulars and crews:

Lila, designed by Small Bros., built in 1905 by Reed & Adams, Boothbay, Maine; 39ft. 10in. over all; 30ft. waterline; 13ft. breadth, and 5.4ft. draft. Scratch boat allows all the others time. Crew—Owner and skipper, Richard D. Floyd, Newark Bay, Y. C.; Robert Schaler, Frank Muller, A. G. Green, Clinton Gilbert and A. B. Thompson.

Tamerlane, designed and built by L. D. Huntington, Jr., New Rochelle, 1905; 38ft. 2½in. over all. Receives 28m. 33s. time allowance. Crew—Frank Maier, owner and skipper, New Rochelle, Y. C.; T. F. Day, J. S. F. Kerr, John Robinson, Leonard Kent and a paid hand.

Bonito, designed by T. E. Ferris, built in 1899 by J. J. Driscoll, Brooklyn; 37ft. 2in. over all; 25.8ft. waterline; 11.5ft. breadth, and 5.3ft. draft. Receives 1h. 3m. 33s. time allowance. Crew—John Haviland, owner and skipper, Brooklyn Y. C.; Walter N. Beiling, Fred H. Beiling, H. Cook, C. Curtis and a paid hand.

Mopsa, designed by the late Edward Burgess, built by George Lawley & Son, South Boston, Mass., 1888; 35ft. 2½in. over all, 27.5ft. waterline, 9.5ft. breadth and 6.5ft. draft. Receives 2h. 8m. 33s. time allowance. Crew—F. C. Sullivan, owner and skipper, Harlem Y. C.; W. S. Sullivan, F. S. Sullivan, E. J. Martin and Jerome Monks. No paid hand.

Gauntlet, designed and built by L. D. Huntington, Jr., New Rochelle, 1905; 27ft. 10in. over all, 22.1ft. waterline, 10.2ft. breadth and 5.5ft. draft. Receives 6h. 40m. time allowance. Smallest boat in the fleet. Crew—L. D. Huntington, Jr., owner and skipper, New Rochelle Y. C.; James D. Sparkman, Montgomery H. Clark, Robert N. Bavier and F. D. Le Count. No paid hand.

The five small craft are competing for a valuable

challenge trophy offered by the Brooklyn Y. C. Arrangements were also made for larger club boats and five boats were entered. They were as follows: Wayward, schooner, Colonel David E. Austen, Brooklyn Y. C.

Gaviota, yawl, G. C. Gillespie, Brooklyn Y. C. Sunshine, schooner, Commodore S. S. Fontaine, Brooklyn Y. C.

Nomad, sloop, W. L. Sawyer, Brooklyn Y. C. Charlotte, sloop, Elmer M. Mount, Brooklyn Y. C.

Last year the Brooklyn Y. C. held a race from Gravesend Bay to Marblehead, a distance of 330 nautical miles. A number of boats entered, and they were favored with such remarkably fine weather that a record run was made. Not wishing to cover the same course this year, the Brooklyn Y. C. decided on a southern route. The most suitable place to finish such a race was at Hampton Roads, and the members of the club at that place offered special inducements for the Brooklyn men in the shape of race and cups. This is the first time that northern and southern yachting organizations have been brought together, and the outcome can not help but be greatly beneficial to the sport.

The Brooklyn Y. C. was favored again this year with good weather for its long race. For three days before the start the weather had been ideal and a fine steady N.W. wind prevailed. It was feared that it would shift and go to a less favorable quarter for the boats going south. These fears were groundless, however, and on Thursday morning, when the crews turned out, the wind was still from the N.W.

The start was made off the Brooklyn Y. C. house in Gravesend Bay. The Race Committee, composed of Vice-Commodore A. C. Soper, William B. Griffin, George E. Reiners and F. W. Bradford, were on board Mr. E. T. Hatch's schooner Nokomis. At 9:50 the preparatory was given, and at 10 o'clock the little craft were started. Lila, the scratch boat, crossed 20s. after the gun, followed 10s. later by Mopsa. Tamerlane was the third to get away 40s. after the gun. Gauntlet was next, 1m. 40s. late, and she was followed by Bonito.

The yawl Anna, owned by Mr. L. C. Johnson, of the Chesapeake Bay Y. C., was to have started. She had left her home port and was proceeding north, but head winds had delayed her so much that she was unable to reach Gravesend Bay in time.

At 10:10 the larger boats were started. Gaviota crossed 1m. 8s. after the signal, with Wayward 15s. behind. Sunshine was next, followed by Nomad and Charlotte. The boats' official times were all taken at 10 o'clock, as it was a one gun start. The actual starting times follow:

Challenge Cup Competitors—Lila, 10:00:20; Mopsa, 10:00:30; Tamerlane, 10:00:40; Gauntlet, 10:01:20, and Bonito, 10:01:30.

Club Class—Gaviota, 10:11:08; Wayward, 10:11:23; Sunshine, 10:12:18; Nomad, 10:12:30, and Charlotte, 10:12:34.

In the run down the coast the participants encountered head winds and a slow passage resulted. The yawl Tamerlane finished first at 11h. 53m. 30s. on Sunday, July 2. The yawl Lila was the second boat to finish. Mopsa was third and Bonito was fourth. No word has been received from Gauntlet as we go to press. The summary follows:

	July 2, A.M.	Elapsed.	Corrected.
Tamerlane, Frank Maier.....	Finish.....11 53 30	73 53 30	73 24 57
Lila, R. D. Floyd.....	July 2, P.M. 5 20 50	79 20 50	79 20 50
Mopsa, F. C. & W. S. Sullivan.....	7 01 15	81 01 15	78 52 42
Bonito, Haviland Bros.....	7 06 50	81 06 50	80 03 17

## Arrival of the Gregory.

From The Yachtsman.

TOO LATE for the race which she would in all probability have won, Mr. Lewis Nixon's motor yacht Gregory has arrived at Algiers. Owing to her having been detained for the arrival of gasoline fuel at the Azores, the Gregory arrived much too late for the Algiers-Toulon race, for which she was entered. In all probability she will run over the course—although, in our opinion, such a procedure is somewhat in the nature of a post-mortem argument. Meanwhile, the usual sheaf of Russian rumors are to hand, and it is said that the Gregory will at once proceed to Sevastopol, and that several similar boats will be at once built to the order of the Russian Admiralty.

The Gregory is 90ft. long, with 11ft. 5in. beam. Her draft is 4ft.; and with two sets of 300 horsepower motors she gets a speed of twenty-two knots. She was built to Mr. Nixon's designs by the Standard Motor Construction Company of America.

Captain Loose, who was in charge of the Gregory during her voyage, gave the following account of it to a representative of the *Matin*:

"The departure took place on Jan. 5. During the first twelve hours the weather remained fine, and an average speed of twenty knots was maintained, but on the morning of Jan. 6 a southwesterly gale sprang up, and the sea becoming increasingly rough, the boat was closed over, the anchors were thrown out, and the vessel allowed to drift.

"For four days the Gregory drifted. By the time the storm had passed over everything had been swept from the bridge by the waves and the masts were broken. It was impossible to go on, and the captain consequently returned to New York.

"The second departure took place on Feb. 8. After forty-eight hours' sailing the Gregory was again caught in a storm and was swept into the current of the Gulf Stream. Again the masts were broken, and again the vessel had to be allowed to drift. The anchors and boats were lost and four barrels of oil had to be used in calming the waves.

"The gasoline receptacles on the bridge were so re-

peatedly beaten by the waves that they at last began to leak and the gasoline invaded all parts of the ship to such a point that it became dangerous even to strike a match. The odor of the gasoline was almost unbearable and the faces of nearly all on board were soon swollen. Eight days out from New York the Gregory arrived at the Bermudas.

"On March 1 the voyage was resumed, under a somewhat heavy sea, but with weather conditions otherwise fair. The sea, however, rapidly became rougher, and ultimately one of the cylinders of the motor broke. This necessitated a return to Bermuda, which was left again on March 19.

"The Azores were reached on April 4, after another terrible storm had been passed through. The provision of gasoline, however, was exhausted, and there was nothing left for it but to await a supply from Lisbon. The sojourn at the Azores lasted thirty-six days, Ponta Delgada being left on May 10. Henceforward the weather was fine, and the Gregory accomplished the 1,400 miles to Algiers in seven days. The captain declared that he would not undertake another such journey for \$10,000."

## Boston Letter.

SPECIAL CLASS FOR 22-FOOTERS.—It has been decided by the Regatta Committee of the Eastern Y. C. to allow the 22-footers to race in their original classification on waterline length in the special open races of July 3 and 4 and Aug. 8. That is, the yachts will compete as a class among themselves, while still competing in the regular rating classes for cash prizes for yachts of all types. For the 22-footers, racing as one class, a special cup has been offered. It was found that the 22-footers measured into the largest of the three rating classes provided, from 33 to 40ft. and would have to race with 35-footers and 30-footers, which the owners of the 22-footers objected to. As the boats built since the first of the year would have to assume the limit of the class, it is likely that they would have to allow yachts of much greater waterline length, and they would also have to give allowance to the older 22-footers. All of this was objected to by the owners of the 22-footers, so the arrangement was made as stated above. This will satisfy the owners of the 22-footers and at the same time will give the committee an opportunity of studying the effect of the new uniform rule as affecting yachts of different types.

NOVEL RACE AT HULL.—Announcement has been made that the Boston Y. C. will give a race for 18-footers and 15-footers sailing in one class, off the Hull station on July 9. This race will be decidedly novel and will, no doubt, furnish much amusement for those who take part as well as for the spectators. Upon signal the boats will be obliged to anchor near the committee boat, lower and furl mainsails, securing them with four stops, and unhook jibs, placing them in the standing rooms. Upon the second signal the boats will make sail and cross the starting line, leaving tenders secured to the anchor roads. After sailing part of the course yachts will leave one man in their tenders, and after another mark has been turned, will return and pick the men up again. They will then proceed to finish the course, but in crossing the finish line must do so stern first. After crossing to the satisfaction of the committee, each yacht must go to its tender and make fast to the anchor road, lower and furl sails the same as at the start. Thence, leaving one man on each boat, the other two will proceed to the club float, one man rowing, where one member of the crew will light a cigarette with wax tapers furnished by the judges. All conditions must be complied with to the satisfaction of the committee. It is also announced that the position of the committee boat may be changed at the finish. The committee consists of Messrs. T. E. Jacobs, H. J. Thayer, John L. Amory, H. S. Potter, C. W. Cole and J. J. Souther.

It has also been announced that the following series of lectures will be given at the Hull club house: July 28, illustrated talk on "The United States Life Saving Service," by Arthur K. Peck; Aug. 5, "Historic American Yachts," illustrated, by Winfield M. Thompson; Aug. 12, "Charts and Navigation," by Capt. George W. Eldridge.

EASTERN Y. C. POWER BOAT RACES.—The Motor Boat Committee of the Eastern Y. C. has issued its circulars for power boat races to be held during the season. The dates are as follows: July 4, Aug. 18, Aug. 26 and Sept. 2. Three special open races will be given on July 27, 28 and 29. The Gay cup will again be competed for this year by boats under 40ft. over all.

The classes for automobile boats, under the classification of the American Automobile Association, follows:

Class A, boats not over 26ft. length waterline; Class B, boats over 26ft. and not over 32ft. length waterline; Class C, boats over 32ft. and not over 40ft. length waterline; Class D, boats over 40ft. and not over 50ft. length waterline; Class E, boats over 50ft. and not over 65ft. length waterline.

The following are the classes for launches: First class, all over 50ft. rating; second class, all cabin boats and boats with standing awnings over 21ft. rating, and not over 50ft. rating; third class, hunting launches and open boats over 21ft. rating, and not over 50ft. rating; fourth class, not over 21ft. rating.

INVADER NEARING COMPLETION.—The 95ft. schooner Invader, building for Mr. Roy A. Rainey, of the New York Y. C., is nearing completion. She has been painted and the joiner work is now going in. She will be ready for the water in a few weeks. Messrs. Wilson & Silsby are at work on her sails. These sailmakers are making suits for Bethulia, Lina, Vigil, Peregrine and the three Rochester defenders for the Canada cup. New sails have been shipped to Cleveland for the schooner Priscilla, and sails are being made for Southern Cross and Verande.

**MANCHESTER Y. C. DATES.**—Championship races of the Manchester Y. C. will be held off West Manchester on July 5, July 15, Aug. 1, Aug. 22 and Sept. 5. The remaining dates for the sailing tender classes are July 8, July 22, Aug. 5, Aug. 19, Sept. 4 and Sept. 20.

**LAUNCH BY SMALL BROTHERS.**—Messrs. Small Brothers have designed a 16ft. launch for Mr. Stanley F. Eldridge, owner of Mattakeeset. The 18-footer designed by this firm for a Chicago syndicate, will be shipped from Marblehead this week. A 16-footer, designed for a Detroit yachtsman, was shipped last week.

**DISPATCH SOLD.**—Mr. Hollis Burgess has sold his fast cruising launch Dispatch to Mr. H. J. Perkins, of Boston. She is 35ft. long and has a four-cylinder engine of 24 horsepower. She has a speed of about 15 miles.

**SANDERLING CHARTERED AND SCRAPPER SOLD.**—Messrs. Burgess & Packard have chartered the 22ft. knockabout Sanderling, owned by Mr. F. A. Brown, of Beverly, to Mr. Lawrence H. Armour, son of Mr. W. A. Armour, of Kansas City. Mr. Armour will use her at Marblehead. The same firm has sold the 18ft. knockabout Scrapper, owned by Mr. A. P. Loring, to Mr. Harold I. Sewell, of Porto Rico, who will use her at Bar Harbor.

**JUBILEE MOVED.**—The 90-footer Jubilee, owned by Gen. Charles J. Paine, which has been in Lawley's basin since 1894, when she was under sail for only a short time, was towed last week to the new yard of Messrs. Burgess & Packard at Marblehead, where she will be hauled out. Her plates forward have been slightly started, but beyond this it is believed that her hull is in good condition.

**BINNEY-DESIGNED POWER BOATS.**—Mr. A. H. Davenport's cabin launch Merlin was launched at Lawley's last week and was made ready for the trip to Squirrel Island, where she will be used principally by Miss Alice Davenport, who entertains parties of young people almost daily during July and August. A working launch is now being built from Mr. Binney's design. This boat is for Mr. Dudley L. Pickman, who will use her in the South as a general utility boat on hunting trips. The wheel will be placed in a well to insure minimum draft. It has been announced that the 60ft. cruising yacht Naoma is owned by Mr. George M. Bonney, of Boston.

JOHN B. KILLEEN.

**YACHTING NEWS NOTES.**

For advertising relating to this department see pages ii and iii.

**SEVENTY-FOOTERS TO RACE WITH AMATEUR CREWS.**—Mr. W. Ross Proctor, owner of Mineola, has received a challenge from Mr. W. K. Vanderbilt, Jr., owner of Virginia, for a match race, both boats to be handled throughout by amateur crews. The challenge has been accepted and the date of the race, together with the conditions governing it, will soon be announced. Mr. W. K. Vanderbilt, Jr., who is commodore of the Seawanhaka Corinthian Y. C., will handle Virginia and Mr. Clinton H. Crane will act as mate. Mineola will be in charge of Mr. Addison G. Hanan and his mate will be Mr. Frank Bowne Jones.

**CRUISING LAUNCH FOR CHARLES M. GOULD.**—The cruising launch Columbine, built for Mr. Charles M. Gould from designs by Mr. Henry J. Gielow, was launched from the yard of the builder, Mr. Robert Jacob, on Saturday, June 10. The boat is of wooden construction and is splendidly put together throughout. She is 46ft. 6in. over all, 42ft. waterline, 10ft. breadth and 3ft. draft. For a length of 25ft. admidships the sides of the hull have been carried up and by this means full head room is gained below for that distance. The boat's accommodations are quite liberal. The owner's room, which is 10ft. 6in. long, is forward. Just aft is a lavatory. Then comes the galley and engine room. Further aft is the main cabin, 8ft. long. The cockpit is 10ft. 6in. long. Columbine is fitted with a 15 horsepower engine which drives her at a speed of 12 miles. Her tanks are of sufficient capacity to give the boat a cruising radius of 600 miles. Electricity is used for lighting.

**MAYFLOWER AND PRISCILLA NOW AUXILIARIES.**—The two old Cup defenders, Mayflower and Priscilla, have both been fitted with gas engines. Mayflower is owned by Mrs. E. M. Barber and was equipped with a 25 horsepower engine. Priscilla is owned by Commodore George H. Worthington, of the Cleveland Y. C. Her engine is of 75 horsepower and was built by Mr. James Craig, Jr. The engine drives the boat at a speed of nine miles.

**LLOYDS' BRITISH YACHT REGISTER.**—Lloyds' register of American yachts is the only accurate and complete record of American yachts ever published. The Lloyds register of British yachts is even more complete, if such a thing were possible. This year the work appears in a larger and more convenient form. This work will be found indispensable to all yachtsmen who wish to keep posted with the sport abroad. There should be a copy in every yacht club on this continent, as it is too valuable a reference book to be without. Copies may be had from Lloyds Register of Shipping, 15 Whitehall street, New York, for \$7.50.

**SALES AND CHARTERS.**—Dr. Edward Reynolds, of Boston, Mass., has sold the auxiliary yawl Thora through the agency of Mr. Stanley M. Seaman to Mr. J. P. Donovan, of New York. Thora is a centerboard boat 45ft. over all, 30ft. waterline, 12ft. 6in. breadth and 4ft. 9in. draft. The same agency has sold the launch Vigilo for Mr. W. B. May to Dr. R. S. Peabody, of New Haven, Conn.; the sloop Whitby for Mr. Edward Swann, of New York, to Mr. Julius Steffens, of Vailsburg, N. J., and chartered the auxiliary yawl Alga for Dr. A. R. Starr, of New York, to Mr. F. R. Ryder, also of New York.

**LAW FOR YACHT OWNERS.**—Judge Thomas, in the United States District Court in Brooklyn, handed down on June 7 a decision in a libel brought by Mr. Robert Jacob, owner of a shipyard at City Island, against the sloop yacht Nellie. In water adjacent to Mr. Jacob's yard the automobile launch, Miss Swift, was launched Nov. 13, while a short distance away the Nellie lay at

anchor. A high wind came up that night, the Nellie dragged her anchor, and the next morning was found on the starboard side of the Miss Swift, which had sunk at her moorings with a hole in her side. It was testified that the Nellie was without any person on board, but was in charge of a man by the name of Hansen. Judge Thomas held that it was the duty of Hansen and therefore chargeable against the boat to provide for the safety of the yacht. In granting a decree for the libellant, Judge Thomas says: "Care, diligence, observance of the rights of others are demanded of the owners of vessels at dock or anchor."—New York Herald.

**LITTLE RHODY WINS BRISTOL Y. C. RACE.**—Little Rhody, the sloop owned by Commodore C. F. Tillinghast, of the Bristol Y. C., won the 88-mile race from Bristol to Montauk Point and return. This is the second long distance in which Little Rhody has participated and twice she has come in a winner. Last year Little Rhody won the Brooklyn Y. C.'s ocean race from Gravesend Bay to Marblehead. Seventeen yachts started in the Bristol Y. C. race and twelve finished. Bambino, owned by Mr. L. Grinnell, of New Bedford, finished first but lost the race on time allowance. The sloop Priscilla, owned by Mr. W. S. Wood, of Fall River, got second prize.

**PURITAN SOLD FOR JUNK.**—Puritan, the yacht that successfully defended the America's Cup in 1885, was sold at auction in Boston on June 27 to Messrs. O'Connor Brothers for \$4,025, and will be broken up for junk.

**Edgewood Y. C.**

Narragansett Bay—Tuesday, June 27.

The first of the season's three races for the 30ft. cats of the Edgewood Y. C. for the Possner cup, a perpetual challenge trophy, was sailed Tuesday afternoon, June 27, and Scatt was the winner on time allowance. Five boats were entered and the race was a close and exciting one, although owing to a shift in the wind the eight-mile course chosen gave only free sailing for the whole distance.

The feature of the race was the rather remarkable performance of Wanderer IV., the new boat designed by Mr. C. C. Hanley for the Flint Brothers. Just after the preparatory gun, Wanderer IV., which was about leaving the club wharf for the starting line, got tangled up in a sharp squall that swept over the bay, and the ensuing delay made her 3m. 45s. late in getting over the line. With this handicap she made a great race, finally catching the fleet and leading for the last mile, crossing the line 31s. ahead of Scatt. She had to give the others an allowance of about 2m., and so lost first place.

The Possner cup was won last year and is now held by Mblem. Two more races will be sailed to determine possession of the trophy for another year. The cup must be won three times in different years by the same boat under the same ownership to become a permanent possession. In each race the winner scored 100, the second boat 50, the third 25, and all others that finished 15. The summary follows:

30Ft. Cats—Start, 3:10.			
	Finish.	Elapsed.	Corrected.
Scatt, H. B. Scattergood.....	4 39 02	1 29 02	1 26 59
Wanderer IV., H. J. & D. W. Flint.....	4 38 31	1 28 31	1 28 31
Mblem, G. E. Darling.....	4 42 42	1 32 42	1 30 39
Elizabeth, W. D. Wood.....	4 43 33	1 33 33	1 31 30
Emeline, W. J. Rooks.....	4 42 07	1 32 07	1 31 48

**Boston Y. C.**

Marblehead, Mass.—Saturday, July 1.

A CLUB race of the Boston Y. C. was sailed off Marblehead on Saturday, July 1, in a strong S.W. wind and choppy sea. The race between the 22-footers was particularly interesting, only 7s. separating Nutmeg and Tyro at the finish. It was Nutmeg's first win, and she did it on the windward leg, after Tyro had got the start. Had it not been for a scrap between Tyro and Medic II., however, it is likely that Nutmeg would not have finished first, as Tyro had been fast overhauling her off the wind. Bat led all around in the 18-footers, and Vera II. did the same thing in the 15ft. class. Chewink IV. won by a good margin in the first rating class and Carma II. had lots to spare in the second rating class. The summary:

Class E, 22-Footers.		
	Elapsed.	
Nutmeg, A. C. Jones.....	2 11 53	
Tyro, W. H. Joyce.....	2 12 00	
Medic II., H. H. White.....	2 12 22

**Atlantic Y. C.**

Sea Gate, New York Harbor—Saturday, July 1.

The second race for the Underwood trophy, Classes P and above, and the first for a new cup, presented this year by Rear-Commodore E. B. Havens, for Classes Q and below, were held at the Atlantic Y. C. on the afternoon of Saturday, July 1. A fine S. breeze and good courses made excellent sport. Vivian II. won among the larger boats, thereby securing a leg on the Underwood trophy. Bobtail got the first race held on June 10. The new Class Q creation, Saetta, scored the first leg on the Havens cup. Both trophies have to be won three times by the same owner for permanent possession. In a scrap among the old Class Q boats, Trouble beat Wraith.

The courses sailed by all classes took them across the channel, where there was a good sea running. This feature, in connection with a strong breeze, caused several mishaps. Lizana lost her bobstay and bowsprit, Cockatoo II. came very near doing the same. Mary had her rudder disabled, and More Trouble lost the top to her forward hatchway. All of these boats withdrew.

The feature of the day was the work of Saetta. She defeated Quest over a 12 1/4-mile course by 5m. 18s. Vivian II. defeated Redwing by 53s. elapsed time and 2m. 41s. corrected time.

All of the boats sailed the first leg of the course together. This was from Sea Gate to Craven Shoal Bell Buoy, which proved a reach. From the first mark the racers in Classes P and above went out to the bell buoy to the northward of West Bank Light and home, covering the triangle twice, an aggregate distance of 11 1/4 miles. The other boats went from Craven Shoal to the can buoy of Swinburn Island and home, all but the old Class Q creations doing the distance three times for a total of 12 3/4 miles. The old boats went over the course but twice, a total of 8 1/2 miles. The second leg for all the contenders was a beat, and the third a reach. The summaries follow:

Sloops, Class P and Above—Start, 3:05.		
	Finish.	Eclipse J.
Vivian II., S. E. Vernon.....	5 00 52	1 55 52
Redwing, J. B. O'Donohue.....	5 01 45	1 56 45

Trouble, W. A. Barstow.....	5 02 45	1 47 45
Wraith, Cavin Tompkins.....	5 06 57	1 51 57
Mary, Max Grundner.....	Disabled.	

**New Rochelle Y. C.**

New Rochelle, Long Island Sound—Saturday, July 1.

The annual regatta of the New Rochelle Y. C., was held on Saturday, July 1, and the thirty-five boats that started enjoyed the most satisfactory and conclusive racing of the season. The courses were of good length, and the wind was of sufficient strength to make good time over the triangles possible. The courses selected were as follows:

No. 1.—From the starting line, N.E. by 3/4 E., 2 1/2 miles to and around red gas buoy off Scotch Caps, thence S.S.W. 1/4 W., 3 1/2 miles to and around the black spar buoy off Prospect Point, thence N.W. by N. 2 miles to and around the stakeboat at the starting line, leaving all marks on starboard hand.

No. 2.—From the starting line, E. by N., 4 miles, to and around Buoy A (black and white stripes) off Parsonage Point, thence S. by W. 1/4 W., 3 1/2 miles to and around the stakeboat at the starting line, leaving all marks on starboard hand.

The 33ft. sloop and New York Y. C. 30ft. class sailed Course No. 1, twice around; distance 15 1/2 nautical miles.

The 27 and 22ft. sloop, raceabout, and Larchmont 21ft. classes sailed Course No. 2, once around; distance 11 1/2 nautical miles.

The boats in classes R and S sailed course No. 1 once around; distance 7 1/4 nautical miles.

The preparatory signal was given at 12:05, and at this time the wind was light from the S.W. It was hardly an ideal racing day, as the sky was overcast, indicating rain, which, however, did not materialize.

Classes K and L did not fill, so the first boats to start were the 33-footers, at 12:20. Mimosa III. crossed slightly in the lead of Alert, her only competitor. Balloonjibs were broken out smartly on both boats. Alert picked up a little, as the S.W. wind commenced to freshen. The wind began to free a little, and spinnakers were set. Alert nearly ran by Mimosa III., but the latter boat rounded the Scotch Caps buoy a little in the lead. The wind had now freshened enough to kick up a little sloop of a sea that killed Alert with her full bow. Mimosa III. had just the conditions she wanted, and she dropped Alert fast. It was a close fetch to the second mark, and Mimosa III. rounded well in the lead. The third leg was a spinnaker run. The boats were timed at the first round as follows: Mimosa III., 1:27:30; Alert, 1:30:55.

The wind had now shifted to the E. of S., and the boats were just able to carry ballooners by sheeting them well aft. On the second leg the boats had a little windward work, and it was necessary to make two hitches to fetch the mark. The wind had lightened a little, and Alert did better; but Mimosa III. was far enough ahead to save her time and win easily. Balloonjibs and spinnakers were carried on the run home, and Alert made another small gain on this leg.

Mimosa III. sailed a beautiful race, and was splendidly handled throughout. She not only defeated Alert, but got away with the New York Y. C. one-design boats in a surprising manner. Whenever Mr. Park's boat gets any kind of a breeze of wind, she will prove a very slippery customer.

At 12:25 nine of the New York Y. C. 30-footers started, with Banzai in the lead. She was followed by Alera, Phryne, Cara Mia, Maid of Mendon, Nautilus, Minx, Dahinda and Neola II. Balloonjibs were carried, and when about halfway down the leg, spinnakers were set. Phryne had a nice lead at the first mark, and appeared to have the race well in hand. At the end of the first round the boats were timed as follows: Phryne, 1:32:50; Banzai, 1:33:28; Nautilus, 1:33:54; Alera, 1:34:03; Dahinda, 1:34:40; Minx, 1:35:07; Neola II., 1:35:35; Maid of Mendon, 1:35:44; Cara Mia, 1:38:35.

Phryne rounded the first mark on the second round in the lead, but something went wrong aloft, and it was some time before her working jib was set. By the time things were straightened out, Nautilus was on top of her and took the lead. From that time on it was all Nautilus, and the Hanan boys won by 1m. 3s. from Phryne. Banzai was 25s. behind Phryne. Dahinda was fourth. Maid of Mendon was hopelessly in the rear, and did not finish.

In Class P, the 27ft. sloops, Thelema ran up a nice lead on Rascal and won by 3m. 32s. Dorothy won in the Larchmont 21ft. class from Hourii by 2m. 9s. Vaquero withdrew.

The competition in the raceabout class was close, and the eight boats that started afforded some interesting racing. Tartan beat Mystral by 43s., and Nora by 53s. There were five starters in Class Q. Paumonack beat Nimbus III. 6m. 41s. Kenoshi was third. Hamburg won in Class R, beating Ace 3m. 13s. Arizona withdrew. Dod took a sailover in Class S.

The race was well handled in every way. Mr. G. P. Granbery, Chairman of the Race Committee, was on the tug Glen Cove, which was used as the committee boat. The summary:

Sloops, Class N—Start, 12:20—Course, 15 1/2 Miles.

Corinthian Y. C.

Marblehead, Mass.—Saturday, June 17.

THE ocean race of the Corinthian Y. C. from Marblehead to Isles of Shoals and return, on Saturday, June 17, was a great success. The thirty-five starters were sent away shortly before 8 in the evening, and twenty-nine of these yachts finished early the next day. Conditions were somewhat fluky, but this only added interest to the race, as the leaders were constantly changing. The schooner Redskin III. led the fleet by a long margin at the outer mark, White Island, but on the beat back in a S.W. wind, the 35-footer Cossack caught and passed her. In Class B there was a close race between the 25-footers Sally VII. and Seboomook. Sally VII. finished first, making the fastest time of any boat over the course; but she lost to Seboomook on corrected time. Medic II. was the winner in the 22ft. class. She was sailed with good judgment, and at one time led the entire fleet. Carina II. won in Class D. The summary:

Table with columns: Class, Name, Elapsed, Corrected. Includes Class A (Cossack, Redskin, Hilda, Diana, Nokomis), Class B (Seboomook, Sally VII, Jingo, Mattacheset, Dorel, Alpha, Myrtle, Sauquoit, Ida, Al Kyris), Class C (Medric II, Nutmeg, Clorinda, Setsu, Athlon, Chewink V, Tyro, Urchin), Class D (Carina II, Herald, Sea Fox, Sally IV, Margaret, Pamaho, Jaunata, Quill II, Calista, Kit, Marion, Cricket).

Saturday, June 24.

A club race of the Corinthian Y. C. was sailed on Saturday, June 24, in a light and somewhat fluky S.W. breeze. It was intended to sail this race under the classification of the new uniform rule, but as the only class to fill was Class Q, in which there were two entries, the 22-footers and 18-footers were taken in under their original classification. In the 22-footers, Rube was first across the starting line, followed by Tyro, and Medic II. Chewink V. pulled up through the fleet and led at the first mark. On the windward leg Tyro, by good judgment in picking out the wind, went into first place, and held it to the finish. In the 18ft. class Hayseed II. was first at the starting line, but she had trouble with her sheets and Moslem II. went into first place, holding it all around the course. In class Q, Margaret was a winner by a good margin, but the result on corrected time was not announced, as Margaret had not been measured.

Table with columns: Name, Elapsed, Corrected. Restricted 22-Footers (Tyro, Chewink V, Rube, Nutmeg, Medic II, Setsu, Medic, Peri). 18Ft. Knockabouts (Moslem II, Hayseed II, Otter, Arbeka II, Moslem I). Class Q (Margaret, Carina II).

Bristol Y. C.

Narragansett Bay—Saturday, July 1.

THE spring open regatta of the Bristol Y. C., postponed from the previous week on account of a lack of wind, was sailed Saturday afternoon, July 1, in a good S.W. breeze. There were eleven starters in four classes, the number of contestants being reduced to some extent by the fact that the Bristol-Montauk ocean race was to start at 5 P. M., and took a number of boats that would otherwise have participated in the afternoon regatta. The winners were Priscilla, Echo, Qui Vive, and Scatt. In the 30ft. sloop class Priscilla had a good contest with Sigma III., winning on time allowance. In the 21ft. knockabouts Echo had a sailover. Qui Vive won easily in the 18ft. knockabout class, and Scatt won handily in the 30ft. cats, putting up a good scrap with Emeline. The summary:

Table with columns: Name, Elapsed, Corrected. 30Ft. Sloops—Start, 1:43 (Priscilla, Sigma III). 21Ft. Knockabouts—Start, 1:49 (Echo, Qui Vive). 18Ft. Knockabouts—Start, 1:52 (Qui Vive, Wawaloam, White Cap, Mahogany). 30Ft. Cats—Start, 2:00 (Scatt, Emeline, Elizabeth).

Cottage Park Y. C.

Winthrop, Mass.—Saturday, June 24.

A CLUB race of the Cottage Park Y. C. was sailed off Winthrop on Saturday, June 24. The wind was light and fluky, and the contest in the sailing class was unsatisfactory. Rosalie got the start, but Katrina soon went into first place and held it, closely pushed by Medora. Katrina finished first, but lost to Medora on corrected time. In the power boat class, More Whiz won a close race from Alice. The summary:

Table with columns: Name, Elapsed, Corrected. Sailing Yachts (Medora, Katrina, Rosalie, Frances). Power Boats (More Whiz, Alice, Margaret, Anita, Spook, No. 13, Jewel, No. 39).

Wollaston Y. C.

Quincy, Mass.—Saturday, June 24.

AN interclub race between the Wollaston, Quincy and Squantum Yacht Clubs was sailed under the auspices of the Wollaston Y. C. on Saturday, June 24, in a light S.W. breeze. In Class A, Harriet, an old-time Y. R. A. champion finished first, but lost to Wavewock on corrected time. In Class B, Eclipse was first to finish, with Marvel only a few seconds behind, and Marvel won on corrected time. In Class C, Primrose finished first but lost to West Wind on corrected time. The summary:

Table with columns: Name, Elapsed, Corrected. Class A (Wavewock, Harriet, Whisper). Class B (Marvel, Stranger, Dorothy, Eclipse, Josephine, Argestes, Sheila, Hustler, Gohlin, Idler, Harold, Dentzia). Class C (West Wind, Primrose, Peacock, Miji, San Toy, Eleanor).

Lynn Y. C.

Lynn, Mass.—Saturday, June 24.

A CLUB race for sailing classes and power boats was given by the Lynn Y. C. on Saturday, June 24. The wind was very light, from the S. W., not enough for the sailing classes, but it was ideal for power boat racing. In the first power boat class Kazardy was home first by a long margin, but lost to Edith M. on corrected time. In the second power boat class Aspirant was first across the finish line, with Mogul second, but Niobe took first on corrected time. In the one-design class Winniahdin got the start and led all over the course. In the handicap class Lobster got the start and led all around, but lost to Theorem on corrected time. The summary:

Table with columns: Name, Elapsed, Corrected. First Class, Power Boats (Edith M., Kazardy). Second Class, Power Boats (Niobe, Aspirant, Jennie M., Admiral, Mogul, Wym). One-Design Class (Winniahdin, Haymaker, San Toy). Handicap Sailing Class (Theorem, Za Zar, Lobster, Trump).

Seawanhaka Corinthian Y. C.

Oyster Bay, Long Island Sound—Saturday, July 1.

THE Seawanhaka Corinthian Y. C. held a club race over inside courses on Saturday, July 1. Two classes filled, and six boats started. There was a good sailing breeze from the S.W. In the 33ft. class Nike won, beating Regina, the second boat, 1m. 50s. Sabrina beat Chipmunk in the 15ft. class by 2m. 11s. The summary:

Table with columns: Name, Elapsed, Corrected. Sloops, 33Ft. Class—Start, 3:05 (Nike, Regina, Tito). Sloops, 15Ft. Class—Start, 3:10 (Sabrina, Chipmunk, Imp. F. L. Landon).

Winthrop Y. C.

Winthrop, Mass., Saturday, June 24.

ONLY two classes filled in the club race of the Winthrop Y. C., sailed off Winthrop on Saturday, June 24. The wind was light and fluky and the best work of the yachts was not brought out. In the 25ft. class, Hermes won by a good margin. Lady Fair, in the 21ft. class, broke down, and Opeechee had things all her own way. The summary:

Table with columns: Name, Elapsed, Corrected. 21Ft. Class (Opeechee, Lady Fair). 25Ft. Class (Hermes, Kit, Alpha, Natorus).

Cohasset Y. C.

Cohasset, Mass.—Saturday, June 24.

IN the club race of the Cohasset Y. C., sailed Saturday, June 24, the wind was so light that the 17ft. class could not get across the starting line. Aztec won easily in the handicap class. The summary:

Table with columns: Name, Elapsed, Corrected. Handicap Classes (Aztec, Sea Gull, Schma, Lassic).

A. C. A. Membership.

NEW MEMBERS PROPOSED.

Eastern Division—John J. Haley and Richard E. Clapp, both of Dedham, Mass., by F. Brodbeck; Edward P. Davis, Boston, Mass., by F. Brodbeck; Sydney P. Sargent, West Medford, Mass., by J. H. Darragh; S. S. Hargraves, North Andover, Mass., by Marcus Butler; John F. Alter, Frederic W. Houston, B. E. Horne, Ralph W. Sawyer, Frederick Butler, H. M. Roope and J. J. Buckley, all of Lawrence, Mass., and all by Marcus Butler.

Atlantic Division—Edward F. Maloney, New York city, by A. Kumke; F. Sebring Slifer, Glenside, Pa., by M. D. Wilt.

Northern Division—C. W. Farran and P. H. Le Seuer, both of Smith's Falls, Canada, and both by J. Cam Douglas.

Trapshooting.

Fixtures.

- July 6-7.—Traverse City, Mich., trapshooting tournament. W. A. Murrell, Sec'y.
July 11.—Bergen Beach, L. I., Gun Club monthly shoot.
July 11-12.—Eufala, Ala., Gun Club tournament. C. M. Gam-mage, Sec'y.
July 11-12.—New Bethlehem, Pa.—Crescent Gun Club second annual tournament. O. E. Shoemaker, Sec'y.
July 12.—Brooklyn, L. I.—John Wright's merchandise shoot; added money. John Wright, Mgr., 318 Broadway, New York.
July 12-13.—Manning, Ia., Gun Club second annual amateur tournament. R. A. Rober, Sec'y.
July 12-13.—Menominee, Mich.—The Interstate Association's tournament, under the auspices of the Menominee Gun Club. W. W. McQueen, Sec'y.
July 12-14.—Bertterton, Md.—Malone's eleventh annual summer tournament; \$200 added. J. R. Malone, Mgr., 2671 Pennsylvania avenue, Baltimore.
July 17-18.—Charlottesville, Va.—Charlottesville and University Gun Club sixth annual money and merchandise shoot. G. L. Bruffey, Mgr.
July 22.—Rutherford, N. J.—Tournament on grounds of the Boiling Springs Gun Club.
July 22.—East Rutherford, N. J., tournament of the Boiling Springs Gun Club. Address Hugo Brugmann, Rutherford, N. J.
July 24-25.—Winnipeg, Man.—Industrial Exposition Annual. J. A. Lindsay, Sec'y.
July 24-28.—Brehm's Ocean City, Md., target tournament. H. A. Brehm, Mgr., Baltimore.
July 28-29.—Newport, R. I.—Aquidneck Gun Club tournament.

DRIVERS AND TWISTERS.

The programme of the Crescent Gun Club shoot, New Bethlehem, Pa., July 11 and 12, is now ready for distribution, and can be obtained on application to the Secretary, Mr. O. E. Shumacher.

The programme of the Manning, Ia., Gun Club offers good competition, and has \$100 in cash and \$110 in trophies and merchandise added. G. A. Rober is Secretary.

The Parker Gun Club will give an all-day shoot at their grounds, Mcriden, Conn., Monday, Sept. 4, 1905. H. L. Carpenter is the Secretary.

The annual trapshooting tournament of the Winnipeg Industrial Exhibition will take place in Winnipeg on July 24 and 25.

Owing to our going to press on Monday this week several reports of shoots are of necessity deferred.

BERNARD WATERS.

Jackson Gun Club.

THE following are the scores of the shoot of the Jackson Gun Club:

Table with columns: Name, Shot at, Broke. June 20, First Day (B Scott, P C Woods, W Rennick, G B Stanley, N E Hubbard, M Hensler, J E Reid, Phellis, Boa, Ott, Taft, Hyndman, Watts, Albin, Jarvis, Brown, A R Hensler, Gaylord, Rosevear, Gilkeson, Magel). June 21, Second Day (B Scott, P C Woods, Wm Rennick, Schuman, N E Hubbard, Le Compte, C E Alban, Dr Taft, Watts, Crosier, Jarvis, Hyndman, A B Hensler, W H Osman, Harris, J E Kerd, Phellis, Boa, I R Ott, Sutton).

Lancaster County League.

THE first shoot of the Lancaster County League of Gun Clubs for a cup presented by the Peters Cartridge Co., took place on the grounds of the Bob White Gun Club at Lancaster, Pa., on Saturday, June 24. This cup is to be shot for during the season of 1905 by teams of five men, shooting at 25 targets each. The five clubs participating in the first shoot were Elizabethtown, Atglen, Columbia, Pecquea, and Bob White. After the team shoot there were several sweepstake events shot, which were participated in by many of the local and out-of-town gunners.

Elizabethtown, Pa., Gun Club Team—Shissler 22, Westafer 23, Cable 21, Kersey 22, Gouchmaur 18; total 106.
Atglen, Pa., Gun Club Team—Feiles 17, Benner 23, Mattson 23, Williams 21, Wilson 20; total 104.
Columbia, Pa., Gun Club Team—Kline 21, Hoffman 13, Gundle 19, Stevens 19, Jamerson 17; total 89.
Pecquea Gun Club Team, Lancaster, Pa.—Clark 18, Anderson 20, Prube 22, Leamon 17, Mylin 11; total 88.
Bob White Gun Club Team, Lancaster, Pa.—Reese 19, Plein 16, Anderson 17, Barr 18, Kruger 21; total 91.

Rochester Gun Club Handicap Shoot.

THE following are the scores made in the second contest for the Borst cup on the grounds of the Rochester Rod and Gun Club last week:

Table with columns: Name, Brk. Hdp., Tot'l. \*Weller, Coughlin, \*Rickman, \*Borst, \*Skutt, Re-entry scores (Coughlin, Coughlin, \*Stoddard, Sterling, Sterling), Back scores (Skutt).

The Grand American Handicap.

THE sixth Grand American Handicap, held under the auspices of the Indianapolis Gun Club, had much in the way of pleasant and important significance. It was a complete success in itself, as to the conduct of it, from start to finish. It was a record-breaker in respect to the number of entries, the excellence of the competition as shown by the large number of averages which exceeded the 90 per cent. mark, by the enormous number of targets thrown, by the general interest evoked in both a local and national way, and by the large and fashionable attendance which graced the club house and grounds daily to witness the contests.

The mammoth competition progressed smoothly from start to finish. It began at 9 o'clock on Tuesday, and ended at 5:45 on Friday, the dates being June 27-30. Every event was finished, though some carried over from one day to another. So smoothly and progressively did the great shoot move from one event to another that it seemed to be a matter which, once started, would run itself without any supervision whatever. But the very smoothness was in itself the true index of the master minds which conducted to intelligent and smooth action, namely, the management was thoroughly organized in every detail, and had expert assistance in every department, and the grounds were equipped completely for comfort and for competition.

The manager, Mr. Elmer E. Shaner, had provided for every possible contingency. He had special talent in every department, regardless of price, men who did things instead of furnishing excuses why it was not possible to do things, hence there was a perfect co-ordination in every department to make a success of the complete whole.

By the system of squadding, the immense number of contestants were handled with the same ease that obtains at a regimental drill in the regular army.

Five Blackbird club traps and Blackbird targets furnished the mechanical features of the competition. They worked admirably. Indeed, had they not done so, it would have been a physical impossibility to have completed the programme within the dates fixed upon. The total number trapped during the four and one-half days of the tournament amounted to the enormous total of 184,500 targets. On the Grand American Handicap day, 45,280 targets were thrown. The total number thrown last year was 152,300.

The manner of handling the shooters at the firing points to expedite the action and to establish equity was that devised and used by Mr. Shaner, the manager, last year, which is officially described as follows:

"Five automatic traps will be used, and five different events will be commenced at the same time, one respectively at each trap. The total number of qualified contestants will be divided into five sections, as nearly equal in number as possible, and a section will be started at the same time at each trap. After all members of a section have finished competing at their trap, they will pass on to the next trap and compete there, and so on, until they have competed at each of the five traps.

"For example: Say we have 200 entries—40 squads of five men each. Divide the 40 squads into five sections and it would make 8 squads to each section. Squads 1 to 8 would compose first section. Squads 9 to 16 would compose the second section. Squads 17 to 24 would compose the third section. Squads 25 to 32 would compose the fourth section, and squads 33 to 40 would compose the fifth section. These sections simultaneously would be started at Nos. 1, 2, 3, 4 and 5 traps respectively. After all squads of a section finished competing at a particular trap, their entire section would pass on to the next trap and compete there, and so on, until they had competed at the entire five traps."

With the perfect equipment, good weather, and perfect management all long-distance records in target throwing were smashed. In this connection, it is proper to mention that the trapping interests came conspicuously to public attention at this tournament in an unpleasant manner. As already mentioned, the Blackbird trap and targets were used. As completed and put on the market by the manufacturers, that trap is a perfect mechanism, and is forthwith ready for full service in target throwing. The man in charge of the traps, as the representative of the Indianapolis Gun Club, added an unimportant spring to each trap, which he considered an advantage, to secure easier pulling. Mr. Paul North announced that this improvised spring was an infringement of one of his patents, and that he contemplated getting an injunction against the club, restraining them from using the spring in the tournament. This caused some apprehension, in a general way, that by the injunction the shoot would be stopped. Rumor and facts were, however, at variance.

The club did not seem to be alarmed, or to be obsequious. Mr. North later announced that as an accommodation to the club he would permit the use of the springs through the tournament, and no longer. Nevertheless, the springs were not really needed at all. They were removed voluntarily. They were no part of the traps. Without them everything progressed as smoothly and serenely as was becoming to a delightful June day, when birds sang sweetly and flowers bloomed peacefully. Nevertheless, many of the contestants thought the incident was far-fetched and unpleasantly gratuitous, perhaps no more than a teapot, yet a teapot much out of place.

Many members of the Indianapolis Gun Club, particularly the officers, were present most of the time, and were alert to lend a helping hand, to give the old friend and the new cordial greeting and attention, to listen with interest to what improvements could be made, if such were possible, and to promote the general success unselfishly by word and deed.

The level, broad grounds, vividly green, with a light bespangling of beautiful June wild flowers, were a delight to the eyes, besides being complete in every mechanical detail. Roomy tents on each side of the club house afforded comfortable seating room for the spectators. A large tent was specially devoted to restaurant purposes, and gave most satisfactory service at reasonable prices.

The list of skilled men who did the work of the G. A. H. is quite large in number. Nearly all are trained specialists. First, there was the manager, Mr. Elmer E. Shaner, who, as an officer and masterful expert, was supreme ruler of the shoot, adding new honors to the many already won. The fact that this record-breaking tournament ran from start to finish without a flaw, carried with it its own just praise. To accomplish this great work, Mr. Shaner was busy all day, and nearly all night, for as one day was finished all the clerical work had to be prepared for the next.

The assistant manager was Mr. Clyde Osborn, of Indianapolis, who did excellent service.

The cashier, Mr. F. C. Whitney, of Des Moines, Ia., handled the moneys with the grace, expedition and accuracy for which he is a long-time justly famous.

The hard-working and affable compiler of scores was Mr. J. K. Starr, of Philadelphia, who is thoroughly proficient, and who has held the same position in Mr. Shaner's staff in prior years.

The assistant compiler of scores was Mr. E. C. Reed, of Pittsburgh. The following clerks assisted:

Mac Stillwell, Crawfordsville, Ind., and T. D. Stevenson, R. W. Bailey and H. J. Wochoer, of Indianapolis, Ind.

The following is a list of the trap crews:

No. 1 Trap.—J. A. Martin, referee; scorer, F. M. Shafer; squad hustler, E. R. Holdson, all of Indianapolis, Ind.

No. 2 Trap.—Referee, A. L. Ballweg, Indianapolis, Ind.; scorer, Glem M. Forbis, Muncie, Ind.; squad hustler, M. W. Socwell, Indianapolis, Ind.

No. 3 Trap.—Referee, D. C. Morris, Indianapolis, Ind.; scorer, Geo. H. Kerr, Bridgeport, Ind.; squad hustler, F. A. Gregory, Indianapolis, Ind.

No. 4 Trap.—Referee, Matt Harris, Muncie, Ind., and scorer, George George; squad hustler, Dillen Hacker, both of Indianapolis, Ind.

No. 5 Trap.—Referee, J. E. Bombarger, and scorer, John Pratt, both of Indianapolis, Ind.; squad hustler, Len. Shepherd, Cincinnati, O.

The weather was delightfully pleasant and favorable for competition and out-door enjoyment during the four days. It was of June's best—clear and warm, tempered by balmy breezes. The good weather signified much to the competition. An interruption, however brief, would have seriously disturbed the programme. Even under the favoring conditions, the skill and energy of the management were taxed to the utmost to conclude the programme within the four days. Events of the first, second and third days were carried over, but as a whole, the programme was finished promptly on time.

A matter of general interest was that concerning where the G. A. H. would be held next year. There were other cities which manifested a desire to give their keys to the Interstate Association. But no city can well bid for the greatest of trapshooting events if it is not prepared to offer better than Indianapolis can offer; and it is extremely difficult to offer better than the best.

The Indianapolis grounds are sixteen acres in area, level, with a background of trees in the far distance. They are complete in every appointment for target throwing and for comfort. They are pleasing to gaze upon.

The hotel accommodations are ample and excellent. The transportation is practically from the door of the hotels to the gate of the club grounds. The club members are active and skillful, with high standards of sportsmanship for guidance, and there is a trained staff available in and about Indianapolis for manning the five traps efficiently. Also Indianapolis is a railroad center. Taken all in all, the foregoing in its entirety is a hard proposition to surpass. Indeed, it is not an easy matter to surpass it in any one of its details.

Mr. J. W. Bell, the secretary, was busy as a beaver in the ammunition house, with stacks of ammunition about him to dispense to all purchasers. The only restriction was that the purchaser must name the kind he wanted. The management, being impartial, declined to name the ammunition, and a legend on a conspicuous sign gave notice to that effect.

The G. A. H. was won by Mr. R. R. Barber, of Paullina, Ia., with a score of 99, a record-breaker for this event. He is a shooter of rare nerve and skill.

The first G. A. H., in 1900, had 74 entries. It was won by Mr. R. O. Heikes, of Dayton, O., with a score of 91.

In 1901, there were 75 entries. It was won by Mr. E. C. Griffith, of Pascoag, R. I., with a score of 95.

In 1902, 91 entries; it was won by Mr. C. W. Floyd, of New York, with a score of 94.

In 1903, 192 entries, 180 starters; it was won by Mr. M. Dieffenderfer, with a score of 91.

In 1904, 318 starters; it was won by Mr. R. D. Guptill, of Aitkin, Minn., with a score of 96.

As shown in the introductory to the Grand American Handicap, the advance in skill and odds have been so great that the 22yd. mark is practically prohibitive. The winning scores of previous years would have been smothered by higher scores this year, and would have been tail-enders in the money.

June 26 was a practice day. There were five events of 20 targets each. Messrs. J. S. Boa and F. M. See scored 99. A number of others were close up in score totals. One hundred and eighty-eight participated in the practice.

June 27, First Day—Sweepstakes.

Delightful weather made the day pleasant to those who shot or did not shoot. The sky was cloudless, with gentle, intermittent breezes.

The programme of the first day consisted of ten events each at 20 targets, \$2 entrance, \$25 added, no handicaps; manufacturer's agents or paid representatives shot for targets only. Two hundred and eighty-four participated. The most diligent competition and long hours failed to complete the day's programme. The competition was not suspended till darkness supervened and the view was obscured. Part of the latter half of the programme was carried over to the next day. When the total of 200 had been completed, Mr. W. R. Crosby had scored 199, Fred Gilbert 194, Mr. L. H. Reid, of New Paris, O., had tied Crosby in the first five events with 99, but Crosby had run nine events straight, missing his only target in the first event.

The averages of the contestants were of a high order, showing a general improvement over prior opening day records.

Of the amateurs, Mr. C. A. Powers was high with 194. Messrs. W. Akard, Fairplay, Mo.; F. E. Foltz, McClure, O.; W. Henderson, Lexington, Ky.; F. D. Kelsey, the New York State champion, were 192 each.

Table with columns for names of contestants and their scores across multiple events. Includes names like Chas Dreihls, O. F. Britton, T. H. Parry, etc.

Table of scores for the first day of the tournament, listing names and their respective scores across various categories.

June 28, Second Day.

The programme of the second day provided two trophy contests, the Preliminary Handicap and the State team event.

The Preliminary Handicap was at 100 targets, unknown angles, \$7 entrance, targets included; handicaps 14 to 22yds.; high guns; \$100 added.

The State team event was for amateurs only. Each team consisted of five contestants, bona fide residents of the same State.

The left-over programme of yesterday was completed to-day.

Owing to the great number of entries and the crowding of the programme from yesterday's postponed events, the Preliminary Handicap started later in the afternoon, and was completed only to the sixtieth round.

The weather was delightful—clear, comfortable, with gentle breezes.

The Preliminary Handicap was won by Mr. R. R. Barber, of Paulina, Iowa, a newcomer in the Grand American Handicap, and a shooter of rare skill.

The 98's—R. R. Barber, received \$159.

The 97's—Wm. Veach and K. P. Johnson, received each \$135.

The 96's—C. M. Powers, J. L. D. Morrison, C. O. LeCompte, J. S. Young and E. D. Rike, received each \$79.50.

The 95's—H. C. Hirschy, G. E. Painter, E. O'Brien, A. B. Richardson, F. D. Kelsey, F. A. Weatherhead, G. L. Lyon, L. G. Scranton, B. T. Cole and R. H. Conerly, received each \$25.40.

The 94's—J. W. Garrett, J. S. Boa, H. W. Cadwallader, L. Foley, A. J. Stauber, H. C. Watson, Dan Bray, Mark Arie, E. F. Gleason, J. L. Orr, Frank Foltz and J. S. Thomas, received each \$15.90.

The 93's—M. E. Atchinson, Ben Scott, O. F. Britton, A. H. Durston, J. J. Faran, J. A. Flick, H. L. Stumpfer, F. L. Pierstorff, W. Henderson and G. J. Roll, received each \$15.90.

The 92's—W. R. Crosby, F. Alkire, L. B. Fleming, J. B. Barto, Burton Call, K. C. Shephardson, D. Linderman, H. O. Burnham, C. B. Clapp, W. S. Hoon, G. Maxwell, B. O. Seymour, A. A. Brown, Eugene Dupont, F. M. Dooden, Chris. Gotlieb and C. A. Young, received each \$8.30.

In this event there were 307 contestants. The scores:

Preliminary Handicap. Table with columns for Hdc. and Total, listing names and scores for various participants.

Table of scores for the State Team Event, listing names and their scores across various categories.

The State Team Event.

Seventeen teams entered the State team contest. Five were from Illinois, three from Pennsylvania, two from Indiana and Ohio respectively, and one each from Maine, Missouri, Iowa, Colorado, Michigan and Nebraska.

The competition narrowed down to a contest between the Ohio and Illinois teams, which were quite evenly matched, and which smashed targets in expert form.

The members of the Ohio team were Messrs. Orr, Rhoades, Upson, Snow and Alkire.

The members of the Illinois team were Messrs. Graham, Willard, Dunnell, Sconce and Powers. Messrs. Sconce and Snow were high men on their respective teams with 97. This event was started about mid-day.

This contest evoked keen interest and warm competition. There is no doubt but what next year will bring forth a large entry to compete in it.

For a first contest of this kind as an Interstate Association event, it was a pleasing success. It is a noticeable fact that in the team contest many of the members fell far below the usual individual averages. The scores:

Table of scores for the State Team Shoot, listing names and scores for various participants across different states.

Table of scores for various regional events, including Pennsylvania No. 1, Colorado, Indianapolis of Indiana, Michigan, Illinois No. 4, and Nebraska.

The Grand American Handicap.

June 29, Third Day.

The weather again was warm and pleasant. A few squads had not finished their G. A. H. competition on Thursday, so that a small part of the G. A. H. was carried over to Friday morning.

The great event of the tournament, and also the great event of America in the matter of trapshooting competition, was the programme event of to-day. The conditions were: Open to all, 100 targets, unknown angles; \$10 entrance, targets included; handicaps 14 to 22yds.; high guns, \$200 added.

The division of the moneys was based on two places for each ten entries or fraction thereof up to 250 entries and over, which number was allowed fifty moneys, divided as follows: 10, 9, 8, 7, 6, 5, 4, 3 per cent; eight more received 2 per cent., and thirty-six more received 1 per cent, thus covering the fifty places.

Regular entries were made on or before June 17. Penalty entries were \$15, and could be made up to 5 o'clock of June 28.

The Grand American Handicap this year was won without a tie, and thus, in a way, was devoid of the spectacular finish of last year between Messrs. R. H. Gupitil, of Aitkin, Minn., and W. M. Randall, of Telluride, Colo.

But on the other hand, the scores were higher. Last year's winning score was beaten by several of this year's contestants.

The judgment of the tournament committee placed the seasoned leaders, Messrs. W. R. Crosby and Fred Gilbert, at the back mark, 22yds., and this was a manifestation of the official as well as personal judgment in which they are held as superior masters of the shotgun.

Three were on the 21yd. mark, namely, Messrs. W. H. Heer, C. M. Powers and C. A. Young. Thirteen were on the 20yd. mark. Twenty were on the 19yd. mark, and sixty-two at the 18yd. mark. There were 335 contestants.

Mr. R. R. Barber, winner of the Preliminary Handicap, was winner of the Grand American Handicap. He made the excellent score of 99, a record-breaker in this event.

At the end of the 80th round, Mr. Burton Call of Montpelier, O., had 79, and by breaking his remaining 20 straight, he could have tied the winner. But the breaking of 20 straight in the great event is a rare feat, and not even the most expert has any assurance of accomplishing it.

Mr. Barber received \$319.50. Four tied on 98, thereby demonstrating that the winner was in hot competition. The 98s were Messrs. Russell M. Klein, W. Akard, B. Cole and T. S. Bibbee. They received \$239.60 each.

The 97s, F. Alkire, A. B. Richardson, Al Willerding, Mark Arie, W. G. Hearn, J. A. Flick and Ben Scott, received each \$91.30.

The 96s, M. Anderson, J. S. Boa, G. E. Painter, H. G. Taylor, L. I. Wade, F. H. Snow, A. J. Stauber, George Volk, Wm Veach, C. W. Hart, J. W. Hightower, Geo. Maxwell, E. G. White, F. E. Schwartzkopf, Burton Call and J. B. McCrory, received each \$35.10.

The 95s, H. C. Hirschy, J. L. D. Morrison, H. McMurchy, L. Foley, H. C. Watson, E. E. Dupont, Bert Gephart, F. L. Pierstorff, J. S. Thomas, A. Olesen, Geo. Premo, J. S. Fanning, E. W. Holding and W. Henderson, received each \$31.95.

The 94s, W. R. Crosby, R. O. Heikes, J. B. Barto, M. E. Atchinson, L. Z. Lawrence, H. O. Burnham, Geo. Eck, D. D. Gross, W. S. Hoon, K. P. Johnson, Joe Michaelis, C. W. Phellis, Joe Rohrer, J. T. Skelly, H. L. Snow, B. O. Seymour, L. G. Scranton, J. A. Prechtel, W. C. Bower, Eugene Dupont, J. W. Eastburne, C. C. Smith, F. A. Weatherhead, Guy Ward, Andrew Meaders and J. S. Young, received each \$3.80.

Thus the 94s were in the money to a slight degree, while the 93s were not in the money at all. And yet it is but a few years since 93 was considered an excellent performance.

In view of the great progress which has been made in recent years in target shooting, the general activity in it throughout the United States, and the large number of trapshooters who can score 90 per cent. or better to a certainty under average conditions, we venture to make some suggestions to the Interstate Association concerning the situation.

The success of the Interstate target tournament programme is proof that it was admirably devised. From their first target tournament till the present time, there has been no particular need of a change; but there are so many shooters now who can score nearly or quite 100 per cent., a special event for that class would undoubtedly be a great attraction to the programme.

It should be as different from the G. A. Handicap event as possible, and should be arranged to try out thoroughly the experts in the competition. We would suggest 150 targets per man, 18yds. rise, all at scratch, high guns, use of both barrels. Since some States have abolished live-bird shooting at the traps, and in others it is waning, trapshooters have had no opportunity at the traps to use both barrels.

Their use at 18yds. would permit the shooter to utilize the full capacity of his gun to the extent of two shots as in live-bird shooting. At present, tournaments do not permit the use of but one barrel. The champion shot is thus cut out of one-half of his gun use, and hampered in his display of skill. It would enlarge the competitive field and introduce a contest among the giants of the tournaments. It also would utilize the shotgun to its full capacity.

To give such an event proper dignity as a championship event, only those trapshooters who have shown superior skill should be eligible. For instance, only those who had won a high average at an open tournament in the eighteen months prior to the Grand American Handicap, and were in the money in that event, in any year, should be eligible.

With fifty or more winners in the G. A. H. this year, and the high average winners through past months, there was quite enough material to insure the success of a championship this year, on the lines suggested. With the conditions so radically different from the G. A. H., a championship contest would not mar or conflict with that event in the least. It would determine which are really the best shots, a matter which is now indeterminate under present conditions.

As the G. A. H. programme is now constituted, it could not be added to it; for Mr. Shaner is taxed to the utmost, even with his rare skill and energy, to carry it through from start to finish. But it could be substituted for the Consolation Handicap, an event which is now redundant, which is the stake of least interest, and which is insignificant in value when compared to a genuine championship tryout on the lines herein suggested.

Aside from the friendly yet earnest competition for first honors in the G. A. H., the sensational feature was the presentation of the cups. This was the climax to the long and chivalrous struggle for victory. The presentation covered a broader scope than in prior years, for there was the State competition, which had a trophy significance, an event which was the first of its kind in the Interstate programme. There also was the novel presentation of two cups to one contestant, the winner of the Preliminary Handicap and the G. A. H., Mr. R. R. Barber, of Paulina, Iowa.

Shortly after midday on Friday, in front of the club house, with a large and appreciative audience of ladies and gentlemen keenly interested in the ceremony, Mr. Irby Bennett, president of the Interstate Association, made the presentation address. He pos-

# U. S. Government Ammunition Test.

Accuracy test of Krag-Jorgensen .30-Caliber Cartridges held at Springfield Armory by order of the Ordnance Department, United States Army.

**TESTED**—Ammunition of all the American Manufacturers.

**CONDITIONS**—10 and 20 shot targets, muzzle rest.  
10 and 20 shot targets, fixed rest.

114-116 Market St., San Francisco.

esses oratorical powers of a high degree, and held his audience from start to finish. He touched briefly on the great work and high purposes of the Interstate Association, the progress it had made, the great assistance rendered by the Indianapolis Gun Club members as individuals and as a club, and for which he tendered thanks in behalf of the Association, and the appreciative manner in which the event had been adorned by the presence of so many gentlemen and beautiful ladies. He called attention to the excellence of the competition, in which the records of all prior G. A. H. scores and entries had been broken; the praiseworthy team competition and the phenomenal achievement of Mr. R. R. Barber in winning a double victory, the Introductory Handicap and the G. A. H.; and the gentlemanly class of shooters who made the greatest of tournaments possible. No salient point was left untouched, yet each point was treated briefly and clearly and graciously. The team trophies were presented first. Mr. Barber, who is as retired and modest in private as he is redoubtable in competition, felt somewhat overwhelmed by so much public honor. He was called upon for a speech, but Mr. Bennett explained that only by the most assiduous attention to the competition could the Consolation event be finished, therefore it was essential that the ceremony be made as brief as possible. Mr. Bennett's speech was accorded hearty applause. Mr. William Armstrong thereupon mounted the box which served as a rostrum, and in behalf of the Indianapolis Gun Club, of which he is an officer, he thanked the shooters for their generous support of the great tournament, the Interstate Association for their magnificent work, and concluded with some words of just praise bestowed on Mr. Elmer E. Shaner, the manager, and called for three cheers for him, which were heartily given. In the brief time that Mr. Armstrong was speaking, he demonstrated that he is a vigorous and tactful orator.

After the cheers had subsided somewhat, there were earnest calls for "Shaner" and "speech." Mr. Shaner quickly responded by thanking them for the honor, and explaining that the exigencies of the competition were pressing at that moment to such a degree that time for a speech was not to be spared, and that in behalf of the Interstate Association he was present to show how a tournament should be run, and would have to proceed accordingly, which evoked more hearty cheers. The whole incident displayed the genuine good fellowship accorded the winners, the workers and the two managements, the Interstate Association and the Indianapolis Club.

As a whole, the handicaps as awarded by the committee, Messrs. E. H. Tripp, Indianapolis, Ind., Chairman; Lem. Willard, Chicago, Ill.; F. E. Mallory, Parkersburg, W. Va.; P. C. Ward, Walnut Log, Tenn.; Frank Alkire, Williamsport, O., were accepted as good; but there was a few individual exceptions to this acceptance, as there always has been and probably always will be.

Of those who demurred, their greatest objection was against the handicap allotted the winner, Mr. Barber, whose distance was 16yds. However, it should be borne in mind that no handicap committee can know the ability of all the shooters in the United States. Even if they knew all of them, they would not consider that a shooter, however good in private or ordinary competition in public, if not seasoned by campaigning, could perform near the maximum in the G. A. H. A glance at the scores will show that numerous other shooters of known excellence were on the 16yd. mark, and, had any one of them won, there is no doubt but what the same kind of criticism would have been uttered. Some one must win, and in a handicap whose scope takes in America, the one is quite likely to be "a dark horse." All the "dark horses" do not win, but each year brings out such a formidable aggregation of them that they are not a negligible quantity in the competition.

The records of the G. A. H. show, however, that the well-known experts are too heavily handicapped. With the continually growing odds due to the greater number of entries, the generally higher average of the scores, and the general increase in public knowledge concerning all the technical points of the competition, 22yds. is too far back for any shooter to stand and compete against the skill and odds of the present day, even if such back marksmen are the invincible Crosby and Gilbert.

The competition, in the matter of skill, was marvelous in its excellence. The targets were thrown a full 50yds. and perhaps a bit more. Ninety per cent. and over was quite the rule, though the poor ninety per cent. man now is in need of the fearful plea for protection from the 100 per cent. man, that the 80 per cent. man so feelingly uttered in his own behalf not many months ago.

A distinct feature of wonderful skill was that exhibited by Messrs. G. W. Maxwell, of Holstein, Neb., and J. A. Flick, of Ravenna, O., each of whom are one-armed shooters. The former scored 96, the latter 97. Their performances would seem to indicate that an extra arm is superfluous.

Mr. Barber, the winner, used Winchester shells, Dupont powder and a Lefever gun.

The beautiful Fred A. Stone Scarecrow cup, donated by Fred A. Stone, of the "Wizard of Oz Company," was won by Mr. W. G. Hearne, representing the Marlin Fire Arms Co., of New Haven, Conn. It was for the best professional score in the G. A. H. It is a massive, valuable cup, beautifully designed. Mr. Hearne has been in the professional class only a few months, and in that time has come rapidly to the front in competition. The cup was publicly awarded at the club house on Thursday evening, by Mr. Bennett, and Mr. Hearne received hearty and unanimous congratulations. The scores:

Handicap table listing names and scores for the June 30, Fourth Day—The Consolation Handicap.

June 30, Fourth Day—The Consolation Handicap.

After the conclusion of the G A H., and the four sweepstake events of the morning programme, the Consolation Handicap was begun. It had 183 entries. The winner is Mr. J. T. Atkinson, of New Castle, Pa. He tied with Mr. C. E. Binyon, of Lowell, Ind., on 99.

Both gentlemen were nervous when they began the shoot-off, but Mr. Atkinson pulled himself together the quicker and won. Mr. Atkinson used Peters ammunition.

The division of the purse in the Consolation Handicap was as follows:

First, 99—J. T. Atkinson, \$95.50.

Second, 99—C. E. Binyon, \$85.95.

The 98's, W. S. Hoon, L. B. Fleming and A. Oleson, received each \$66.80.

The 97's, C. M. Powers, E. W. Holding, C. W. Hart, R. R. Barber, F. D. Kelsey, L. H. Reed, Dan Bray, R. H. Connerly, G. Rupert and W. T. Brooking, received each \$48.80.

The 96's, L. I. Wade, W. Henderson, Wm. Akard, Geo. Maxwell, A. P. McDowell, G. J. Roll, J. S. Thomas, F. G. Fuller, E. F. Gleason, J. L. Orr, F. Stanton and E. A. Randall, received each \$18.30.

The 95's, H. C. Hirshy, J. B. Barto, R. M. Klein, O. A. Felger, A. D. Mermod, F. C. Riehl, E. H. Storr, A. W. Loud and Geo. Bartlett, received each \$9.55.

The 94's, J. L. D. Morrison, J. S. Boa, W. H. Heer, F. Alkire, Walter Huff, H. C. Watson, J. R. Graham, R. S. Rhoades, W. D. Stannard, B. Dunnill, B. T. Cole, A. H. Hardy, R. Merrill, G. H. Darton, W. B. Darton, C. B. Lamme and W. Webster, received each \$1.10.

The scores of the Consolation Handicap follow:

Springfield, Mass., Shooting Club. Our practice shoot on the afternoon of June 24 drew out thirteen shooters, and it being an exceptionally favorable afternoon for shooting, some very good scores were made, Snow averaging the highest with 67 2-3 per cent. In the prize event at 15 targets for half a dozen photographs, Parsons won with a score of 15. He succeeded in breaking 13, and having a handicap allowance of 3 targets, won out for him, with Douglass close behind with 14 from scratch, and Le Noir, Kites, Snow and Chapin all tied on 13. Any one wishing one of these photographs must apply at once, so will say. The other two contests, one for Peters cup and the other for three club merchandise prizes, are to be shot for during the season, added target handicap in the cup contest, and in the contest for merchandise prizes the shooters

are divided into classes A, B, C, 60, 70, 80 per cent. Prizes of equal value in each class. Scores in these three handicap events follow:

Score table for Event No. 4, 15 targets, weekly prize, half dozen photographs.

Score table for Event 5, 25 targets, Peters cup contest.

Score table for Event No. 6, 25 targets, three club prizes.

Score table for Scores in regular events follow.

Consolidated of Connecticut.

NORWICH, Conn., June 27.—The fifth tournament of the Consolidated Gun Club of Connecticut took place on the grounds of the Norwich Shooting Club to-day. The day was pleasant, but a strong breeze from the northwest played havoc with the scores. Trade representatives present were G. M. Whhler, J. H. Brimley, and E. B. Thompson.

The officers of the C. G. C. are: President, H. J. Mills, Bristol; Vice-President, Dr. W. J. McElligott, Waterbury; Secretary and Treasurer, Dr. D. C. Y. Moore, So. Manchester.

The local committee having charge of the arrangements was composed of J. A. Mitchell, W. H. Gates, I. P. Taft, and Willis Austin, and the events were worked off rapidly. About 9,350 targets were thrown.

The team shoot was interesting, and eight teams of five men each participated. Rockville came in first, with Norwich a close second. The office end was handled in a very efficient manner by Mr. J. H. Gould, of New Haven.

The team scores were as follows, 20 targets each man: Rockville—Moore 16, White 12, McMullen 20, F. Metcalf 15, H. Metcalf 19; total 82.

Norwich—Olcott 19, Noble 16, Mitchell 15, Taft 15, Richards 15; total 80.

Willimantic—Prest 18, Edgarton 18, Laramie 16, Ockford 15, Bugbee 9; total 76.

New Haven—Mack 18, Hepburn 13, Lines 15, Kelly 17, Savage 12; total 75.

New Britain—Higby 11, Langdon 16, G. Finch 16, Barnes 11, Reynolds 17; total 71.

Waterbury—Hart 14, Hall 15, Dreher 17, McElligott 14, Geddes 12; total 72.

Hartford—Rowe 12, Fernside 11, Colt 15, Libby 14, Newick 12; total 64.

Bridgeport—E. Finch 15, T. Stirling 13, S. Sterling 11, Beers 12, Seery 13; total 64.

Total scores: Rockville 392, New Haven 387, Willimantic 380, Waterbury 379, Norwich 362, New Britain 357, Hartford 351, Bridgeport 319.

Score table for Shot at. Broke, listing names and scores.

Hudson Gun Club.

FOLLOWING are the scores made by the Hudson Gun Club June 25. The day was fine, and some good scores were put up, Schorty, Staples, Cocklin and Gille being well to the front. Summary:

Score table for Hudson Gun Club, listing names and scores.

SIDE LIGHTS OF TRADE.

The Lefever Arms Co., Syracuse, N. Y., in writing us concerning their great prominence in the G. A. H., of 1905, first having been won in that event by Mr. R. R. Barber, of Paulina, Ia., with a Lefever gun and a score of 99, mention the following matter of interest: "You will note that in 1903, at Kansas City, Mo., the Lefever gun won the Grand American Handicap. So we have fallen into the habit of winning the National trophy of America."

The Laffin & Rand Powder Co., write us as follows: "The following letter was sent to Mr. J. S. Fanning: "St. Thomas, Ont., May 30.—Friend Jack—It may interest you to know that I have recovered my Smith ejector No. 200-250. You may say for me that Infalible will not pit a gun; for my brother Bob—Bob Enslie and myself used the gun at the Dutchman's, firing 120 shots from it on Dec. 29. The gun was not wiped out before it was stolen. I recovered it May 29 still uncleaned. It wiped out just as good as new, without a pit. Will have my shells loaded with Infalible for the coming season. "JOE COFFEY, Box 482."

Answers to Correspondents.

No notice taken of anonymous communications.

L. G. S., Brooklyn.—Do you know of any one in the neighborhood of Panther Lake, Andover, N. J., to whom I may write for information concerning the fishing, places to put up at, etc.? I will deem it a favor if you will answer the above in your next issue. Ans. You are advised to write to P. J. Chrispell, Panther Farm, Andover, N. J., for the desired information.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

**The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.**

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

"Atte the leest, he hath his holsom walk, and mery at ease, a swete ayre of the swete savoure of the meede flowres that makyth hym hongry; he hereth the melodyous harmony of fowles; he seeth the yonge swannes, heerons, duckes, cotes, and many other fowles, wyth thyr brodes; wyche me seemyth better than alle the noyse of houndys, the blastes of hornys, and the serye of foulis, that hunters and fawkeners and foulers make. And if the angler take fysshe, surely thenne is there noo man merrier than he is in his spyryte."—Dame Juliana Berners, 1496.

## THE AUDUBON BIRD LAW.

THE Audubon Society has been working for a number of years to secure the adoption by the several States of a uniform law for the protection of birds other than game. To gain the end the Society began in a sensible way by classifying the birds into three divisions—the game, the song and insectivorous, and the species which because of their harmful character may be classed as vermin and are legitimate objects of destruction. The game birds, so designated, comprise the Anatidæ, or swans, geese, brant and ducks; the Rallidæ, or rails, coots, mudhens and gallinules; the Limicolæ, or shore birds, plover, snipe, etc., and the Gallinæ, or wild turkey, grouse, prairie chicken, pheasant, partridge and quail. The game birds thus defined, a simple form of law was drafted providing that no other birds than those classified as game, or those denominated vermin, might be killed. As to what species should come under the head of outlaws, there is wide difference of opinion. The English sparrow is universally conceded to be undeserving of protection. As the laws read, every man's hand may be against the sparrow, but it nevertheless thrives and multiplies and makes itself a nuisance and a destroyer of its betters. Crows, hawks and birds of prey are for the most part unprotected. Some birds which are carefully protected in the North are outlawed in the South; this is true of the bobolink, everywhere cherished in the Northern States for his attractive ways and musical song, but in the South, under the name of ricebird, detested and warred upon because of his destructiveness to the rice crop. As an interesting comparison we list the States which have adopted the Audubon law, either wholly or in part, and designate the several species which in each State are thought to be undeserving of protection. The list of thirty-four States is a tribute to the good work, wisely planned and persistently carried on by the Society, and in particular by its Secretary, William Dutcher, of this city. Indeed it is hardly too much to say that the results attained have been due to the personal activity of this one man, who has devoted himself to the cause with an enthusiasm and a perseverance of which the whole country is reaping the benefits.

Arkansas, 1897.—Excepted: Crows, blackbirds, hawks, owls, eagles and other birds of prey.

California, 1905.—Excepted: Sharp-shinned hawk, Cooper's hawk, duck hawk, great-horned owl, bluejay, house finch.

Colorado, 1903.—Excepted: Sharp-shinned hawks, Cooper's hawk, goshawks, duck hawks, great-horned owls, pinon jays, magpies, bluejays, eagles. Doves are included in game birds.

Connecticut, 1901.—Excepted: Crows, great-horned owls, and hawks other than the fishhawk.

Delaware, 1901.—Excepted: Red-wing blackbird, purple grackle. In 1905 a law was enacted giving one-half of all fines to the Audubon Society.

District of Columbia, 1901.—Excepted: Crows, Cooper's hawk, sharp-shinned hawk, great-horned owl.

Florida, 1901.—Excepted: Sharp-shinned hawk, Cooper's hawk, great-horned owl, crow, ricebird, meadowlark, jackdaw and butcherbird. Robins and doves classed as game.

Georgia, 1903.—Excepted: Great-horned owl, sharp-shinned hawk, Cooper's hawk, crow, lark, crow-blackbird, jackdaw, ricebird. Doves classed as game.

Illinois, 1899.—Excepted: Crow, crow-blackbird or chicken hawk. Doves classed as game.

Indiana, 1891.—Excepted: Crows, hawks and other birds of prey.

Kentucky, 1902.—Excepted: Sharp-shinned hawk, Cooper's hawk, great-horned owl, crows and crow-blackbird,

Louisiana, 1904.—Excepted: Cooper's hawk, duck hawk, sharp-shinned hawk, great-horned owl. Crows and crow-blackbirds can be shot on own premises if destroying crops. Doves classed with game birds.

Maine, 1902.—Excepted: Common crow and the hawks and owls.

Massachusetts, 1901.—Excepted: Crow-blackbirds, crows, jays and birds of prey.

Michigan, 1905.—Excepted: Blackbirds, crows, Cooper's hawks, sharp-shinned hawks, great-horned owls.

Minnesota, 1903.—Excepted: Blackbirds, crows, sharp-shinned hawks, Cooper's hawks, great-horned owls.

Mississippi, 1904.—Excepted: Cooper's hawk, duck hawk, sharp-shinned hawk, owl, jaybird. Crows and crow-blackbirds may be killed by owner on his own premises. Doves classed with game birds.

Missouri, 1905.—Excepted: Cooper's hawk, chicken hawk, goshawk, sharp-shinned hawk, great-horned owl, crow.

New Hampshire, 1901.—Excepted: Crows and hawks. Eagles are protected by special section.

New Jersey, 1901.—Excepted: Reedbirds, blackbirds, crows, Cooper's hawk, goshawk, sharp-shinned hawk, duck hawk, great-horned owl.

New York, 1901.—Excepted: Crow, hawk, crow-blackbird, snow owl, great-horned owl.

North Carolina, 1903.—Excepted: Owls, hawks, crows, blackbirds, jackdaws, ricebirds. Dove, robin, meadowlark and chewink are classed as game birds.

Ohio, 1902.—Excepted: Chicken hawk, Cooper's hawk, blue hawk, sharp-shinned hawk, crow, great-horned owl. Ownes can kill blackbirds any day except Sunday. Doves classed as game birds.

Oregon, 1903.—Excepted: Crows, bluejays, horned owl, butcherbirds, magpies.

Pennsylvania, 1905.—Excepted: Bluejay, kingfisher, Cooper's hawk, sharp-shinned hawk, goshawk, duck hawk, pigeon hawk, great-horned owl, crow. Doves, reedbirds and blackbirds are classed with game birds.

Rhode Island, 1900.—Excepted: Hawks, owls, crows, crow-blackbirds, on own land. Fishhawks protected.

South Carolina, 1905.—Excepted: Cooper's hawk, duck hawk, sharp-shinned hawk, great-horned owl. Crows may be killed on premises if destructive to crops. Ricebird, blackbird and dove classed with game birds.

Tennessee, 1903.—Excepted: Great-horned owl, sharp-shinned hawk, Cooper's hawk, crow, crow-blackbird and turkey buzzard. Doves, robins and meadowlarks classed with game birds.

Texas, 1903.—Excepted: Hawks, crows, buzzards, blackbirds, ricebirds, owls.

Vermont, 1902.—Excepted: Blue heron, bittern, loon, crow-blackbird, jay and birds of prey.

Virginia, 1903.—Excepted: Owl, hawk, eagle, crow, crow-blackbird, ricebird. Robins classed with game birds.

Washington, 1903.—Excepted: Chicken hawks.

Wisconsin, 1901.—Excepted: Crow, sharp-shinned hawk, Cooper's hawk, owl (*Ulula cinerea*), blackbirds.

Wyoming, 1901.—Excepted: Magpies.

## THE CHESTNUT'S CROWN.

THE rounded crowns of the giant chestnut trees are white now with a forest of blooms which a few months hence shall yield a rich brown fruitage, eagerly sought for by the ruffed grouse, the squirrel and the small boy. We are accustomed to talk of the change of the seasons, of Christmas and New Year's, and of the days when the sun crosses the so called "line," but is there, in all the year, an event which more clearly marks the culmination of things in nature than the coming of the chestnut blooms?

Long ago the vegetation started and grew and flourished and became rank, and when the chestnuts bloom it is at its greatest luxuriance. Spring wildflowers and June roses have blossomed and gone. The hay fields, which have billowed and bloomed all through the early summer, have now begun to fall before the mower, and half shorn, are dotted with rounded cocks of hay, sources of mingled pleasure and anxiety to the farmer, and objects for the artist to rave over. Wheat fields are yellow and ready for the binder, but the corn not yet half grown, waves its brilliant graceful leaves in the sun and seems to increase in height from day to day.

The birds, returned from their migrations, built their nests, laid their eggs and reared their young, which now have left the parental home and started out in the world to fend for themselves. The robins with spotted breasts, the gray young cow buntings, the streaked chippies have been seen hopping over the lawn, at first insistently calling for food in the wake of their parents, but by this time quite independent of help. Birds are beginning to grow silent, for the moulting season is near.

In the tall grass and the cattails of the marshes along the river the broods of blackbirds are beginning to come together in flocks, anticipating the ripening of the tall wild rice, which for a few weeks in August and September shall furnish food to them and to the yellow reed-birds, and at low water over the fallen vegetation and the little patches of bare mud along the shore, the mother railbird may be seen leading her half-grown brood, soon to be able to use their wings and to flap away before the gunner, whose boat invades their reedy solitudes. In many a marsh the young wild ducks are half-grown now, though still for the most part down-covered, and in the woods and swamps the chicken partridges, as big as quail, are able to make strong flights, while the old mother flutters along in front of the disturber with seemingly injured wings and failing strength. The broods of swallows have already begun to resort to the telegraph wires, where for a month now they will be seen in constantly increasing numbers, until at last some morning we shall wake up and find that the last of the swallows has taken its southward flight.

The blooming of the chestnut trees marks the end of the year's growth. From this time on there will be months of ripening, of preparation for the harvest, but the season of increase has passed, and each year when the chestnuts bloom, we may say to ourselves that this is the beginning of the end. The season has reached its prime, its very highest point, and, like the man who during some year of his life is in his most perfect physical condition, and then begins to run down hill, so, with the bloom of the chestnut trees begins the decadence of the vegetation of the year.

J. G. MORRIS.

OLDER readers of FOREST AND STREAM, and especially those interested in yachting and duck shooting, will learn with sincere regret of the death on June 30 of Mr. Jacob G. Morris, of Easton, Md. Mr. Morris was one of the old guard of the FOREST AND STREAM contributors and had been a subscriber to the paper since its foundation.

He was born at Fountain Green, near Philadelphia, Nov. 5, 1835, but lived at his father's home "Magnolia," near Tacony, on the Delaware, until 1867, when he moved to Maryland, where he had since resided. He was devoted to all field sports and was a remarkably successful all-around sportsman. He was a fine shot, both at upland game and wildfowl, and was exceedingly well informed as to the habits of the latter as they are found in Chesapeake Bay, where he had shot them from boyhood. He was a thorough yachtsman and probably one of the best amateur racing sailors of small boats in the country. He was one of the charter members of the Riverton Yacht Club, of Riverton, N. J., and later was vice-commodore and secretary of the Chesapeake Bay Yacht Club, owning and sailing the yawl Cora. He was a member of the Philadelphia Skating Club and Humane Society, and of the Maryland Board of Agriculture, one of the oldest organizations in the State. Mr. Morris had always lived the life of a country gentleman, having few interests outside of his horses, dogs, boats and guns. He was especially interested in the breeding of Chesapeake Bay dogs, and his strain of retrievers is known over much of the United States.

Under the pen-name of "Sinkbox" Mr. Morris contributed occasional articles on yachting and duck shooting to the columns of FOREST AND STREAM, and when the volume "American Duck Shooting" was in course of preparation he lent its author most kindly aid, and his name is frequently mentioned in its pages. His writings were always straightforward and to the point, and his wide experience gave a high value to whatever he wrote.

Mr. Morris was a kindly, simple country gentleman who had a very large circle of warm friends. His passing away is genuinely regretted, not merely by these, but by many another who knew him only from his writings.

## Early Morning on Little River.

THE day began very early, as it was but half past two on a summer's morning when I carefully closed the squeaking door and stole away. For some time I had tip-toed about the house, awaking pandemonium in my efforts to dress and quietly fortify the inner man against faintness until breakfast time. Outside it was dark as Erebus after the lighted room, and as I had come home but the night before and had not learned the lay of the land, my first adventure came as I tacked around the corner of the front verandah under the open windows of mother's room, for I ran squarely a-foul the low wire netting with which she had guarded her young flowers—from lawless dogs and cats, and with a suppressed exclamation and a terrible clatter, rod, creel, waders, and I went down in an ignominious heap amid promising sweet Williams and four-o'clocks and petunias. No word from above, however, and no damage to the old rod or to my old bones, as with great care I steered a wide course around the poor broken flowers, outside the great elms, and squared away toward a bridge two miles up the road.

The luxury of a summer day is spread through all its twenty-four hours, and these last hours before the dawn have a charm all their own. Deep sleep lies upon everything, and the gentle stirring of the soft air is the breath of sweet slumber. Sounds from miles away faintly catch the ear and every little rustle nearby quickens the sense. Under the village trees it was black, but beyond, in the open, the yellow road stretched away and was lost over the rise beyond. The cool night breeze was laden with the scents of wood and meadow, and the old-fashioned gardens—the fragrance of new hay, sweet odor of honeysuckle and that of late blooming syringas. Here along the wall ran a wild tangle of grape vine yielding its delicate perfume, beyond a thicket of young pines whispered with balmy breath, and further on came the greeting in the pungent odor of sweet fern—that secret delight of boyhood, before one has burned incense at the altar of Latakia and Perique. How clear this early morning air! Along the tops of the northern hills lay the faint gray edge of the day that was beyond, and up in the eastern sky burned those constellations that are so strange in summer—brave Orion, the "stormy Hyades" and the "diamond necklace of the Pleiades." Higher still blazed great Jupiter.

One must always drink at the cold spring that bubbles up in the alders above the road, and then comes the wood that reaches up the valley to the meadow below the bridge. This is enchanted land. Now and then to the quick ear comes the faint sound of some ripple of Little River, which the Indians called Apaguang. Time was when all pertaining to the red man found ill favor with our fathers, and it is not easy to win back those old names that were lost with all their woody flavor. Our Geological Survey friends have set their seal upon Little River and there is no escape. Deep in this wild tangle of laurel is a warm, sunny slope where, one May day, Web and I lay in perfect silence more than an hour in order to get a glimpse of certain tawny-coated, wicked-eyed little imps that lived in a terribly odorous burrow dug in the sand. By now they are scouring around these hills and woods learning much wickedness from their wily fox mother. For in all this region not a turkey "gobbles" or "quits," much to the annoyance of thrifty souls, but, alas! not greatly to the sorrow of certain lovers of sad-faced "hound dogs!"

Little River leads a quiet and gentle life, flowing between many hills down a valley mostly wooded, with here and there a reach of fine green meadow. Its waters are unvexed by any dashing torrent or any work of man more serious than an occasional small saw-mill. Moreover, when the water is just right and the day and hour nicely chosen, with due consideration of the change of the moon and the glare of the sun, one possessing the proper spirit and knowing where to try his luck, may now and then catch a trout in Little River. Indeed, a few weeks earlier the dean of the fishing fraternity of our village drove up stream one morning when the Red Gods were making medicine and returned later in the day with a basket well filled with beauties—not one under half a pound. Now, this kind of thing, like the discovery of a litter of young foxes, should not be made public, but the news did leak out and a wild zeal for fishing possessed the village below ours. Web told me that every morning for some weeks, and particularly on Sundays, a procession of teams of all kinds carrying men of all kinds came up from the lower village and hurried off up the valley, and all through the afternoon these same teams, less sprightly and containing men in all conditions, straggled homeward. But the reports of catches were vague and uninteresting. The effect upon the fish, however, was demoralizing, for when, a few days previous to my morning, Web and Edgar—mighty fishers before the Lord, who possess the confidence of the finny tribe of our valley—ventured to pay their addresses to the inhabitants of well known retreats for trout along the river, their approaches were treated with scorn, and they returned having met with the luck of those grand fishers of old who labored all night and caught nothing.

It is a good plan to begin at the bridge, for there

is a good pool, then a stretch of meadow and then a mile of woods in which the water lies just right. I do not know a prettier stretch of water for fishing nearer than the White Mountains, if one is not particular about catching fish. It was when I reached the edge of the woods that "the rosy-fingered Dawn, the Daughter of the Morning," appeared in her radiant glory over the northeast hills. A robin chirped, then another, then a jay screamed high on the hillside, and soon every thicket and all the trees were alive with song. Every bird was awake—robins, song sparrows, vireos high in the trees, warblers of various kinds, and here in a near laurel a Quaker-garbed catbird was pouring out his glad song in mad ecstasy. Only in the woods does daybreak come thus, and all these wild creatures see and are a part of the wonder of each dawn. 'Tis a pity the voice of man is not pitched in tune with the great chorus. The best he can do is to go a-fishing and be thankful deep in his heart that he is allowed once in a long time to listen to the glad voice of nature. How long the concert lasted I do not know, for I was enchanted; but after a time the woods became more quiet and from the softened chorus sounded the one voice of all that is to me the sweetest—the veery's. Gradually all other singers became silent, as if to listen to this divinest voice. The charm of those liquid spirals of song—those silver chimes—is indescribable. All the sweetness and purity and fragrance and mystery of the life of the woods seems to find its utterance in the voice of this brown-coated singer. It ever casts a spell over me and fills me with thoughts and feelings that cannot be expressed because speech is too poor. It is a song of exaltation and nothing mean or unworthy can abide with it. \* \* \* With the ceasing of the song there was a splash in the shallow water under a fern bank and the briefest glimpse of a brown, furry little creature scurrying away into the brush. Had the spell been over him, too?

Artemus Ward, of blessed memory, once suggested that an occasional funny story improved a comic paper. The same wisdom might suggest that a fish or two might not be out of place in this fishing sketch. This is true, and there were a few fish that might be mentioned as we pass along. But it is proper to confess that neither skill in the practice of angling nor much knowledge of its science and art are mine. In a very humble spirit, with hook and line and a few fresh worms, I am made glad if I catch two or three good trout, and to capture a dozen of the royal beauties is such wild luck that I am filled with dread lest disaster be imminent. Careful working of the pool under the bridge yielded one horn pout. This was doubtless intended as a joke by the river gods, for that pool is a good one, and I have taken pretty fish there. As for the rest of the river my mind recalls a thousand incidents that make the morning's tale, but two only need be mentioned.

My veery was hidden in the thick hemlock that crowns the high bank over Deacon David's Deep Hole. Standing in the ripple above the hole, I listened to his song, and my little friend in brown fur was listening by a tiny brook that tumbles down from a spring high up in the Deacon's pasture and winds through the narrow meadow to find its way into the Deep Hole. This is the place where trout live, and things did conspire that morning to mark the pool afresh in my memory. A lusty worm went sailing away down under the bank into the deep water, and it proved a sore temptation to the Queen of the Deep Hole. She played the game as a queen should play, but it was all too short for her and soon she lay on a green turf under a wild rose bush. There never was a more beautiful trout. Not a blemish of color or form appeared on her perfect body. Her length was just a foot, and she weighed, upon reaching the house, ten ounces, and she was a perfect specimen of a noble race—a very queen. To have taken her life seemed a sad mistake. Though advancing years bring a keener regret, when fortune brings to any rod a particularly beautiful fish or my gun takes the life of some happy creature in feather or fur, still the passion for rod and gun also becomes keener.

I laid the fair creature carefully away in moss and fern with a wild rose for a garland and waded on. Below was the fallen trunk lying across the stream. Along the snowy covering of this narrow highway one cold day last December we followed the dainty track of a red fox as he crossed from Woodchuck Hill to Board-wine. The pool above gave nothing, but some distance below in a widening of the water came a vigorous bite. There was no doubt whatever that I had hooked the grandfather of the whole race of trout in Little River. I bravely guessed his weight, for all the strain I dared put on my old rod failed to bring him nearer. What dreams of triumph and vanities of pride will possess one at such times. Nothing like this trout had been caught in the river this season, though fish of two pounds and more had been taken within the memory of man. There was a wild rushing back and forth in the pool, and it was keenly exciting for a while. The yielding came, however, and then I could take in line. I worked my way back to a shelving bed of pebbles, and here in a short time I landed a very pretty bass. Well, a bass is hardly in the trout class for beauty, and all that is clean and sweet in a fish, but he is a sturdy

little ruffian and to play this one was a joy. I had to forgive him for not being a trout, even though he had put vain thoughts into my mind. He was twice as heavy as my trout.

There were other trout—three of them—and two other bass, and goodness knows how many idiotic, pot-bellied dace I hooked and threw back. But the other trout were smaller and only moderately exciting in their antics. Before I realized that the sun had come well up over Woodchuck Hill the morning whistle down the valley was calling the busy villagers to their day's work and I had reached the Gulf. This is an awful place. Dense laurel hedges it thickly on both sides, and the water is deep, the bottom rough and slippery and strewn with great boulders, so that the unwary angler is very apt, like Archie Moncur's "waestrel," in the final issue of his dissipation, to "gang plunk; aye, juist plunk!" And it was breakfast time—I had no doubt whatever about it—so here I left the cool water and gathered fresh moss and ferns and roses, made a clean bed in my creel for the fish and was soon home, bathed and eating breakfast as a man should eat.

It will be many moons before I have another hour or two on Little River. October may bring a day with the partridges and quail over Potash Hill way, and it is our custom on Christmas morn to start a fox in Salt Rock Woods, but though both these occasions give a certain fullness of life it is going a-fishing that fills my cup completely.

## Pacha.

In the spring of 1870 I was in Paris, pursuing my studies. At the outbreak of the war most students, who were old enough, volunteered, and the old Dutch-Flemish fighting blood, inherited mostly from my mother's side, asserting itself, I did like the rest. It would take the whole of this paper to relate the vicissitudes, struggles, privations and sufferings of all kinds we went through, for the whole campaign was bungled, when after the terrible fighting at Balan and Bazailles (Sedan) we were taken prisoners. I had two prospects before me: Give my word of honor not to fight any more during the war, when they would let me go home; or imprisonment in a North German fortress. Neither pleased me very much, and then and there I began to cudgel my brains for a means of escape. I asked permission to accompany a squad of stretcher-bearers and surgeons going over the field to search for wounded, and as surgeons were in great demand, they gave their consent to the lieutenant doctor.

We gradually went toward the River Meuse, the borders of which are covered with trees and undergrowth, and, watching my chance, I slipped in a clump of bushes. The others thought, I presume, that I was either caring for a wounded or in search of one, and paid no attention to my absence for the time being. As it grew darker I crawled farther in the brush and hid myself. Hearing something rustle, I cautiously peered through the branches and saw a beautiful Arab horse, saddled and bridled, not thirty paces from me—I watched him for quite a while, thinking the rider was nearby, and finally ventured toward him. He seemed glad to see me; I spoke to him, and patted him, and we got acquainted. Horses, as well as men, suffered terribly in that campaign, and he was very thin, but as far as I could see, unharmed. I led him lower down the bank toward a place where there was some grass and browse, took off his saddle and bridle, and tying him with the reins and some rope I found in the holsters, gave him a chance to feed and lie down to rest.

The plan was to get away from there before daylight as far as possible. The moon came up at about 1 o'clock, and we started away from the battlefield, keeping as much as possible under cover. At daylight we were three or four leagues away, up stream, always close to the river bank. That night I heard horsemen approaching, and Pacha either winded or heard them long before me, and I was afraid he would answer the other horses if they called. I covered his ears and eyes with my coat, all the time speaking soothingly to him, and four hussars passed us within twenty paces. I thought it was all up with me, but they rode on, never suspecting anything.

The goal was Belgium by the safest and least frequented roads toward Bouillon (Belgian Ardennes). I was getting pretty hungry, and following a country road came to a little farm house. I boldly went to the door and explained that I wanted something to eat for my horse and myself. Fortunately I had enough money with me to see my way through until I could wire home. The farmer received me kindly, for those people naturally sympathized with our misfortunes, and he satisfied our wants. After telling my story—for his good, honest, frank face inspired confidence—he advised me to take all the superfluous officer's trappings from the saddle and bridle and leave them with him, also my uniform, and gave me a full suit of clothes of one of his sons, promising to send the whole to me when times were calmer and opportunity afforded, which he did. Dressed in the garb of a farmer I was comparatively safe from capture by prowling hussars, and after several narrow escapes I succeeded in slipping through the Belgian pickets and arrived safely at Bouillon, where I had been before and had friends. Both my horse and myself needed rest, and writing home I told my people I was safe and sound on Belgian soil, and would proceed in a few days, by easy stages, home, saying nothing of my (?) horse.

After a week's rest I started, taking six days, and arrived home on a Saturday morning. Riding in the courtyard and, dismounting, the first person I met was my father, who was never demonstrative and kept cool under all circumstances. He was glad to see me and shook my hands, but it took nearly five minutes to disentangle myself from the embraces of mother and sisters. When finally I could turn around, father, who had a keen eye for good horseflesh, was walking around Pacha sizing up his good points.

"Julius, where did you get that horse?"

"Captured him from the Prussians."

"The Prussians have no Arab horses."

"Must have captured him themselves from the French."

"Hum! Hum! it is doubtful!"

However, he stopped his inquisition then and there and rode Pacha afterward as much, or more, than I did. I told him the true story a few days later, but I am not altogether sure until this day that he ever took much stock in it, he had been a soldier himself. Pacha was a splendid Arabian stallion, about seven years old then, and must have belonged to a French officer of the Algerian contingent; his master was killed or wounded, and the horse wandered away, as hundreds of others did on that bloody field. He had all the sterling qualities of the Crud, but we never could break him to buggy or carriage, and, after a few ineffectual efforts, desisted.

As a saddle horse he was simply perfect. A peculiarity of his was when let run in the large orchard he would go all by himself through the movements of an Arabian fantasia, charging full-tilt and stopping abruptly, raising on his hind legs and apparently in sheer exhibition of animal spirits. I presume he was bred by an Arabian sheik and trained in his youth, and afterward sold or captured in a "razzia." There are some of his descendants at home and in the surrounding country yet, and the most have some of his qualities.

Nobody having ever claimed Pacha, I kept him, and he died on the place after many years of usefulness, one of the noblest horses, both in form and disposition, it has been my good fortune to possess.

JULIUS THE FOX HUNTER.

## Trails of the Pathfinders.—XXXII.

### Fremont—IV.

(Continued from Page 32, Vol. LXIV.)

KEEPING on down Snake River, sometimes in its valley, sometimes, to avoid bad traveling, keeping back on the hills, the party went on. There was little to record of the journey, except general descriptions of the country, and the streams and places passed. The Indians seemed poor, and without any idea of providing for the future.

Before long the Grand Rond was passed; and soon after this the party entered the timber, through a part of which they were obliged to cut their way.

When the missionary station, occupied by Dr. Whitman, was reached, it was found that he was absent on a visit to the Dalles of the Columbia; but here were seen a party of emigrants—men, women and children—all in good health, and living largely on potatoes, which were even then raised here of good quality and in some quantity.

All the trading posts in the Oregon country were still controlled by the Hudson's Bay people, but all received Fremont cordially and helped him on his way. They crossed John Day's river, the Des Chutes, called by Fremont, Rivière aux Chutes. At the Dalles was a comfortable settlement: "Two good-looking wooden dwelling houses, and a large school house, with stables, barn and garden, and large cleared fields between the houses and the river bank, on which were scattered the wooden huts of an Indian village." Here the party again divided, Fremont leaving a part of his people at the Dalles, with Carson, while he and Mr. Preuss went on down the river by canoe.

The new mode of travel seemed very delightful to men who had been for months journeying on foot and on horseback over a rough country. It seemed very pleasant to float along down the broad stream, camping from time to time to build their fires, and cook the fat salmon, and potatoes and coffee, which they had, with bread and sugar—luxuries to which they had long been strangers. It was a motley group, but a contented one. Three Indians assisted in paddling the canoe, while the commander of the expedition, the German Preuss, the Frenchman, Bernier, and the colored man, Jacob, floated onward to the sea. Fremont's eagerness to reach Fort Vancouver led him to travel during a part of each night; and for the greater part of the voyage they had beautiful weather, made good progress, and enjoyed the wonderful scenery. They were now in sight of the splendid Cascade range, and of the towering peaks of Mount Hood, St. Helens, and later, Mount Rainier. As they passed on down the river the hills grew lower, and presently, one night, they heard the noise of a sawmill at work on the bank, and camped not far from Fort Vancouver. Here, Dr. McLaughlin, the executive officer of the Hudson's Bay Company for the territory west of the Rocky Mountains, received the travelers with that courtesy and hospitality for which he was so well known, and concerning which all those who passed through the region in early days spoke with so much gratitude.

About the fort were many American emigrants, some of them in a more or less destitute condition, but all of them supplied with the necessities of life by the kindly Hudson's Bay officer, who allowed them to pay for what they had by their labor.

From Dr. McLaughlin Fremont procured three months' provisions, and through his kindness was enabled also to secure men and boats to transport these provisions up the river to the camp of his main party at the Dalles. The return journey was slow with the laden boats, for they were obliged to cordelle the Mackinaw along the shore, being unable to overcome the swift water by their oars.

Fremont was much impressed by the appearance of two barges of the express from Montreal, which he met coming down the river, and the system and rapidity with which the boatmen effected the portage and passed their boats over the cascades, is spoken of in terms of high praise. These boats, it appears, at that time carried the express of the Hudson's Bay Company to the highest navigable point

of the north fork of the Columbia, whence it was taken by an overland party to Lake Winnipeg, and there divided, a part going to Montreal and a part to Hudson Bay. Very likely this is the route spoken of by Ross Cox, who made such a journey nearly thirty years before, when, however, it was in the nature of an exploration and not of a traveled route.

From the Dalles it was Fremont's purpose to go south, on the west side of the Cascade range, as far as Klamath Lake—by Fremont written, Tlamath Lake; thence south to the reputed Buenaventura River, which is said to empty into San Francisco Bay; thence across the desert to the Rock Mountains, opposite the headwaters of the Arkansas River, and there, crossing the mountains, to follow down the Arkansas to Bent's Fort, and so back to St. Louis. Much of this region was then quite unexplored, and certainly had never been passed over by a surveyor. To make this trip at the beginning of winter, the party consisted of twenty-five men, with 104 mules and horses, and a few California cattle, to be driven along as food for the company.

After leaving the Dalles, Fremont's whole party were occupied in making the necessary preparations for the start into this new region. Horses were purchased, provisions accumulated, all unnecessary baggage cut out and left behind, and the little wagon which had hitherto carried the instruments given to the mission. The howitzer, however, was to be taken with them. Here a Chinook Indian, nineteen years old, who had expressed a desire to see the whites, was permitted to join the party.

They started Nov. 25 and followed along the plateau on the east flanks of the Cascade range, and so on the western side of the Fall River. The weather was cold and the streams frozen along the edges, while snow lay on the ground. When the sky cleared superb views were had of Mount St. Helens, Hood, Rainier, Jefferson and other mountains of what is now called the Presidential range. The weather grew colder and the road more rough, it being over volcanic plains, often interrupted by deep gulches or stream valleys. They were now passing through the country of the Nez Percé, the Cayuse and certain tribes of Diggers, and heard from their Indian guides more or less alarming accounts of the fierceness and treachery of the Indians before them. Dec. 10 they reached Klamath Lake, and saw smoke arising from different points about it. Here, for the purpose of encouraging their guides, who evidently felt very shaky about the local Indians, and alarming the latter, Fremont caused the howitzer to be fired with a shell, and tells that "the bursting of the shell at a distance, which was something like a second fire of the gun, amazed and bewildered them with delight. It inspired them (the guides) with triumphant feelings, but on the camps at a distance the effect was different, for the smokes in the lake and on the shores immediately disappeared."

The next day Fremont set out to look up the Indians, and before long came near to a village from which two people were seen advancing to meet them.

"We were surprised, on riding up, to find one of them a woman, having never before known a squaw to take any part in the business of war. They were the village chief and his wife, who, in excitement and alarm at the unusual event and appearance, had come out to meet their fate together. The chief was a very prepossessing Indian, with very handsome features, and a singularly soft and agreeable voice—so remarkable as to attract general notice.

"The huts were grouped together on the bank of the river, which, from being spread out in a shallow marsh at the upper end of the lake, was collected here into a single stream. They were large, round huts, perhaps twenty feet in diameter, with rounded tops, on which was the door by which they descended into the interior. Within, they were supported by posts and beams.

"Almost like plants these people seemed to have adapted themselves to the soil, and to be growing on what the immediate locality afforded. Their only subsistence at this time appeared to be a small fish, great quantities of which, that had been smoked and dried, were suspended on strings about the lodge. Heaps of straw were lying around, and their residence in the midst of grass and rushes had taught them a peculiar skill in converting this material to useful purposes. Their shoes were made of straw or grass, which seemed well adapted for a snowy country, and the women wore on their heads a closely woven basket, which made a very good cap. Among other things, were parti-colored mats about four feet square, which we purchased to lay on the snow under our blankets, and to use for tablecloths.

"Numbers of singular-looking dogs, resembling wolves, were sitting on the tops of the huts, and of these we purchased a young one, which, after its birthplace, was named Tlamath. The language spoken by these Indians is different from that of the Shoshonee and Columbia River tribes, and otherwise than by signs they cannot understand each other. They made us comprehend that they were at war with the people who lived to the southward and to the eastward, but I could obtain from them no certain information. The river on which they live enters the Cascade Mountains on the western side of the lake, and breaks through them by a passage impracticable for travelers, but over the mountains to the northward are passes which present no other obstacle than in the almost impenetrable forests. Unlike any Indians we had previously seen these wore shells in their noses. We returned to our camp, after remaining here an hour or two, accompanied by a number of Indians."

As many persons have been since that time, Fremont was much impressed by the attractions of Klamath Lake, and he stopped here a short time to rest his animals. From this point on there were no maps, and practically nothing could be learned of the country from the Indians, although they drew rough maps in the effort to direct the explorers. The road before them was hard and difficult, much of it through heavy forest, made hard to travel by fallen trees, and by snow, which was constantly growing deeper. After two or three very laborious and most uncertain days, they came suddenly to the edge of a precipice, from which they could look over into a green and sunshiny valley below, partly filled by a great lake, which, from its appearance, Fremont called Summer Lake. It stands so on the map to-day. The descent from the mountain was a difficult one, but at last a way was found. It was impossible, however, to reach the shores of the lake,

on account of the deep mud. However, streams of good water were passed at sufficient intervals. They had now left the forest behind them, and their fuel consisted of willow twigs and sage brush. A little further along another lake was approached, called Lake Abert, after Colonel Abert, who was then chief of engineers. The water of this lake, however, was very bad. Everywhere about this lake were signs of Digger Indians, and about this time they came upon a broad trail over which horses had passed. Most of the country was sterile, and as they crossed the mountains, from the watershed of these lakes, they found snow a foot deep.

While crossing a sage brush plain, riding along over the snow, the party suddenly came upon an Indian camp, consisting of two huts, open at the top, and loosely built of sage. As they approached them the Indians rushed out, and scattered to the hills, but a woman, carrying two children, was captured, and, screaming with terror, brought to the camp. She was at last soothed, and induced to answer inquiries. These were Diggers, no doubt Piutes, of some one of the desert tribes.

GEORGE BIRD GRINNELL.

[TO BE CONCLUDED.]

## Begin Now.

Editor Forest and Stream:

In your editorials, from time to time and in communications from your correspondents there is emphasized the wisdom of taking regular periods of rest, vacations of substantial length.

The appeal is addressed to the class most in need of suspending for a while the strenuous life—the busy, pushing, successful men who work with hand or brain, or both. The basis of the advice is usually, and wisely, founded on reasons hygienic, utilitarian, etc. I wish in a few words to emphasize a phase of the question that only the older of your readers are in a position fully to realize, and I assume that your readers are mostly men enjoying, in some degree, the love of the "wild," the camp, the stream, the forest, the sea.

We will assume the case of a typical American lad. He leaves the family roof tree with little impedimenta, but with a high determination to succeed in life. He plunges into the fierce competitions characteristic of modern life. In his earlier years of struggle he takes no thought of genuine relaxation. Perhaps semi-occasionally, when the bow is unstrung, he looks back to the days of joy in boyhood when, tasks being done, he hid him away to the trout brook, or to the brier-infested field after the wary quail. Heaving a sigh he resolves some day to get a rod and gun and have a bit of the pleasures of long ago. Alas! the resolution fades with the morrow. The zest for gain resumes its sway. The years, ten, twenty, thirty, pass. The purse is now plethoric to bursting. The rod and gun, of superb quality, are now purchased and a visit made to some choice stream or cover. The first few hours on the hillsides or wading the boulder-strewed stream evolve a touch of the old enthusiasm; but this wanes by jumps as the long unused muscles cry in loud protest against serving as of old. The laboring heart thumps at the throat its angry disapproval, and the spirit, no stronger than the flesh, relaxes, its fires die down, and the victim, surprised, irritated and disappointed, looks back with wonder that he ever found so much enjoyment in such diversions. Has he not these many years in his day dreams pictured himself enjoying day after day in uninterrupted happiness just such sport as this fair morning affords? Has he been hugging to his heart a vain delusion for half a lifetime? His open-eyed reason asserts itself and says, "You fool! you think for a score of years to cramp the spirit and deny the healthful demands of the body in the mad race for wealth that you can now renew your wholesome youthful zest and enthusiasm as you would don a new garment? Can you eat your cake and have it? Don't you realize that you are a prematurely old man? Had you been wise with each recurring season you would for a time have withdrawn from the artificial life to the natural, renewing the joys and delights of youth, building up your abused and neglected body, and allowing your asphyxiated soul to revive and expand amid the countless glories of God's undecorated temples."

Sadly does our victim of the over-strenuous life realize now the force of the old, old story that nature never fails to exact the penalty for violation of her laws. From this poor picture of ever recurring experiences the reader may easily draw the moral: Work by all means, but play also, and do not postpone the latter until some indefinite future time. Begin now, this year, to give your body and soul their God-given rights. Hie away to the mountains, stream or sea. If slim of resource with a bit of canvas make you a pack for the back, or with a few boards build a sufficient boat. Sleep under the stars, eat of your own gathering; and, your whole being renewed and rejuvenated, return to the scene of your labors strengthened in body and sweetened in spirit.

ROEEL.

## Trained Foresters in Demand.

WASHINGTON, D. C., June 27.—The demand for foresters is increasing rapidly both for State work and with private owners. Many States now have forest commissioners, and several of them have State foresters. A trained forester at \$2,400 a year and two assistant foresters at \$1,200 each are wanted by California. Wisconsin wants an assistant forester at \$1,500, Indiana a forester to take charge of its State reserve, and Washington offers \$1,800 a year for a trained forester. In many other States the advisability of creating the office of State forester has been under discussion this year, and it is only a matter of a few years when such an official will be considered a regular part of an efficient State government.

The demand for foresters by private timber owners is growing at a still more rapid rate. During the last twelve months seven of the Bureau of Forestry force have left to take up work with such owners, and four have accepted public positions—two with Massachusetts, one with Connecticut, and the fourth with Ontario, Canada. A number of other requests from private owners cannot be met because men are not available. The year before there were less than half as many applications for trained men. But the demand for trained specialists in this line has only begun.

# NATURAL HISTORY

## Dark Foxes.

Editor *Forest and Stream*:

The Smithsonian Institution has lately issued a pamphlet (No. 1405) by Chief Factor Hudson Bay Company, R. MacFarlane, on mammals collected and observed in the northern Mackenzie River district. In this, speaking of red, cross, silver and black foxes, he says: "The natives consider the foregoing as belonging to one and the same species (the common red fox), an opinion generally, but not universally accepted by naturalists and collectors; and while it is just probable that the different varieties have occasionally been found among the litter of a red fox mother, yet I have been for a long time of the opinion that there must have been originally two distinct and well-defined species of the North American red fox, the pure red and the pure black (*Vulpes fulva* and *V. nigra*) and, as a matter of fact, there still exist many of the former and some of the latter throughout the entire region under review. I also firmly believe that sexual intercourse between a male and female red fox invariably results in the production of only red foxes. I am equally satisfied that similar results always follow cohabitation between a male and a female black fox. In the course of many years' trading of fox skins, I have observed perhaps every possible degree of variation between the practically perfect typical red fox and the same description of the black form. These varieties between the two are easily accounted for, as a consequence of the natural commerce which exists between the sexes during the annual seasons of copulation."

As the Mackenzie River district, of which Mr. MacFarlane wrote, contains a larger proportion of dark foxes than any other territory known (Chief Trader Bernard R. Ross setting the proportions at six-fifteenths red, seven-fifteenths cross and two-fifteenths silver and black) it may seem presumptuous for one who probably has not handled one dark fox where he has handled hundreds to question his statements; still, having probably handled as many red foxes as he, and having observed them closely for over sixty years in a territory where the dark bear a very small proportion to the red, I am obliged to believe that the natives to whom he refers are correct, and that he himself is mistaken.

I believe, and think I can prove, that a black fox is due to melanism and that the various crosses are due in some cases, as he states to the crossing of these melanistic individuals with the pure red, but in others are the result of partial melanism.

Mr. MacFarlane speaks of white wolves being more plentiful in some sections, gray wolves in others, and black wolves in others, but he does not intimate that they are of different species. He also speaks of black beaver and black muskrats being taken, but he does not give his views as to the origin of them.

All naturalists and most other people know that there are albinos of many varieties of both animals and birds. In some cases these reproduce perfect albinos, and in others, by crossing, partial albinos. I have known a pure white doe to have two pure white fawns; I have seen three white mink taken in different years—from the same place, which would be strong evidence of reproduction. Now albinism is just the opposite of melanism. Why is it not just as reasonable to believe that two red foxes may have a black cub as that two black crows may have white young? I have in my collection nearly thirty entire or partial albinos of birds; I have a white crow taken near Portland, Oregon, which was one of three pure white young crows, the parents being black; I have a swallow, white as snow, whose parents I know were of the normal color; I have myself seen three coal-black northern hares, also a coal-black red squirrel, and a good many black beaver and muskrats, also a number of coal-black raccoons. In fact, black muskrats and raccoons are often quoted separately on price lists of furs, though not one ever thinks of either being a separate species.

Why cases of albinism should be found oftener in some kinds of birds than in others, is as yet unexplained, but it is a well known fact. The same is true in melanism. There are so many cases of entire or partial melanism among rough-legged hawks that for a long time the black form was considered by ornithologists as a separate species under the name of *Archibuteo sancti johannis* to separate it from *Archibuteo lagopus*. I believe the same is true of mammals. In handling deer skins by the thousand I have never seen a black one nor one which approached that color, but I have seen white, or partially white deer by the score. On the other hand, in handling hundreds of thousands of muskrat, I have seen many black and but one pure white one and one other with a small portion of white. Mr. L. M. Turner, in his report upon animals in Alaska, makes particular mention that where there is the largest proportion of dark foxes there is also the largest proportion of dark foxes. He gives the proportion of silver and black foxes in Alaska as one in five hundred, and of cross as one in seventy-five to one hundred. Here in Maine, where we do not get one dark fox in a thousand, we have a much better chance to judge correctly as to melanism than can be had farther north, where dark foxes are more abundant. I know surely that there may be both silver and cross foxes in the same litter, as when I was a boy my father had and raised two cross and a silver taken from the same den.

While I believe that a pair of black foxes may have young of the same color and that crosses may do the same, still I firmly believe that both originate from the common red just as white crows do from black ones, and that often the abnormal strain of blood is confined to one individual. While in some cases there is but one dark fox in a litter, in some cases there are more. Something over fifty years ago my father bought six foxes taken on Swan's Island (then called Burnt Coat Island). Of these

one was a silver and five were black. Some two or three of the black were very fine skins, the others of a more slaty color. Now my father had bought almost the entire catch of the island for years before and did the same for years after; as far as I knew he never got another of either black, silver or cross from that island or from any other island near it. These foxes were all shot in winter and probably of one litter. I distinctly remember the skins, as we kept them over summer and the care of keeping them free from moths devolved upon me. I will add that my father did not buy another dark fox that year from any part of the State.

Some sixty-five years ago my father obtained a permit from Colonel Black, of Ellsworth, Me., to go to the outer Duck Island to kill foxes. Some years before Colonel Black had placed a pair of black foxes upon this island. There had been no foxes upon the island and those were under the protection of the light keeper. As far as known none of these or their offspring had been killed. There was snow on the ground, so that every track could be seen, my father and his companion had a good fox hound, and the island is quite small. They were on the island several days and shot three very large cross foxes, but did not see nor hear of any black or red. The reasonable supposition is that the original pair was dead and that these crosses were bred from them.

In Maine the larger part of all the dark foxes I ever knew taken were taken quite near the seacoast. I have known of more being taken on Mt. Desert Island than upon any space ten times its size inland.

My father used to buy a great many more cross than silver or black, while my experience has been exactly the reverse. I have to-day looked over my books and found in one year over 3,300 red foxes shipped and only one silver and no cross. My experience has been that I would occasionally get a dark fox from some place far inland, where I had bought the larger part of the catch for years, and never get another or a cross again taken anywhere near there. What is noticeable is that a large proportion of all the dark foxes I have seen were foxes of the year. In the Far North, where the proportion of dark foxes is quite large, I have no doubt that the strain of blood is kept up by mating with those of like color, but here, where they are very rare, it is very seldom that two are taken near each other for years, and then they seem to be from the same litter.

We occasionally have here what we call "mongrels," foxes of a color between a cross and a red; also what are known as "Sampson foxes." These look like a red fox which has been singed all over. I have seen a silver Sampson and a Sampson cross. We know positively that both mongrels and Sampsons are from red foxes. Why is it not more reasonable to suppose that the different shades of dark foxes are produced in the same way than to suppose that they have wandered down here hundreds of miles from the north?

I once bought a pure white fox taken near here and one season bought three which were about one-third white. Two of them I know were from the same litter. I have bought several foxes of a chocolate color, and once saw one which had all the ends of the hair, except on tip of tail, coal-black, while the inside fur was red. If all these various colors are born of red foxes, why may not what black and cross we have, been produced in the same way?

In the Far North we have the polar white fox; next the blue fox (I have never heard of their mixing, although in some cases they are found on the same ground). Next we have a region where the dark foxes predominate, but there are red among them; as one goes south the proportion of red increases, till south of Maine the black is extremely rare and the southern gray begins, a separate species which does not mix with the red. The kitt fox of the West is a separate variety and is not known to mix with other species. The fact that neither kitt, gray, white, nor blue intermix is strong presumptive proof that foxes' like wolves, are in the north inclined to melanism in a greater degree than farther south, and that finally the wolves all merge into the gray and the foxes into the red. It is a certain thing that in Maine our dark foxes are born here and do not come from any black blood to the north.

Skunks, which by fur buyers are graded into black, half-stripe, narrow-stripe and white or wide stripe, are a very close parallel to foxes, which are classed as black, silver, cross and red. Often when from eight to ten skunks are taken from the same den, all these different colors can be found among them. While no two unselected lots from any section would be likely to grade alike, still the proportion of colors of a lot taken in Maine east of the Penobscot would be not far from (in a lot of twenty), one black, three half-stripe, seven narrow and nine wide stripe. A lot from between the Penobscot and the Kennebec, which lies only fifty miles west, would show a larger proportion of dark, and this increases as they are taken farther west. I have never handled any skunk taken west of Maine, but a collector of furs in northern New York used to tell me that his collections averaged fully half black or half-stripe. Now it is indisputable that the same set of parents produce all four grades, and also that the proportion of colors varies with the section. Not only this, but skunk sometimes produce nondescripts just as foxes do. I once bought a prime, fully-furred skunk which had the stripes brown instead of white, and I have had several whose stripes were tinged with pinkish magenta. MANLY HARDY.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## Wapiti and Red Deer Cross.

From the London Field.

SUCH facilities have been afforded of late years for the transport of large game animals from one continent to another, and the method of capture and treatment en route is now so well understood, that the presence of a herd of wapiti (*Cervus canadensis*) in an English deer park or Scottish deer forest no longer gives rise to much astonishment. Many experiments of the kind have been made with varying success. In Germany, so long ago as 1888, a wealthy manufacturer of Berlin, owning an important shooting near Luckenwald, imported a small herd of these animals (known as elk in America and Canada, where the true elk is called moose) and turned them out in his forest. Here the following year, seven of them were successfully stalked and shot, one of them having a head of fourteen points. In Thuringia a year or two later several were turned out by Duke Ernest of Saxe-Coburg. The object of such importation was a desire to improve the size and weight of the red deer, with which it was hoped the wapiti would interbreed, and it is known that such interbreeding did actually take place.

In 1893 there were at least two importations of wapiti to England; there may have been others which were not reported. Mr. C. J. Leyland, of Haggerstone Castle, Beal, Northumberland, received a herd of eleven, and Sir Peter Walker, of Osmaston Manor, near Derby, introduced a herd of twenty (fourteen hinds and six stags), providing them with an extensive range surrounded by a high fence. It is of this last-named herd that we are now enabled to give some particulars. On their arrival in this country in 1893 the animals varied in age from one to three years. They were captured in or near the Snake River Valley, Lake Idaho, by Mr. W. H. Root, of Laramie, Wyo., in the following manner:

In the fall of the year the deer "bunch up" or collect together to pass the winter, and are pursued by the hunters on snowshoes in the spring, when, the snow being soft and wet, the animals sink deep at every footstep, and may then be overtaken. Those first captured are roped on the forelegs, and then others are pursued, caught, and hobbled in the same way, so that sometimes a distance of a mile or two may separate the first caught from the last. At length, when the requisite number has been obtained the animals are conveyed on sledges to the ranch. Those consigned to Sir Peter Walker had to be transported 110 miles to the railway by which they were taken to New York, whence they were transported by the White Star Line to Liverpool, and thence to Ashbourne, Derbyshire. This was in October, 1893. By Feb. 1, 1895, three of them had died, it was said, from a disease akin to liver-fluke in sheep. The remainder of the herd were then moved from the front of the manor to their original pasturage near Copse Hill, and, the ground there being more elevated, their condition improved.

At the present time, however, only four of the original herd are left, and the last one that died having been submitted to the inspection of Capt. T. Aulton, veterinary surgeon, of Derby, he found, on a post-mortem examination, that death was due to a tapeworm (*Tænia marginata*) which infested the intestines in large numbers.

Although so few of the original herd now survive at Osmaston, the result of interbreeding with the red deer has been satisfactory, and at the present time, as the owner informs us, there are fifty-six hybrid deer surviving. One of these hybrids which was killed last year weighed 29st. 9lb., and carried good antlers, which resembled those of a red deer rather than a wapiti. No doubt good feeding had much to do with the weight. The food usually supplied at Osmaston is oats and peas, with beans occasionally for a change, and sometimes locust beans. In the spring they are given a moderate supply of dried acorns, which, being somewhat astringent, are effectual to prevent scouring. Throughout the winter months they get hay. It may be added, that for the purpose of carrying out the experiment of crossing, the red deer selected were of Irish descent, and were imported from Ireland in September, 1896.

## Bird Rookeries in the Gulf of Mexico.

MR. FRANK M. MILLER, President of the Louisiana Audubon Society, has recently returned from a tour of inspection of the bird breeding islands in the Gulf of Mexico. These islands, which from time immemorial have been great resorts for sea-fowl, have within the past few years become also resorts for eggers, so that the colonies have been constantly broken up and the birds driven away. Louisiana now has a good bird protective law and every effort is being made to enforce it.

During Mr. Miller's excursion, he found a small colony of laughing gulls on Sundown Island, but Martin Island Key, long famous as a breeding island and somewhat further from Pass Christian was found to be without birds, owing, as is stated, to the depredations of the crew of the schooner Alpha, of Ocean Springs, Miss. On the other hand, several islands in Morgan Harbor were found to have plenty of birds on them, although here also a schooner from Mississippi was seen and suspected of depredations. On one or two other islands birds were found breeding in great numbers—gulls, terns, man-of-war birds and pelicans—but on the other hand, many rookeries have been robbed by Mississippi vessels, it is alleged, and the birds driven away.

It is clear that much work still remains to be done in the way of watching the islands of the Gulf coast, but the Louisiana Audubon Society is heartily in earnest and will do its best. Much work is needed in the way of educating the people of adjacent States to a point where they will do their best toward protecting the islands of the Gulf.

# GAME BAG AND GUN

## Points of View.

BOSTON, Mass.—*Editor Forest and Stream:* The "Points of View" published in recent numbers of *FOREST AND STREAM* have interested me very much, particularly that one from the pen of Mr. John C. Kimball.

While it was presented as a quasi scientific argument, was confined to the scope of the faddist. Mere assertion or reference is not science.

It is quite a common occurrence in argument that man, wedded to a fad by the association of years, and mental trains of thought limited accordingly by long habit, comes to believe firmly that his pet idea is a universal fact. Time invariably refutes him.

The main point of view presented by Mr. Kimball is as follows: "It is a great law of nature set forth by Darwin, Haeckel, and other leading scientists, with wonderful significance, that the individuals of each animal species, including man, pass normally, in reaching their maturity, through all the preforms and phases, be physical and mental, that their tribe in its evolution has passed through. \* \* \* As infants, they go through all fours and utter only inarticulate sounds; in boyhood, have their anthropoid stage of climbing trees and indulging in all manner of monkey tricks; arrive later in the period of savage superstitions and a savage's fight in the use of weapons and in killing other creatures; and only in their full maturity reach the stage of the highest civilized humanity, that of love for God's creatures and of finding their highest enjoyment in the pursuits of peace." That applied solely to physical and mental development, not moral.

I respectfully submit that the learned gentleman has apprehended Darwin and Haeckel, and others, and that he has read into their writings some ideas which are not to be found in them. If there are such ideas in these authors' works, I would be very glad to know where in them they can be found. They cannot be deduced.

On the contrary, those authors describe in detail the ceaseless, incessant and world-wide destruction which has taken place in past æons, is taking place and undoubtedly will take place while there is life, animal or vegetable, on the earth. They are histories of destruction and reproduction.

In civilization, man takes to agriculture from necessity, not from choice. The animal life on the earth is insufficient to supply his necessities, hence he must derive sustenance from other sources or perish. But in civilization, man's instincts are not changed in the least. Agriculture and civilization denote a radical change of environment, not a change of human nature. Therefore man likes to go hunting when he can. That civilization has eliminated superstition is contradicted by the success of hordes of palmists, astrologers, fortune tellers, card readers, etc., which flourish in our great cities where intelligence is at its height, but where money is most abundant and therefore more available for the rapacious maws of the flatulents. The wearing of charms, amulets, etc., is common alone to savages. But his citation concerning superstition is irrelevant.

It will afford me much gratification if Mr. Kimball will designate just how much civilization has done to change human nature from what it was. Also, if the best enjoyment is in the pursuits of peace, what is the significance of the civilized wars, our national wars included, whose destructiveness far exceeds anything perpetrated by our savage ancestors?

Man reverts to the environment of savage life with promptness and delight. He gains health and strength such life far surpassing the potency of the doctors' trums. Such life is in accord with his true nature, and his true nature is that inherited from his ancestors, not from that faulty code thought out by the parlor philosopher, who, by the beneficence of civilization, does not, neither do they spin.

To join the killing of wild animals equally with robbery and murder as a capacity of man's nature is to beg and pettifog the question and argue unfairly. Lying upon each other is a trait of many different species to-day, and man himself is a victim to the needs many species. The tiger uses him for food on opportunity, as do some other species. Yet the tiger is a killer from malice. He acts and lives according to his nature as it came to him from creation. Yet there is no doubt but what some tiger who has lost its teeth might hold that teeth were not fashionable as the fox hold concerning tails once upon a time.

To pursue and kill wild animals was and is a pleasure and a necessity of man's nature. Without the power of passion for the chase man himself would have been exterminated long since. Thus such pursuit was and is a benefit to the human race, both in respect to obtaining a food supply and protection.

Robbery and murder are harmful to the human race. They have always been so regarded. They are considered as being the worst of offenses and are accorded the worst punishment. On the contrary, prowess in the chase is a theme of song and story.

The meaning of the word nature is not now as limited as Mr. Kimball. Its meaning is as understood now by all civilized-speaking peoples. Peoples make their own language to express their own ideas, and a word is coined in meaning, rejected entirely, or coined to fit the needs of the present. But human nature is independent on a word.

Mr. Kimball makes the mistake of dealing with nature as if it were a thing apart from man, something so distant that he can contemplate it without being involved in it. As a matter of fact, man is a part of nature to as much as is any other form of life, animal or vegetable.

That Mr. Kimball can study nature best with the aid of a camera is much as if he were to declare that he could study mankind merely by gazing in his own mirror. To me it seems that is a very narrow view of nature which is obtained via camera. If we accept it as the true view, then no one had a true view of nature before the camera was invented. No one has a true view now who views without a camera, and yet there are many very good people who do not own cameras, and who do not care for them.

Nevertheless no camera gives a true view even as a view, because the perspective, owing to the convexity of the lens, is always distorted, and such things as colors, variable expression, etc., all so essential to the beauties of nature, are impossible with the camera. Yet that perhaps is emblematic of the camera faddist's point of view.

When a man reaches the stage of life wherein he can study and enjoy nature with a camera, he should not deceive himself with the declaration that such idea is a universal concept. It is a personal idiosyncrasy merely. There are groups of faddists innumerable who, by assurances to each other of each others' excellence and worth, come to believe that they and their fads are true and universal; but fads and faddists come and go quickly without any marked effect on life or jolt to the world, while human nature and all nature remain the same forever. If all the freaks and fancies had been tagged to human nature according to the dictum of the heads which were in a stage of arrested development, or over-development, or hollow, human nature at the present time would be a motley exhibit indeed. Nature is all right as she is. JAMES H. DOUGLAS.

*Editor Forest and Stream:*

As I never was a sportsman (except in deer and fox chasing) I may have a "point of view" your various correspondents have not taken.

Now why not look at killing of wild animals from the view point of facts, as they are? Admit fully that abstractly, and from the viewpoint of pure reason all killing of any wild animal, not for some purpose of use, or by necessity is *abstractly* cruel? Is there any other conclusion to be reached by any process of pure reason? I think not.

But the world does not, never has, nor do I believe it ever will, be guided by pure reason, nor should it be in practical directions. Even mathematics is not a science of pure reason, when we come to use it; if it were, I would not remember so much of conic sections in matters wherein I have had use for it, and have utterly forgotten how to arrive at the "least common multiple."

Now there is no denying the fact that there are, and have been, thousands of men of the kindest, tender hearts, men of "Uncle Toby's" type, who were most ardent sportsmen. I need only cite one most eminent example—the late Hon. Felix R. Brunat. The man who staid far in the front in the bloodiest battle in the Civil War, aiding and succoring the wounded, who unshrinkingly performed the most revolting offices of field hospitals, who took his life in his hands and visited the camp of the Modoc "Captain Jack" after that treacherous scoundrel had murdered General Canby, under a flag of truce; and whose whole life was one of self-sacrifice. How can we say that such a man was "cruel"? Or remember the late General Bristow, who left us the noblest example of official purity and honor, not merely in act, but in thought?

What is the use of ratiocination that would stamp such men as cruel?

What breed of men stand higher for all the best attributes of kindly manliness than the English country gentlemen of the true type, and who are keener sportsmen?

It may be amusing to trace out (or imagine we are doing it) how such men and such a race of men can enjoy "killing things," but guessing matches at that teach nothing, and solve no problem, while the fact proves a lot. So it seems to me to be the reasonable thing to settle down to it being a fact that killing wild animals for the pleasure given cannot be cruel *per se* when such men do it.

I fancy that Mr. William H. Avis wrote of "the tortured animal" in a vivisection in a lack of exact knowledge of how vivisections are conducted. All physicians I have talked with have said that they never saw a vivisection when the animal was not rendered insensible to pain. It is evident that the operator would not have the animal squirming from pain, while operating. I think that in cases of vivisection of the brain, an anesthetic cannot be used, as the brain functions would be interfered with, and that in such cases cocaine (I guess that is the agent) paralyzes the nerves in the scalp, which is then cut off, and the drilling of the circle of holes in the skull is almost painless.

I think it probable that (being a layman) I have not got all the details correct, but I know I am near enough for a layman, and for my brother laymen I also know that for heartless cruelty, the ravings, in entire ignorance of what they are shrieking about, of anti-vivisectionists are doing great work for Satan, and his tail must wag itself crooked whenever he reads anti-vivisection literature.

As for the fellow who called President Roosevelt "an educated bulldog," he wrote that the lady whose neck vertebra were crushed in a chase after a tame deer was "served exactly right"; in self-sufficient ignorance of the fact that the deer was safely in its stable before the hounds were loosed, and that it was the deer's trail that was chased.

However, to one who knows the noble, affectionate, but indomitable character of the true bulldog, it is no insult to call President Roosevelt one, as I know of no animal which comes as near our honored President. But, of course, an "angel" is not expected to know the disposition of bulldogs, nor the customs of a "carted" deer chase. WM. WADE.

## North Carolina.

RALEIGH, N. C., July.—Curator Herbert Brimley, of the State Museum, has returned from a visit to the little known lakes in eastern North Carolina. There are five of these, three being in Jones and two in Onslow county, and all are remarkable. Tradition says that all these were once great beds of sphagnum, moss and peat, and that during very dry seasons this was burned, in the depression water settling, coming in not from streams, for there are none flowing into the lakes, but from the surrounding country. Mr. Brimley says the stories as to this mode of formation of the lakes appear to him to be well founded, for upon examination he found the sand which covers the bottom of the lakes to be the finest he ever saw, and he is convinced it is sand which was blown upon the beds of sphagnum by gales of wind during the course of many years and which has made the bed of the lake of infinite smoothness. The water is extremely shallow in these lakes and one can wade out a great distance, at 200 yards from the shore the water not being more than neck deep. The lakes are several miles in width, and one of them has to be waded in order to get at the most important one of the number. In one lake there is a large colony of Florida cormorants, the most northerly one known of this species, there being said to be another in a county in the extreme southeastern part of North Carolina. Secretary Gilbert Pearson, of the Audubon Society, who visited the lake in question not very long ago, counted 150 nests of the cormorant, and allowing two old birds and three young to each nest, there are 750 in the colony, which, Mr. Brimley thinks, is a very close estimate. These lakes mark also what may be termed the northern limit of the alligator, and some of these saurians are of great size, almost as large in fact as the biggest in Florida. The alligators keep a very close eye upon the cormorants, particularly the young ones. On one occasion Mr. Brimley was standing waist deep in the wonderfully clear water of one of the lakes on the lookout for alligators, rifle in hand, when he saw a young cormorant swimming some fifty yards from the shore. He then saw the eyes of an alligator suddenly appear, not even rippling the water, some yards astern of the cormorant, which was about three-fourths grown. The alligator, taking the bearings of the bird, sank and then the eyes reappeared, this time only half a dozen feet astern, again sank and in a moment there was a tremendous upheaval of the water, like an explosion, and in the midst of which appeared the big head of the alligator, who, in a gulp or two, took down the struggling cormorant.

Mr. Brimley found that the young cormorants occasionally fall from their nests and that the wily alligators keep on the watch for them in such a case. Of course it is but seldom that they get the grown ones. Mr. Brimley cannot give an idea, he says, of the number of alligators in these lakes. He shot one nine feet in length, after quite an adventure. He had waded out some distance, there being no boats, and was standing motionless when he saw the eyes of an alligator. He fired and struck; the animal sank but reappeared and he shot it again. Then it sank and did not reappear and he had to perform the task of wading out toward it and feeling for it with his feet, not knowing whether it was dead or alive; a very uncanny proceeding. To his great satisfaction he found it dead and brought it in. It was found that the bullet, penetrating his skull, had at its exit torn out a place as large as one's fist.

Mr. Brimley says that at the angles these alligators present for shooting a bullet has to be put into a very small mark to kill, as otherwise he thinks even the highest powdered bullets would glance. The killed alligator is nine feet in length and the skin is now being prepared for mounting in the museum, Mr. Brimley being a very accomplished taxidermist. He fired at the alligator which was swallowing the unlucky cormorant, but thinks he missed it, the conditions for shooting being bad, as he had to look at the scene through narrow spaces between cypress knees and trunks of those trees. He shot but failed to get an alligator over twelve feet in length, judging from the distance between the eyes. He says it was a monster, by far the largest he has ever seen anywhere in this part of the country.

In the southeastern counties, not far from Wilmington, there are many alligators which attack cattle and hogs not infrequently and which have been known to attack people. Seventeen years ago one of them crawled upon a causeway on a turnpike and attacked a horse which was being driven to a buggy, in the buggy being a young man and young woman. The young man had a heavy revolver and he met the alligator at close quarters, it requiring five shots to finish the latter, which, it is said, was eleven feet in length and of great girth.

Curator Brimley was accompanied on his visit to the lakes by State Entomologist Franklin Sherman, the latter collecting many insects while Mr. Brimley applied himself to alligators and snakes mainly. Two very large specimens of the cotton-mouth moccasin were shot and brought here. This snake is as deadly as the rattlesnake, though its fangs are not so large. In parts of North Carolina it is called the "swamp lion," and people declare that it will attack persons who venture into the thick swamps, known locally as "pocosins." Deer hunters tell me that early in the autumn they have had, on a number of occasions, to shoot these snakes in self-protection, and declare that the snakes advanced upon them fearlessly. This snake has a tail as blunt as that of any rattler and a very large head.

Curator Brimley has completed the work of mounting and exhibiting the specimens of the beasts and birds of North Carolina, which fill one of the halls in the notably fine museum here, the latter being not even approached by anything in this country south of Washington, and no other State except perhaps two having a collection com-

parable to the one it contains. The variety of both birds and animals takes a wide range, all the way from the pelican to the golden eagle and the parakeet, and from the harbor seal to the beaver. One of the cases which attracts much attention contains eagles, very life-like in pose, and with all the accessories carried out with marked faithfulness of detail. Another represents a scene in the life of a large family of opossums. This also is in every way admirable. Fine examples of the buffalo, the elk and the panther tell of the time when all of these animals were numerous in North Carolina. The last record of the buffalo in the State is about 1780, and the last of the elk about 1810, while only a few panthers now remain, these being entirely in the wildest mountain regions.

To return to the lake territory visited by Mr. Brimley and Mr. Sherman, it may be said that it forms part of the great game preserve. The lands in which the lakes are set contain 57,000 acres outside of the lakes themselves, and all is held upon lease, for the hunting privileges, great numbers of deer, ducks, etc., being killed by the sportsmen who have the land lease from the owner, the Bryan family of Newberne. In one of these lakes there are fish, while in the others there do not appear to be any, though there is no reason why they should not be fully stocked. At one time all this property was owned by the State and the lakes were what were known as "swamp lands," some years ago an effort being made by a Raleigh sportsman to buy some of them at a fixed price per acre.

Lake Ellis is the property of James A. Bryan, but the other lakes belong to the State, or rather to the State Board of Education, and under a peculiar provision which gives that Board the title to all the swamp lands. Twenty years ago Mr. Bryan planted Lake Ellis in rice, but there was a failure and the signs of cultivation now show only in the ditches, which are themselves under water. The water in Lake Ellis appears dark because the bottom is of humus. Great Lake is the clearest of all, the bottom being of snowy sand. The fish are in Lake Ellis, though every part of the latter can be waded except a few of the ditches. These lakes form one of the finest inland hunting preserves in the South Atlantic States, and the bags of ducks made there last winter were large enough to gratify any sportsman.

The outlook for game during the coming season in North Carolina is very good indeed. June was a favorable month for young partridges, and good broods were brought off. The Audubon law is found to be working excellently well, and the dissemination of literature regarding birds has stimulated knowledge on the part of farmers. Dogs are among the greatest destroyers not only of young partridges but of the eggs of that bird, negro families in the country always having at least one dog, which lives very largely upon what it can pick up anywhere in its region. But the number of country negroes is very rapidly diminishing, as they are deserting entire neighborhoods in some cases and going to the towns, sawmills, etc., and in a very great many cases drifting northward, allured by labor agents, so that the danger from their dogs to the birds grows less and less.

At the State poultry farm at Raleigh, which is under the management of Mr. J. S. Jeffreys, a pheasant hen has brought off a fine brood of her young of her own raising. The little birds are so artful in secreting themselves that not even a trained eye can discover them in the grass about their homes, though their mother is not particularly timid. Usually, in fact invariably here, the eggs of pheasants are hatched by hens, but in this case Madam Pheasant wanted to show that she could look after her own affairs, and so far she has been very successful.

Good news continues to come from the shore bird rookeries on the North Carolina coast, particularly of those of the terns, not far from Beaufort, in which Mr. Gilbert Pearson is so much interested. Later in the year Governor Glenn and the writer intend to have a look at these rookeries, upon invitation which Mr. Pearson has given, and will make the trip in the Audubon patrol boat, which is in commission, and which has done good service this year. Later another of these boats will be built.

Supervising Game Warden John W. Upchurch, of Raleigh, who during the past two years has done such excellent work in the way of bird protection in two-thirds of the State, has been laid up with rheumatism for several weeks and is just now getting on the road again. The writer had the pleasure of nominating Mr. Upchurch to Governor Aycock for this position, and has always felt that by this nomination and the Governor's prompt appointment a great service was done both for bird lovers and to birds, notably partridges and song birds all over North Carolina.

FRED A. OLDS.

## An Arkansas Outing.

AFTER many hot and weary days in the valley of the Arkansas River, on a day in July, accompanied by my wife and our two children, Harry and Leo, I went to my farm in the Ozark Mountains, where the air is pure and cool, the water is cold and sparkling, and fruits of all kinds are in luxuriant abundance. And how cool and quiet the evenings were. The house sits up on the hill and at the northwest corner of the porch bubbles up one of the finest springs in Arkansas. On our first evening we sat upon the porch and listened to the whippoorwill, as he gave his strange and thrilling notes, while away across the valley on the far mountain top a great owl gave his weird cry of "Who-who! Who-are-you?" and the insects sang and buzzed and the cool breezes of the mountains fanned and lulled us to drowsiness.

What a night's sleep one gets in such surroundings, and how refreshed we were in the morning. We began to get our fishing tackle in shape for the gamy bass that lurk and lie in the crystal pools of White River. There were squirrels, too, in the mountains and valleys. We had a fine pack of fox hounds, or at least were part owner of them; and the foxes were abundant back a few miles from the railroad. One fine evening, after a rain, I took Harry, who is an enthusiastic hunter and fisherman, out with me to have a fox chase. The nine hounds comprising our pack were in fine shape, and we went some two and one-half miles west of the little town of Brentwood, to a spot where a cyclone had torn the timber down some three years before. When we were just at the edge of

the wilderness the hounds picked up a trail and worked it for an hour, when they lost it. Going around north the dogs became scattered, when Spot, a fine young hound, and another named for William J. Bryan, struck a warm trail and were soon gone out of hearing into the cyclone-torn timber. Riding around a point of the mountain and out on to a ridge, we could just hear a faint sound of these two hounds and two more that had joined them. But they were coming our way, and soon all the pack were off like the wind to join them. Shortly the entire pack were coming up the mountainside in full cry, and a great race it was. We were eagerly straining our eyes for a glimpse of the fox, when he crossed the opening like a gray streak, and right behind him, silent as the grave and straining every nerve, was Bryan fully 200 yards ahead of the pack. But almost before we had time to turn our horses to follow, the pack swept by. Circling a few times around the mountain side the fox started again to cross the open space, when Bryan, about midway of the small clearing, overtook him and our chase was over. He was a fine gray fox, but only lasted one hour, after the dogs had him on the run.

We had many more chases during the two months we spent in the mountains. One night we started early in order to reach this place, where the foxes, wild cats and other wild animals congregate, and soon had a fox on the run; and in about two hours he went to earth. When we reached the place, Jim, one of my dogs, was not there. We dug out the fox and then went out on top of the mountain, and, stopping our horses, could hear Jim away down in the jungle; and by the way he gave tongue we knew that he had something up a tree. The other dogs all went to him at once, and when we got there we found up in the tree the largest bob cat I ever saw. But no sooner did he see us than he began to come down, and, leaping when twenty feet off the ground, made his escape. He was forced to take to another tree in about a mile and tried the same tactics, but the dogs were too quick for him and soon he was a dead cat.

We spent many pleasant days fishing in the cool waters of the west fork of the White River, pursuing the gamy small-mouth black bass that abound in that stream. And when tired of fishing and following the hounds, we found squirrel hunting as good as any one could wish. The crops of nuts and acorns for the past two years have filled the mountains around Brentwood and Winslow with squirrels, and they furnish sport at all times. There is one thing about the squirrels that I observed: For more than two months Harry and myself killed from one to three or four—never killing any more than could be used for food—and of all this number there was not one that we could call a fox squirrel. They were all gray squirrels. I returned there in October and made three short hunts and killed thirteen squirrels, and six of them were very large fox squirrels. Where did they come from?

One other thing I did, I found a bee tree. One evening while resting by some water in the woods, I noticed some bees coming for water and going immediately away as soon as they had their fill. I soon got the direction they took, and going a short distance found them at work, going in and out of a hole in the top of a large black oak. I cut the tree the next day and got a fine lot of honey.

Last but not least of my experiences, I ran close on to a panther, and was scared out of my wits, as I had neither dog nor gun, and it was late at night. I had to go a mile to get home, and this through a cornfield. The panther kept up the noise but did not come any nearer to me, so far as I could tell. It is a great mystery where this panther came from. It has been in that vicinity for the past six months, and while it can be heard almost every night somewhere in the neighborhood, very few people have seen it.

But my story is getting too long. The good the outing did my family and myself is almost beyond computation. The transposition from the heat and dust of the town to the cool shade of the mountains, where the breeze is always cool, where the water—as pure as it is possible for water to be—bubbles from the earth and goes tumbling over the gravel bed of the rivulet on its way to the sea, and where orchards are laden with the finest of fruit, where everything combines to make glad the heart is, in my judgment, a better place to spend the summer than in any fashionable summer resort. In the country you can take life easy, you can rest from your labors and fill your lungs with the pure ozone of the mountain air and return home with your vitality increased and your nerves strengthened to begin again life's battles.

J. E. LOUDON.

ARKANSAS.

## Cats vs. Birds.

BOSTON, Mass., July 8.—*Editor Forest and Stream:* Our good friend, Professor Hodge, has created quite a commotion in Worcester by killing off some of the felines that frequent the neighborhood of Clark University. It seems Mrs. H. B. Green, of Hawthorne street, missed her pet kitty named Bud, and, calling at Dr. Hodge's house, reported the fact to Mrs. Hodge. Afterward she went to the University to look for Bud, and later secured an interview with the Professor, but was unable to get any trace of her pet. So, with a woman's tenacity of purpose, she called on Dr. Hall, the president. Not satisfied with the information she had obtained, Mrs. Green took the matter to her lawyer and called up the police office, and at last, called on the agent for the prevention of cruelty to animals, who promised to investigate some of the stories he had heard from several persons about losing their kitties.

Professor Hodge advised Mrs. Green to put a collar on her cat, if she wanted to keep one, remarking he thought "she had better keep a dog." It seems since Dr. Hodge lost a couple of his partridges there has been something like an epidemic among the cats that have been meandering about, and the Doctor does not deny his knowledge of what has become of some of them. But he claims the right to protect his property against what he terms "stray cats."

On being asked his opinion, Mr. A. B. F. Kinney said the experiment Dr. Hodge is making is of interest not only to the whole State, but to the world, and, in his opinion, a "few cats" should not be permitted to frustrate his attempt to raise grouse in captivity.

If he were raising chickens or ducks, he said, and they

were killed by cats or dogs he would resort to such means as he saw fit to exterminate them and protect his property. That roaming house cats are among the worst destroyers of bird life is a well known fact, and the man who shoots one of them saves many birds. They often go on a regular hunt over the farmer's mowings and into his wood lot, and it is pretty sure death for a young robin, quail or partridge that comes within line of vision. It is a question open to argument on both sides whether cats do not kill more birds than foxes do. Dr. Hodge's crusade against wandering felines should be productive of good in the preservation of bird life.

CENTRAL.

## A Handy Candlestick.

THE hunter of experience has learned that an oil lamp or lantern is bulky and nine times out of ten leaks out or runs over his duff. A large number have come down to the candle, which never leaks and does not take up much room. It furnishes enough light for one's tent, a little light is necessary.

The folding candle lantern is very good, but if it should break or be lost the birch bark candle-stick is the next best thing. This candle-stick can be made in five minutes.

It can be made in almost any part of a forest, as birch bark can be had at almost any time. The construction is as follows: Cut a stick about one foot long and one inch thick. Split one end down two inches and sharp a point at the other end, as shown in Fig. 1. Then peel off a piece of birch bark two inches wide and four inches long, as in Fig. 2. Bend the bark to the size of the candle and slide it in the split stick, and your candlestick is made. It is then stuck in the ground in any part of the tent desired. The longer the stick the higher the light will be.

E. M. JOHNSON

## The Adirondacks.

BLUE MOUNTAIN LAKE, N. Y., July 3.—*Editor Forest and Stream:* As you like news from the Adirondacks, I will state the latest and most important item: The sun shines! June was a drencher. A hotel man who makes observations, says about twelve inches of rain fell in June. Many agree that they never saw this lake so high. In consequence the fishing has been only fair. But the law of compensation holds; there are more trout left for later comers.

I like your plan of publishing a series of articles about cheap summer homes. They make for the strengthening of the work of our national life, the family. Hotel in the cities breaks that up too much. The summer trip to the country should set the other way. Push the cheap house idea. Permit also a suggestion. Prospective buyers can save expense for enlargement as needs increase by erecting higher buildings at first.

It costs no more to roof two floors than one. The siding costs but little more when the building is made one and one-half or two stories instead of one, and capacity is doubled. Rooms above can then be finished as needed.

Four new cottages are erected here this season—some quite elaborate. At Eagle Lake, connecting with this new club house, boat house, and many improvements greet the visitor to the golf grounds. Cottagers and some hotel guests are coming in, and more to follow.

JUVENAL

## Vermont Notes.

SHELDON, Vt., June 30.—*Editor Forest and Stream:* Since my last letter to you I have had, through the kindness of one of your old subscribers and occasional correspondents, Mr. H. A. Noyes, of Hyde Park, several lightful outings in the "Digging's Woods," which is situated east from Hyde Park. We made some catches of trout, and saw numerous game signs. We saw deer, ruffed grouse, woodcock, etc., and if I had seen beaver tracks, we saw such tracks in one locality. The woods are very extensive and contain miles of a tangle swamps. The streams are no place for the fisherman to visit.

Do cats possess the sense of direction? A lady in Sheldon last winter gave to her son, who resides in Walden, fifty-five miles distant, her house cat, which was a household pet. Pussy remained for a time quietly at her home, until the last of January, when she disappeared and a few weeks later turned up at her old home in Sheldon. This journey was made during a season of extremely cold weather and snow storms. It is interesting to say that the cat will remain at her old home during the remainder of her days.

STANSTEAD

## SEA AND RIVER FISHING

## Jugging on the Mississippi.

I DON'T know as this can be classed as game fishing; when the water was clear and low and the channel fish were hungry it was very exciting sport, which in my younger days I often indulged in with the keenest enjoyment. But it is too hard work for an old man, and our great river has been so thoroughly drained by the market men with their bait and trammel nets, trotlines and drag seines, it promises very uncertain returns now.

About thirty-five years ago I was so unfortunate as to be obliged to remain a month at Hamburg, Calhoun county, Illinois, a small landing some fifty miles north of St. Louis, containing two trading stores, whose chief articles were tobacco, sugar and calico, and about a dozen dwellings. To this day this country is designated as the "Kingdom of Calhoun," owing to its isolated and peculiar condition. While the surrounding territory is very populous and fertile with all the usual facilities of business and intercourse, this is isolated by being bounded on the east, west and south by the Mississippi and Illinois rivers.

It is a long narrow strip of hilly land, thereby unfitted for the usual agricultural products, sparsely populated by the old-timers, who have always exhibited the greatest antipathy to the negro, not one of whom has been allowed to locate there, and they even object to their traveling across their district. Formerly this country was heavily timbered and its chief products were cord wood and the best oak barrel stuff and railroad ties that were carted to the river landings and floated to St. Louis; but these trees were cleared out twenty-five years ago, and the hills being well adapted for fruit culture they introduced numerous orchards, and now export large quantities of our Ben Davis or Red Missouri apples. Up to ten years ago the Kingdom of Calhoun did not contain a telephone, telegraph or express office, and to-day has no railroad, while the bounding countries are netted with them. Neither does it afford any game fishing streams or lakes. For this reason, having nothing to do but wait for the slow tow of a heavily loaded barge of machinery up the river, I grew very weary until I thought of jugging, for which the stage of the Mississippi is particularly favorable at that time.

It will be understood, as the name implies, that this sport simply requires a dozen or so of corked jugs to be handled of each of which is secured a stout cotton line about No. 36 three feet long, and a catfish hook baited with almost anything from old meat to spoiled cheese rind. Marketmen generally use tin cans or dry white pine floats for this purpose. I found this tackle at one of the stores and from that time until my departure I supplied free of cost all the town of Hamburg with the finest channel catfish, which, by the way, is excellent eating, especially for people who enjoy a buffalo or even "Dutch" carp. "German" is too respectable a name for this contemptible class of the finny tribe.

To illustrate the details of this sport I will give an account of one of my most successful trips, explaining what for fast and comparatively easy work it is best for one to be accompanied by a helper, but not being inclined to the companionship of any of the loafing natives, a brier root was enough company.

Taking my skiff, I rowed up the river about three miles, then baiting the hooks, I dropped the jugs across the channel about twenty-five feet apart and dropped behind waiting results. In calm weather, when the water is smooth, a one-pounder will bob the floats perceptibly and larger ones will yank them around at a lively rate, but it requires a big fish to sink them for more than half a minute, and another thing is that the game seldom escapes; once hooked, they are there for good.

I had only had time to pipe up and regain my wind after the arduous exercise of rowing until the fun commenced. A jug bobbed, and after it I went, pulling in about a three-pound catfish. By the time the hook was rebaited and thrown back into the water, two jugs were jumping around, so the sport was growing exciting and somewhat laborious.

This continued for about an hour, while I was floating down stream, securing more than a dozen fish of from two to fifteen pounds, when something surprising occurred. One of the jugs went down as a black bass takes a cork. Presently it appeared some distance away, sliding rapidly over the water. Grabbing the oars I put after it, running bow on and jumping to the front only to see it sink quickly and scoot off under the surface. Again and again I went for it with the same results. Noticing that the disappearances were growing shorter, which indicate that the cat was getting tired, as well as myself, I rested, while the fish still kept going with less efforts until the float was nearly stationary. Then I quietly paddled alongside and grabbed it with both hands, when down it went with a rush that caused the boat to take a tub of water and pull me nearly overboard.

Talk about your game fish—my experience with the rod and throw line is that the cat pulls more and dies harder than any other fish of equal size. When a boy I caught an eight-pounder at noon and carried it upon the bank, as I was afraid to string it with our bass and crappie, where we could hear it flopping around for some time. Nearly five hours later, when well started home, my elder brother, finding our big fish apparently dead and covered with dirt and leaves, walked out on the fallen treetop to wash it off. As soon as he gave it a swish in the water, it suddenly revived, pulling him into the stream; and although he was an expert swimmer and had it by the gills, it escaped, to our great disappointment.

To resume. Seeing that the job was rather difficult for one person, I used more caution, so as I grabbed the jug again and gave the line a quick turn around the oar lock and sat down until my game was completely exhausted, then dexterously pulled him aboard. The scale weight was 70 pounds.

By this time the floats were badly scattered, and being below my port I began gathering them in, when my only two-gallon float went down like a flash, and although I stood and closely scanned the water in all directions for about fifteen minutes, it never appeared. The fish must have been a whopper.

Formerly we had some very large fish of this class. Nearly fifty years ago a market man caught one I saw at Quincy, Ill., that weighed 220 pounds. It is very exceptional now to hook one over half this size.

S. E. WORRELL.

## As to Pompano.

Editor Forest and Stream:

Will you or some of your readers kindly tell me something as to the fish pompino, or pompano? It is on the market here, San Francisco, quoted retail at \$2 per pound. I bought two pounds in January at fifteen cents per pound and found it a very fine fish. It is thin, as broad and as long as a man's hand, small, blunt head, very little waste in dressing, comparatively free of bones as fish go. Is silvery white on the belly and gradually shades on the sides to a dark gray or bluish black at the back. In taste, texture, flavor, etc., it is as fine a fish as I ever ate. By some people it is called the "butter fish." But others tell me it is not the butter-fish of the Atlantic. I have consulted dictionaries and encyclopædias, but such as I have gave me no light as to the pompano or pompino. What I did find under the head of "butter-fish" did not seem to apply to the fish I am curious about. One authority said the flesh of the butter-fish was not in high esteem. Here, however, the pompano is considered the *bonne bouche* of the finny tribe by gourmets and epicures. The price for years here has run between 50 cents and \$1.50. The dropping to 15 cents last January was on account of an extraordinary catch. Within a few days, however, the price went to 35 cents, and has now got up to \$2.

A fresh fish that will command \$2 gold for sixteen ounces avordupois at a seaport must have other merit than rarity or scarcity. I found a man (professional) who said he used to get pompino from Pensacola Bay, at New Orleans restaurants, and that they were considered a luxury there. His pompino dinner began with a Swiss ess followed by turtle soup and sherry; then a salad, then the pompino and fried potatoes, with a red wine, closing the luncheon with fruit, black coffee and a cigar. His description of the fish corresponds with mine except that he said those in the New Orleans market were from six to twelve inches long. I have never seen any here longer than six inches. These come from southern California seas around San Diego, San Pedro and the Catalina Islands.

Also please tell me whether there are any true turbot in American waters. I often see the turbot spoken of in English papers as something evidently superfine. My encyclopædia says that what is known in this country as spotted turbot is New York plaice. Soyer, in one of his stories anent the Crimea, speaks of clout, or knotted turbot, "a peculiar kind of turbot found in the Black Sea, leaving the inference open that there are several kinds of turbot, all of excellence.

Goodholme declares Spanish mackerel to be the choicest of all fish, "perhaps." I used to think that the small-mouth black bass of Michigan and other Eastern States waters were the finest table fish in existence, with mountain trout second on the list. But I hear people dispute my claim as to the bass being superior to turbot. I was practically raised on black bass and for many a one did I troll from a catamaran on Detroit River and Lake St. Clair, and I might be prejudiced in their favor on that account. I have eaten all kinds of salt and sweet water fish on the Pacific coast, and I must say that I found the pompino a delectable morsel, I and a friend making a dish of them—the *pièce de résistance*—at an Italian table. That is, the auxiliary dishes were Italian—the vegetable soup, chicory salad, Italian bread (white), mashed potatoes, stuffed French artichokes, stewed calf's head, were all from Italian recipes, and winding up with Swiss cheese, California fruits and a champoreau. The beverage was California dry Sauterne, a bottle between the two of us. That menu, including the two pounds of pompino, cost \$1.30 all told. This was at a modest Italian restaurant in the fish market district. The cooking was perfect. At the swell restaurants and grills it could not now be duplicated for less than \$10 or \$15, that, of course, including champagne. So I feel that buying pompino in San Francisco at 15 cents per pound was the seizing of one of those opportunities that so rarely present themselves. I had previously looked upon pompino with longing eyes, but deemed it a sin to expend upward of half a dollar a pound for them. That 15-cent day is a red letter one in my diary of gustatory experiences. It certainly was a superb luncheon. I have paid 50 cents a pound here for Lake Tahoe and Truckee River trout and did not consider that excessive.

But I do want to know more about the pompano—its scientific name, habits, natural history, etc., and will thank anyone who will gratify my curiosity through FOREST AND STREAM.

A gentleman tells me that he has eaten pompano in New York city which he had purchased under the name of butter-fish at ten cents per pound. They were the true pompano, he said, but were to be had so cheap because very few people appreciated the excellence of the

fish. He said they sometimes were caught as far north as Connecticut, having evidently taken an excursion or exploring trip up from Florida or Caribbean waters. The public, he said, were not educated up in the merits of fish, or there would be more discrimination shown, and the wealthy would be making such a demand for pompano as to keep the price way up.

In my investigations in quest of knowledge as to pompano I ran across the word "pompilos" in Ainsworth's. Pompilos was defined as "a kind of fish which swims with its belly upward."

In the Century Dictionary I find "pompilus," (from the Greek, meaning a fish that follows ships), "a genus of stromateoid fishes: same as centrolophus."

The said dictionary also contains "pomfret" (apparently corrupted from the equivalent Portuguese "pombo" or "pampo"). "In the East Indies a fish of the genus Stromateoides, distinguished from the other stromateoids by the restricted lateral branchial apertures. The white pomfret is *Stromateoides sinensis*, having no distinct free spines between the dorsal and anal fins, and the caudal lobes sub-equal. It is highly esteemed for its flesh. The gray pomfret is *Stromateoides cinereus*, which has free truncated spines before the dorsal and anal fins, and the lower caudal lobe much longer than the upper; young specimens are called silver pomfrets."

There is seemingly some connection of pompino or pompano with pomfret, pombo, pampo, pompilos and pompilus. Are any of your readers able to trace it through? I've heard sailors who have been in Chilean waters speak of a fish called the pampanito down there, and from their description it corresponds with the California pompino. Pampanito, however, appears to me to be more of an Italian word than Spanish, but as the other words are apparently of Greek and Portuguese derivation, they are all suggestive of the Mediterranean, and I've an idea that the pompino may be a well known fish in Italy and other Mediterranean countries, but under a different name now. It is, seemingly, a fish that belongs to tropical salt waters, and the seas immediately contiguous to the north and south, sallying forth, perhaps, periodically, in schools from their natural geographical habitat in a spirit of adventure to foreign waters.

Since writing the foregoing I was told by the clerk of a fish stall that twenty years ago a pompino was caught in Monterey Bay, California, that weighed 12 pounds (192 ounces), and that the fish was sold to the Mercantile Lunch, in San Francisco, for \$25 spot cash. I have had no opportunity, before this writing, to attempt to get this story corroborated, though I have no reason to doubt it, and tell it here to show that the pompino may grow into a goodly-sized fish. The same clerk told me that nowadays the pompino that could more than cover a man's hand is a *rari avis*. He could not explain the discrepancy in the sizes of twenty years ago and of to-day, except that, possibly, the fish were being fished out too closely. He also says that the pompino and the so-called butter-fish, are two different fishes, and should not be confounded, although they look alike.

I have written to Dr. D. Starr Jordan, ichthyologist of the Leland Stanford, Jr., University, for information, but in the meantime I should like to hear from your readers in the Southern and Atlantic States as to what they know about pompino. I shall take pleasure in reciprocating in a like manner any time in the future.

WM. FITZMUGGINS.

SAN FRANCISCO.

Since my former letter as to pompino I have continued my search for knowledge as to this high priced fish, and got a clue in Good Housekeeping which, in an essay on the preparation of fish, spoke of the pompano. The spelling made a difference, and going back to the dictionaries and encyclopædias I found some interesting information in the Century on the pompano. Evidently that is the correct spelling, although in the market reports of the San Francisco daily papers it is spelled habitually with an "i" instead of an "a". Some people say there isn't much in a name, but in this name the spelling of it sent me off on a sort of wild goose chase for information, and caused me to consume considerable midnight oil in pouring over ponderous tomes, and spreading much writing fluid over white paper in making memoranda or penning questions as to the identity, habits and history of a fish. My bump of curiosity had got fevered, and nothing but facts and truth would allay the fever. But no harm is done if it all results in somebody being made more wise as to pompano. "You must have pompano on the brain," said a friend to me who was witness of my efforts at the library to get at the information. I admitted that I had, and that I would not be cured of the malady except by knowledge. So I am feeling better to-day after having found a few remarks on pompano in the Century. That authority says the name is applied to "the fish *Stromateus fiatola*. A cangaroid fish of the West Indies and South Atlantic and Gulf States, *Trachynotus carolinus*, attaining a length of eighteen inches and highly esteemed as a food. \* \* \* The name also extends to other members of the same genus as the ovate, round or short pompano, *Tovatus*, of tropical seas (and north as far as Virginia), and the glaucous or long-finned pompano, *Tovatus glaucus*, of tropical seas (and north as far as Virginia or Lower California). In Florida along the western coast of Florida, a geroid fish, *Gerres olisthostoma*, specifically known as the Irish pompano. In California, the *Stromateus simillimus*, quite different from the fore-named, and is closely related to the harvest fish, and to the butter-fish or dollar-fish." Anyway, that establishes a standing for the pompano with me.

In the Young Folks' Cyclopædia I am told that the pompano is common in the West Indies and in the South Atlantic and Gulf States, is eighteen inches long, has a

blunt nose, and is bluish above and silvery or golden on the sides. Also, that the California pompano is a different kind of fish, abundant on the Pacific coast in the good old summer time, seldom more than a foot long, and is blue above and silvery below. That it is also a good food fish, and that its name is derived from the Spanish pampano.

I am told by a fisherman that pompano weighing one pound have been caught as far north as Point Arena, 39th latitude, but not often, and that their usual habitat does not extend in the Pacific further north than Montcrey. That it is periodically abundant in the Mexican seas and the Gallapagos Island waters. He insists that it is the most delicate and finely flavored of all salt water fish.

At any rate, I have discovered this: That the pompano is to be found in the Pacific Ocean along the shores of the Americas between latitudes 40 north and south—from Cape Mendocino south to Valparaiso, but at these extremes the fish appear only periodically, and are thus migratory; that most of the pompano taken are less than a pound in weight and more usually under eight inches in length, but that now and then one is taken that has a phenomenal length or weight, the latter not exceeding 12 pounds, and the former not in excess of eighteen inches. I am also more than ever inclined to the opinion that the word pompano is of Portuguese origin, and came from the Mediterranean, or Latin, country salt waters, or possibly from African Atlantic (Canary Islands and Gulf of Guinea) waters. That there is a large fish known as the pompano, at least larger than the California, my conclusion having been arrived at from the name pampanito, that being the name for the California pompano in Chilean and Peruvian waters. According to my etymology, pampanito is an Italian diminutive of pompano, signifying little or small pompano. This would mean that Italian sailors or fishermen recognized a fish in the American Pacific similar to a fish that they knew in the Old World waters, but of smaller size, and named it accordingly.

There is a passage in a version of Horace which reads:

"Or the rich turbot, or the dainty char,  
If ever to our bays the wintry blast  
Should drive them in its fury from afar."

That would indicate that the turbot and char were driven at times into, for them, strange waters by rough weather. From what I can learn, the pompano does not make its appearance in north California waters through stress of storm—on the other hand, it is more likely to return to, or hang close to, equatorial waters.

It is said, too, that often schools of the true Spanish mackerel appear in California waters, the schools having evidently crossed the Atlantic from the European waters, "rounded the Horn," and came up north on an exploration trip.

I believe that the migration of birds and animals has been held as a mystery, and perhaps that of fish should be held so, too. Perhaps the almost total disappearance of cod from Norwegian waters may be accounted for in the surmise that in an instinct for self-preservation the cod have found a new habitat in some other portion of the briny world. Did they, too, like the Spanish mackerel, send out scouting or exploring parties, from time to time, for ages past, to discover and keep in touch with possible seas or depths or banks of refuge? Did they have a Columbus or Vespucci?

To what submarine chaplains does the lordly salmon retreat after its annual migrations to its fresh water breeding streams? What "grazing" or feeding resorts—where it accumulates such rich fat, phosphorus and color, making it such a food for man that "mullet or thornback cannot please me more"—has it in the saline depths or marine wildernesses?

Do the salmon, in their migrations, have, like the geese, leaders that know the currents and the barrens and can safely pilot their schools in their great annual and semi-annual journeyings?

Those are the questions that come to me as I stand upon the summit of Telegraph Hill and gaze around upon San Francisco Bay and the Golden Gate and off out to the grand old Pacific and think of the myriads of finny denizens of the salty deep.

WM. FITZMUGGINS.

There are in Atlantic waters several pompanos, the best known being the common pompano (*Trachinotus carolinus*)—"trachus," rough, and "notus" back; "rough-backed"; and *carolinus* from Carolina. Jordan and Evermann in "Fishes of North and Middle America," describe it: "Color bluish above, silvery or slightly golden below; pectorals and anal light orange shaded with bluish; caudal and upper portion of caudal peduncle with bluish reflections. Length 18 inches. South Atlantic and Gulf coasts of United States, ranging north to Cape Cod on sandy shores, very common southward, rare or accidental in the West Indies and in Brazil. The most valued food fish in our southern waters, its flesh rich, firm and delicate, superior to all others of its genus or family. On the Pacific coast it is scarcely known as a food fish, perhaps from its scarcity."

The California pompano is a different fish, the *Rhombus simillimus*. We quote the same authority: "In color it is bluish above, bright silvery below; fins punctulate; anterior lobes of dorsal and anal dusky-edged. Length ten inches. Pacific coast of the United States, Puget Sound to San Diego; abundant in summer, especially about Santa Cruz; highly prized as a food fish, its flesh being rich and delicate."

In his new work, "A Guide to the Study of Fishes," Dr. Jordan refers to the *Rhombus simillimus* as "the dainty California poppy-fish, miscalled Pampano." This spelling "pampano," by the way, is used in the "Guide" as the more correct form; the name is from the Latin pampano, a grape leaf, referring to the broad body of the fish.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Wifkins—I believe that dog of mine knows as much as I do.  
Bifkins—Huh! I've seen smarter dogs than that.

## New England Fishing.

BOSTON, Mass., July 8.—*Editor Forest and Stream:* At Cottage City of late some visitors have been taking bluefish, while others have had good sport in catching perch in Farm Pond. Rev. E. F. Clarke, of Taunton, is high line among the latter, taking ninety in one day's fishing. At Nantucket bluefishing is exceptionally good for the time of year. A party that went out in a dory from Siasconset one day returned with thirty-four, which is considered very good luck. Boats going out from the various resorts on Buzzard's Bay bring in scup, sqaeteague and tautog, and some anglers have taken bluefish off the "Ledges."

But few people are aware that there are good brooks for trout in almost every town of the State, and in many towns there are several. There are a number of brooks within ten miles of the Hub from which have been taken fine strings of trout, but only a few know anything about them.

From personal observations, a study of county maps, and from conversation with citizens in various parts of the State, I place the number of streams which to-day should furnish good sport for the trout fisherman at a figure well up in the hundreds. The work of stocking, done the past two or three years by the commission, has helped a small fraction of them a little. I believe that is all that can be said and keep within the truth, and it is no reflection on the present board nor on the former chairman, the late Captain Collins, of blessed memory.

The one only hatchery in the State capable of rearing fingerlings—that at Sutton—has been taxed to the utmost. Commendable efforts have been made to develop the resources at Hadley in the direction of raising fingerlings, but without success, and this year matters have been made worse by the building of a reservoir on the stream for a water supply of the town. Apparently, then, there is no hope whatever for any increase in the output from the State hatcheries. Why should not Massachusetts have a United States hatchery? If there is any good reason the writer would be glad to learn what it is.

There are regions in Massachusetts that offer inducements for the angler and hunter from outside our borders. One such tract has been recently secured by a syndicate, of which Mr. Miles Roberts, of Wall street, New York, is president, which has bought some thirty farms in Toll-and, including about 4,000 acres of land and a beautiful lake 1,500 feet above sea level. Most of the land is covered with forest, which, with proper treatment, will continue to add to the attractiveness of the preserve and will eventually become a source of income. The stockholders are chiefly sportsmen of New York, Brooklyn, Yonkers and Plainfield, N. J., who as an organization, will control the hunting and fishing and other privileges. On the lake shore is a commodious club house.

This is not the only instance where the possibility to get sport with rod and gun has been the chief attraction in bringing within our borders men of large means. All must admit that in the twentieth century it is a short-sighted policy that would neglect the full development of fish life in our ponds and streams, or animal and bird life in our covers.

The recent visit to Kineo of ex-Governor John F. Hill, of Augusta, and Hon. William T. Haines, of Waterville, has revealed facts concerning the opening of a new railroad route to Moosehead Lake by the extension of the Somerset County Railway from Bingham. There is no doubt in the minds of close observers that the extension is to be pushed forward as rapidly as possible. By the new route a saving of not less than four hours will be made in the time from Boston to Moosehead. This means that a man may leave Boston in the evening and reach the lake in time for breakfast next morning—returning, he can leave the lake by an evening train and breakfast next morning in Boston. It is also expected to result in quite a reduction in the expense of the journey. Messrs. Hill and Haines have large interests in forest lands and have in mind, no doubt, the lumber interests to be benefited, as the extension will pass through some forty miles of virgin forests, which are now practically inaccessible. The road was extended to Moxie Pond for lumber purposes. A second section is under construction and bids are opened for the third, leaving only a final stretch of about fourteen miles to be provided for.

It is said that the building of this cutoff means the construction of another large hotel on the opposite shore from Kineo—a project which several capitalists have had in mind for some time. Two eligible sites have been talked of, one at Sand Bar Farm and one at what is known as the Calder place. At either of these places there will be room for the building of cottages or camps for families and parties, which it is believed will find plenty of occupants. Such an expansion of accommodations will mean, in the near future—perhaps in two or three years—a great increase in the number of anglers, and the question whether the fishing will hold out with the number of fishermen twice that of to-day is a very important one.

Is it possible to keep up the supply in the lake when twice as many fish are taken? The writer believes it can be done if the winter fishing is cut off entirely and the work of stocking is greatly increased, but not otherwise. While many old-time visitors may choose to go over the same route they have traveled for years, and thus get the delightful ride on the lake from Greenville to Kineo, the majority of those from outside the State will be likely to avail themselves of the new and shorter route, and there will inevitably be a very great increase in the number who will visit Moosehead. Kineo will, however, continue to be a powerful magnet with its old patrons, and need not fear competition.

Several guests at Kineo have derived pleasurable excitement from seeing a bull moose swimming in the lake. Dr. and Mrs. F. H. Jenckes, of Woonsocket, R. I., with James Findlay as guide, who were on the lake in a canoe, approached the animal near enough to caress his shaggy back with their fly-rods before driving him ashore. When he reached terra firma it did not take him long to make a break for the forest.

Fly-fishing is reported prime, and among those enjoying it are: Frank H. Green and wife and Rev. A. H. Fish, of New York; W. E. Hodgman, of Yonkers, N. Y.; Judge and Mrs. C. W. Richardson, Mr. and Mrs. G. W.

Grant and James Donaldson, of Salem, Mass.; Messrs. H. L. Moorehouse and A. K. Beach, of Bridgeport, Conn. and Rev. L. K. Storrs and Elias J. Bliss, of Brookline, Mass., and many others.

As has been his custom for several seasons, Judge Charles Allen, of Boston, is making Kineo his place for summer recreation. The resident physician, Dr. Rowland Cox, Jr., of New York, has arrived and will soon be joined by his family.

Morris and Richard Williams and two friends from Philadelphia are making the Allegash trip. Messrs. F. A. Schermerhorn and Lenox Smith, of New York, made Bangor in their yacht, Freelance, and have had a few days' fishing at Moosehead.

At North Pond (Belgrade Chain), South Smithfield the fly-fishing is ahead of previous seasons. Four boats one day brought in 300 bass taken on the fly. Four new camps have just been completed and several parties from New York have secured quarters for a sojourn of several weeks. Boston is represented now by Messrs. Lester Monks and C. D. Winter. Mr. M. H. Hardwick, a Boston artist, who has been visiting Mr. H. B. Austin, of Phillips, reports finding good bass fishing in Lake Web in Weld.

By a typographical error in my last letter I was made to speak of good salmon fishing in Lowell. It should have read Lovell, which is a town with several lakes in eastern Maine within a short distance of the White Mountain. There are further reports of salmon ranging from 6½ to 10½ pounds each taken since my last letter was written from Kezar Lake. From Eustis a very fair buckboard road of thirteen miles (the writer once walked it after 5 P. M.) takes one to Round Mountain Lake, and a good place it is. Trout may be taken in the lake or in Alder Stream. Blanchard Pond, a couple of miles or so distant, affords trout fishing. The proprietors, Messrs. F. R. Morse and R. J. Jackson (joint owners), of New York, are passing part of the season there, as is the usual custom.

The Messenger party, Mr. E. M. Messenger, of Winchester, and son, and Mr. F. W. Winn with wife and daughter have recently returned from Round Mountain and bring reports of good fly-fishing at the lake, where they passed a couple of weeks.

The Bean party, of Lowell, F. S. Bean and wife with Joseph Peabody and W. H. Wight, have just come out from Tern Pond bringing along a fine box of trout to distribute among their friends. At the Birches Dr. and Mrs. H. W. Steele, of New Haven, have taken Sans Jen Cabin, and with them are R. O. Watkins and son, of Waterbury, Conn.; Herbert Moore and Russ Spinny at their guides.

Henry C. Kennedy and family, of Brooklyn, are at Camp Bijou, which they have occupied several seasons.

Mr. and Mrs. Henry W. Stevens and Miss Hayes, of Concord, N. H., have occupied Sunset Camp for a month with Dan Heywood as their guide. Other camps are occupied by well known visitors from many cities of Maine, Massachusetts and New York.

Mr. F. R. Whall and wife, of Boston, are in clover at Camp Ellis of Bald Mountain camps, this being a honey moon trip. Mrs. Whall has taken her first salmon, a pounder.

CENTRAL.

## Commercial Breeding of the Snapping Turtle.

NOT long after the artificial propagation of certain sorts of fish became an established commercial success people began to talk about breeding of terrapin and frogs. They have been talking about it ever since but so far, we believe, nothing more has been done in the matter than to collect living terrapin to put them in an inclosure and keep them there until the proper time came for marketing them. The State of Pennsylvania has made some experiments in frog breeding the results of which have not yet been announced.

While we here in America have been doing a great deal of talking, the patient, energetic and successful Japanese have been doing things in many directions and one of these directions has been the successful cultivation of marine and fresh-water animals. For some years the artificial culture of shell fish, eels, certain fishes and a snapping turtle have been carried on successfully, and so profitably that all these industries have become thoroughly established on paying bases. A number of these are not new, for the culture of the oyster at Hiroshima and of algae in Tokyo Bay have been carried on for hundreds of years. Incidentally a very great number of Japanese in recent years have taken up the study of biology as applied to many of these creatures and their investigations have helped to push forward these matters to success on the commercial side.

Before the International Congress of Arts and Science held at the Louisiana Purchase Exposition in August of last year, an interesting paper on the subject was read. It was by Dr. K. Mitsukuri, who occupies the chair of Zoology at the Imperial University, Tokyo, Japan, and contains so much information that it has been printed by the Bureau of Fisheries in Washington. Dr. Mitsukuri discusses the artificial propagation and rearing of gold fish, carp, eels, mullet, salmon and trout, besides a number of shell fish, but our view the subject that has the most interest for America is the business of turtle raising. The species dealt with is a soft-shelled tortoise, known in Japan as "suppon," the Latin name of which is *Trionyx japonicus*. This business has been pushed to a point where it is extremely successful, and it would seem that the methods employed in the culture of this species might be perfectly applicable to the diamond back terrapin. Of the propagation of this species Dr. Mitsukuri said:

The place occupied among gastronomic delicacies by the diamond-back terrapin in America and by the green turtle in England is taken by the "suppon," or the snapping turtle, in Japan. The three are equally esteemed and equally high priced, but the Japanese epicure has this advantage over his brothers of other lands—he has no longer any fear of having the supply of the luscious reptile exhausted. This desirable condition is owing to the successful efforts of a Mr. Hatori, who has spared no pains to bring his turtle farming to a high pitch of perfection and is able to turn out

tens of thousands of these reptiles every year. As his are, so far as I am aware, the only turtle farms in the world which are highly successful, a description of his establishment and methods will, I think, prove interesting and serve as a guide to those who may have similar undertakings in view. In passing I may remark that I have known Mr. Hattori these twenty years and have spent a number of summers on his original farm, collecting, with his kind consent, ample materials for my studies on the development of *Chelonia*. In return, Mr. Hattori is kind enough to say some of the facts and suggestions I have been able to give him, based on my embryological studies, have been of service in carrying out improvements.

The Hattori family has lived a long time in Fukagawa, a suburb of Tokyo, which lies on the "Surrey" side of the Sumida River, and which, having been originally reclaimed from the sea, is low and full of lumber ponds, and until recently of paddy fields. The occupation of the family was that of collecting and selling river fishes such as the carp, the eel, and the crucian carp, and of raising gold-fishes, in addition to the ordinary farmer's work. As far back as in the forties of the last century, the high price commanded by the "suppon" seems to have suggested to the father and the uncle of the present Hattori the desirability of cultivating it, and this idea, once started, seems never to have been lost sight of, although lying in abeyance for a long time.

In 1866 the first large turtle was caught, and from then on additions were made by purchase from time to time, so that in 1868 there were fifteen, and by 1874 the number reached fifty, which were all very healthy, with a good admixture of males and females. In 1875 these were placed in a small pond of 36 tsubos,\* with an island in the center which was intended for the turtles to lay eggs on. They, however, seemed to prefer for this purpose the space between the water edge and the outer inclosure; hence, to suit the tastes of the reptile, the pond was hastily modified into a form very much like the one in use at the present day. That year over one hundred young were hatched, but, unfortunately, they were allowed to enter the pond in which the adults lived, and all but twenty-three of them were devoured, making it evident that some means were necessary to

In order to give a connected account of the raising of tortoises, we might begin with a description of the pond for large breeding individuals, or "parents," and with an account of egg-laying and hatching.

The "parents' ponds" does not differ in any remarkable way from the general plan of a pond given above. Usually one of the largest ponds is chosen, and it can be distinguished from the others, because one or two of its slopes are usually kept up very carefully, while the other slopes or those of other ponds are apt to be worn by rain and wind and to become rugged. These well-kept slopes are invariably on the warmer sides, where the sun pours down its midsummer rays longest, and are carefully worked over in the spring so that the tortoises will find it easy to dig holes in them. In the breeding season these sides are seen to be covered with wire baskets which mark the places where the eggs have been laid.

Copulation takes place on the surface of the water in the spring. Egg deposition begins in the last part of May and continues up to the middle of August. Each female comes out of the water and wanders about a little, while on the banks of the pond in search of a suitable locality in which to deposit eggs. Having finally chosen a spot, with her head directed up the bank she firmly implants her outstretched fore-feet on the earth, and during the whole operation never moves these. The process of egg deposition, which takes altogether about twenty minutes, may be divided into three portions occupying about the same length of time, namely: (1) digging a hole, (2) dropping eggs in it, and (3) closing the hole. The digging of the hole is done entirely with the hind legs. Each with its nails outstretched is moved firmly from side to side—that is, the right foot from right to left and the left from left to right, and the two are worked in a regular alternation, while the body is swayed a little from side to side, accompanying the motion of the legs. The force put in the lateral pressure of the feet is so strong that the earth that has been dug out is sometimes thrown off to a distance of 10 feet or more, although the largest part of it is heaped up around the hole. Digging seems to be continued as long as there is any earth within the reach of the legs to be brought up. The result is a squarish hole with

The traces of a spot where the snapping turtle has laid eggs are (1) the two marks made by the forepaws holding on to the earth during the whole operation, and (2) a disturbed place some distance back of the line of the forepaws where the hole has been made. The three marks are at the angles of a triangle. I have noticed a very interesting fact in regard to these traces. When a young female is depositing her first eggs, she is very clumsy, the hole being badly made and the filling in of it very imperfect, so that often a part of it remains open. Old females are extremely neat in their doings, and one can determine at once the age and size of the female by the skill displayed and by the distance between the three marks of egg deposition. This shows that although the elaborate actions necessary in egg laying must be, in the main, due to instinct, each individual has to add its own experience to the inherited impulses and is able thus only to accomplish the desired end with perfection.

In Hattori's farm a person goes around the "parents' pond" once a day or so and covers up with wire baskets all the new deposits made since the last visit. Each cover basket may be marked with the date if necessary. This covering serves a two-fold purpose—the obvious one of marking the place, and in addition that of keeping other females from digging in the same spot. When hundreds, or even thousands, of these baskets are seen along the bank of a "parents' pond," it is a sight to gladden the heart of an embryologist, to say nothing of that of the proprietor.

The hatching of the eggs takes, on an average, sixty days. The time may be considerably shortened or lengthened according to whether the summer is hot and the sun pours down its strong rays day after day, or whether there is much rain and the heat not great. It may become less than forty days or more than eighty days. By the time the last deposits of eggs are made in the middle of August, the early ones, which were laid in May or June, are ready to hatch; and inasmuch as if small tortoises that have just emerged from the eggs are allowed to get into the "parents' pond" they are devoured by their unnatural fathers and mothers, a special arrangement has now to be put up to prevent this. The left side of the plan in cut 2 are intended to show this arrangement. Long planks about 8 inches wide are put

Cut 1.—Plan of a turtle farm.

Cut 2.—Plan of pond.

protect them from their unnatural parents. Thus was gradually evolved the present system of cultivation.

In general appearance a turtle farm is at a first glance nothing but a number of rectangular ponds, large and small, the large ones having a size of several thousand tsubos. The ponds are undergoing constant modification, being united or separated just as need arises, so that their number may vary considerably at different times. Cut 1 gives the plan of the Hattori turtle farm at Fukagawa as at present laid out. There pass through the farm two small canals which communicate on the one hand with the river across the road, and on the other with the ponds, so that the water can be drawn into, or emptied from, each of them at will.

All the ponds, whether large or small, are constructed very much on the same plan. They are limited on their four sides by plank walls, the top of which may either be on the level of the ground (see the right side of the section, cut 2) or may be more than a foot above the ground when two ponds are contiguous (the left side, cut 2). In either case the plank wall has a cross plank of some width at right angles to it on its top, and is also buried some inches in the ground. The former arrangement is, of course, to prevent the tortoises from climbing over the wall, and the latter to prevent them from digging holes in the ground and making their escape in that way, while at the same time it serves to exclude the moles. On the inner side of the plank wall there is more or less of a level space, and then a downward incline of 3 or 4 feet. At the foot of this incline and directly around the water's edge there is another level space which enables people to walk around the pond. From the edge of the water the bottom of the pond deepens rather rapidly for a space of some three feet, and there reaches the general level of the bottom, which is about two feet below the level of the water. The greatest depth of a pond is about three feet and is always toward the water gate by which the pond communicates with the canals. The bottom is of soft, dark mud, several inches thick, into which the tortoises are able to retire to pass the winter.

On a turtle farm one or more of the ponds is always reserved for large breeding individuals, or "parents," as they are called. The just-hatched young or the first-year ones must have ponds of their own, as must also the second-year ones; those of the third, fourth, and fifth years may be more or less mixed.

\*One tsubo, an area 6 feet square, is the unit in the measurement of small land surfaces.

the angles rounded off, and although its size differs with the size of the female, it is generally about 3 to 4 inches across at the entrance, with the depth and width inside about 4 inches or more. When digging is finished eggs are dropped from the cloaca into the hole, which naturally lies just below it. The eggs are heaped up without any order, but, there being no chalazae, the yolk is able to rotate in any direction, and the blastoderm, having the least specific gravity, always occupies the highest spot of the yolk in whatever position the egg may happen to be dropped. The eggs are generally spherical in shape, although sometimes more or less oblate. Their diameter is in the neighborhood of 20 millimeters, the largest being as large as 24 millimeters, the others smaller according to the size of the females. The number of eggs in one deposit varies from 17 or 18 to 28 or more, the smaller individuals producing the smaller number.

When the eggs have all been deposited, the turtle's legs are again put in-requisition, this time to fill up the hole, which is done by alternate motions as before. The earth about the hole is used at first, but search is made for more loose earth for a little distance, as far around as the legs can reach with a slight motion of the body either to the right or left without moving the front legs. Toward the end of the process the loose earth is trampled down. When the hole is well filled up to the level of the ground, the turtle turns around and goes immediately down into the water, not casting even one backward glance.

I have noticed an interesting contrast between the behavior of *Trionyx* and of *Clemmys* during the egg deposition. If one wants to watch a *Trionyx* depositing eggs, one has to crawl on all fours behind the plank wall of the pond and peep through a hole, being careful not to show himself. The moment the snapping turtle sees anyone, it stops in whatever part of the egg-laying process it may be engaged and plunges straight into the water. Utterly different is the behavior of *Clemmys*. When once it begins the process of egg-laying it is never deterred from carrying it out, no matter how near or how boldly one may approach. Whenever I watched a *Clemmys* working away in the direct midsummer rays with its carapace all dried up and with its eyes alone moist, I could not help comparing it to a slave of duty fulfilling his fate with tears in his eyes. What causes such a difference of behavior in the two species? What is its significance? What difference in the nervous system corresponds to it?

up lengthwise around the edge of the pond, leaving perhaps 1 foot margin between them and the water. The two successive planks are not placed contiguous, but a space of about 3 feet is left between every two, and closed by a bamboo screen put up in the shape of an arc of a circle, with its convexity toward the pond. Thus the slope or the bank where the eggs have been deposited is completely cut off from the pond itself. In the center of every pocket-like arched space made by a bamboo screen an earthenware jar is placed with its top on the level of the ground, and some water is put in it. This elaborate arrangement is for the reception of the young tortoises, which, as soon as they break through the egg shells—those belonging to the same deposit generally coming out at the same time—crawl up to the surface of the ground by a hole or holes made by themselves, and go straight down the incline toward the pond, as naturally as the duckling takes to the water. They are stopped, however, in their downward hydrotaxic course by the planks put up, as stated before, around the pond, and they crawl along the length of the planks and sooner or later drop into the jars placed in the recesses between every two planks. A man going around once or twice a day can easily collect from these jars all the young hatched since the last visit.

The young just hatched are put in a pond or ponds by themselves and given finely chopped meat of a fish like the pilchard. This is continued through September. In October *Trionyx* ceases to take food, and finally burrows into the muddy bottom of the pond to hibernate, coming out only in April or May. The young are called the first-year ones until they come out of their winter sleep, when they are called the second-year young. At first the same kind of food is given these as that given to the first-year young, but gradually this may be replaced by that given to older individuals, namely, any fish meat or crushed bivalves, etc. Figure 2, plate I, shows a lot of the second-year young in August. From the third to the fifth year, inclusive, the young need not be kept in ponds strictly according to age, but may be more or less mixed, if necessary. The young of these years are also the best and most delicate for eating and are the ones most sold in the market. In the sixth year they reach maturity and may begin to deposit eggs, although not fully vigorous till two or three years later. How old these snapping turtles live to be is not known. Those 1 foot and more in length of carapace must be many years old. The

following table gives the average size of the carapace and the weight of the young:

	Length in centimeters.	Breadth in centimeters.	Weight in grams.
Just hatched	2.7	2.5	...
First year	4.5	4.2	23
Second year	10.5	8.8	169
Third year	12.5	10.5	300
Fourth year	16.0	13.5	563
Fifth year	17.5	15.1	750

One of the most important questions in turtle farming is that of food supply. The profit depends largely on whether a constant supply of healthful food can be obtained cheaply and abundantly. In the Hattori farm chief dependence in this respect is laid on the "shiofuki" shell (*Maetra veneriformis* Deshayes) which occurs in enormous quantities in the Bay of Tokyo. These shells are crushed under a heavy millstone rolled in a long groove in which they are placed, as shown in Fig. 2, plate III. Other kinds of food given are any dried fish scraps, silkworm pupæ, boiled wheat grains, etc.

A curious part of the ecological relations of a turtle pond is this: It would be supposed that putting other animals in the same pond with the snapping turtles would be detrimental to the welfare of the latter, but experience has proved just the contrary. It is now found best to put such fishes as carp and eels in the same ponds with the turtles. The reason, I am told, is that these fishes stir up mud and keep the water of the pond always turbid, and this is essential to the well-being of the turtles, as is proved when the messmates are taken out of the pond. Dirt and mud then settling down, and the water becoming clear and transparent, the turtles, which are extremely timid, will not go about searching for food, and thus very undesirable results are brought about.

The business of turtle raising has thrived well. When I first became acquainted with the turtle farm, now over twenty years ago, it was a small affair with only a few small ponds, and the eggs hatched out in one year were, all told, not much over 1,000. Now the enterprise embraces three establishments: (1) The original farm at Fukagawa, Tokyo, now enlarged to 7 acres; (2) the large farm at Maisaka, near Hamamatsu, province of Totomi, over 25 acres, whither the main part of the business has been transferred; and (3) the second farm in Fukagawa, about 2 acres in extent. These three establishments together will yield this year (1904) about 4,100 egg deposits, which means 82,000 eggs, counting 20 eggs to a deposit on an average. Probably 70,000 young will be hatched from these, and deducting 10 per cent. loss before the third year, there will be about 60,000 "suppon" ready for the market in three years. The turtles sold in a year in Osaka, Tokyo, Nagoya, and a few other towns weigh about 2,000 kwan (= 16,500 pounds), and are worth about 6.50 to 7.50 yen (1 yen = \$0.50) per kwan.

There are several minor turtle farms besides those mentioned above, but as they are all modeled after those under Mr. Hattori's management, they need not be described further.

## Fly Fisherman vs. Sea Angler.

It is interesting and often amusing to note the calm complacency with which the devotee of one kind of angling asserts its superiority over all others, and I have often, when discussing such matters with one of my friends, been almost unable to keep a sober countenance when he, with a metaphorical hand-wave, brushed into contemptuous insignificance methods of recreation which have charmed some of the master minds of the world.

"Salmon and trout angling," exclaims a bass and squeteague fisherman, "not any in mine, if you please. I've tried them, and I give you my word, I never had such a beastly time in my life. I was invited by a friend who had a salmon stream in Canada to come up and try my luck with him, and in a weak moment I accepted his invitation, got up an outfit, split bamboo salmon rod, a 150-yard oiled silk line, big reel, casting lines, fly book and flies that cost me all the way from \$5 to \$20 a dozen and all the other accessories that are deemed indispensable, and we started for the north.

"Well, my friend talked salmon, breathed salmon, and for aught I know, dreamed salmon from the moment we stepped on the train until we arrived at the river. Now, when I go fishing I like to take solid comfort; I go for recreation, for all the sport I can get out of it. I like to sit comfortably in my boat and take my bass or squeteague in a quiet, gentlemanly way, and when the fish are not biting I can enjoy my cigar in peace and refresh myself occasionally with a bottle of Bass' ale or Milwaukee beer which repose comfortably in a box of pounded ice beneath my seat or in the cuddy. Yes, sir, that's solid comfort.

"When we arrived at our first tenting-place I was just simply fagged out, for we had come in on an old buckboard over the roughest road imaginable for a half dozen miles or so, and at the end of that road we had to take shank's mare for a couple of miles through the woods; that was the roughest tramp I ever took in my life, and I never shall forget it.

"All the way through the woods we were followed by an endless drove of mosquitoes. Now I thought I knew something about mosquitoes, for I made their acquaintance in Jersey many years ago, but all that I ever saw in that remarkable mosquito breeding ground were not a patch on those hungry brutes in Canada.

"I had my rod case in one hand during that tramp and with the other I slapped and fought and rubbed and scratched, and though I killed hundreds, perhaps thousands, of the fiends they streamed out behind me in as many more thousands like the tail of a comet, and my friend assured me it wasn't an extra good day for mosquitoes at that.

"By dint of perseverance and endurance I reached the camping place. Yes, it was a pretty enough spot, the tent having been pitched by the guides by the side of a large basin in the river which my friend called a pool, although it was not my idea of a pool, for the water seemed alive in every portion of it, moving around in it in all kinds of whirls and eddies.

"Above it were two or three cascades or whatever one

may please to call them, my friend said they were rapids, and I guess he was right, for the water came tumbling and roaring down over the rocks in a way that was decidedly rapid.

"The place was picturesque all right, for on both sides of the river were huge, rocky cliffs which towered up higher and higher until they became veritable mountains.

"It didn't take my friend long to set up his rod and get his tackle ready, and while our men began to make preparations to get supper, he went up to the head of the pool and began casting, while I sat down on a boulder nearby and watched him. I thought I wouldn't fish that day but wait and see how it was done, for I hated, mortally, to have the guides know I was a tenderfoot. I had a feeling that the way I swore at the mosquitoes during that long tramp had not given them a very high opinion of me as a starter, for somehow those fellows have a way of sizing up a man in very short meter, and so I allowed I would not try to do much salmon fishing until I saw how the trick was done. There's no mistake he handled that big rod with consummate skill, and he cast his fly all over the pool, which was seventy-five feet wide at least, just as easily as I could throw out a fiddler crab or menhaden bait for striped bass.

"While I sat on that boulder watching my friend, and, I am free to confess envying the skill with which he handled his rod, I discovered an entirely new sensation. Now, discovering a new sensation is often a good thing. Old Nero tried it and lots of other duffers after him have tried it, and there's a host of fellows in New York to-day who are actually aching to realize something new in this line, but a little of the kind I had will go a condemned long ways.

"I had heard or read somewhere about black flies, but my entomological experiences had never before enabled me to make the acquaintance of those little insects; but when I sat down on the boulder I had an introduction to them which was far from formal. I felt a burning sensation behind my ears, on my neck, and on my forehead just below the rim of my hat. I say burning sensation, and preachers have told us about heaping coals of fire on one's head, but I swear to you I felt as if some chap was rubbing live coals all over my head and face, and when I put up my hand to rub one of the burning places I found it was smeared with blood, the black flies had sampled by venous fluid, and no mistake.

"I jumped up and began rubbing my face and neck with my handkerchief, and when I removed it it was thoroughly stained. Just then one of our men who had been watching my gyrations, approached me with a box of ointment in his hand which he advised me to rub on my face, neck and hands.

"What is it?" I inquired, looking at the box rather suspiciously.

"It's fly poison," he replied, "rub a lot of it on and they'll not bite you any more; it's made of tar, pennyroyal and oil," he added.

"Well, I smeared myself with that flamboyant smelling stuff, and the flies kept away from me; they couldn't stand the odor, but I had to. To drown the smell I filled my pipe and lighted it, but I couldn't quite overcome the perfume of the 'fly pison.'

"I sat down again and watched my friend, for barring a greasy feeling on my hands I was, in a way, beginning to feel comfortable. Suddenly, as he was dragging his fly from a distant part of the pool, I saw his rod bend and then his big reel gave a shriek and I knew he had hooked a salmon, and a good fish it was, too, for it was soon leaping and cavorting around for all the world like a barracouta; the fish seemed to be in a dozen places at once, and in the air about as much as in the water.

"My friend played him skillfully, and it was nearly a quarter of an hour before one of the guides, succeeded in gaffing it. It was as bright as silver, which showed it was 'fresh run,' as my friend said, whatever that meant, but it weighed only ten pounds. It didn't seem to me nearly as strong as would be a bass, kingfish or barracouta of equal weight. We had some of that salmon for supper, and it was the real thing, and no mistake, altogether different from a salmon that has been kept on ice a month or two—such as we get in our markets.

"That night I was lulled to sleep by the howling of mosquitoes in the tent, by the rush and roar of the rapids, and the hooting of a big owl in the trees nearby. I say lulled to sleep; I should say I was kept from going to sleep a long time by these sounds. On the following morning I set up my rod, and rigged my tackle, attaching to my casting-line one of my handsomest and most costly flies, for I wanted to do the liberal thing by the fish, and, selecting a favorable point, I began casting, imitating my friend in all his movements as well as I could, and I flatter myself I was rather an apt pupil, for I succeeded in placing my lure where I wanted to. Somehow I got the right drag and I thought I was getting on swimmingly, although I had not raised a fish. But if I was all right in my front casts, I wasn't in my back ones, for the first thing I knew my fly was hitched high up in a tree and it was hitched so firmly I couldn't pull it down without breaking my casting-line, which I disliked to do, and to free it I had to call one of our men who was preparing breakfast and he, to release my fly, was obliged to climb the tree. I will say right here that I kept one of our men busy climbing trees during the few days I was on the river.

"Well, to make a short story of it, I didn't kill a salmon; in fact, I didn't kill much of anything in the fish line except a few measly sea trout, none of them over a pound in weight.

"No, sir, no salmon or trout fishing in mine, if you please, give me the deep blue sea, where the mosquitoes, black flies and those other little fiends, the midges, cometh not, where there are no trees to bother one in his back-cast and where, when he hooks a fish, he has a chance to play it in good, deep water, without being obliged to wade out to one's armpits, or to race down a river chasing a salmon, stumbling over rocks and boulders and barking one's shins every now and then by way of additional excitement. I don't think there's any comparison between salt and fresh-water fishing, and give me the salt every time."

"But think of the deadly monotony of it," replies the fly-fisherman, remonstratingly.

"Monotony, nothing!" exclaimed the other. "What is

there monotonous about fishing for striped bass from the rocky ledges all along the coast, casting the bait far out into the boiling surf and fighting a fish that is game to the finish. I tell you a 10 or 15-pound bass gives just as good sport, yes, better than does a salmon of the same size. It's true, he doesn't leap like the other, but the barracouta does, and lots more of the fish which are found in the sea. Why, there's nothing monotonous about still-fishing for bass and squeteague from a boat, even, for one has the ocean all around him, a vast body of water which has ever varying moods and changing conditions; why, its color even is changing all the time; there the lungs are filled with the purest ozone ever vouchsafed to man, and when the fish are biting freely the angler has all he wants to attend to. No, sir, I'm a salt water fisherman every time, and I'm not alone in my devotion to the sport, by a long shot. Here, see what a celebrated English writer says about bass fishing," he continues, taking a book from the shelves and opening it. "This is what Mr. G. A. Thring says about it:

"Bass fishing has a decided fascination. It is most fascinating, perhaps, when indulged in from the rocks, but it is not unpleasant in a boat on a breezy day. There is another aspect in its favor. It is a healthy sport and one without many of the disadvantages of other pursuits. It needs no wading—a frequent cause of rheumatic troubles. It needs no rain and showers, dear to the soul of the trout and salmon fisher, but dangerous to his lungs. Bright sunshine, fresh sea air, and plenty of ozone are its chief associations. Truly, it is an ideal sport for the worn-out man of business and the jaded city hack."

"That's all right," replies the fly-fisherman; "while I admit that the striped bass is a gamey fish well worth the following, I still deny that the ordinary run of salt water fishing from a boat begins to compare with the sport derived from the use of the fly, and your own author says so, too," he exclaims, quoting from the book which the other had been reading, for this is what he maintains:

"From a sportsman's point of view sea fishing is generally either wearisome or monotonous. It is wearisome to tack up and down all day with a line lazily dragging outside the boat, even though the day be fine and the air refreshing; it is monotonous when at last the right locality is found, to pull in the line incessantly with one or two fish attached to it every time. Indefinite slaughter is unpleasant and unworthy of the true sportsman."

"No, my friend," he continues, closing the book, "give me my fly-rod on the wild mountain stream where even the water rushing over the rapids sends out a music surpassing any that dear old Beethoven ever wrote. The ever-varying scenery, the picturesque hills, cliffs and ravines, the constantly changing moods of the perfume-laden forest, the flowers, the songs of woodland birds, and last and perhaps best of all, the capture of the beautiful trout with the feathered lure and delicate tackle. As you say, there is no comparison between the two, and, as for writers, I can quote dozens to your one. That grand and devout angler in his most entertaining book, 'I Go a-Fishing,' says:

"You must have quick ears to hear any sound when either C. or Dupont throw fifty feet of line on the lake, for they use light rods, and there is an absolute perfection of beauty in the curves described by their lines. Now and then the sharp rise and swirl of a trout may attract your attention for an instant as one or another strikes him, but go on thinking while we go on fishing. If, indeed, you be an angler, join us and welcome, for then it is known to you that no man is in perfect condition to enjoy scenery unless he has a fly-rod in his hand and a fly-book in his pocket."

"As for the poetry of fly-fishing, here is what F. E. Pond says in 'Fishing With the Fly':

"It has been said that the angler, like the poet, is born, not made. The genuine angler is almost invariably a poet, although he may not be a jingler of rhymes—a ballad-monger. Though, perhaps, lacking the art of versification, his whole life is in itself a well-rounded poem, and he never misses the opportunity to cast his lines in pleasant places."

"And here is what Dr. J. A. Henshall says in the same book: 'The charms of fly-fishing have been sung in song and story from time immemorial by the poetically gifted devotees of the gentle art, who have embalmed the memory of its æsthetic features in the living green of graceful ferns, and the sweet-scented flowers of dell and dingle, and in the liquid music of purling streams. The fly-fisher is a lover of nature, pure and simple, and has a true and just appreciation of his poetic side, though he may lack the artist's skill to limn her beauties or a poet's genius to describe them.'

"Why, man, there's a whole library that supports me in my views," continues the fly-fisherman; "here is what David Foster, the author of the 'Scientific Angler,' says: 'The roving disciple of the rod wanders up to the head of the river, into the heart of the mountains, sometimes cheered by the pleasant converse of a few true men and honest anglers like himself; often alone with nature in her fairest or wildest loveliness. Solitary or social, his appreciation of all the sweet charms of wild nature is keen and lively.'

"And here is an extract from a letter lately received from an old angler who knows as much about fish and fishing as any other man: 'For real enjoyment give me the stream well stocked with trout from one-half to two pounds in weight, along the banks of which I can pursue the sport with light tackle and small flies; every turn of the stream displaying a different picture; here a foamy rapid, there a long, quiet reach, broken only by boulders near which lie the big fellows whose capture depends largely on my knowledge of their habits, my judgment as to their taste in flies, and my skill with rod and reel.'

Now, both fly-fisherman and sea-angler are right each from his own point of view; while it is true that fishing with the fly on forest lake and mountain stream appeals more strongly to all that is æsthetic in our natures, the man who casts his lure on the bosom of the mighty ocean finds in many ways as keen enjoyment as does the other. All men are not constituted alike, and it is fortunate that this is the case, for were it otherwise the world would be monotonous, indeed.

To him who has the time and means at his disposal which will enable him to seek the princely salmon in the far north, or even the beautiful spotted trout which in-

habit our lakes, rivers and brooks nearer at hand, his tastes are, as a rule, gratified only in their pursuit. But the anglers are comparatively few who can become lessees of salmon streams or spend one or two weeks in trout waters, and the great majority find their recreation—and it is a blessed thing they can do so—in a day's sport now and then among the gamy bass, the beautiful and sprightly squeteague, the strong and dogged fighter, the pollock, the crafty and powerful tautog, and other fishes which are found in great abundance all along the Atlantic coast where they are easily accessible and free to all.

E. A. SAMUELS.

## The Log of a Sea Angler.

### The Tuna Season.

(Concluded from last week.)

I fished to-day with Mr. Dennison, of Philadelphia, the opening of the Tuna Club tournament. There were prizes of rods for anglers and boatmen, for the first tuna of the season. Jim's boat was on the ways, and in a weak moment we took another and smaller one, though a good-sized yawl. I had a strike off our cañon, and never enjoyed a play so well. The fish, while powerful, was not a Hercules. I was fishing with a 21-thread line, and a jointed light greenheart rod, my yellowtail outfit. I wished to try the experiment. It detracts from my pleasure to know that I have the advantage, which the fish should have. This tuna was caught fairly, and by the watch I brought him to gaff in just forty minutes. I know this well, as it was the last token I had from a valued timepiece. The tuna played on the surface like a bonito, did not sulk, and was a splendid picture of activity. As I brought it to the quarter, Mr. Dennison went forward to give me full play, and Gardner gaffed it cleverly and slid it into the boat. The next I knew, I was treading water. I have an indistinct recollection of seeing the fish bend, leap into the air, land on the gunwale, tipping the boat and capsizing her. I was standing in the stern at the time overhauling my line, ready to hold the fish if it should attempt escape, and the boat literally dropped from beneath me. I began to tread water and my head did not go under, so I merely stood in the water, holding my rod and laughing at the extraordinary suddenness of the change of scene.

But we were nearly a mile offshore, and our tender, a large launch, was six hundred or one thousand feet away, lying off to clear the line and not frighten the fish. I hailed her at once by waving my hat. At that precise moment the new engine refused to work. The boat had gone down stern first, shot up into the air, covering the water with the varied articles of the angler—rods, oars, gaffs, boxes of tackle, pies (lunch) and many articles which spread out over the smooth surface. The boat as it shot up, fell over on to my companion, who, as Gardner and I righted her, called that he could not swim, and, as any helpless man would, threw his arms about the bow, clinging to it, which had the effect of rolling the craft over and over. He was also handicapped with an overcoat, while I was weighted down by thick corduroy hunting suit and leggings. It was very evident that my companion was in a bad plight. The boat would not hold three of us, continuing to roll over despite the efforts of Gardner and myself; so I suggested to the boatman that we turn her bottom up, get the helpless angler on it, flattened out, and that we try the swim to the launch and assist in bringing her up.

This we carried into execution, or, rather, I did. I noticed that Jim was not very active; but there was not much time to think, so I turned the boat over and we pushed Dennison on to the bottom and found that he was all right and could float by not moving. The tuna had passed out of my mind, and as we struck out for the launch, I was thinking of the main chance of reaching it so handicapped; but we could swim, and Dennison could not, so it was the only thing to do. Gardner had been a professional swimmer before he became a tuna gaffer, and I was fairly at home in the water; and had we been dressed for the swim, it would have been an easy matter. Exactly how far we swam, I do not know. I remember I was very weary, and that I experienced a decided sense of relief when a shout came over the water and I saw the launch had started and was coming to pick us up. The launch had slowed down, and was not fifty feet from me, when my boatman's wife, who was on the launch, screamed that her husband was drowning. I stopped swimming and turned around. Far away I could see Dennison's form on the bottom of the yawl, but Jim had disappeared. I knew that he was a perfect swimmer, and there was but one conclusion—sharks—and as I started to swim back, I fully expected to see the dun-colored shapes that I had always scorned, and whose courage I despised; but up out of the depths came an apparition, Gardner's head.

"What's the trouble?" I shouted, swimming toward him as quickly as possible.

"All right, sir; I've got the tuna," he replied, then disappeared suddenly, as though jerked from below, while the loud screams of his wife again came from the launch.

I was amazed, and could hardly believe that Gardner could have held the gaff through all the excitement; but up he came, and now alongside, I saw that he held the gaff, on which was hooked my lusty tuna that three times jerked this plucky gaffer down out of sight. The fish evidently would run ahead, turn and bore down, hauling the boatman down several feet, a performance at once sensational and extraordinary, but one that did not disturb the serenity of the boatman in the slightest. At my offer of assistance, he replied, "I'm all right, sir," and struck out with his right hand in a lusty stroke, dragging the struggling fish.

I reached the launch first, and well exhausted, hung to the rope thrown me; but when the men attempted to haul me on board they could not accomplish it; my corduroy suit was like lead, so I hung a few moments, when I was gradually hauled aboard. In the meantime Gardner had seized a rope thrown by his wife, and now threw his legs about the propeller and rested. I

leaned down while the men held me by the legs, and when Gardner lifted up the tuna I ran my arm into its mouth, grasped it firmly by the gills, and gave the word; the men hauled me by the legs, and I the tuna, which I dropped in the cockpit, where it flung itself about as though perfectly fresh. We then hauled Gardner aboard and ran alongside the yawl and threw a line to my plucky companion, who had insisted, in answer to our constant shouts, that we save the fish before picking him up, when he learned that Gardner had it. A line was thrown him, which he made fast about his waist, and by this he was brought through the water and up the side of the launch. The boat was then picked up, while a fisherman who had rowed out began to gather the wreckage, which was now spread over several acres of the channel. This accomplished, we started for shore. We were hardly underway, when I thought of a fine rod and valuable reel now at the bottom of the bay, with other things. At that moment Gardner reached down and discovered a hook that was fastened to his trousers. To the hook was attached a line, and the launch being stopped, Gardner hauled in nearly six hundred feet of a 21-thread line, attached to which was my rod and reel that had been down to the bottom of the bay. In the flurry the hook had become detached from the tuna and had caught in Gardner's clothing, and he had towed it as well as the fish.

The tuna weighed but 95 pounds. I hang on my study wall, a silent partner in one of the most remarkable fish stories it was ever my fortune to hear of, much less be a party to, and it is an excellent illustration of the cleverness and pluck of California boatmen and gaffers. How many men would have held a bleeding tuna a mile out in a channel where sharks were known to be in evidence around the tuna schools; held a fish powerful enough to drag a man under water. Not many, I venture to say. This realistic angling drama made Jim famous. The story was telegraphed far and wide, and I learned from a friend that he read a graphic account of the affair, doubtless with embellishments, in Paris the following day.

From these accounts it may be assumed that many tunas have been caught; but up to date but forty men wear the blue button of the Tuna Club, showing that they have taken a 100-pound fish. This does not mean that the fish do not bite well, as hundreds have been hooked and eluded the lure in skilled and untutored hands. There is a charm about this strenuous sport difficult to explain. The soft winds, the cool air in summer, the splendid blue of the Santa Catalina Channel, the contrast of rock and sea, the perfect calm of the bay, the romance of the island, all combine, perhaps, in making the chase of the elusive tuna one of the most interesting of pastimes. In the evening, when the moon rises out of the sea, I stroll away from camp, climb the side of the cañon by one of the many sheep trails, and reaching the divide, look down on the silent summer sea; then turn and trace the dark, winding cañon that reached up to the distant mountains like a great sinuous snake. Somewhere, perhaps not far away, is the old temple. I may stumble upon it some time by merest accident. Then I descend and join the group around the camp-fire, the men barbecuing wild goat over the coals for *chili con carne*, and I ask Mexican Joe if he thinks the temple is up the cañon, to which he replies, "It's up there somewhar." I must find that temple.

C. F. HOLDER.

## Ouananiche.

DURING the first few days of the ouananiche fishing this season in the Grand Discharge, anglers were somewhat incommoded in the pools immediately below the *grande chute* by the number of logs which were being run through the rapids. The water was fortunately high enough to allow of speedy driving by the river men, and before the last of June the drive was practically over. It is gratifying to learn that the fish are running larger this year in the Discharge than for the last two or three years, which certainly showed quite a falling off in size. Mr. George Donaldson, of Harrisburg, Pa., had very good sport there some days ago, and his fish were of very fair size. Several 4 and 5-pound fish have been taken by local sportsmen, and the guides and Island House people are at present having a pretty busy time.

Ouananiche are certainly not as capricious as the salmon of the sea in their choice of artificial flies. One angler assures me that the fish in the Grand Discharge rose to almost every fly which he offered them in the first day or two of July, and he tried about half the flies in his book, of which he had quite a goodly array. This is more than can be said for salmon, even when they are in good rising humor. Yet I have often had days on the Discharge when it was difficult to coax the ouananiche with any kind of a fly at all. Sometimes they will take the professor or coachman or brown-hackle or grizzly-king as readily as the most beautifully tied salmon fly. At other times they are fastidious enough to want a Jock-Scot, a Durham-ranger or a silver-doctor, or to refuse to rise at all. This is why I always counsel friends and visiting anglers who talk or write to me about the Grand Discharge to be sure to have a few good standard salmon flies of various sizes with them. For fishing in the heavy water where the largest fish usually lie, and where the best of the sport is to be had when a fish is hooked, a No. 3 or 4 hook is none too large, though in quieter places, and when the weather is hot and the water clear, the fly can scarcely be too small, and one of the largest fish which I have seen killed in the Discharge—an 8-pound ouananiche—was taken on a No. 8 hook. Then, too, a General-Hooker or B.-A.-Scott fly is as good as a Jock-Scot, but it must be very small.

E. T. D. CHAMBERS.

## The Gut Crop of 1905.

MESSRS. S. ALCOCK & Co., LTD., report that the gut crop last year, 1904, was the smallest produced for the last twenty-five years, consequently prices were advanced, but the present crop, 1905, is less than the average, and, stocks being low, prices for raw material have advanced. As regards the heavier classes, the supply is the smallest for the last dozen years.

## Edward Carver's Heroism.

ASBURY PARK, July 8.—It is always a source of much greater pleasure to me to tell the *FOREST AND STREAM* family that there is much doing and great things in prospect than to write of monotony and disappointment. June always gives us the best of our striped bass fishing, and the month closed, has been rather disappointing. While some very fine fish have been taken, still the summary is not great.

Kingfish are very scarce. Of the hundreds of rods fishing each day, I do not think it exaggeration to say that a half dozen fish in a week would total the entire catch. This, when compared with experiences of past years, is most remarkable. A few weakfish are being taken now from the piers and also from the beach. It is a little early to expect good catches at these points, as August and September usually give good results. Barnegat is hardly up to the standard as yet; some bluefish, however, are in the bay and they always give a zest to fishing, no matter where found.

In the absence of so much of our old-time glory many of the fraternity now turn their attention, when the sea will permit, to off-shore fishing. Of course this is not to be attempted without a skillful surfman, but when conditions are favorable the reward is great and will be much in vogue now until late in November. We always have our fishing and sailing yachts; but your true angler cares but little for the sport to be had on them, as the motly throng always aboard savors not of his kind of sport.

To those, however, who delight in sailing only, the opportunity offered is superb, and this season the swift yacht *Ivanhoe*, owned and sailed by Capt. Frank Pierce, is now in commission. She is from the fleet of the New York Y. C. flyers, and is a beauty. I had the pleasure the present week of being a guest on board for a cruise, and cannot say too much in behalf of ship and crew. A most pathetic incident, however, marred the close of the sail. When we were about one and a half miles from the anchorage, a young lady (whose name by request of the mother I withhold), slipped over the yacht's stern, and but for the heroic effort of Mate Edward Carver must have been lost. So rapidly was the yacht thrashing through the water that a full quarter of a mile was gone over before assistance could reach the thoroughly exhausted girl. It is a pleasure to record heroism of this type. The brave act will ever stand a bright monument to the credit of Edward Carver in the estimation of all who witnessed his valorous deed.

LEONARD HULIT.

## A Turtle Trade.

Editor *Forest and Stream*:

A more or less regular visitor at the port of Erie each season is the schooner *Bertha Wallace*, Capt. A. Winne. She is only 35ft. over all and 11ft. beam, and hails from Port Clinton, Canada. Her only cargo is of turtles that are carried in a squirming mass down in the hold. She made her first voyage for this season a week ago, being later this year than usual, as the turtles are rather scarce yet, Captain Winne says, but he expects to do better from this out. He only had 2,800 pounds this time.

These turtles are caught in traps set in a marsh behind Long Point, Canada, nearly opposite to Erie. The traps are much like fish nets and are baited with fish. Captain Winne has often as many as sixty traps set. They have to be watched as carefully as an animal trap. The captain has been in the business now for thirty-five years; he is a full cousin to Postmaster-General Wynne, though he spells his name a little differently.

The turtles he brought over this time would not average more than 9 pounds each, though a few of them weighed 20 pounds. The largest one he ever brought here weighed 60 pounds. It was kept in Erie to furnish soup for the patrons of one of the hotels.

These turtles, when they arrive here, are turned over to a fish company, which ships them all over the country, a good many of them going to a company in Ohio that then ships them East.

To unload the turtles, a man gets down among them in the hold, then seizing each one by its tail, never by its head, he gives it a quick fling that lands it always on its back on the dock; here another man, taking a new tail-hold, throws it into a box, which, when it is full, is nailed up and shipped right off.

There is no duty to be paid on these turtles; they seem to have been forgotten when the last tariff was made up. They are not even protected here in the United States, at least not in this State, though the frogs are.

CABIA BLANCO.

## Bluefish vs. Black Bass.

Editor *Forest and Stream*:

Your article under the above title reversed admits of some adverse criticism. If your fresh-water angler tries the blues on "relatively" light tackle I do not think he will make the unfavorable comparison he does, again. Why should the fighting quality of a fish of 4 to 6 pounds, caught with a rod of 10 ounces, and line evidently 18 or 21-thread, be judged when such implements are used and the fish gaffed in five minutes? The time consumed in boating him savors strongly that "horsing" him was resorted to, and suggests that the same method was used upon the black bass, naturally resulting in the demolition of the two rods. The relative resilient power of rods of equal quality is not judged in the usual percentage ratio; for instance, an eight-ounce rod is more than twice as strong as a five-ounce rod; a ten-ounce rod in the hands of an angler has five times the strength of a four-ounce rod used with the same skill as the lighter one. A bluefish weighing from 3 to 6 pounds and (I have frequently found a 3-pound fish to fight harder and longer than a 5-pound fish) caught on a four or five-ounce rod, and nine-thread line, will give as pretty a fight as any fish that swims, perhaps barring some varieties found on the east coast of southern Florida. I will venture to say, that the bluefish will play the same havoc in shorter time than the bass did, when he put the rod out of business, if the same tackle is used. Weight for weight and size for size the black bass is not in the same class with the blue. Let Mr. — try the blues on a bass rod and line and reel and if he has anything left worth bringing home of his outfit, that his skinned knuckles will admit of carrying, I shall be surprised after his black bass experience.

C. T. POND.

## Texas Tarpon.

KANSAS CITY, Mo., June 30.—*Editor Forest and Stream:* I have just received a letter from my friend, Mr. Robert E. Farley, the well known taxidermist of Tarpon, Tex., describing some fishing that they have had down there lately. He says the fishing is such as it never was before, all records having been broken.

In one day fourteen sportsmen landed 118 tarpon. One of them landed twenty-four, quitting at 4 o'clock. This is the greatest tarpon catch on record. Some years ago an eastern gentleman fishing at Boca Grande, Fla., landed twenty-two fish in one day, and the greatest previous record for Aransas Pass was made last year by Mr. Edward Cotter, who landed eighteen in one day. The gentleman who now holds the world's record is a Mr. Murphy, of Indiana. I fished with him at Aransas Pass some three years ago. He is a fine fellow and a thorough sportsman, and in spite of his years can handle as many big fish in a day as anyone I know. He fought in the American Civil War and lost an eye in the service. I wrote you once about the splendid tussle he had with a six-foot two-inch tarpon, and told how the fish jumped six times to a height of twelve feet. I was close alongside of his boat at the time and stopped fishing to view the struggle.

The Spanish mackerel have been slow in going into Aransas Pass this year, but the jewfishing has been good, one man having landed in a half day seven of these fish. Mr. Farley does not say how large they were, but I know they run very heavy down there. You may remember that nearly three years ago I broke the world's record on jewfish landed with rod and reel by taking at that place a 450-pound specimen. Mr. Farley says the sharks are very bad in the Pass this year, being encouraged to go there by the number of crippled tarpon that escape the sportsmen or that are turned back after being beached. Mr. Farley favors beaching all tarpon and letting them lie there so as to discourage the sharks, for he thinks the supply of tarpon is practically unlimited.

I have business that will take me to Texas several times this summer, and I expect to be able to run down to Aransas Pass with one of my sons in the near future. If I have any good luck I shall tell you and your readers about it.

## A. J. Stone Explorations.

FROM the press of the American Museum of Natural History has just been issued a limited edition of a folio publication of over fifty pages which is singular for its beauty, and interesting for the purpose which it serves. It is intended as an acknowledgment by the Museum of the generosity of those whose liberal contributions have made it possible for Mr. Andrew J. Stone to attack the zoological problems of the Northwest. The Museum wishes to make known more generally the scientific results that have attended Mr. Stone's efforts, and hopes that the example given of achievements gained through a combination of men ready to help with a man ready to do may result in the organization of other expeditions to other lands. The subscribers to the Stone Exploration Fund numbered less than twenty-five, but 100 numbered copies of this brochure have been issued and distributed to the subscribers to the fund, to men who, though not subscribers, have in one way or another given assistance to the expedition, and to those especially interested in the work which Mr. Stone set out to perform. The paper is fully illustrated by photographs of Arctic mammals, Arctic scenery and Arctic men. Of the latter four photographs of Eskimo, facing four photographs of Loucheux Indians—the northernmost red men on this continent—are especially interesting. Photographs of Grant's and Osborn's caribou, of the giant Alaska moose, and of various northern bears adorn the large and beautiful pages.

Early in 1901 steps were taken by friends of the Museum to provide a fund for the systematic prosecution of Mr. Stone's work in the North. This project was largely the thought of Mr. Madison Grant, Secretary of the New York Zoological Society, and of the Boone and Crockett Club, and through his interest in the matter and his energetic efforts in its behalf pledges were received for annual contributions sufficient to carry through these explorations for the period of three years.

The present paper gives an account of these explorations so successfully conducted by Mr. Stone.

## Fishing in Erie Harbor.

ERIE, Pa., July 8.—*Editor Forest and Stream:* The hook and line fishing in Erie harbor was never better than it is this season. Large strings of fish are caught every day both from boats and from the channel piers. The largest fish I have seen for several years here was taken by a dock laborer with a rather crude outfit of hook and line; it was a maskinongé measuring twenty-seven inches. I did not have a chance to weigh it, but estimated it at 40 pounds.

The fish pirates that have spoiled the fishing time and again are being watched closely by the new harbor master; he has been given the fish warden's office in addition to his own, and he proves to be the right man for the place. He gives Misery Bay an examination every day or two, and has found a number of nets this season. His last find, a few days ago, was a large net and a long night line, both of them set in the bay. Some of the nets that he has found and destroyed have the names of fish companies here stamped on the floats and sinkers. The companies claim that these nets have been stolen from them. They could easily have been stolen by anyone so minded, but the companies when they missed them should have reported it. That would have cleared them of all suspicion.

An old man, an amateur fisherman, was arrested a few days since for using several hooks on a night line instead of one hook. This is a rather common practice here. I noticed several different men last season using these gangs of hooks, strung on the line, one above another, but I did not consider it to be an offense grave enough to be reported, while the nets and night lines are. But if Harbor Master Jordan keeps up his good work—and he will—the nets will have to go.

## New Publications.

## Last Winter's Forestry Congress.

IN January there was held at Washington, D. C., a meeting quite extraordinary in character and of especial interest to all Americans. This was the meeting of the American Forest Congress. It was attended by a great number of delegates and others, of whom the most important was the President of the United States, who delivered an address on "The Forest in the Life of a Nation." There were present also experts in all branches of forestry, as well as in all those trades and interests likely to be especially affected by the preservation or the destruction of the forests.

It is but a few years since the foresters stood alone, while the lumbermen, the miners, the railroads and other industries especially interested in lumber and timber took absolutely opposite points of view as to forest treatment and were bitterly hostile to the foresters on forestry questions. Happily they understand each other better

now, and realize that what is for the advantage of one interest is also for the advantage of the other. It is understood now that the forests must be preserved for their use to man, and not simply on sentimental grounds. On this basis all can cordially work together.

The sessions of the Congress, which was held under the auspices of the American Forestry Association, extended over four days. They dealt in a broad way with a number of subjects—the importance of forestry to the nation in respect to agriculture, irrigation, the lumber industry, the grazing industry, the railroads and the mines, and closed with a discussion of what should be the forest policy of Nation and of State.

A short time after the adjournment of this Congress, the Federal Legislature passed a law transferring the care of the Forest Reserves from the Secretary of the Interior to the Secretary of Agriculture, following which there came into existence on the 1st of July, 1905, the Forest Service of the United States, which is described in the address given at the Congress by Mr. Gifford Pinchot, Forester of the United States. The passage of such a law has long been desired by all who were best informed on forestry matters.

While it is impracticable to give any general notion of what was done at the Congress, it is certain that it accomplished much good. It was summoned to establish a broader understanding of the forest in its relation to the great industries depending upon it, to advance the conservative use of forest resources for the present and future needs of these industries and to stimulate and unite all efforts to perpetuate the forests as a permanent resource of the nation. It may fairly be said that the Congress contributed largely to these good ends by bringing about a still better understanding between people whose ideas in the past have been very diverse. It brought together from all parts of the country experts and business men, no one of which we fancy left the Congress without having added something to his knowledge and having become broader in his views. And of the delegates who, at the close of the sessions, dispersed to their respective homes, carrying with them the memories of this Congress and its proceedings, there are few, we venture to say, who have not become missionaries to spread the doctrines advocated by the Congress and the American Forestry Association over the length and breadth of the land.

The American Forestry Association has recently published a large volume containing the full proceedings of the Congress, and it were greatly to be wished that this volume, which is very inexpensive, might have a wide circulation.

## Recent Scientific Papers.

AMONG the papers extracted from the Bulletin of the American Museum of Natural History, and recently sent out, are several which, though quite technical, are of much interest to naturalists. One of these is an illustrated account of the "Ants of the Bahamas, with a List of the Known West Indian Species," by William Morton Wheeler. Notes as to the life habits of a number of the species are given.

Mr. Oliver P. Hay has two papers on fossil turtles, discussing the groups *Toxochelyidae* and *Amphichelydia*. Several new species of fossil turtles are described, and there are remarks on the origin and relationship of the suborders, superfamilies and families of the Testudines. Besides many cuts in the text, a chart is given expressing the author's views as to the descent of the turtles from Permian time.

Bulletin No. 2, of the Connecticut State Geological and Natural History Survey, contains a preliminary report on the "Protozoa of the Fresh Waters of Connecticut," by Prof. Herbert William Conn, Ph. D., of Wesleyan University. It is illustrated by thirty-four beautiful plates.

## Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

JULY.

12. Seaside Park, club.
12. Sea Side, open.
15. Royal Canadian, club.
15. New Rochelle, club.
15. Knickerbocker, one-design power boats.
15. Seaside Park, club.
15. Country Club, Detroit club.
15. Edgewood, club.
15. Bensonhurst, Bellows challenge cup.
15. Keystone, club.
15. Atlantic, Underwood cup.
15. Beverly, club.
15. Boston, cruise.
15. Corinthian, club.
17. Edgewood, N. B. Y. R. A., open.
18. New Brunswick Y. R. A. regatta, Prudence Island.
18. East Gloucester, club.
19. Seaside Park, club.
19. Rhode Island, N. B. Y. R. A., open.
20. Rhode Island-Sachem Head, team race.
20. Royal St. Lawrence, Seawhaka cup.
21. Fall River, N. B. Y. R. A., open.
21. Knickerbocker, power boat race to Marblehead.
22. Knickerbocker, one-design power boats.
22. Winthrop, M. Y. R. A.
22. Bristol, N. B. Y. R. A.
22. Rhode Island, cruising race.
22. Seaside Park, club.
22. Royal Canadian, Canada's cup trials.
22. Beverly Y. C., club.
22. Marine and Field, second championship, Y. R. A. G. B.
22. Unqua Corinthian, Molineux cups.
22. Corinthian, club.
26. Seaside Park, club.
27. Eastern, power boat races.
27. Sea Side, club.
27. Eastern, power boat races.
28. Seaside Park, Bay Head and Island Heights, cruise.
28. Sea Side, open.
29. Eastern, power boat races.
29. New Rochelle, ladies' race.

29. Chicago, race to Mackinac.
29. Country Club of Detroit, race to Mackinac.
29. Seaside Park, open.
29. Edgewood, club.
29. Knickerbocker, one-design power boats.
29. Hampton Roads, cruise.
29. Rhode Island, cruising race.
29. Royal Canadian, cruising race.
29. Beverly, club.
29. Corinthian, club.
29. Boston, club, Marblehead.
29. Indian Harbor, annual.
29. Bensonhurst, Childs trophy.

## Log of Gauntlet in B. Y. C. Race.

From New York to Hampton Roads, Virginia.

BY JAMES D. SPARKMAN.

THE contestants in the race from Coney Island to Hampton Roads, under the auspices of the Brooklyn Y. C., started on Thursday, June 28, in their long race down the coast.

Five little vessels responded to the starting signals, a fairly good showing, but not up to expectations. The measurement rule barred a number of yachts with records for speed and seaworthiness, but no rating rule has ever been devised that is perfect, and on the whole it worked fairly well, three new boats having been built under it during the winter, Tamerlane, Lila and Gauntlet, the first two being yawls about 30ft. waterline and 40ft. over all, while Gauntlet was designed to get the maximum allowance, her dimensions being 27ft. over all, 22ft. waterline, 10ft. beam and 6ft. draft.

The start was made promptly at 10 o'clock in a light N.W. wind, tide  $\frac{3}{4}$  ebb. The boats crossed in the following order: Lila, Mopsa, Tamerlane, Gauntlet and Bonita. Off East Bank the wind backed to S.W., mak-

ing a beat to the Hook, which was passed at 11.30, Bonita leading and Gauntlet last, about  $\frac{1}{4}$  of a mile astern. At this point we are well within our time allowance. Wind shifted to W. by N. Set balloon at noon and chose watches. At 1 o'clock wind backed again to S.W. Headed off shore; course, S by E., good, allowing for leeway and set of current. At 4 o'clock tacked ship and took in topsail, wind freshening. Sloop Nomad and schooner Sunshine, which started 10m. behind us, are about 2 miles dead to leeward; the rest of the boats are closely bunched 3 miles ahead. Barometer 30.10 and shows no drop for S. wind.

Too rough to do much cooking. Coffee-pot trying to do a jig on the stove, so had to lash it to stove pipe to keep it right side up. Wind dropped about 10 o'clock, leaving a nasty slop of a sea and remained calm all night.

Friday, June 29.—Barnegat Lighthouse bearing W. about 7 miles. At daylight the fleet was hull down ahead of us. We are now 50 knots from the start—a poor showing for 20 hours—but the conditions are most unfavorable. A nasty head sea bothers us, but does not seem to affect the larger boats so much. At noon, the wind increased to 10 knots, and we are able to head S.W. or about 3 points to leeward of our course. Gauntlet was nicknamed "Virginia Creeper" early in her career, and the name seems to fit. For a boat 22ft. waterline, however, she has done well, and is dry and comfortable under all conditions, the crucial test for offshore work. Atlantic City abeam at 4 o'clock. Wind much stronger, and sea making up. Took in topsail at 5 o'clock. Sunshine is hull down astern of us.

Saturday.—At midnight we made a long board off shore, and on the next inshore tack, picked up Five Fathom Lightship 20 miles to sea. Wind fresh and sea

moderate all night. We are taking to the routine of watches very kindly, and the relieved watch never loses any time in turning in, but seldom gets an uninterrupted watch below. Cooking is the most strenuous job on board, as it is almost impossible to keep things on the stove, and out of the question to set the table, so we have to hold our grub in our laps in true forecastle fashion. A few hours of fair wind and smooth water would be very welcome. In fact, a shift from any quarter would help, as it has been end on for 48 hours. Passed close to and hailed Fenwick Shoal Lightship. They reported that they had seen nothing of the racers, which means that they probably passed in the night and are a long way ahead. The man who answered our hail looked as if he hadn't been ashore for months, and acted as if he had forgotten how to talk; all we could get out of him was a nod or shake of the head. About sundown we passed through a big fleet of fishermen anchored a long way off shore. There were twenty-four schooners in the fleet, and the dories were out miles from some of their vessels. We learned from them that two of our boats had been seen early in the morning, which puts them about 16 hours ahead of us.

Sunday.—Wind moderated during the night, but held from same quarter. Passed Winter Quarter Shoal Lightship at 5 A. M. Weather overcast, with occasional rain and wind squalls. This is the fourth day out, and we look like a lot of Cape Horners, no one having shaved since we started. At 10 A. M., wind much stronger and sea heavier we have yet had. Steamer passed close aboard, bound south, and a torpedo boat destroyer bound north. We are directly in the steamer track, which is further in shore than we want to be, as our plan has been to keep from 20 to 30 miles off looking for easterly slants, but they have failed to materialize thus far. About 4 o'clock we sighted a sloop ahead, and by 6 were near enough to make her out to be the Nomad. Hog Island Light bearing S.W. by W. 8 miles—seas very heavy and Nomad making bad weather of it. By 8 o'clock wind and sea had both increased, and we decided to heave to under reefed mainsail. By daylight it moderated, and a few hours later dropped almost to a calm, but could not set light sails for fear of slatting and chafing them to shreds. Gauntlet proved herself to be an exceptional sea boat, and during the worst of the blow, the sea, which was very high and irregular, never broke over her bows.

The last of the ice disappeared yesterday. I forgot to note it in the log, although it is the most serious thing that has happened yet. No more cold drinks, and we have to butter our bread with a spoon. We hope to get a square meal to-day, however, as it is flat calm and sea smooth, save for a heavy ground swell which does not bother us. Hog Island Light is still in sight, which means that we have made absolutely nothing since yesterday P. M. O. D. steamer passed us this morning headed S. This is the second time that we have seen the same boat, and hope she has reported us.

Late in the afternoon, after laying becalmed all day, a light S.W. breeze sprang up and gave us a little lift, and at 5 o'clock we made Cape Charles (Shore) Light.

Toward evening the wind veered to S.E., and for the first time in five days gave us a favorable slant. Cape Charles Lightship was passed at 7:40, and a fair tide and wind enabled us to cross the finishing line 5 hours later—the last boat in our class, but ahead of two much larger boats in the class above. After grounding twice in an unsuccessful attempt to get into the Hampton Roads Y. C. anchorage, we gave it up and anchored off Old Point about daylight.

Much to our disappointment, we learned that the others had finished many hours ahead, but had had more favorable conditions, and the winner, Tamerlane, had sailed about 100 miles less than Gauntlet, whose log showed over 400 knots. Tamerlane stood even further to sea than we, got the slant we were looking for, and her skipper is to be congratulated on his clever win. She was designed and built by Mr. L. D. Huntington, Jr., who also designed and built Gauntlet for his own use.

We realized after the second day of head wind that we were out of it, as a 22ft. waterline boat is too small a craft to be driven to windward fast against a head wind and sea, but our crew, consisting of Mr. L. D. Huntington, Jr. (owner), Montgomery H. Clark, R. N. Bavier, Frederick Le Court and the writer, kept her going for all they were worth night and day, and with the exception of the amateur cook, it is doubtful if any of us had more than 16 or 18 hours' sleep during the five days we were at sea.

**Newport 30-Footers.**

THE first race of the season between the Herreshoff Newport 30-footers was held July 2, and the Loretta, owned by Mr. Oliver Harriman, was beaten for the first time by Mr. Pembroke Jones' Carolina, which, for several reasons, has been the champion of the Newport "thirties." The owners sailed their boats, and with Mr. Jones in Carolina was Mr. Elisha Dyer, Jr.

The course was a short one, a run up the bay of about 4 miles, and a beat back, and the two contestants kept close together until they hauled on the wind, when they parted company, and Carolina soon took the windward position and the lead. She reached the finish line a winner by a half minute. The event was a match race, for a cup to be paid for by the loser.

**BENSONHURST Y. C. CLUB HOUSE OPENED.**—The new Bensonhurst Y. C. club house, on the shores of Gravesend Bay, was formally opened on Saturday, July 8. A large number of yachtsmen and lady guests visited the station during the afternoon and were enthusiastic about all that they saw. In the evening a vaudeville entertainment was given. The club membership limit has now been reached and every department seems to be in a prosperous condition.

**CAPE MAY Y. C. OFFICERS.**—The Cape May Y. C. elected the following officers on July 4: Com., J. Wesley Allison; Vice-Com., Christopher Gallagher; Rear-Com., J. Clifford Wilson; Sec., Adam Suelke; Treas., William K. Holman.

**British Letter.**

**END OF EARLY RACING SEASON.**—The departure of the big handicap class on June 22 in their race from Cowes to the Clyde marks the termination of the first part of the yachting season. Rosamond and White Heather have been the most successful boats in this class, their improved form over that of last year being the result of slight alterations and a change of skippers. Rosamond has taken four first prizes; White Heather two first, one second and one third; Brynhild one first and one second; Clara one first; Creole three seconds and one third, and Valdora and Moonbeam one second each. Valdora has fallen off this year, but she will probably come to the front again before the season is out. White Heather would probably have had another first prize had she not mistaken the course in the river match of the Royal Thames Y. C., in which case Clara—the only other competitor—would have been without a winning flag. In the smaller handicap class Gauntlet, the scratch boat, has suffered the penalty for being the best kept up and most smartly sailed boat of the fleet, by being handicapped out of it. Viera has won three first, Sonya a first, three seconds and a third, and Indema one first, one second and a third. Why Gauntlet should have to allow her sister ship, Indema—built in the same year and designed by the same designer—over 13½min. from the Nore to Dover is a puzzle, as also is the allowance of 6min. 14sec. which she had to make her over the short course at Dover two days later. As Gauntlet has apparently not won a single prize this season it is high time her penalties were considerably reduced, as the object of handicaps is to put all boats on a level. The surprise of the past fortnight has been the remarkable improvement in the Herreshoff 52ft. rater Sonya. Since shipping her new hollow mast she has won three first prizes out of four starts, and has proved herself to be a better boat than any of the others, with the exception perhaps of Moyana—when sailing to windward. She is also very fast when running dead, but with a beam wind, or a quarter wind, she is not so fast. Her first race after shipping the new hollow spar was under the burgee of the Royal Corinthian Y. C. at Port Victoria on June 10 (not June 12, as I stated in my last letter). Her sole opponent was Moyana, and in a long turn to windward the British boat beat her by more than 3min. In the run back Sonya picked up the leader to some extent, but was beaten by over 1½min. Since then, however, she has started three times and won three first prizes, and the improvement in her form may be put down not so much to the hollow mast as to the position of the crew, who have been sitting well forward and getting her tail out of the water a little. It was feared at one time that Sonya would desert the class for the Kiel regattas, but fortunately her owner, Mrs. Turner Farley, changed her mind, and all four of the 52ft. class have left in tow for the Clyde where they will have a fortnight's continuous racing. Both Sonya and Moyana will have new suits of sails by Laphorn & Ratsey. It will be interesting to see whether the American boat will do as well or better to windward under the flat sitting British sails than she did under the more baggy Herreshoff canvas. She is so stiff that there is some talk of taking off some of her lead so as to make her faster in light weather. If this is done, however, it will hardly be until after the Clyde Fortnight, and during the races her true form will probably be found. At any rate, there will be sufficient data to go upon to decide whether such an alteration is advisable. If Sonya keeps up her winning mood it will be a feather in the cap of the supporters of our rating rule, for she certainly conforms more closely to its requirements than any of the other boats. She has more body, more draft of water and her overhangs are by no means excessive. Moyana should be much improved with new sails and close racing is looked forward to with the four boats. Britomart has not apparently found her trim yet. She, like Sonya, has been handicapped through having to carry a solid mast for some time. Maymon is not going so well as last year, which is probably to be accounted for by the fact that she has changed skippers, and the new man, who has for many years been in charge of larger vessels, has not yet quite settled down to her.

**THE RACING.**—The New Thames Y. C. had its river matches on June 14, the course being from the Lower Hope, just below Gravesend, round the Mouse Lightship and back to Gravesend, for the big boats and 52-footers, and round the West Oaze Buoy and back for the small handicap class. It is an obsolete course, but the New Thames stick to it because their club house is at Gravesend. White Heather was first home, but Rosamond took first prize on the handicap, and Creole the second. The course gave a beat to the lightship and a run back. Britomart was an absentee in the 52ft. class and Moyana gave up soon after the start through some of her gear giving out. In a hard beat to windward Sonya, although making a bad start, caught and passed Maymon and reached the weather mark 7min. ahead of her. Maymon picked up 6min. in the run home, but Sonya scored a well deserved victory. Indema and L'Amoureuse won the prizes in the small handicap match. The next races were those of the Royal Thames Y. C. from the Nore to Dover. The racing was quite spoiled from lack of wind. White Heather and Brynhild won the prizes in the handicap for yachts exceeding 100 tons. Rosamond was winner in the second handicap, and Viera and Indema took the prizes in the small handicap. In the 52ft. class Sonya was fortunate in getting a clear start, after which she ghosted away from the others and won easily, Maymon being second, some 10min. later. On June 19 the Royal Thames had a race for the big boats from Dover to Calais and back, and for the 52-footers and small handicappers over the Dover course. Brynhild, Creole and White Heather took the prizes in the cross-channel race; Sonya fairly flogged her class beating to windward in a short jump, though it is said she was disqualified for finishing the wrong side of the mark boat. Britomart was second, after having led most of the day. Her long overhangs stopped her in the jump to windward and Sonya beat her 2min. in the short beat from the South Foreland to the line. In the match from Cowes to the Clyde six boats started in a jackyard topsail breeze, viz., the yawls White Heather, Brynhild and Valdora, the cutter Merrymaid and the schooners Adela and Norlanda. As they beat down the west channel toward the Needles Brynhild was leading and Valdora second. The course is not a very long one, just over 500

miles, but the winds are fluky and capricious off our coasts at this time of year, so that the race will probably occupy some days.

**THE GERMAN EMPEROR'S CUP RACE.**—The race from Dover to Heligoland, which was started on the same day as the Royal Thames matches from the Nore to Dover, suffered in the same way from lack of wind. There was a capital entry of a dozen fine vessels, including several American yachts. Navahoe was scratch, the other starters being the yawls Satanita, Ailsa, Therese, Lethe and Formosa, and the schooners Hildegard, Endymion, Clara, Susanne, Fleur de Lys and Sunshine. The yachts were all brought up off the Goodwin Sands in a flat calm until after dark, when a strong westerly breeze sprang up and they squared away with a fair wind. Navahoe was first boat to finish, but Susanne won first prize by time. Therese second, Navahoe third, and Sunshine fourth. Navahoe did the course in 36h. 28m. 32s.

**COWES TO CLYDE RACE.**—After an extremely dreary passage of five days the racing in the handicap match from Cowes to the Clyde was brought to a finish on June 27. In every case the weather is reported to have been of the most unfavorable kind, especially after making the Longships. From the start wind was a light sailing breeze from southeast, which held more or less true to the Land's End. White Heather was soon ahead, the last of her rivals to be lost sight of being Valdora, which was left between Portland Bill and the Lizard. After leaving the English Channel the prevailing airs were northeast and northerly with great stretches of calms. White Heather was off the Isle of Man on Monday morning, and there she had a good slant to Portpatrick, but subsequently the airs fell away, and after being hung up under the Holy Isle she took eighteen hours to do the remainder of the course—about thirty miles. Brynhild and Valdora were a great deal together on the passage, and were next in order to White Heather. The timings were as follows:

Mr. Myles B. Kennedy's yawl White Heather (scratch), winner of £100 cup.....	8 00 16
Dr. J. Douglas Kerr's yawl Valdora, 3d prize, £20 cup..	12 33 17
Sir James Pender's yawl Brynhild.....	12 29 13
Mr. R. Young's cutter Merrymaid.....	3 29 50
Mr. Claud T. Cayley's schooner Adela.....	3 35 08
Mr. F. Milburn's schooner Norlanda, 2d prize, £40 cup.....	5 18 13

E. H. KELLY.

**Rhode Island Notes.**

**NEW YACHT CLUB STATION.**—The New Prudence Island station of the Rhode Island Y. C. was appropriately opened with a housewarming party on the evening of July 3, and a large assembly of members and guests attended the affair. A vaudeville programme furnished the evening's entertainment, and a Dutch luncheon was served. About forty yachts of the club fleet were anchored off the station during the evening. The new club house is 52 by 32ft. in size with an ell 25 by 24ft. It is two stories in height, and a handsome building situated on rising ground about 100ft. from the north shore of the island. The lower floor of the main building is given up to a club room, a large dining hall and a smaller private dining room. The second floor has a good-sized hall, a ladies' dressing room and five sleeping rooms, while the ell contains the kitchen and pantries and steward's quarters. A verandah 12ft. wide surrounds those parts of the house that front on the bay. The Prudence Island station will make an attractive stopping place for visiting yachtsmen who go to the upper part of Narragansett Bay.

**NARRAGANSETT BAY Y. R. A.**—On July 17, Monday, the week of open racing of the Narragansett Bay Y. R. A. begins with the Edgewood Y. C. open regatta, that club entertaining the visiting yachtsmen in the evening. The Tuesday racing will be an Association regatta off Prudence Island, and the Rhode Island Y. C. regatta will be sailed over the same course on Wednesday. The following day there will be a team race between the Rhode Island and Sachem's Head fleets, with an entertainment for the visiting club at the Prudence Island station in the evening. The Fall River Y. C. racing will be on Friday and the Bristol regatta on Saturday. All the week's racing, excepting the team race on Thursday, will be open to the yachts of any recognized club, and large lists of entries are expected. F. H. YOUNG.

**CLASS Q BOATS AT LARCHMONT.**—The first race for the Bellows Challenge Cup for class Q, in which each club on Gravesend Bay is allowed to enter its best performer in a series of three events, was down to occur under the auspices of the Bensonhurst Y. C. on Saturday, July 8. It was postponed until Thursday, July 27, because of threatening weather conditions at the time for the start. The struggle for the same trophy, which was scheduled to be sailed on Saturday, July 15, has been called off for the present to allow the new class Q creations to go up the Sound for Larchmont race week. W. H. Childs' More Trouble, George H. Church's Saetta, F. J. Havens' Quest are to enter for the series prize offered for the class. George E. Reiners' Ojigwan is also almost sure to be in the fray. Hendon Chubb's Cockatoo II. will not compete up the Sound, her owner planning to be out of town. The new boats have proven fast in work on Gravesend Bay and there is much speculation among local yachtsmen as to how they will do at Larchmont.

**AUXILIARY SLOOP FOR ALLEN PINKERTON.**—The new sloop built from designs by Mr. Henry J. Gielow at Mr. Robert Jacobs' yard, City Island, was launched during the latter part of June. She was built for Mr. Allen Pinkerton and is 51ft. over all, 36ft. waterline, 13ft. breadth and 3ft. 7in. draft. A 7½ horsepower Buffalo engine is located under the cockpit floor. A very considerable amount of internal room is obtained under the cabin house. The companionway leads directly to the main cabin. The owner's stateroom is forward on the starboard side and the toilet room is on the port side opposite. Just forward is the galley and forecastle.

**REDWING SOLD.**—The racing sloop Redwing has been sold by Rear Commodore J. B. O'Donohue, of the Bensonhurst Y. C., to Mr. Arthur H. Whitney, of the Shelter Island Y. C. Redwing is one of the Bar Harbor 30-footers designed and built by the Herreshoff Mfg. Co.

Columbia, Chicago and Jackson Park Y. C's Interclub Regatta.

Chicago, Lake Michigan—Tuesday, July 4. THE Columbia, Chicago and Jackson Park yacht clubs held a joint race on Tuesday, July 4. There were twenty-six starters and the winners were as follows: Anita, Mildred, Smuggler, Illinois, Areadia and Mintoa. Vanenna, Nomad, Junita and Fawn had no competitor in their respective classes and were forced to take sailovers. A heavy wind prevailed throughout the race, and a shift more to the westward made all the legs reaches. In the 25ft. class Cyma nearly captured the race on corrected time. Phineas lost her mast in an unusually hard puff, so Smuggler and Gloria were left to fight it out in the 30ft. class. Illinois distinguished herself by not only winning in her class, but also by taking another leg in the Thomas H. Webb cup for yachts from 18ft. to 30ft. waterline. Of the five starters in the cruiser class there were three withdrawals. Mr. G. H. Atkin had no trouble winning with his smart little ship Minota. The race in the 21ft. class was such a failure that the afternoon event for these boats was abandoned. The Race Committee, composed of Messrs. Charles E. Kremer, Chicago Y. C.; F. A. McFarland, Jackson Park Y. C.; W. L. Shepard and Edward S. Balcom, Columbia Y. C., were on board Commodore Marshall D. Wilbur's steam yacht Marcia. The summary follows:

Table with columns for boat names, class, start time, and race results (Finish, Elapsed, Corrected).

Atlantic Y. C.

Sea Gate, New York Harbor—Tuesday, July 4. NINETEEN craft started in the open regatta given by the Atlantic Y. C. on the afternoon of July 4. A splendid breeze blew throughout the event. The winners proved to be Vivian II., Anona, Cockatoo II., Wraith and Beta. The feature of the day was the victory of Cockatoo II. in Class Q. This new creation sailed an excellent race after a good start, wasting no distance in useless tacks and making every leg a winning one. She beat Saetta by 2m. 27s. for the 7/8-mile course. More Trouble was just beaten out at the finish for second place by 3s. Boats in classes P and above sailed a course from the starting line off the Atlantic Y. C. to Craven Shoal buoy and thence to the bell buoy three quarters of a mile to the northward of West Bank Light and home, covering the journey twice. The first leg was a reach, the second a beat and the last a reach home. The other competitors covered the usual Association course, leaving all marks to port. It was a reach to Ulmer Park, a fine spinnaker run to the Marine and Field Club, another reach to Fort Hamilton and a beat home. The course, covered twice, aggregates 7.62 miles. The journey taken by the larger creations was approximately 11.75 miles. Lizana broke down early in the race, having trouble with her bobstay. Ogeemah lost her throat halyard on the second round. There was some dissatisfaction expressed by owners of old Class Q creations not in the Atlantic Y. C., because of not being notified of a separate start for the older boats. The summaries follow:

Table with columns for boat names, class, start time, and race results (Finish, Elapsed).

VICE-COMMODORE OF THE ATLANTIC Y. C. RESIGNS.—The resignation of Vice-Commodore Frederick D. Underwood, Atlantic Y. C., has been tendered and it will be acted upon at the next meeting of the club's trustees.

BELLE HARBOR Y. C. IN COMMISSION.—The Belle Harbor Y. C., that was organized last winter, went formally into commission on July 4. The club is now occupying its handsome new home at Belle Harbor, L. I.

It Will Interest Them.

To Each Reader: If you find in the FOREST AND STREAM news or discussions of interest, your friends and acquaintances who are fond of out-door life will probably also enjoy reading it. If you think of any who would do so, and care to send them coin cards, which, when returned with a nominal sum, will entitle them to one short-time "trial trip," we shall be glad to send you, without cost, coin cards for such distribution, upon receiving from you a postal card request. Or, the following blank may be sent:

Form for requesting coin cards, including fields for Name, Address, and State.

Jamaica Bay Y. R. A.

Jamaica Bay, L. I.—Sunday, July 2. IN a fresh S. E. breeze the first Jamaica Bay Y. R. A. regatta was sailed on Sunday, July 2. The starters covered the Jamaica Bay Y. C. courses. Kismet won in Class C by nearly 3m. Baby Roger protested, but the protest was not allowed. Psyche was the only starter in Class E, and she took a sailover. Ariel ran away from Lizzie Green in Class H, and won by 28m. 36s. Boozie won easily by 7m. 19s. in Class K. The summary follows:

Table with columns for boat names, class, start time, and race results (Finish, Elapsed, Corrected).

Riverton Y. C.

Riverton, Delaware River—Tuesday, July 4. THE Riverton Y. C. sailed its forty-first annual regatta on Tuesday, July 4. Four classes filled, and there were nineteen starters. The wind was light from the N.E. at the start, but later hauled to the S. and freshened. Sea Gull won in the catboat class, and H. McIlvain Biddle won in the one-design class. In the jib and mainsail class Dorathea finished in first place. The launch races were held in the afternoon. There were five starters, and it made the fastest time over the course. The summary:

Table with columns for boat names, class, start time, and race results (Finish, Elapsed).

Penataquit Corinthian Y. C.

Bay Shore, Great South Bay—Saturday, July 8. TWELVE boats participated in the first open race of the Penataquit Corinthian Y. C., held on Saturday, July 8. The Lighthouse cup was won by Arrow. Cornelia, the only other starter, withdrew. Arrow has won for two years, and if the craft wins again, Mr. Macy will be owner of the handsome \$500 trophy. The cup was offered by J. Campbell Smith five years ago. Mr. Smith's Amy Foster won the cup the first year, H. O. Havemeyer's Electra the year following, and for two seasons past Arrow has been the winner. The wind was light throughout, and the winners in the other classes were: Emla II., Elleen, Skip, and Hope. The summary:

Small table with columns for boat names and race results.

Gloucester City Y. C.

Gloucester City, Delaware River—Tuesday, July 4. FOURTEEN launches and sailboats started in the open race of the Gloucester City Y. C., held on Tuesday, July 4. The winners were as follows: Estella S., St. Cecilia, Anton, Harry B. and John Brennan. The summary:

Table with columns for boat names, class, start time, and race results (Finish, Elapsed).

Newport Y. C.

Narragansett Bay—July 4. THE Newport Y. C. held a catboat race on the afternoon of July 4, for prizes offered by the city of Newport, which was one of the most successful given in some years. Thirteen boats were entered in the four classes. There was a good whorl S.W. breeze and the boats made good time over the triangular course, the marks being at Bishop's Rock and off the North Dumpling Rock. The winners were Madge, Thyrsa, Restless and Vesper II. The summary:

Table with columns for boat names, class, start time, and race results (Finish, Elapsed, Corrected).

Rifle Range and Gallery.

July 24-29.—Newark, O.—Second annual of the Ohio State Rifle Association. July 26-Aug. 1.—Creedmoor, L. I.—Second annual of New York Rifle Association. Aug. 7-8.—Springfield, Mass.—New England Schuetzenbund. Aug. 11-18.—Fort Des Moines.—Iowa Rifle Association annual meeting. Aug. 24-28.—Sea Girt, N. J.—National rifle and revolver matches. Aug. 29-Sept. 9.—Sea Girt, N. J.—National Rifle Association and New Jersey State Association.

Providence, R. I., Revolver Club.

OUR Fourth of July all-day shoot was well attended and greatly enjoyed by the members who took part. Shooting was done from 12yds. with pocket revolvers to 200yds. with rifles. Many of the men indulged in simply practice work, but the following recorded the following scores: Revolver, 50yds.: Arno Argus 88, 84, 87, 79, 75, 93, 83, 82, 84, 80, 75, 84; William F. Eddy 82, 90, 80; William Almy 85; A. C. Hurlburt 81, 80, 87, 83, 79, 84, 81, 80, 80; W. C. Pixley 67, 73, 67. Pistol, 50yds.: Wm. Bosworth 92, Wm. Almy 89, Fred Liebrich 68, 65, 63, 64, 62. Revolver, 50yds., military target, possible 50 points: Arno Argus 50, 47, 46, 47, 46, 45, 47, 46, 47, 46, 46; Wm. F. Eddy 47, 50, 46; A. C. Hurlburt 47, 47, 47, 45, 45, 47, 45, 48, 47. Rifle, 50yds., 20yd. Standard pistol target: H. Powell 85, 85, 82, 80; B. Norman 80, 80. Rifle, Standard target, 50yds.: Frank L. Vaughan 71, 64, 63. Rifle, 25yds., German ring target, possible 250: W. Bert Gardiner 236, 237, 235, 232, 233, 234, 236, 231, 236. Rifle, German ring target, 200yds.: A. B. Coulters 183, 189, 179, 214. Interest in the club is increasing steadily, and good men are gradually learning that we have a snug place to shoot, and are taking up the sport. Saturday, the 8th, was a hot day, and very little regular shooting was done, excepting by the team men. Major Eddy kept pace with the temperature and shot some excellent scores, his 97 establishing a new 10-shot record for our range. The following scores were recorded: Revolver, 50yds., Standard—Wm. Eddy, .38 military, 91, 89, 90, 97, 80; A. C. Hurlburt, 82, 85, 84; Arno Argus, 77, 76. Pistol, 50yds.—Wm. Almy, .22 cal., 89, 91, 90, 90. Revolver, 50yds., military target, possible 50—Eddy, 50, 50, 49, 50, 47; Hurlburt, 47, 47, 47; Argus, 44, 46. Rifle 50yds., on 50yd. Standard pistol target—C. H. Jeffers, Jr., .32-20 repeater, 84.

The Seventh at Bisley.

THE Seventh Regiment rifle team, N. G. N. Y., was defeated by the Queen's Westminster volunteers, at Bisley, Eng., on Friday of last week, in competition for the Sir Howard Vincent shield. The defeat was on the narrow margin of ten points. The totals were, Westminster 1480, Seventh, 1480. The weather was fine and favorable for good scores. The match was shot with the most scrupulous observance throughout by the contestants. The scores:

Table showing scores for Seventh Regiment, Individual, and Westminster Volunteers.

Remington Gun and Rifle Club.

LION, N. Y., July 4.—Rifle match, 200yds: Warner, rest, 221; offhand, 73. Lee sporting rifle special prize. Rifle, 200yds., rest 3 shots, first prize \$5 in gold; Lancaster 219, J. Tomlinson 216, Woodward 214, Brown 213, Hubbard 210, Jackson 208, Hendrick 207. Rifle, 200yds., offhand, 3 shots, first prize \$5 in gold: Hubbard 74, Brown 71, Woodward 69, Hendrick 69, J. Tomlinson 64, Jackson 62. Rifle, .22 caliber, 5 shots, first prize, cigars: Warner 111, Brown 94, Comstock 94, Douglass 77, Excell 75, R. H. Tomlinson 74. Pistol, 5 shots: Warner 96, R. H. Tomlinson 56, Lancaster 48, Brown 45. Brown, first red flag, rest; Brown, last red flag, rest. Warner, first red flag, offhand; Hubbard, last red flag, offhand.

Rifle Notes.

A prize shooting contest for cash prizes at the Badisches Volkfest, to be held at Sulzer's Harlem River Park, New York, July 16 to 23, is announced. Competition is open to all. Any .22 rifle allowed. Any sights, telescopic included. Ten prizes, ranging from \$15 to \$1. Two best tickets to count. Premiums, first five best tickets, \$5; second, \$3; third, \$2. Shooting begins at 11 o'clock A. M. Joe Fueger, Mgr.; Wm. Rosenbaum, Shooting Master.

Applicant—I see your advertised for a floorwalker, sir. Manager—Yes. Have you had any experience in that line? Applicant—Two pairs of twins, sir.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Ohio Riflemen.

THE June medal shoot of the Twin Valley Rifle Club was held at Jesse Johnson's woods three miles south of West Alexandria. The medal was won by Chas. W. Matthews on a score of 44 out of 48. The shooting was offhand, 100yds., 4 shots. The medal was won by J. Johnson in December, January, February and May, and by N. Clemmer in March, April and May. At the June shoot J. W. Leshner and J. Johnson were second, with 43 each. Following the medal contest came the 4-shot match for money prizes, shot in five 4-shot events, possible 48 in each, possible total of 240. G. W. Izor won with a total of 222, his best 4-shot score being 46. This match was won in April and May by Jesse Johnson with 222 and 223. The Outing Rifle Club, of W. Milton, O., has a fine range and large membership. The officers are W. S. Kessler, President; Chas. Chase, Secretary. Their shoots are at 100yds. offhand and 40yds. muzzle rest. The Outing Rifle Club, of W. Milton, held their tournament on July 4. The wind blew a gale all day and interfered with the scores as well as the comfort of those in attendance. The shoot was at the military range on Stillwater River, and all contests were at 200yds., offhand and rest, any rifle and sight except telescope. Five money prizes in each event, 3 shots, possible 30. In the offhand match first prize was won by D. W. Jones, 23; second, H. Amett, 18; M. F. Hampton, 16; Dr. H. Pearson, 15; J. C. Anderson, 10. The muzzle rest match had thirty entries. Five prizes, 3 shots, possible 36. W. F. Jay was high with 31. J. A. Vore and W. E. Pearson tied for second with 29. J. F. Liddy, C. A. Getzandiner, John Spitzer, Dr. H. Pearson, 27 each, D. W. Jones 26, W. Schwartz 25. The July contest for the Gratis Township Rifle Club's medal was well attended. A strong wind during the greater part of the day cut down scores materially. In the offhand match at 100yds., 4 shots, possible 48, Jesse Johnson tied with G. O. Chrismer on 42, and in the shoot-off the former scored a center 2, while Chrismer scored 11. Johnson stands well in the list of winners of other clubs, but this is the first time he has captured the medal of this club. Other winners of the medal are: January, C. Glage, 45; February and June, M. Pence, 46; March, J. W. Leshner, 46; April, G. O. Chrismer, 45; May, I. Liddy, 47. The usual five events of 4 shots each, possible 48, possible 240 for the 20 shots, followed. Five money prizes in each event and four prizes in the aggregate scores. Winners of the aggregate prizes were J. Johnson, 217. He also won first in the first and third events with 46 and 46. Second, G. O. Chrismer, 15; J. W. Leshner, third, 211; G. W. Izor, third, 206. In the second event J. W. Leshner and G. W. Izor took first and second with 45 and 45. In the fifth event Leshner and F. Chrismer took second and third on 44 and 44. In the fourth event A. U. Lemmer took first with 45, G. O. Chrismer, second, with 43. The monthly cup contest of the Dayton Sharpshooters will be held on July 20 and is open to members only; 200yds., muzzle rest, 5 shots, possible 120. Adolph Schwind is the present holder of the cup having won it in May and June with scores of 108 and 104. On the same day matches, offhand and muzzle rest, will be arranged, open to all, with money prizes, and the best shots from W. Alexandria, Eaton, Lewisburg, W. Sonora, Englewood, and W. Milton will compete. The Fourth of July shoot of the Englewood Rifle Club was held on their own range for cash prizes and the medal. The conditions were 100yds., 4 shots, Standard American target, center

- Oct. 11-12.—Dover, Del., Gun Club tournament; open to all amateurs. W. H. Reed, Sec'y.

Mr. E. H. Taylor was high professional at the tournament of the Monongahela Valley Sportsman's League of West Virginia, July 4, held on the grounds of the Mannington Gun Club. He scored 140 out of 175 targets. First high amateur average was won by Mr. C. P. Kinney, 159 out of 175; second, J. F. Phillips, 155 out of 175. The League five-man team contest for the Peters trophy was won by the Mannington team, with 107 out of 125.

The opening tournament of the West Virginia Gun Club, Sistersville, W. Va., July 18, has a programme of fourteen events, each at 15 targets, \$1.50 entrance. Totals 210 targets, \$21 entrance. At the conclusion of the sweepstakes, there will be a five-man team race, 25 targets per man, for the team championship of the Ohio Valley Sportsmen's League. The high individual score will constitute the individual championship. At this meeting an association, to be known as the Ohio Valley Sportsmen's League, will be formed, and it is desired that the clubs of Steubenville, Martin's Ferry, Wheeling, McMechen, New Martinsville, St. Marys and Parkersburg will send representatives, and teams if possible. Shooting will begin about 9:30 o'clock. Rose system will govern.

A clay target has been invented in England. It is described as being similar to the ordinary clay target, but hollowed, so as "to contain a bunch of bright-colored worsted, to which a small weight is attached, and this is kept in its place by a small card disk. When the clay bird is struck by the shot the weight at once drops to the ground, and the colored wool plainly indicates the exact distance from the shooter at which the bird is killed. As a test of skill and to obviate the disadvantage which arises when ordinary clay birds are used, and the gradual slackening of speed facilitates hitting them, the lawn over which the clay birds are projected from five traps in the usual way is divided by three semi-circular boundaries, so that the birds when hit must fall into one or other of the intermediate spaces, and those which fall nearest to the shooter score the highest number of points." The colored wool stuffing recalls the feather filled glass balls of the ancient Bogardus and Paine days, when to break the glass ball was to make the feathers fly. Or, the Best tin pigeon days, few but merry, in the '80s. The tin pigeon was so constructed that a piece of tin, held by a flange to the underside of the target, and

Mr. R. R. Barber, of Paullina, Ia., winner G. A. H. and P. H., 1905.

Mr. J. W. Bell, I. G. C. Secretary, in charge of ammunition at G. A. H. Mr. Bell is at the left in window.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

Messrs. Knox & Knapp, Mgrs., announce their annual Labor Day tournament, Sept. 4, at Auburn, N. Y.

The Montclair, N. J., Gun Club has suspended shooting during July and August, owing to the absence of members. The next shoot of the club will be held on the first Saturday in September.

The Monongahela Valley Sportsmen's League of West Virginia will hold their next shoot at Morgantown, W. Va., on the grounds of the Recreation Rod and Gun Club, Aug. 8 and 9. The first day will be League day; the second, Club day.

Mr. A. A. Schoverling writes us as follows: "All-day shoot of the Mullerite Gun Club on the grounds of the Aquidneck Gun Club of Newport, R. I., on Saturday, Aug. 26. Full particulars from Mr. P. H. Powell, Newport, R. I., or A. A. Schoverling, secretary, 2 Murray street, New York."

The Chicago, Ill., Gun Club announce a tournament for July 22. Fourteen events at 10, 15 and 20 targets, entrance \$1, \$1.50 and \$2. High averages \$10, \$7.50, \$5 and \$2.50. Class shooting. Targets, 2 cents. Shooting will commence at 10 o'clock. No bang, no 0, unless a fair target is refused. Address all communications to the Secretary, C. P. Zacher, 221 Fifth avenue, Chicago.

attached to the rim of it by a chain, fell out and hung pendulously when the target was hit, then bringing the target to the ground promptly. This new idea thus is one which was obsolete in America years ago.

BERNARD WATERS.

Kingston Gun Club.

Druggist (to little girl customer)—Did you say pills, miss? Little Girl—Yes, sir, please. Druggist—Antibilious? Little Girl—No, sir, but Uncle is.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- July 12.—Brooklyn, L. I.—John Wright's merchandise shoot; added money. John Wright, Mgr., 318 Broadway, New York.
- July 12-13.—Manning, Ia., Gun Club second annual amateur tournament. R. A. Rober, Sec'y.
- July 12-13.—Menominee, Mich.—The Interstate Association's tournament, under the auspices of the Menominee Gun Club. W. W. McQueen, Sec'y.

IN NEW JERSEY.

Montclair Gun Club.

MONCLAIR, N. J., July 1.—Handicaps apply in events 6 and 6 only, and should be added to these scores. The contest for the Daly gun, postponed from June 10, was run off to-day, Mr. C. L. Bush being the winner with scores of 21 and 25—events 5 and 6—with an added handicap of 2 targets or a total of 48.

Some three other events—not here recorded—miss-and-out, each for a prize of a box of shells, were won by Howard, who shot in very good form the entire afternoon.

Table with 7 columns (Events, 1-7) and 7 rows (Targets, G Boxall, C L Bush, G Porter, E Winslow, G Howard, P Cockerfair, I S Crane).

July 4.—Some seven events were run off to-day, Nos. 2, 3 and 5 being for silver prizes. Some seventy dollars' worth of prizes were distributed among the contestants, every one getting something. Event No. 1 was won by Bush with a clean score of 23 breaks to his credit. Event No. 2, 25 targets, unknown angles, was won by Howard, who took first prize, one dozen after-dinner coffee spoons, the second prize going to Batten, who took home a soup ladle. Bush and Cockerfair tied for third place, Bush winning out in the shoot-off and getting a half dozen oyster forks, and Cockerfair a box of shells. Event No. 3, 15 targets straightaway, scratch, Bush and Howard tying for first place, Bush and Holloway and Cockerfair tying for third place. On the shoot-off (event No. 4) Bush and Howard tied again, Holloway winning third place and a silver meat fork and Cockerfair taking a box of shells. Bush and Howard now tossed for position, Bush winning first place and a set of individual butter knives, Howard taking a silver berry spoon. In Event No. 5, 25 targets, unknown angles, handicaps, Messrs. Moffatt, Boxall and Holloway all scored 24, with Howard and Bush tying for fourth place. In the shoot-off (event No. 6) Moffatt broke 14 out of 15 and won one dozen teaspoons, with Holloway a good second, he winning a gravy ladle, Boxall coming a third and getting a cream ladle. The shoot was voted a great success by all present.

Table with 7 columns (Event, 1-7) and 7 rows (Targets, F W Moffett, P H Cockerfair, Chas L Bush, G F Howard, Geo Boxall, Geo Batten, E Winslow, H F Holloway, J T Howe).

Handicaps apply only on events Nos. 2 and 5. July 8.—The club held its closing shoot to-day, it having been determined not to keep the grounds open during the summer, as so many of the members leave town for the summer months. The opening shoot will be held the first Saturday in September. The best shooting was done by Bush (if we except Jack Fanning, who was present, and shot along with the boys), with Allen a good second.

Table with 6 columns (Events, 1-6) and 6 rows (Targets, A R Allen, C H Hartshorne, C L Bush, W T Wallace).

EDWARD WINSLOW, Sec'y.

North Branch Gun Club.

NORTH BRANCH, N. J., June 24.—Ten Eyck scored a second win on the trophy donated by the Hunter Arms Co.

Table with 12 columns (Events, 1-12) and 12 rows (W H R, H B Ten Eyck, W H R, H B Ten Eyck, Purcell, Ten Eyck, W H R, W J Woolverton, J S Bunn, T J Flick).

South Side Gun Club.

NEWARK, N. J., July 1.—The following scores were made to-day on the grounds of the South Side Gun Club:

Table with 4 columns (Targets, 25, 25, 25, 25) and 4 rows (Brugmann, Nott, Lanerhaus).

Table with 4 columns (Events, 1-4) and 4 rows (Targets, 25, 25, 25, 25) and 4 rows (Nicol, Lanerhaus).

Recreation Rod and Gun Club.

MORGANTOWN, W. Va., June 30.—The Recreation Rod and Gun Club, of this city, held its thirteenth regular weekly shoot of the season at Recreation Park this afternoon, and had out a very nice crowd, ten shooters shooting through the programme. The weather conditions were very fair, and some pretty fair scores were chalked up, as scores go in our club.

The club championship gold medal was won for the week by W. N. Dawson, with a general average for the entire programme of 91.8 per cent. The officer's goblet handicap, 20-targets base, was won by W. Evans Price, shooting at 22 and getting 19. The scores:

Table with 4 columns (Events, 1-4) and 4 rows (Targets, 15, 25) and 4 rows (Cobun, Barthlow, White, Jacobs).

Event No. 4—Club team race, 5-men, 15 targets per man: Cobun, Capt. 13; Price, Capt. 12; Dawson 14; Barthlow 14; White 13; Christy 10; Sivey 13; Crumline 4; Miller 8—61 Jacobs 14—54.

July 7.—The Recreation Rod and Gun Club, of this city, held its fourteenth regular weekly shoot at Recreation Park this afternoon with nine guns and several visitors out, and had a very enjoyable shoot. During the afternoon a regular business meeting was held, and committees for our two-day tournament, on Aug. 8 and 9, were appointed.

The club championship gold medal was won for the week by Jno. M. Cobun with an average of 80 per cent for the entire programme. Mr. Cobun also won the officers' goblet handicap for the week, with a score of 17 out of 20 shot at. This event was a tie between Mr. Cobun and W. E. Price, Cobun breaking 17 out of 20 and Price breaking 17 out of 19 and Cobun winning out in the shoot-off by a score of 19 to Price's 14. The scores:

Table with 4 columns (Event No., 1-4) and 4 rows (Targets, 15, 25) and 4 rows (Cobun, Barthlow, Wiedebusch, Jacobs).

ELMER F. JACOBS, Sec'y-Treas.

Monongahela Valley Sportsman's League.

MANNINGTON, W. Va., July 4.—the fourth regular monthly tournament of the Monongahela Valley Sportsman's League was held here to-day on the grounds and under the auspices of the Mannington Gun Club, and was attended by fifty-one sportsmen from the various clubs of the league and from the Wheeling, McMechen, Pittsburg and Sistersville.

This shoot inaugurates the new grounds of the Mannington Club, and they are a decided improvement over their old grounds and should boom the game to the limit in this city. Two traps were used, and about 8,500 targets were trapped during the day. The programme was completed by 3:30 o'clock.

First high average (amateur) was won by C. P. Kinney, with a score of 159 out of 175 shot at. Second high amateur average was won by J. F. Phillips with a score of 155 out of 175 shot at. High expert average was won by Mr. E. H. Taylor with a score of 140 out of 175 shot at.

The Peters silver cup, emblematic of the League team (five men—25 targets per man) was won for the month by the Mannington Gun Club with a score of 107.

The Lafin & Rand silver cup, emblematic of the Individual League championship, was won for the month by Mr. Jno. F. Phillips with a score of 17 out of 20 shot at.

The next regular shoot of the League will be held on the grounds of the Recreation Rod and Gun Club, at Morgantown, W. Va., on Aug. 8 and 9, the first day being League day, and the second day club day. The scores:

Table with 4 columns (Shot at, Broke, Shot at, Broke) and 2 columns (Mannington Gun Club, Recreation Rod and Gun Club).

Table with 4 columns (Shot at, Broke, Shot at, Broke) and 2 columns (Fairmont Gun Club, Grafton Rod and Gun Club).

ELMER F. JACOBS, Sec'y-Treas. M. V. S. League.

Springfield, Mass., Shooting Club.

THIRTY-FIVE shooters attended the July 4 tournament of this club, held on their grounds at Red House Crossing. It was an ideal day for shooting, and some very fine scores were made. Shooters were present from Leominster, Hartford, New Haven, Somerville, Conn.; Northampton, Westfield, Greenfield and Pittsfield, while the club members turned out in goodly numbers. During the day 4,100 targets were trapped. The six merchandise prizes put up for amateurs shooting the entire programme of 190 targets, were won as follows: First, \$5 gold piece, Frederick Le Noir, of local club; second, trout rod, Archie Cooley, of Somers, Conn.; third, half-dozen photographs, William McMullen, of Somerville, Conn.; fourth, box of cigars, Melvin Hepburn, of New Haven; fifth, box of cigars, Dr. D. C. Y. Moore, of South Manchester, sixth, \$1 worth of shaves, W. H. Snow, of local club.

Following are the averages of those shooting the entire programme of twelve events:

Table with 4 columns (Shot at, Broke, Per Cent, Shot at, Broke, Per Cent) and 2 columns (Le Noir, Cooley, McMullen, Hepburn, Dr Moore, Snow, Bradley, Gates, Kites, Arnold, Dr Newton, Coats, Cheney).

Following are scores by events:

Table with 12 columns (Events, 1-12) and 12 rows (Targets, 10, 10, 10, 10, 10, 10, 10, 10, 10, 10, 10, 10).

Rochester Gun Club.

ROCHESTER, N. Y., June 28.—In the second contest for the George Borst cup, to-day, the Rochester Rod and Gun Club shoot resulted as follows:

Table with 4 columns (Brk. Hdp. Tot'l, Brk. Hdp. Tot'l) and 2 columns (Weller, Coughlin, Rickman, Borst, Skutt, Re-entry scores, Back scores).

\*Wins points on cup.

WESTERN TRAP.

Cincinnati Gun Club.

Cincinnati, O.—There was a good attendance on July 8, and the work done was fair, but not up to the average in several cases. The weather was cool and pleasant, with very good light. Five men made full scores, including their handicaps. Among these was Ackley, who shot more as he used to.

The balance of the series for the Schuler trophy shoot will be over No. 1 set of traps. This series closes on Sept. 9. The club has been presented with a beautiful bronze figure by Hon. Thos. A. Logan, which will be known as the Ackley trophy, and placed in competition immediately after the Schuler contest is ended. It is one of the handsomest and most valuable trophies which has been presented to the club for a long time.

Gambell did good work to-day in the team race, missing only 2 out of 50. Capt. A. W. du Bray is still in the city, but will soon start on a long trip.

The tournament committee is busily at work on plans for the coming event, and promises one or two surprises, and not unpleasant ones, for those attending.

Mr. J. G. Dukeman, of Somerset, Ky., was a visitor at the grounds to-day. He is secretary of a flourishing gun club in Somerset, consisting of twenty-five members, and says a tournament will be held this fall, probably the latter part of September. The day's scores:

Table with 4 columns (Schuler prize shoot, 50 targets, handicap allowance) and 2 columns (Peters, Herman, Gambell, Ahlers, F. Altheer).

Table with 4 columns (Team race, 50 targets) and 2 columns (Gambell, Barker, Ahlers, Peters).

The attendance at the Fourth of July shoot was good, over fifty members and visitors being present. Sliding handicap was used. All started at 16yds. in the first event. Those shooting into first money go to 19yds. in the next event; second money men to 18, and third money to 17. Go back to 16yds. if they do not get into the money.

Shooting began at 1:25, and the programme was finished at 5 o'clock, 3,080 targets having been thrown. A very strong wind blew all day, causing the targets to duck badly, and the scores suffered. Rain stopped the sport for a few moments. Faran was high with 138. Barker second with 133. Penn third with 132. The shoot was in charge of Supt. Gambell, with Secretary Davies in the office. The totals:

Table with 4 columns (Shot at, Broke, Shot at, Broke) and 2 columns (Peters, Dick, Ahlers, Penn, Harig, Faran, Krehbiel, Linn, Maynard, Bullerick, Pohlar).

Notes.

The Welfare Gun Club, of Dayton, gave a shoot on July 4, which proved to be one of the best it has ever held. Eighteen shooters took part in the various events. The programme consisted of ten events at a total of 170 targets, shot on the Jack Rabbit and per cent. plan. Some good scores were made in these events, in spite of a strong wind. Cain was high with 161 out of 170. N. Watkins second with 158. Craig third with 156. E. Watkins fourth, 154. Welsh broke 89 out of 100. Practice and sweeps filled the time until dark, but scores were much lower. At the regular medal shoot of the Welfare Gun Club, Dayton, O., Menbeck and Cord tied on scores of 25 or better, and after three shoot-offs, the former won. C. H. Cord was high man at practice, breaking 69 out of 70. Shooting at 10 pairs, Cord broke 16, and Watkins 19.

The Advance Gun Club, of Dayton, held a very enjoyable shoot on July 4, thirteen men taking part. The scores were much below the average, owing to the high wind. E. G. Middleton was high gun with 56 out of 150. J. Schaefer second with 52 out of 100. The sport consisted of seven 25-target events.

About twenty of the best shots in the State took part in the shoot held at Mt. Sterling, Ky., on July 4. The championship event, at 50 targets, was won by W. G. Green, of Maysville, with a score of 48. The prize was a silver cup valued at \$50. The prize for high average, a silver loving cup, was won by W. Henderson, of Lexington, with a score of 228 out of 245.

Sixteen shooters attended the handicap shoot of the Cleveland Gun Club. McVeigh, Pocock, and Ong were high with 50 each, including their handicaps. Doolittle, Pocock and Burns tied for high gun in actual breaks on 45. Alex. second with 44. The ribbon winners were: Class A—Doolittle, Pocock, and Burns first; Wallace, second. Class B—Alex. first; Saffold second. Class C—Tobey first; McVeigh second. Class D—Ong first; Riley second.

On July 3 the Greenville, O., Gun Club held its regular weekly medal handicap. In Class A, McCaughey and Baker tied on 37 out of 50 from 17yds., the former winning the shoot-off. In Class B, Huddle and Hartzell tied on 36 from 14yds., and in the shoot-off the latter won. Mr. and Mrs. Frank Butler (Annie Oakley) are visiting at the Oakley home in Darke county, and Mr. Butler was a guest of the club. He shot in the practice events, scoring 133 out of 150. E. R. Fouts has been away for several weeks, and the members gave him a hearty welcome on his first appearance. A high wind accounts for the low scores. Baker broke 74 out of 100, Hartzell 77, Ayers 67, and McCaughey 77.

At the weekly shoot of the Springfield, O., Gun Club, Wm. Poole was high man with 119 out of 125, and won the medal Snyder was second with 115, and tied Poole in the last 100 targets, each breaking 95.

Ten members were on hand for the weekly shoot of the Dayton, O., Gun Club. Four 25-target events were shot, Hendrickson being high gun with 84. Barnes made the best score, breaking 24 in the second event, missing his third target. In order to increase the interest of the members, the club should offer a medal or trophy of some sort at its weekly shoots.

At the regular handicap medal shoot of the Rohrer's Island Gun Club, Dayton, on July 5, a new name was added to the list of winners of the medal. This was Carl, the young son of Phil Hanauer, who won the medal last August and again to-day after a hot shoot-off with some of the best shots of the club. Six members qualified with scores of 25 or better. In the first shoot-off, Oswald, Miller and Craig dropped out. Barr dropped out in the second, and in the third, Hanauer broke 5 to Cain's 4, and won. One-half the series of 32 contests for the medal will be shot on July 12, and the members should be on hand. Four 15-target sweeps were shot after the medal race. Oswald was high target with 56. Mack second with 55. Oswald was high gun for the day with 94 out of 100 shot at. Cain second with 93. Carl Hanauer shot at 72 and broke 62.

Garfield Gun Club.

Chicago, Ill., July 1.—The appended scores were made on our grounds to-day on the occasion of the second series. Keck, Dr Meek and Hicks tied for Class A trophy on 24 out of 25, while T. S. Smedes won B trophy on 25 straight. N. S. Birkland won C trophy on 24 out of 25.

In the Dupont cup shoot, which followed, Hicks won in Class A on 20 straight. Dr. Reynolds won Class B also on 20 straight. George won Class C on 19. The day was a perfect one for trap shooting, and twenty-one shooters lined up for the occasion. The scores were good, as out of the twenty-one shooters only four did less than 20, and two of those did 19, two going 25 straight and five making 24:

Table with 4 columns (Events, 1-4) and 4 rows (Targets, 25, 25, 25, 25) and 4 rows (Thomas, Keck, Meek, Dr Reynolds, Birkland, Sr., Kampp, Davis, Hicks, Horns, Eaton, McDonald).

# U. S. Government Ammunition Test.

Accuracy test of Krag-Jorgensen .30-Caliber Cartridges held at Springfield Armory by order of the Ordnance Department, United States Army.

**TESTED**—Ammunition of all the American Manufacturers.

**CONDITIONS**—10 and 20 shot targets, muzzle rest.  
10 and 20 shot targets, fixed rest.

**DISTANCE**—1000 yards.

**RESULT and OFFICIAL REPORT: U. S. Cartridges excelled all others**

MANUFACTURED BY

## UNITED STATES CARTRIDGE CO.,

LOWELL, MASS., U. S. A.

Agencies: 497-503 Pearl St., 35-43 Park St., New York.

114-116 Market St., San Francisco.

Event No. 1 was Dupont cup. Event No. 2 was the trophy contest.

Team shoot, Thomas and Eaton Captains: Eaton's team—Eaton 9, Hicks 9, Geotter 9, Saymore 10, Dr. Reynolds 6, T. L. Smedes 9, A. Smedes 5; total, 57.

Thomas' team—Thomas 7, Dr. Meek 9, Keck 9, Davis 10, Birkland, Sr., 9, McDonald 5, Birkland, Jr., 7; total, 56.

July 4.—The following scores were made on our grounds to-day. Ten events of 10 targets each were shot off and in each event some member won a fine pocket knife. In case of a tie they drew for the knife, and the lucky man was barred against further competition, thus insuring all of the knives to be distributed to different men.

The day was exceedingly windy, causing the targets to soar and dip in a decidedly puzzling way. Still, some very good scores were made. The afternoon passed off very pleasantly, and all had a fine time except Mr. Davis, who tied for a knife about six times and was beaten in the draw every time—and he needed a knife, too.

July 8.—The appended scores were made on our grounds to-day on the occasion of the fifth trophy shoot of the second series.

In the trophy event Eaton won on a straight score of 25 in Class A, while Lord, a visitor, tied the score.

In Class B, Dr. Reynolds and T. L. Smedes tied on 21, while George won Class C on 22.

In the Dupont cup shoot which followed, Thomas, Keck and Hicks tied for Class A on 19 out of 20. T. L. Smedes won in Class B on 18, and George in Class C on 15.

The day was a fairly good one for target shooting, only a little wind and pleasantly cool. Attendance fairly good.

Honors were even in two team races captained by Dr. Meek and Eaton. Scores:

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	25	25	20	15	Targets:	25	25	20	15
Lord	25	19	19	11	George	22	15	19	..
Thomas	24	19	16	14	C Einfeldt	19	12	14	..

No. 1 above was the twelfth trophy. No. 2, the Dupont cup. Dr. J. W. MEEK, Sec'y.

### In Other Places.

HERMAN HORN, of the Holes Corners Gun Club, Milwaukee, Wis., was a participant at the G. A. H. We do not see his name among the winners. Yet he had one sure prize that is his for keeps. Just before starting on the trip he was united in wedlock to Miss Jesse Meyrose, who accompanied him. He will in the future have the assistance of her advice in the shooting line, as she is herself a crack shot.

Abe Franks, of Memphis, Tenn is pegging away with about the usual 90 per cent. At the last meet of the gun clubs, W. J. Abston, with a handicap of 10, won the pitcher.

There are many people in the cities of Montana who are much interested in trapshooting. There are a number of these gentlemen in Anaronda, and they were delighted with some experts who lately visited their city.

A new improved trap was tried at the Anna, Ill., tournament on July 4.

It is all well enough to hold a regular tournament in the south on July 4; but it seems that in the north they are nearly all failures, as shooters spend that day with their families picnicking.

Now and then we notice that a gun club puts in electric pulls, but, as a rule, they are growing scarce.

At the West-Point, Ia., Gun Club shoot Dr. C. W. Roberts broke 46 out of 50, and Charles S. Bryens 44.

John J. O'Bram, of the Park Trapshooting Committee, of Buffalo, N. Y., announces a meeting of their club hereafter on Friday instead of on Saturday.

E. H. John won the shoot held by the Mauga Gun Club, Sterling, Ill., on last Thursday.

Mr. H. C. Williamson, secretary of the gun club Iola, Kansas, received a very pretty medal donated by a prominent gun company, as a reward for the best shot.

The next meet of the Missouri League of Trapshooters will be held at Carthage, Mo., in August.

The newly organized Gun Club at Aberdeen, S. D., is progressing finely. E. V. Campbell lately made a straight 15. C. D. Pehis only lost one.

There is shooting at the Taylor Park, Freeport, Ill., on Friday of each week, to which the public is invited.

Shooting members of the Illinois Athletic Gun Club have elected officers, and among other very important matters, have chosen O. Von Lengerke as captain of the trapshooting. This means that there will be something doing in the shotgun line.

Jack Cullison was high gun at the Multnomah Gun Club, Portland, Ore., on Sunday last with 92 out of 100. There is much interest being taken in the coming northwest tournament.

The third annual tournament of the Binghamton, N. Y., Rod and Gun Club will be held at the club range July 20 and 21. Dupont will give a cup for high average.

The Marquette, Mich., Gun Club will hereafter hold shoots regularly, and many special attractions will be offered during the season. Grounds open for practice at all times. The newly elected officers are: President, Robert Harnes; Secretary, J. E. Brotless; Treasurer, F. G. Jenks.

John Boa was the attraction at Jackson, Mich., where he gave a daily rifle exhibition during the shoot held there last week.

Hutchison, Kan., Gun Club is now officered as follows: Will Allen, President; Dr. Van Leonard, Vice-President; G. T. Rankin, Secretary and Treasurer; O. H. Guy, Field Captain.

The Osage City, Kan., Gun Club will purchase a new automatic trap and make some very necessary improvements at the shooting park.

The clubs at Montan, Mancelona and Travers City now have each one of the new clay bird automatic traps.

There is a new club at Fontanel, Iowa. Members, viz., John

Brawdy, E. D. Branhill, E. D. Walsworth, E. E. Winn, Will Welscher, G. D. Keating, J. W. Emmers, Nels Jensen, Clyde Knaut, W. J. Lovenz, George Hulbert, Frank Hulbert, Chas. Juddith, John Knouf, C. H. Clongie, N. W. Gibson, Frank Sears and C. F. Jarvis.

The N. C. R. Gun Club, Dayton, Ohio, is now booming. After having secured the next State shoot, they are now after the G. A. H.

There were thirty-four shooters who took part in the tournament held at Appleton, Minn. Those who made the highest scores, shooting at 320 targets, were: A. E. Close 267, Jones 261, Quiglon 253, C. M. Minert 250, J. Grady 249. Among the low scores was that of George E. Gray, the well-known dog trainer.

The Plainview, Minn., team, composed of J. J. Erding, W. N. Mills, R. Mills, A. J. Fricke and F. T. Dickerman, won the badge contest held at Minnuska on Wednesday last.

Mr. Ferd Drey, of Brainerd, Minn., has been elected treasurer of the State Gun Club. He is a good shot and deserving of any honors bestowed upon him.

Hess and Welnowski, of Nanticoke, Pa., won the Powder trophy, in competition with teams from Scranton and Wilkes-Barre clubs; score, 86 out of 100. They won first in the opening sweep with a straight score.

The El Paso, Tex., Gun Club will in the future hold shoots on Saturday, which will enable more of the shooters to attend than on the former day.

At the regular shoot of the Urbana, O., Gun Club there were seven men present. In the county contest the eight highest scores will count. Mr. Holding, in shooting for a badge, made the most excellent score of 49, 49 and 48 in three times try at 50.

The officers of the reorganized gun club at Houghton, Mich., are: A. D. Edwards, President; Michael Messner, Jr., Secretary; William Parsons, Samuel Bryant Jr., and R. S. Tewarth, Directors.

A movement has been started that will consolidate the Mason City and Clear Lake, Ia., gun clubs. One of the objects is that of watching game law violators. Any such who are caught will be punished by the combined club.

Joseph Michaelis sprang a surprise on the shooters at the tournament held by the Limited Gun Club, of Indianapolis, when he captured the Grand Hotel cup with a score of 46 out of 50. Dr. Britton, the oldest man in the game in the State, was high for general average, 915 per cent.

The Lookout Mountain, Tenn., Gun Club held its second shoot on the old College grounds, last Wednesday.

The Keystone Gun Club, Bluefields, W. Va., has made some extensive improvements to their grounds quite recently, which include a shooting stand and storage room for the targets.

The annual meeting held by the Asheville, N. C., Gun Club resulted in the election of the following officers: T. C. Cox, President; Dr. S. W. Battle, Vice-President; J. D. Carrier, Secretary; H. T. Adicks, Jr., and Ford Rutledge, members of the Executive Committee.

Dr. William Buck, of Eaton, O., made a perfect score of 50 while shooting for the Cartridge Co. trophy. William Dunlap and James Clark were hot contestants.

J. J. Racheo, Faribault, Minn., won the gun club trophy with a straight 25.

The tournament held Tuesday last at Harris, Ia., was well attended, and proved a success.

At Oleton, Pa., last week, when the West Branch Rod and Gun Club was holding its practice meet, and not being successful, it was suggested that some of the ladies present try their skill. Mrs. North scored 1 out of 2, and Miss Martha Reरिक scored 3 out of 4. This is very remarkable, as it was her first experience.

The Menominee, Mich., Gun Club is keeping up regular practice, and there will be a very creditable showing by this club when the July tournament comes off.

Another new gun club is that of Wabeno, Wis. Officers: A. J. Tipler, President; Jake Bradley, Vice-President; M. J. Dickinson, Treasurer; Dr. Hubbard, Secretary.

The Western circuit of shooting events will be a grand one, starting with the Indian shoot, then Colorado Springs, and the Trinidad, Colo., and then comes the Interstate Western Handicap at San Francisco. Several of the traveling men will make the circuit.

The tournament held by the Groesbeck, Tex., Gun Club was a success. F. M. Faurote won professional high average, 258 out of 275. The individual championship medal held by Capt. L. E. Ross, of Corsicana, was again captured by him with a score of 47 out of 50.

Messrs. M. R. Bower, J. M. Barnett, Adam Wolfe, and William Alexander, of Bloomfield, Pa., have each won the medal twice, and it now remains to be seen who can win it a third time and thus become permanent winner.

The club house used by the Taylor, Tex., Gun Club was destroyed by fire. It occurred at about 1 o'clock in the morning, and therefore the origin is likely to remain a mystery.

There are some clever shots at Spokane, Wash. The champion three-man team is composed of Jack Forbes, T. B. Ware and E. J. Chingren. However, Ike Dornberg won the medal at the last meeting, scoring 93 out of 100; but T. B. Ware and E. J. Chingren were but one behind. These men will all be heard from at the Portland, Ore., big tournament.

Many of the shooters who were present at the G. A. H. last week were made sick by the water used at the club grounds. Some of the Western boys are sick abed, viz.: C. C. Gere, Urbana, and H. H. Cadwallader, Decatur.

Ben Scott, of Grass Lake, Mich., won the honors at the Michigan State shoot at Jackson. In the merchandise event Ponto Wood, of Detroit; H. E. Hubbard, of Battle Creek; M. Hensler, Iowa, and G. R. Wilson, of Detroit, were winners. In the team shoot, Battle Creek was first with 68, Detroit second, 67, and Jackson third, 66, each out of a possible 75.

There will be semi-weekly shoots held at Iowa City, Ia., by the members of the gun club. There are some good marksmen in the club, and some fine records will be made before the season closes.

It would fill a book with a thousand pages could the ifs be printed that have been told their friends by the G. A. H. contestants during the past week.

The Rose system and the Jack Rabbit system were both used at the shoot given by the Tarentum Gun Club, Pittsburg, Pa., July 4.

The Mt. Clemens, Mich., Gun Club is being reorganized, and will be incorporated. Good club rooms will be provided.

Members of the Gem Township Gun Club, near Aberdeen, S. D., report that there will be a wholesale slaughter of bird dogs, as the dogs are permitted to run the country over, destroying chickens and the eggs.

Last Sunday, at Des Moines, Ia., there were good scores made. Waddington was high with 95 out of 100.

Messrs. Henry Neville, E. Ashford, John Schuster, Theodore Willebrand, A. McLeod and M. Schneider, of Sault Ste. Marie, Mich., are interested in organizing a gun club.

The Celestial Gun Club, of Pekin, Ill., held their shoot last Sunday. Some new members were taken in. As the club is being run on an economical basis, it bids fair to last for many years. Ed. Bolander was noted for his rapid improvement.

There will be 500 targets shot at by the members of the Deadwood, S. D., Gun Club during this season, and prizes will be awarded in classes for the highest scores.

J. W. Lee, Kent, O., made a "clean sweep" at Lake Brady last Thursday, as he captured all the three trophies put up for competition.

The annual spring tournament of the Berea Gun Club, Elyria, O., was held Saturday. There were thirty-two marksmen present. La Grange won the team shoot, 199 out of 250. Berea No. 1 second, 194. Elyria third, 186. Powers and Brock made the high individual scores in team shoot.

Clarksville, Ia., will hold a shoot July 25 and 26. Many of the experts have signified their intention to be present. Fred Whitney will attend to the office.

At the second shoot of the Landa Park summer contests, held at Taylor, Tex., Capt. Gilstrap lost the medal—and to a lady, Mrs. Topperwein, with a score of 23 out of 25. Mrs. T. will hold the medal until July 9, when the next shoot will be held.

Manager Fred H. Wallace is making a great effort to make this series now in progress at the Cleveland, O., Gun Club the best ever attempted. The rules adopted are self-imposed handicaps. Many of the prizes are handsome loving cups.

The Rugby Gun Club, of Grand Forks, N. D., offers a reward of \$10 for information concerning the person who shoots with a rifle at the screen which is used at the target traps.

The Sturgeon Rod and Gun Club, the membership of which includes over one hundred glass workers of Elwood and Alexandria, Ind., will spend the next eight weeks on the shores of Long Lake. The club has camped here for the past four years.

Pleasant Valley Gun Club, Youngstown, O., will hold a two-day shoot at De Groff, on Aug. 8 and 9.

The Paducah, Ky., Gun Club held a shoot Thursday, at which Armstrong won the club medal.

At the shoot held at St. Paris, O., last Thursday, the team contest resulted as follows: De Groff 200, Troy 195, Springfield 194, St. Paris 187, Urbana 168. Holding made 49 out of 50, and was high individual.

The West Duluth, Minn., Rod and Gun Club held a shoot Saturday last, and the secretary reports some enthusiasm and poor scores. This club is new, so plenty of time for improvement.

The West Side Gun Club, of Saginaw, Mich., has now a new automatic trap, which will be the means of putting more life into its members.

The Findlay, O., Gun Club held a meeting Friday night, and effected a reorganization. Among the reorganizers were Al. Barton, Dr. J. C. Tritch, Dr. I. H. Truce, Charles Steen, Ott Marvin, Sherman Abrams, Joseph N. Schaffer and Thomas Lang. Mr. Lang is one of the State cracks.

The Hoisington, Kans., Gun Club has forwarded a petition to the Governor, asking that John Lemon be appointed a deputy game warden.

The Omaha Rod and Gun Club will build a club house at Courtland Beach. It will cost about \$2,000.

The Owego, N. Y., Rod and Gun Club will make an exhibit at the county fair, to be held Sept. 12 to 15. There will be live game and fish, together with all kinds of game, also all styles of guns. This exhibit will be placed in a large tent, and will be given with a view to interest the whole county in the protection of game and fish. Truly a very worthy object.

There was a merchandise shoot at Red Oak, Ia., July 4, that was a side attraction for the celebration. It was much enjoyed by the shotgun artists. The prizes were generously donated by the business men.

The Capital Gun Club, of Little Rock, Ark., held a practice shoot on their grounds last Tuesday. John M. Pemberton and E. G. Welles will contest soon for the State championship.

The Freeport, Ill., Gun Club has now two fine hunting pictures that are to be given as prizes at the shoot.

The Meriden, Miss., Gun Club has been reorganized, with W. Perry, Jr., President; B. Frebleman, Vice-President; A. J. Teter, Secretary; W. W. Cocke, Field Captain; C. W. Powtheres, Referee. There will be a tournament held on their grounds, together with a barbecue, July 28 and 29.

Walla Walla will hold the next State tournament given by the Oregon Sportsmen's Association. A committee was appointed to draft a new constitution and present it to the next annual meeting. The committee consists of M. F. Sheard, of Tacoma; E. E. Ellis, Seattle; Thomas B. Ware, Spokane; P. J. Holohan, Wallace, Idaho, and Maurice Abrahams, of Portland. One of the changes suggested is to permit outsiders to compete for money.

Mason City, Ia., Gun Club will hold a tournament July 31 and Aug. 1. Programmes will be issued in due time.

### Chicago Trapshooters' Association.

THE programme of the Chicago Trapshooters' Association tournament, at the Watson Park grounds, Furnside, Chicago, Aug. 17, 18 and 19, 1905, is as follows: No handicaps; all stand 16yds.; \$50 in cash for averages; \$100 each day to seven high averages, \$20, \$18, \$16, \$14, \$12, \$10, \$10; \$100 to six high averages for the three days, \$25, \$20, \$18, \$15, \$12, \$10; \$100 to eight low averages for the three days, \$15, \$15, \$15, \$15, \$10, \$10, \$10, \$10. Ten 20-target events each day. Money divided 35, 30, 20 and 15 per cent. Total entrance, \$20. Professionals and manufacturers' agents will shoot for targets only. Programmes will be ready about Aug. 1, and can be had by addressing Secretary E. B. Shogren, 940 First National Bank Building. Fred H. Lord and E. B. Shogren, managers.

Analostan Gun Club.

WASHINGTON, D. C.—The regular shoot of the Analostan Gun Club, of Washington, D. C., was held June 29. Twenty-five members participated. Uncle Billy Wagner, the veteran of the club, was present, and although shooting a strange gun and shells other than his regular load, made a good showing. Jos. H. Hunter, C. S. Wilson, John Coleman, Dr. Taylor and others performed in good shape. Following are the scores made during the afternoon:

Table with columns for names and scores. Includes names like Jos Hunter, Wm Wagner, Jas Green, Miles Taylor, Ficklin, Wilhite, C S Wilson, Willis, Krusen, Waters, Baker, Barr, McKelden, Wolfe, Hinch, Coleman, Dr Taylor, Pushaw, Brown, Paton, Jones, Watson, Moss, McClenahan, Monroe.

This shoot ended the first series for the club trophies, which was shot under the added bird system. Mr. W. R. Baker won the first prize, a handsome loving cup presented to the club by the Peters Cartridge Company. Mr. Baker is a new member comparatively, but one of the best field shots in the city, a famous turkey hunter from old Virginia, and a leader at trap work. He scored in actual breaks out of 250, 194, and received 25 added birds, which gave him a total of 219.

Dr. Wm. C. Barr, who won the second prizes—the Hunter Arms Company medal, which was carried over from last year—scored 195 targets, and received 22 added birds, which gave him a total of 217. Dr. Barr shoots a Parker ejector, and although he is not old at the game, makes all of the boys hustle.

Miles Taylor won the third prize, an Upthegrove trapshooter's jacket. He scored 198 targets and received 18 added birds, which gave him a total of 216.

Dr. Taylor and his "pump" scored 187, and his added birds increased his score to 214. Mr. Wilhite scored 183 and received 29 added birds, making his total 212. He disposed of his gun and shot "any old gun," he could borrow the last few contests, and if it had not been for this perhaps there would have been a different story to tell.

Dr. Wolfe is one of our new shooters, and if he had got off right in the initial contest, he would no doubt have landed among the winners. He only scored 6 birds out of his first 25, and this handicapped him. As it was, he finished with 139 breaks, and his added birds gave him a total of 206.

The added bird system was adopted with the expectation that it would equalize the shooters and bring out a large attendance, especially of the beginners. Only six took part in all of the contests. It is very evident, however, that had all the members participated, almost all of them would have made a good showing. The club adopted 88 per cent, as a basis. The club contests were at 25 birds each week—250 for the series. If a shooter scored 22 targets, he received no added birds; but if he scored 21, he received 1 bird in the next shoot; 20, 2 birds; 19, 3 birds; 18, 4 birds; 17, 5 birds, and so on.

The next series will be shot under the sliding handicap system, and the members will be divided into three classes—A, B and C. The winner in each class will go back one yard for every time the trophy is won.

Following are the detailed scores of the first series:

Table with columns for names and scores. Includes names like Baker, Barr, Miles Taylor, Dr Taylor, Wilhite, Dr Wolfe, Nalley, C S Wilson, Ficklin, Brown, McClenahan, Coleman, B Wilson, McMichael, W H Hunter, Hogan, Bauskett, Draper.

July 5.—The Analostan Gun Club held an all-day shoot on their grounds, near this city on the Fourth of July. The morning hours were taken up with practice events. The afternoon was given up to sweepstake shooting. The programme consisted of eight events, comprising 140 targets. Some of the members claimed that the targets were easy, but the scores, especially of the veterans at the game, do not bear out the assertion. Mr. J. B. Brown, won high average for the day, and John Coleman and Miles Taylor tied for second average. Following are the scores:

Table with columns for names and scores. Includes names like Brown, Coleman, M Taylor, Craig, C S Wilson, Barr, W Hunter, Baker, Jos Hunter, Bauskett, Wagner, Nalley, Peyton, Dr Taylor, Pushaw, D Orrison, Hedrick, Willett, Krusen, Draper.

After the sweepstake events were finished, the members present shot for the club trophies. There are three of these, and the members are divided into three classes, A, B, and C, and the contests will be shot under the sliding handicap system. Following are the scores in the first event: Brown 23, M. Taylor 22, Coleman 20, Orrison 19, Bauskett 19, Jos. Hunter 19, Dr. Taylor 17, Green 16, Wagner 16, C. S. Wilson 16, Pushaw 15, Nalley 14, McClenahan 10, Hedrick 12, Draper 6.

The members shoot at 25 targets in the trophy shoots. The following members shot up their back scores in the trophy events: Coleman 23, Brown (17yds.) 22, Wagner 20, Peyton 19, Jos. Hunter 17, Green 14, C. S. Wilson 14, D. Orrison 8.

Trap Around Reading.

READING, Pa., June 29.—The Berks County Trapshooters' League was organized to-night at a meeting of delegates representing the gun clubs of Berks county, of which this city is the center. Charles Miles, of the South End Gun Club, of this city, was elected president, and Ed. H. Adams, of St. Lawrence Gun Club, secretary. A tournament committee, composed of Arthur A. Fink, of the Spring Valley Shooting Association, as chairman; Harry Weidner, of the Independent Gun Club, and Charles H. Adams, of St. Lawrence, was elected and instructed by the chair to arrange for the League's first county shoot, the date and club grounds to be selected at the next meeting of delegates on Aug. 2. Two handsome trophies were presented to the new League by Lafin & Rand and T. H. Keller, and will be the individual and team championship trophies in the semi-annual county tournaments. The delegates were delighted in receiving these gifts, and the donors are heartily thanked by the League members.

Allentown, Pa., June 26.—The Allentown Rod and Gun Club held its monthly shoot to-day at the Duck Farm, Griesemerville, high scores resulting although the weather was bad. The old trap, which is about to be replaced, behaved splendidly.

In the monthly medal shoot Howard Schlicher won the gold and Morris Desch the silver medal. Schlicher's shooting was the feature of the day. In former events, with 65 targets to shoot at, every one was hit. His brother, Charles Schlicher, also did some phenomenal shooting.

The scores made in the medal shoot were: H. Schlicher 25, M. Desch 23, F. J. Steiner 21, W. B. F. 14, Wm. Ludwig 19, O. H. Acker 22, C. Schlicher 23, A. W. Knauss 16, Wilson Desch 20, W. Frantz 17, Wolfe 14.

Howard C. Schlicher, to-day's medal winner, has purchased the stock and fixtures of the Duck Farm Hotel from W. C. Miller. Being very popular with the sportsmen of that section, the Duck

Farm shooting grounds and hotel are bound to become the center of the shooters of Lehigh county.

Manayunk, Pa., June 29.—In a match of 50 targets between George Springer and Mark Devine, yesterday, at Thompson's Park, the former won by 15 targets, breaking 39 out of his 50, while Devine broke only 24.

Event No. 1, 10 targets: Rivel 6, Boob 8, Metzgar 6, Detrich 7, C. Boob 9, Springer 9. Event No. 2, 5 targets: Devine 4, Boob 2, Springer 1, Shetsline 4, M. Devine 5, Wolfinger 1.

DUSTER.

South Framingham Gun Club.

SOUTH FRAMINGHAM, Mass., July 4.—The shoot was one of the most successful ever held by the club. The officers worked diligently for comfort of the visitors and the success of the event. An interesting feature was the work of Capt. Geo. E. Bartlett. He did some wonderful rifle shooting.

The club house was prettily decorated in red, white and blue. A committee of ladies occupied and served refreshments in one portion of the building. The members were: Mrs. E. A. Fuller, Mrs. Al Hall, Mrs. F. P. Hewins, Mrs. A. H. Rice, Mrs. Chas. Grant, Mrs. Paul Randall, Mrs. Arba French, Miss Lola Kittredge, Miss Lizzie Kittredge and Miss Emma Cook.

High gun in the professional class was W. H. Heer, 147 out of a possible 150; Capt. Geo. E. Bartlett second, 135, and Gilbert M. Wheeler, third, with 121.

The amateurs Ray and E. F. Cavicchi with 140 tied for first place; G. A. Finch, second, with 136, and F. Churchill, third, with 134.

The Fitchburg Gun Club won first money in the team shoot with a score of 131, Watertown was a close second. The scores: Fitchburg Gun Club, 131; Watertown Gun Club, 128; Derryfield Gun Club, 123; Neponset Gun Club, 122; South Framingham Gun Club, first team, 121; Needham Gun Club, 112; Boston Gun Club, 107; Haverhill Gun Club, 105; South Framingham, Gun Club, second team, 97.

The officers of the South Framingham Gun Club are: President, F. P. Hewins; Vice-President, Frank Underhill; Secretary and Treasurer, Theo. F. Rice; and Captain, A. E. French.

The total individual scores for the men shooting in ten events, 15 targets each, is as follows:

Table with columns for names and scores. Includes names like Heer, Bartlett, Wheeler, Finch, S Darton, Mason, Churchill, Cavicchi, Linfield, Underhill, L E Isham, Fuller, Lincoln, Staples, Prouty, Kirkwood, Williams, Dean, Edwards, Dunning, Ed Adams, Raymond, Rabb, Wadsworth, R S Bowen, Smith, Perley, McCabe, Elmer Reed, Eugene Reed, Bingham, Cutter, Wilder, Converse, Roy, Rice, Randall, Hewins, Wm Bowen, Hall, Richardson, Stanett, Fay, Brown, Fisher, G H Bowen, W C Goss, Clark, Howe, Temple, Allen, Hatch, Spofford, Buckman, Jones, Woodward, Hibbard, Comer, Allison, Atwood, Rogers, Parker, Cook, Grauman, Hason, Henry, Muldown, Bryant, Childs, Wilber, L A Ishan, Daniels, Albro, Fenton, Flower, Sanbourn, L S Adams, Searls, Glidden, Miller.

F. P. HEWINS.

Bloomington Tournament.

BLOOMINGTON, Ill., July 4.—All who were in any way interested in the success of the tournament scheduled for this day were disappointed. They saw the dark clouds and watched the rain descend. It lasted nearly throughout the day.

The club had expected a large crowd, it being a holiday; but in that they were disappointed. Many of their own members had cares that kept them at their business places. The traveling men turned out all o.k. They came during the night or the day previous. They were John Boa, Frank Riehl, W. H. Cadwallader, Tramp Irwin and Ward Burton. Chan. Powers came also and shot through, rain or shine. I think this will prove to all clubs that July 4 is the poorest day that can be selected for a tournament.

Frank Riehl shot extra well. It was his day. He likes stormy weather. His score of 95 per cent, is great.

Powers lost 25, and still was easily high. The Bloomington club is well fixed for giving a shoot, and their club events are well patronized by the members. The grounds will be enlarged and fitted up well for the State shoot that is set for here for next year. The hotel accommodations are very fine. The scores:

Table with columns for names and scores. Includes names like Events, Targets, Riehl, Cad, Crothers, Boa, Powers, McDermand, Leary, Bender, Boettger, Vandervort, Gray, Imig, Sykes, B Bender.

Enterprise Gun Club.

McKEESPORT, Pa., July 4.—The all-day tournament of the Enterprise Gun Club was favored with delightful weather. The out-of-town guests were A. J. Buck, A. B. Henshaw, A. P. Swearer and Charles West, Monongahela; J. B. Cullen, Bellevernon; C. S. Crawford, C. Moore and R. L. Aubrey, Brownsville; J. Prigg and J. M. Prigg, Washington, and G. E. Hull, Pitcairn.

Twenty-two men participated in the regular and special events. Twelve shot throughout the regular programme for prizes. Those winning prizes were: First, umbrella, J. F. Calhoun; second, gun case, A. B. Henshaw; third, revolver, C. Moore; fourth, blouse, C. S. C.; first low gun, box of cigars, R. L. Aubrey; second low gun, 50 shells, Davis; third low gun, 50 shells, J. M. Prigg. There were seven prizes in all, four for high guns and three for low guns. The official score, 150 targets, follows:

Table with columns for names and scores. Includes names like Events, Targets, Calhoun, Henshaw, Moore, C S C, Buck, Noel, Cullen, J Prigg, Snyder, J M Prigg, Davis, Aubrey, West, Byard, Hull, Swearer, J Hale, W Hale, Irwin, Good, Crow, Bradshaw.

Independent Gun Club.

EASTON, Pa., July 4 was a sportsman's day par excellence. For trapshooting, the conditions were perfect. The sky was clear, there was a cool breeze stirring, and all conditions were favorable for shooting.

It being a holiday, not so many of our shooters were out, but those who did attend had a very pleasant time, and enjoyed themselves.

Saturday, July 8 the club will start a series of five shoots of 50 targets each for a silver loving cup, presented by the Lafin & Rand Powder Co. The boys are all taking great interest in these shoots, so we expect some exciting contests in the next ten weeks.

Following are the scores made July 4. Event No. 8 was a handicap for Leffingwell's "Art of Wing Shooting," presented by Mr. Geo. Elliott. All other scores were shot without handicap.

Table with columns for names and scores. Includes names like Events, Targets, Weiss, W Maurer, Sandt 6, Elliott, Ketchner, Markley, Heil, Coken, Richard, J Maurer, Ivcy, Genter, May, Breinger, Visitor, W. R. IVEY, Fin. Sec'y.

Boston Gun Club.

BOSTON, Mass., June 21.—The worst possible weather conditions were in evidence at Wellington to-day, it raining incessantly from start to finish, and what would have proved to be one of the most social shoots turned out very nearly the opposite.

Most of the shooting was done from the door of the house, easily a distance of 25yds., and considering, the scores were good. Dr. Gleason somewhat excelled the rest at this game, and in fact at all distances. It was his day, the honor score in the match and high average all coming his way.

Chas. Worthing started out well, but a drizzling was not on the programme for him, so an early train found him as a passenger.

Table with columns for names and scores. Includes names like Scores, Targets, Frank, Worthing, Burns, Kirkwood, Gleason, Sadler, Blinn, Woodruff, Owen, Bon, Frost, Edmunds.

Infalible Gun Club.

BUFFALO, N. Y.—At the Fourth of July shoot held by the Infalible Gun Club at their grounds a very enjoyable time was had by those who attended. Among the number of out-of-town guests who attended were Sim Glover and Mr. F. E. Butler. Mr. Bozard won the handsome silver trophy given by H. D. Kirkover, Jr., for high amateur average. Gilbert Dietzer was high man in the merchandise event. The scores are as follows:

Table with columns for names and scores. Includes names like Shot, Broke, Shot, Broke, Bozard, Sim Glover, McArthur, Ed Reinecke, Frank Butler, Parker, Cox, Farnam, Teal, A J Black, Hines, Bryant, Wilson, Dr Wooten, Phil Bernhard, Dr Burke, Rhodes, Weiber, Sully, Wm Kurtz, McDonald, Jolley, Smith, G Dietzer, McLeod, Story, U S Dietzer, Hahn, Eberle, Sperry, Burgwardt.

E. J. McL., Sec'y.

Raleigh Gun Club.

RALEIGH, N. C., June 29.—Our weekly shoot was pulled off with only one squad present. It was a fine afternoon for target practice, and some good runs were made. Mr. Johnson dropped only 3 targets in 85, making one run of 35 and another of 43.

Table with columns for names and scores. Includes names like Shot at, Broke, Shot at, Broke, Johnson, Barrett, Walters, Gowan, Barnes, Celiko.

R. T. G.

SIDE LIGHTS OF TRADE.

At the Grand American Handicap tournament held in Indianapolis, June 27-30, R. R. Barber, an amateur from Paulina, Ia., won this the greatest shooting event of the year with the magnificent score of 99 out of 100. He also won the Preliminary Handicap with a score of 98 out of 100, and made a run of 157 straight. Mr. Barber, who is the Togo of the shooting world, used Winchester factory loaded shells, as did several other of the winners. Mr. Barber's performance, and the run of 212 straight made by W. R. Crosby, who also used Winchester factory loaded shells, speak volumes as to their uniformity and splendid shooting qualities.

Mr. W. G. Hearne, representing the Marlin Fire Arms Co., New Haven, Conn., used the regular Grade C Marlin repeating shotgun at the recent G. A. H. at Indianapolis. He broke 97 out of 100 targets, and was high professional, thereby winning the Fred A. Stone "Scarecrow cup." The Marlin Fire Arms Co. will send their Marlin Experience book to applicants who inclose three stamps.

Answers to Correspondents.

No notice taken of anonymous communications.

J. P., Easton, Pa.—Can the captain of a gun club which shoots under American Association rules, change the trap (which was throwing a 30yd. target) to a 45yd. target at any and all shoots of the club, even though the majority of the shooters present want a 30yd. target? Ans. The captain of a gun club can do so under American Shooting Association rules, if those are the official rules of the club. The A. S. A. Rule 7, Sec. 1, governing this point is as follows: "All traps must be adjusted to throw the targets a distance not less than 40yds., nor more than 60yds." A 30yd. target is child's play.

PUBLISHERS' DEPARTMENT.

The Pennsylvania Special as a Time Saver.

A New York broker received a message just before the close of the Stock Exchange requesting his presence in Milwaukee as early as possible the next day. From the other end of the telephone wire he learned that the Pennsylvania Special leaving downtown at 4 P. M. would deliver him there before noon. He boarded the Cortlandt Street Ferry at 4 P. M., arrived in Chicago at 8:55 the next morning, after a comfortable night enroute, and reached Milwaukee at 11 A. M.

The opportunity to purchase in fee simple a thousand acres of land in the county of Gaspé, Canada, is one that should appeal to many an American reader. The country is one of great beauty, has excellent fishing, and used to have fine big-game hunting near at hand. The advertisement is certainly worth investigating.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, SATURDAY, JULY 22, 1903.

VOL. LXV.—No. 4.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

*The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.*

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

## A WASTE OF MONEY.

THE Committee on Legislation of the New York Citizens' Union has been investigating the cost of Albany legislation. There were introduced last winter 2,600 bills, of which 760 passed both houses and became laws. Of the whole number of bills 1,720 were of strictly local character. There were ninety-nine bills to amend the Forest, Fish and Game law, and many of these were of the local class. Governor Higgins has pointed out that it costs \$750 to pass a bill; these ninety-nine, relating to fish and game, then cost \$74,250, a sum which the committee considers an inordinate expenditure. It suggests that the Commissioner of Forest, Fish and Game might better be given the power to change the open and close season for game rather than waste legislative time and money. The committee is right. To spend \$74,250 for tinkering with the fish and game laws is stupendous folly. Better than giving the Commissioner power to change the seasons would be the strict and severe letting alone of the seasons, to stand as they are for a half century. The local changes, when it is considered that they cost the State \$750 each for enactment, are not worth the public money spent for them. Take this example, an amendment of Section 59 to provide that bullheads, catfish, eels, perch and sunfish may not be taken with tip-ups "in that portion of Canandaigua Lake beginning at the edge of the swamp on the west shore of the head of the lake, and running thence northerly along the west shore about one hundred rods to Hazel Dell cabin, thence southeasterly across the lake to a buttonwood tree just north of the large land slide, and about forty rods north of the Sunny Side dock, thence southerly along the west shore of the lake, to the edge of the swamp, thence westerly, following the edge of the swamp to the place of beginning."

If the "buttonwood tree just north of the large land slide" should tumble down, the law would be undone, and the \$750 it cost would have been spent in vain.

## COL. W. F. SANDERS.

WEEK before last there passed away at Helena, Mont., Col. Wilbur F. Sanders, a pioneer of the West who, in many ways, had left his mark on his State, which he helped to make, and on the time in which he lived.

Born in Cattaraugus county, New York, in May, 1834, he was successively school teacher, lawyer and soldier in the Civil War. Ill-health obliged him to leave the service, and in 1863 he went to Montana, where he became a lawyer and miner. During the stirring days of the early mining camps, when for a time law and order were mere traditions and the rifle and the revolver of bandit, gambler, ruffian and bad man ruled the camps, Wilbur F. Sanders, made desperate by the outrages of the time and place, with some other law-abiding souls, organized the Vigilantes of Montana, whose story has more than once been told, but best—so far as we know—by Mr. Langford in his "Vigilante Days and Ways." By his courage, his coolness and his knowledge of the law, Colonel Sanders stood foremost among the Vigilantes and became a terror to evildoers; and after a short but bitter fight his organization succeeded in putting the lawless element to flight. Active and successful in his profession and in politics, he became a leading figure in the Territory and in the State. He was United States Senator from 1890 to 1893, he was president of the Historical Society of Montana for twenty-five years, he stood foremost ever for good work and for good things.

Most men have views as to the qualities which go to make up the best American citizen; the type of man whom we should wish to see imitated and emulated by the young men of to-day, and there is practically unanimity as to these ideals. First among these qualities come honesty, so thoroughly ingrained that there never can be question as to whether a thing is right or wrong, never a mental argument as to whether a little yielding may not rightly be made to expediency. Courage comes next, a devotion to the right so strong that no public clamor, no persuasion of friends, no temptation of any sort, save that supplied by reason, can sway the man; and joined to this courage a love for justice, together with a chivalrous sympathy for weakness which will lead its possessor to take up the cause of the friendless or oppressed and to battle for his rights with the earnestness that the able lawyer exercises in behalf of his wealthy client. Near to these comes perseverance, a dogged determination to carry through to the very end a task undertaken, to fight for it in the face of difficulty and discouragement, but to carry it through, even though the completed work may show failure as a result. If to this be added a good mind, keen intelligence, ready wit, education and the long experience that comes with a full life time, we have a mental and moral equipment which should carry a man to great heights in his profession, in the estimation of his friends, and in service to his fellows and to his country.

Wilbur F. Sanders possessed all these qualities. An uncompromising friend of truth and honesty, a brave man, a good citizen, a splendid lawyer, and a politician of the best type, against whom no evil word was said, even in politics, he set up a standard for Montana and for his country that we may all point to as one to be imitated.

## GYMNASTICS.

THE Birmingham Daily Mail reports a lecture by Dr. Walter Jordan on the subject of "Fatigue," although the real theme was hostility to gymnastics. Professor Muirhead, of the Birmingham University, who acted as chairman, indorsed the lecturer's strictures by declaring that "gymnastics were the most exhaustive and demoralizing kind of exercise that could be engaged in, and that he had suffered from the exercise himself and knew what it meant." This was qualified afterward to mean that gymnastics are a brain as well as a muscular exercise, and to indulge in it could not be regarded as a rest for the student.

The learned Professor did not know, or else ignored it if he knew, that the powers of the mind for soundness and vigor are dependent on the powers of the body, and that during the formative period of growth, exercise is an essential to their best development. His reasoning, too, was faulty, inasmuch as his universal conclusions were drawn from his own personal experience. Many people find gymnastics repugnant to them, some from indolence, some from physical unfitness to engage in them; yet it is self-evident that to consider the whims and infirmities of the habitual croakers as a standard by which to measure what is good or desirable for all mankind is the extreme of absurdity.

The great improvement in the physique of men and women since the general adoption of gymnastics in their many forms, is in itself a material refutation of the strictures uttered by the men whose ideals are the passive and the effeminate.

That gymnastics may be harmful when indulged in to excess, or when there is organic weakness which incapacitates one for active exercise, there is no doubt; but the same may be said of everything else of value in life.

A sound mind in a sound body is a precept good in the past, present and future, and both are to be attained only by the development which comes from physical culture, whether derived from work in the gymnasium, or work fishing, rowing, shooting, or indeed sawing wood.

## BIRD AND CAT.

It has been recorded in our correspondence columns that Professor Clifton F. Hodge, of Worcester, Mass., having succeeded in raising a brood of ruffed grouse, has found himself confronted with the very homely problem of the domestic cat. Other difficulties have been overcome, but in the cat the partridge breeder has met his match. It is no wonder that, his birds having succumbed to the rapacity of the marauding cat, Professor Hodge

should advocate the German system extensively adopted of waging municipal war on the pest. Baron von Berlebsch, the German scientist, who has written a book on the protection of birds, declares that outside of buildings and the home the cat is a wild beast. Many German cities have adopted this view, and acting on it have undertaken systematic plans of cat extermination. Hamburg, for example, according to Baron von Berlebsch, has for certain periods, maintained 300 cat traps every night, and in a year has destroyed 30,000 cats. Other cities have like records; and Professor Hodge urges that American towns should engage in the enterprise. Speaking, after several years of observation of the relations between the supply of cats and that of birds, Professor Hodge is quoted as saying:

"I have given much attention to the subject, and I am firmly convinced the cat is the worst enemy the bird has. Not excepting the severities of winter, scourges of disease which might prevail in bird families, heat of an unusual summer, and all other enemies of bird life combined, the cat is the arch-fiend of them all, and stands at the head of the list as the destroyer of bird life. This has become a matter of national consequence, and demands the attention of people of cities as well as people of the country."

This estimate of the destructiveness of the domestic cat will be sustained by the facts which are within the common knowledge. In the garden, on the lawn, in the fields and thickets the cat is the unrelenting scourge of the birds. The aggregate of killing is enormous. If there be anything in the protection of birds as allies of man in his everlasting contest with the insect plagues, the diminution of the cat tribe, which is all the time fighting on the side of the insects, is of far greater importance than is usually accorded to it. Professor Hodge has not overstated the case.

FROM New York to England in an hour—that is a travel achievement open to anyone who cares to improve the opportunity. At the Brooklyn Bridge take a trolley car for Flatbush, or an elevated Brighton Beach train. At Church avenue change to a car going east and leave the car at Rugby. This is a stretch of old farm lands, plotted off into streets and building lots, but still for the most part meadow. Lie down on the grass and look up in the blue and watch the skylarks mounting and descending, and hear them sing. Under such conditions as those at Rugby one who has known the bird in its home across the sea might very readily persuade his fancy that he was back in England with the larks on the downs.

IN a consideration of "Trawlers and Fly-fishers," the Boston Herald exclaims: "With what fine, superior scorn—as of a fluting wood-thrush for a quacking duck, a lyric poet for a Grub-street hack—does the consummate angler for trout or salmon regard the man who catches fish solely for the market?"

Does he? If he does, why does he? What reason is there for regarding with fine superior scorn the man who catches fish solely for the market? The fisherman, who makes a business of taking an "intermitting succession of skates, dogfish, cod and haddock," is no more to be regarded with scorn by an angler who is at the same time a man, than is the farmer who hoes corn, the carpenter who saws boards, the lawyer who draws briefs, or the shoemaker who cobbles shoes. Of course, no one may say with what feeling—whether of scorn or envy—an individual fly-fisherman may look upon the toiler of the sea, but fly-fishermen, as a class, have no such foolish sentiment. Why should they?

THE Massachusetts authorities are making war on the mill owners who pollute streams with sawdust. Several prosecutions have been instituted this summer, the deputy game wardens winning, and many more are to follow. As some of the streams affected are among the best trouting waters in the State the results of the vigorous campaign will be of decided advantage to the fishing interests. The old notion that a stream of water was created for the express purpose of carrying off mill and factory waste has been so deeply ingrained that it is not easily overcome; but the Massachusetts mill owners are now in a way to gain instruction, which, as it costs something substantial, is likely to be heeded and remembered.

## THE SPORTSMAN TOURIST

### Spring in the Adirondacks.

SPRING in the Adirondacks is doubtless a laggard. She advances with as great a reluctance as winter retreats, and seems loth to touch the trees with the first vernal tints, or free the ground from the iron bonds of frost; but when the ethereal colors of opening buds at last clothe the mountain slopes, how radiant then is the face she turns toward sanguine May skies! It is the flush of youth seen again on an aged, rugged cheek, and the shy, retiring and frequently capricious moods given way to at this season only serve to make more alluring those tender moments that grow longer and sweeter as she draws near the serene maturity of summer. Laving the roots of gnarled cedars that so often line their shores, and held, as it were, in the arms of wooded hills and mountains, lie the Adirondack lakes; and what can be more satisfying or restful than a wilderness lake, breathing forth the fragrant mists of early morn, and mirroring the last pale glow of sunset. "It is the earth's eye; looking into which the beholder measures the depth of his own nature." We cannot interpret with greater beauty the significance of such a creation than in the remembrance of these lines, and once having taken nature by the hand how firm and true is the clasp of her fingers! She is constant in the beginning; constant until the last, changing, and yet changeless. "Nature and man," says the same author quoted previously, "some prefer one, others the other. But that is all 'de gustibus.' It makes no odds at what well you drink, provided it be a well-head."

Thus we go through life seeking well-heads—perennial fountains where our thirst may be quenched and our beings renovated with a crystal draught that perchance flows from some elysium. Certain influences and certain creations all differently affect, exalt and convey spiritual intimations to various mentalities, benefiting them accordingly—administering large or small portions as the case may be. But it is a beneficent provision of nature that the greater amount we are able to assimilate into a secular existence, the more completely does her sublime power advance us to revelations of eternity. The influence of the wilderness and relationship of mountains have ever seemed especially ennobling, and draws one with surprising vigor away from follies and trivialities, planting instead those things that time will not be likely to vitiate or the changing currents of years wash away. When we return to their environment after an absence and feel the old intimacy steal through our veins like a tempered aboriginal instinct; when the forest grows vernal with fresh lustrous foliage and the lakes reflect the sky's deep azure, we experience a natural felicity that emanates not only from the reality, but from those potent invisible forces ever lurking behind it.

The love of angling is innate, and the long-famed piscatorial history of the Adirondacks has caused the fly-rod to bloom abundantly, where it is as well known a symbol of the spring season as the wake robins holding their delicate heads above the leaves, or the witch-happel blossoms flecking the woods with snowy tints. Moreover, where the waters are still uncontaminated by the introduction of black bass or pickerel, it often brings to net many of those crimson-sided, thick-set, native trout, whose lurid coloring and game qualities make them worthy of the highest admiration. And the more intimate our acquaintance becomes with any form of sport the deeper is our appreciation of its intrinsic values, and we find in it something that expands new pleasures instead of contracting them, which is so often the case with many recreations that suffer from the vicissitudes of years, or are swallowed up in monotony and indifference.

To be abroad in the late afternoon or evening of a mild May day, on some sequestered woodland lake where the trout are rising well, results in not only the replenishing of the awaiting creel, but of the awaiting mind, for even the angler must have some dry land in his thoughts if he would save himself from drowning in the limitless ocean of existence. Moreover, if he is wise, he will embrace the present with heartfelt thankfulness and give himself over to the natural unstained chastity of his environment, or, as Thoreau says, "Both for bodily and mental health court the present; embrace health wherever you find her. \* \* \* There is divinity in the wilderness; we see it, hear it and feel it, if we but open the doors of our spiritual temples and let its omnipotent breath flow through and permeate every crack and crevice that perchance is dusty or neglected. Nature moulds human character with a serene and lofty precision, if we will but allow her the opportunity of doing so. Yet how many will have only the roof of their earthly habitation to shelter them."

It is always agreeable after two or more days of wet, sober weather, to discover those signs that foretell a clear-up, and such a change is especially welcome on a fishing trip, when the angler, who has been wrestling with confinement, at last regains his freedom and hastens to seek out some favorite haunt in expectation of making up for lost time. Thus our anticipations were at the high-tide mark one moist spring afternoon as we glided over the unbroken surface of West Pond, and descried those lurid streaks breaking through the dull horizon that appeared as welcome as

the relaxation of a tempestuous brow and advanced our hopes with regard to the prospect of a fine clarified evening.

At the lower end, replenished by many new born rills that fed and swelled its current, the inlet poured an amber stream into the pond, flowing out over a wide expanse of shallows, and here, evidently lured by its wild, cold flavor, the trout had congregated—a discovery two long-tried fishermen had made the day previous, and who, braving the rain, were rewarded with a splendid catch. The "Veteran" therefore decided to go directly to this spot, and if the fish were still there we might expect some good sport, and perchance find a contingent of big trout waiting to seize the first blue-jay, Parmacheenee-belle or professor that floated temptingly over their heads. Once, a man, whom I had known but a few moments, asked me with rather scornful intimation, I thought, how large the trout were which my father and I caught in the Adirondacks. I gave him the average weight and named the largest we had taken that season, feeling a trifle wrathful within at the tone of his inquiry, whereupon he remarked: "Oh, you ought to go farther north and fish for salmon or sea trout; they absolutely spoil any one for trout fishing."

"Well, I would never care to go further north, then," replied I, rather curtly, no doubt, "for to have my appetite impaired with regard to trout fishing would be a loss that I should deeply regret," and so our piscatorial conversation came to an end.

As we neared our destination the vibrant, mellow-peeping of shad-toads, hidden in the slushy marshland depths bordering the shore, fell pleasantly on our ears, and a fish broke with an enticing splash just opposite the mouth of the inlet, sending a circle of eddying waves across the water's surface, where still forms of vaporous clouds might be seen reflected, while in ephemeral mists they kissed the rain-soaked cheeks of the surrounding hills. I cannot refrain from eulogizing the atmosphere, which warm and moist, seemed laden with subtle influences that appeared to inspire the woodland songsters along shore with fresh melody, and made the strains of hermit thrushes even more serene and liquid than usual. And there is no bird perchance, whose song is better adapted to its environment, or whose habits harmonize so completely with forest solitude, unless it be some other member of the same family as the wood thrush or veery. Our Highland bard and essayist, to whom every nature-lover's homage is due, pays this thrush many a beautiful tribute and eulogizes the quality of his voice with a vividness that is almost equal to the reality. His description can only be compared with what Thoreau says of the wood thrush, which, "though heard at noon, there is the liquid coolness of things drawn from the bottom of springs." Occasionally one hears the latter in the Adirondacks, but the other is by far the most plentiful, and when from the shadowed wilderness depths its strain rings out on a summer evening, we are wont to imagine that it is the sylvan lute of Orpheus, searching for his lost Eurydice.

A fine Scotch mist had been falling as we walked over the mile "carry" which led through the woods to the pond; but now it seemed to be quite dispelled, and before commencing to fish, we doffed our raincoats with a sigh of relief. At last reaching the chosen ground, Wallace let the boat drift, and we began casting over the mirrored waters some fifty yards or more from shore, and above where the inlet entered the pond.

"Perhaps all the big ones have moved out to deeper water," the "Veteran" remarked and made a cast on the opposite side of the boat; but just as the flies gently struck the water, a pound fish leaped clean into the air like a crimson bow, and sunk from sight with his dearly bought morsel holding him fast. Every time he caught even a fleeting glimpse of the net Wallace endeavored to slip under him when he came up apparently played out, there would be a fresh struggle with flying spray and foam, and occasional flashes of his brilliant sides; but the firm experienced hand that held the rod was at last victorious, and thus the afternoon's sport opened with a flourish. After this first catch, it waxed fast and furious, and fortunately there were not many black flies, mosquitoes or other winged torments to disturb us, and therefore our full attention could be given to the enjoyment of playing and landing each fish in turn. Neither before nor since do I remember having witnessed such a scene of trout gayety; on every side they jumped and disported themselves, little and big ones alike, as though the moist atmospheric conditions were conducive to aerial performances and also to their appetites, for certainly they did not demur over seizing a modest Rube-Wood or gaudy blue-jay, but every fly seemed congenial to their palates, until too late they discovered their mistake. Some of the large pound or two-pound trout, as they gracefully cleaved the air, made my heart go through similar antics, and finally as one broke water near the boat I was able to place a cast directly over the swirl, and up he came again with a rush. The line flew off the reel at a rapid rate, but having struck hard, I trusted the hook would do its work, and so let him take out a good bit, when suddenly the tension relaxed and with a triumphant splash my finny warrior made his escape.

"Oh! he's big!" I ejaculated, slowly reeling up and

feeling as if I had not eaten anything for a week—the sensation most anglers experience, I imagine, on losing a fish which they fully realize was a noble specimen of his kind. The "Veteran," however, even if he did laugh at my wailings, also encouraged me with the idea that there were probably others who could rival the lost prize in weight and fighting propensities, and just then his surmise was proved correct, for out came the twin brother of the former and swallowed his hand-fly. Watching the brisk struggle which now ensued, I let my own flies drift idly, holding the rod across my arm in a rather careless manner, when a seething boil, directly alongside the boat and a sharp, sudden jolt on the line, scattered previous disappointment to the winds and no doubt drew from me some excited exclamations, for alas! I am not destined to accept such moments as these, without word or sign. Like lightning he bolted under the boat, then out again and streaked across the water, giving one wild bound into the air and striking with a loud slap on the calm, glazed surface, changing its placid aspect to one of turmoil. This time, however, the Seth-Green—which fly it was that had tempted him to strike—held firm, deeply imbedded in his horny jaw, and after fighting vigorously for some five minutes or more, he gave in and was landed without mishap, much to my satisfaction.

"They're coming pretty fast," murmured Wallace, as he unhooked one trout and prepared to net another. "Just look at that!" he added, for as the "Veteran" reeled in his fish, a second one followed up the trailing flies, and lunged at them, hooking lightly, but unluckily breaking loose again. It is amusing as well as interesting to note the different manner in which trout will attack an artificial fly. Some take it, generally the big ones, with a surging rush from beneath, or make a savage leap, striking as they go down, which latter method affords a most attractive and inspiring sight, and usually signifies a well-hooked fish. Again, those of medium size and very small ones, will attack with similar vim and determination, while as often they will follow the fly, toying and nudging it with leisurely playfulness, taking good care, however, not to strike hard. There were plenty of these delayers in our vicinity, but their inability to swallow the flies was made up for by the glorious onrush and subsequent capture of fish whose game qualities remained apparent from first until last, and whose color and beauty was a feast for the most fastidious angling eye.

As had been prophesied by the aspect of the horizon earlier in the afternoon, the sun at last came out, warm and delicious. It was as if Helios had lifted back his beamy cloud helm and exposed the full radiance of his glowing features. The whole landscape, dripping and clearcut after the rain, was suddenly bathed with a melting luminous haze, while through the mists overhead broke great azure lakes of the unstained sky beyond. Seeing the light strike on the glistening poplars and other trees that lined the shore brought to mind a golden thread of mythology which Ovid has woven into his choice, rich verse. Phaëton, who drove his father's chariot and fell through "fiery ambition o'ervaulting itself," had sisters, so it seems, who weeping at his downfall were transformed into poplar trees, and thus the poet memorizes the incident:

"But yet they weep; and in the Sun their tears  
To amber harden, by the clear stream caught,  
And borne, the gaud and grace of Latian maids."

If the birds had been bubbling over with song before the sun made its appearance, their vocal powers seemed now to be redoubled, and vireos, scarlet tanagers, thrushes and warblers poured forth an unceasing chorus, while a broad-wing hawk, wheeling high above the treetops, gave out, at intervals, wild whistling screams. Not soon after landing a fair-sized trout, I lost one through over-anxiety to save him, and of course as he kept down and weighed heavy on the rod, I bitterly surmised he was larger than any that had been hooked previously. The lost fish, however, is invariably summed up as the "biggest of all," and floats in astounding proportions before the disconsolate angler's mind's eye. Whereas, in reality, its size is probably far from extraordinary.

All afternoon scarcely a breath of wind or fluctuating zephyr had dappled the pond's surface in our vicinity, and it lay as smooth and undisturbed as a sheltered pool, which made casting a delight, and displayed the rising trout to advantage. The warm, humid sunlight might have somewhat curtailed the number of hungry fish, however, had it struck directly on the water, where we were located, but, fortunately, the shadows stretched dark and cool along the west shore, and on our way back we kept well within the limits of their shade. Trolling the flies, while the "Veteran" continued to cast, I had a sharp strike, which was repeated several times until the rod tip suddenly bent and quivered, while some distance behind the boat, hooked to the fly, a pound fish broke water. This is a favorite trick of the rainbow trout and landlocked salmon, both of which as a general rule fight close to the surface. I have known instances where the maneuvers of the former were so wild and uncontrollable after being hooked that they appeared almost demented, and in concerning over the water, have rushed against the boat

and knocked themselves off. The salmon likewise often exhibit remarkable gymnastics, and once while fishing we had one leap into the boat and land dexterously in the bait pail. The trout I had on now, however, was less obstreperous and sulked a good deal, keeping down, but waking up if he chanced to observe the approaching net, until at length I succeeded in tiring him out. After this we caught one or two more, and then reeled up and put our rods aside, thoroughly content with the afternoon's catch, which numbered just twenty fish.

How hallowed are those moments that precede the setting of the sun! As we bent our steps homeward through the quiet woods, I saw its red-gold orb glinting between the trees and illumining their delicate leaves with a mellowed brilliancy of declining day. The beams, moreover, have a clarity and youthfulness that tells of the year's nativity. At this hour there is also a peace, a breathless quietude which makes the tumult and struggle of existence seem far removed, and enfolds us in a similar tranquillity. But, who can interpret the Spirit of Solitude in the wilderness? It is subtle and overpowering, for as it starves with a sense of unutterable loneliness, so does it replenish with infinite nutriment, and make absolute the bond of natural affinity to the earth's creations.

"O solitude! if I must with thee dwell,  
Let it not be among the jumbled heap  
Of murky buildings; climb with me the steep,  
Nature's observatory—whence the dell,  
In flowery slopes, its river's crystal swell,  
May seem a span; let me thy vigils keep  
'Mongst boughs pavilion'd, where the deer's swift leap  
Startles the wild bee from the foxglove bell.

But though I'll gladly trace these scenes with thee,  
Yet sweet the converse of an innocent mind,  
Whose words are images of thoughts refined,  
Is my soul's pleasure; and it sure must be  
Almost the highest bliss of human kind,  
When to thy haunts two kindred spirits flee."

PAULINA BRANDRETH.

## Trails of the Pathfinders.—XXXII.

### Fremont—V.

(Concluded from Page 48.)

NEW YEAR'S DAY found them traveling through the desert, over a rough, sandy road. The next day they reached a field of hot springs, the vapor from which was visible a long way off. Fremont was growing uneasy. He had very little idea where he was. There appeared to be no game in the country, except hares, though occasional signs were seen of sheep and antelope. His animals had begun to die, and he felt the necessity of proceeding with great caution. Because of the uncertainty of water for his animals, he formed a plan of exploring the country in advance each day, and leaving the main party behind. On Jan. 10, a beautiful lake, some twenty miles broad, was seen from the top of a ridge, and they proceeded toward it. On the way, herds of mountain sheep were seen on the hills, where they came on a little stream about a mile from the margin of the lake. They found a broad Indian trail following the shores of the lake to the southward. This was followed for a short distance, and then ascended another precipice, against which the waterashed below, and it was very difficult to get the howitzer along this trail. Mountain sheep in numbers, and ducks, and some fish were seen, and the party passed the pyramid which rises out of the lake and gives it its name. The last of the cattle driven from the Dalles was killed for food. On Jan. 15 a few Indians made their appearance about the camp, and one of them was persuaded to come into it. It was difficult to communicate with him; but from what he said, it was inferred that at the end of the lake was a river, which subsequent investigation showed, ran into the lake, which has no outlet. Here, to the great delight of the white men, the Indians brought in fish to trade. Fremont calls them salmon trout, and says that they were from two to four feet in length. They appeared to form the chief food of these Indians, who, Fremont says, hold the fishery in exclusive possession. And who are different from the "Digger" Indians so frequently spoken of in crossing the desert. It appeared that these Indians were in communication either with the whites or with other Indians knowing the whites; for they possessed some articles of civilized manufacture.

The party now followed up the stream running into Pyramid Lake, traveling along toward the Sierra Nevada Mountains. They were on an Indian trail, and hoped soon to find the Buenaventura River, for which they had been looking. Columns of smoke rising over the country at intervals made them sure that the Indians were notifying each other that strangers had come into the country. Their animals were growing thin and weak; their feet were much worn away by the rocks, and many of them were lame. Fremont decided, therefore, that he must abandon his course to the eastward, and must cross the mountains into the valley of the Sacramento River as soon as possible.

Keeping on southward along the mountains, they crossed streams issuing from them which tempted them to try for a pass; but the heavy snows which appeared to lie on the mountains induced the leader to keep on further southward. Jan. 24 an Indian came into the camp, and offered the strangers a little bag of pine nuts, which they purchased from him. They also gave him some presents; and as nearly as they could understand his signs, he promised to conduct them to the opening of a pass, of which he knew. From here on they constantly saw Indians, all of whom traded pine nuts to them, and all were armed with bows and stone-pointed arrows. The level of the country appeared to be growing higher, and the snow grew deeper. They put one of their guides on a horse, but he was evidently unacquainted with the animal, and did not even know how to guide it. Soon they entered the range, and having left the desert country, found a country well timbered, and which appeared to produce con-

siderable game. They climbed to the head of the stream, passed over a ridge, and saw from the summit a sunless country where there was evidently grass. Here the Indians were wearing snowshoes, and accompanied the party, running around them, and swiftly and easily traveling over the snow. They appeared to have no idea of the power of firearms, and thought themselves perfectly safe, so long as they kept out of arm's reach.

Descending on the head of this next stream, Fremont learned, before he had gone very far, that this was merely the head of another stream running eastward into the Great Basin, and that they had still to cross a great ridge before they could reach Pacific waters.

The Indians here had heard of a party of twelve white men, who two years before had ascended the river and crossed to the other side; but this was done when it was summer time, and there was little or no snow to oppose the passage; and at present the Indians declared it could not be done. Nevertheless, they agreed to furnish a guide to take the whites as far as possible. Provisions were now getting low, and consisted chiefly of peas, a little flour, some coffee, and a quantity of sugar. It was on this day, Jan. 29, that the howitzer, which had been dragged so far, was finally abandoned. On Jan. 31 they continued to climb the mountains among the snow. Indians kept visiting them in greater and greater numbers, and from all most discouraging accounts were heard of the possibility of crossing the range. An old man told them that if they could break through the snow at the end of three days they would come upon grass, which would be about six inches high; and here Fremont decided to attempt the passage, and to try to reach Sutter's ranch, on the Sacramento. Preparations were made, therefore, to face the cold of the heights, and clothing was repaired and put in order, and a new guide was engaged, who was also fitted out with special reference to the hardships likely to be met with. A dog that had been with them for some little time was killed, and this, with a few rabbits purchased from the Indians, gave the party a strengthening meal.

When they started, the snow soon became so deep that it was absolutely necessary that a road should be broken for the animals. This was done in systematic fashion, and for several days they advanced by very short marches, but without meeting any obstacles greater than the depth of the snow. Sometimes the lack of feed at the end of the day's march would render it necessary to send back the animals to feed at some point on the trail just passed over, where there was good pasture. Two or three days of this hard work was very discouraging. However, Fremont's energy never faltered. He and Carson and Fitzpatrick, on snowshoes, went ahead, reconnoitering in all directions, and trying to pick out a good road; and on Feb. 6 they reached a peak from which they saw the valley of the Sacramento; and Carson recognized various natural features which he had not seen for fifteen years.

The difficulties of travel for the horses was so great, and the hillsides so steep, that many of the animals found the greatest difficulty in getting along themselves, and could not carry their loads. Sledges were made, therefore, on which the men drew the baggage over the snow; but of course this made progress very slow indeed. The hunters went out to look for game, but found none. On the 9th it began to snow, and the wind and snow filled up the trail that had already been beaten, so that it was again impossible for the horses to go along. Fremont ordered Mr. Fitzpatrick to make mauls, and to open and beat a road through the snow, by which the animals could be brought along. Meat, which for some time had been unknown in the diet of the travelers, was now supplied by the flesh of another dog, and that of a mule.

Happily, during all this time the weather had not been very cold; though at night the thermometer sometimes fell nearly to zero, the days were uncommonly warm, and the snow melted fast under the sun. While this relieved them of suffering, it made travel still more laborious.

It was on Feb. 20 that they camped with the animals that were left, and with all the material of the camp, on the summit of a pass in the dividing ridge, about a thousand miles from the Dalles, whence they had started. The prospects of the descent were not promising. Before them were rough mountains, among which lay deep fields of snow; but shortly after they started on their way, they heard the roll of thunder, and looking toward the valley saw a thunder storm in progress. As the sky cleared, they could see a shining line of water leading toward another broader and larger sheet; and in these they recognized the Sacramento River and the Bay of San Francisco. Yet so frequent had been their disappointments during their wanderings through the rough mountains that they hardly dared to believe that they were at last to penetrate the warm, pleasing country, where they should be free from the hardships and exposures of the last few months. This night they killed a mule for food, and again the next night, Feb. 23 was their hardest day, for they were forced to travel along steep and slippery mountainsides, where moisture, snow and ice, together with the tough evergreens of the mountain, made walking difficult and wearisome; but on this night a storm showered upon them rain and not snow. The men, exhausted by the labor of travel and by the lack of food, were beginning to lose strength and courage.

However, now they were constantly descending. The thermometer was just about freezing, and they had left the Sierras behind. The green grass was beginning to make its appearance. The river was descending rapidly, and growing larger. Soon they came to deciduous trees and a warmer atmosphere. The country was covered with growing plants, and the voices of singing birds were heard in the summer air. They were still killing the horses for food.

Fremont now believed that the main difficulties of the road were over, and leaving Fitzpatrick to follow slowly with the main camp, he started ahead with a

party of eight, intending to reach Mr. Sutter's house as soon as possible, and to return with provisions and fresh animals for the party. Fitzpatrick was left in command of the others, with instructions to bring on the animals slowly, for all were very weak.

But they were not yet out of their troubles. For much of the way the river ran through narrow cañons, and the travelers were obliged to clamber along the mountain side, over a road rough and almost impassable for their enfeebled live stock. However, at their camps they found grass. As they went on they were obliged to leave their animals behind, and Fremont left his favorite horse, Proveau, which could no longer keep up. One of the men started back to bring the horse, but did not return until the second day, when it was apparent that his mind was deranged. This day Mr. Preuss, who had gone ahead, did not appear at night, and his absence caused much anxiety. The next day they met some Indians, and kept on down the river, still continuing their search for the lost man. They came upon tracks of Indians, little piles of mussel shells and old fires where they had cooked. On March 4 they came on an Indian village, where they found houses, and near each one a store-house of acorns. In the houses were basketfuls of roasted acorns, and although the Indians had fled, the travelers supplied themselves with this food, leaving various small articles in payment. In a village not far below three Indian women were captured. They were much frightened, but encouraged by good treatment offered food. This night Mr. Preuss came in, very weak from starvation, but not otherwise in bad condition. He had subsisted on roots, ants, frogs, and had received some acorns from Indians whom he met.

At the next village Indians were found wearing shirts of civilized manufacture, and then they came to another and larger village, where the people were dressed more or less in European clothing. Here was a man who could speak Spanish, a vaquero in the service of Capt. Sutter, whose fort was but a short distance away. At the fort Fremont was met by Capt. Sutter, who gave him a most cordial reception, and a night of enjoyment of all the luxuries that he had so long been without. The next day, with fresh horses and provisions, Fremont hurried back to meet Fitzpatrick, and brought in the rest of the party. The second division had had a hard time, having lost many animals; so that of the sixty-seven horses and mules with which they started to cross the Sierras, only thirty-three reached the valley of the Sacramento. The beef, the bread, and the salmon, which Fremont brought, put heart into the starving men, and before long they had reached a permanent camp not far from Sutter's fort.

Capt. Sutter had come to California from the western part of Missouri in 1838-39, and had settled in the Sacramento valley on a large grant of land received from the Mexican Government. Though he had at first had some trouble with the Indians, he succeeded, by his judicious treatment, in converting them into a peaceable and industrious people. They did practically all the work of the ranch, and were paid in shirts, blankets and articles of clothing. The soil was fertile, and its yield ample. Cattle and horses were abundant. He had a number of mechanics, who made whatever he needed.

The blacksmith of Fremont's party, desiring to remain in California, was here discharged, as were also four others of the party. Derosier, one of the best men in the outfit, the one who a few days before had gone back after Fremont's horses, wandered away from the camp and never returned.

On March 24, the party having recovered from the suffering endured in crossing the mountains, and being now once more strong, set out to continue their journey. An ample stock of provisions had been secured, and a fresh supply of animals, consisting of 130 horses and mules, and about 30 head of cattle, had been secured. An Indian herder was furnished by Capt. Sutter, to look after the stock, a great part of which was absolutely wild. From this point it was purposed to go south, up the valley of the San Joaquin, to a pass at its head. Thus, they were to move southeastwardly to reach the Spanish trail, which led to Santa Fe. Following this trail through the desert, they would be sure of water, even though sometimes the journeys were very long, and might reach the Rocky Mountains somewhere opposite the southern extremity of the Great Salt Lake. Their southward journey was delightful. Fremont speaks in terms of enthusiasm of the flowers they met with, of the beautiful groves of oaks, the songs of the birds, the sweet odors that perfumed the air. Elk and antelope were in great abundance, and the horses were so numerous that the travelers feared for the safety of the wild stock they were driving with them. On April 7 they crossed the divide between the headwaters of the San Joaquin and the Tulé Lakes. The passage brought with it more or less of a change in climate, and a distinct change in surroundings. Indians were met with constantly, and most of them seemed well disposed. As they lowered their altitude, after passing over the divide, the way became more rough, though the feed for the animals was still good.

On April 13 they met an Indian from the mission near the Pueblo of Los Angeles. He told them much about the country, and as it lay on his road, agreed to accompany them for two days to point out the way to them. As they crossed some low spurs, which gave a view of a desert to the east and north of them, their guide pointed to it, saying in substance, "On those great plains there is neither water nor grass—nothing. Every animal that goes out upon them dies." At length their kindly and good-natured guide was obliged to leave them; but before doing so, he pointed out the way to them. On this day they saw a number of antelope among the hills, and on the day following, several deer. Their guide, from an elevated point, had shown them land marks where they might expect to come upon the Spanish trail, and then he started off toward his home near the sea coast. The following day they came upon the trail, which greatly encouraged them. Here was a road to travel on, and a course to follow. Often the distances would be great, but at least they were not wintering in the desert, with no notion of

what next would come to them. They found, however, that the description of the trail was very different from the reality. Sometimes, where they expected to find water, there was none. At other points, large streams flowed where they had been told that no water was to be had.

Fortunately Fremont's party was ahead of the annual Santa Fe caravans, which insured them good grass at the camping places. They had not gone far before they met parties of Mohave Indians, who seemed friendly enough; but on the day following, two Spaniards, a man and a lad, came into camp telling of their party of six having been attacked by Indians, about eighty miles beyond the encampment. They had with them about thirty horses, and were suddenly attacked by a party of Indians, who had previously been in camp and seemed friendly. The horse guards—the two who had just come into Fremont's camp—drove their animals through the attacking party and escaped with their horses, which they had left about twenty miles behind on coming to Fremont's camp. When the white men came to the place where the horses had been left, it appeared that the animals had been driven off by Indians. Carson and Godet, with the Mexican Fuentes, started after them; but in the evening the Mexican returned, his horse having given out.

"In the afternoon of the next day a warwhoop was heard, such as Indians make when returning from a victorious enterprise, and soon Carson and Godey appeared, driving before them a band of horses, recognized by Fuentes to be part of those they had lost. Two bloody scalps, dangling from the end of Godey's gun, announced that they had overtaken the Indians as well as the horses. They informed us, that after Fuentes left them, on the failure of his horse, they continued the pursuit alone, and toward nightfall entered the mountains, into which the trail led. After sunset the moon gave light, and they followed the trail by moonshine until late in the night, when it entered a narrow defile, and was difficult to follow. Afraid of losing it in the darkness of the defile, they tied up their horses, struck no fire, and lay down to sleep in silence and in darkness. Here they lay from midnight till morning. At daylight they resumed the pursuit, and about sunrise discovered the horses, and immediately dismounting and tying up their own, they crept cautiously to a rising ground which intervened, from the crest of which they perceived the encampment of four lodges close by. They proceeded quietly, and had got within thirty or forty yards of their object, when a movement among the horses disclosed them to the Indians. Giving the war shout, they instantly charged into the camp, regardless of the number which the four lodges would imply. The Indians received them with a flight of arrows shot from their long bows, one of which passed through Godey's shirt collar, barely missing the neck. Our men fired their rifles upon a steady aim, and rushed in. Two Indians were stretched on the ground fatally pierced with bullets; the rest fled, except a lad that was captured. The scalps of the fallen were instantly stripped off; but in the process, one of them, who had two balls through his body, sprung to his feet, the blood streaming from his skinned head, and uttering a hideous howl. An old squaw, possibly his mother, stopped and looked back from the mountainside she was climbing, threatening and lamenting. The frightful spectacle appalled the stout hearts of our men; but they did what humanity required, and quickly terminated the agonies of the gory savage. They were now masters of the camp, which was a pretty little recess in the mountain, with a fine spring, and apparently safe from all invasion. Great preparations had been made to feast a large party, for it was a very proper place for a rendezvous, and for the celebration of such orgies as robbers of the desert would delight in. Several of the best horses had been killed, skinned and cut up, for the Indians, living in mountains and only coming into the plains to rob and murder, make no other use of horses than to eat them. Large earthen vessels were on the fire, boiling and stewing the horse beef, and several baskets containing fifty or sixty pairs of moccasins indicated the presence or expectation of a considerable party. They released the boy, who had given strong evidence of the stoicism or something else of the savage character, in commencing his breakfast upon a horse's head as soon as he found he was not to be killed, but only tied as a prisoner. Their object accomplished, our men gathered up all the surviving horses, fifteen in number, returned upon their trail, and rejoined us at our camp in the afternoon of the same day. They rode about one hundred miles in the pursuit and return, and all in thirty hours. The time, place, object and numbers, considered, this expedition of Carson and Godey may be considered among the boldest and most disinterested which the annals of western adventure, so full of daring deeds, can present. Two men, in a savage desert, pursue day and night an unknown body of Indians into the defiles of an unknown mountain, attack them on sight without counting numbers, and defeat them in an instant—and for what? To punish the robbers of the desert, and to avenge the wrongs of Mexicans whom they did not know. I repeat, it was Carson and Godet who did this—the former an American, born in the Boonslick county of Missouri; the latter a Frenchman, born in St. Louis—and both trained to western enterprise from early life."

A little later the party came to the place where the Mexicans had been attacked. There were found the two men of the party, both killed by arrows; but of women there was no trace, they having evidently been carried away. Journeying onward, making short marches and some that were very long, they kept on along the Spanish trail. May 4—the longest journey of all, between fifty and sixty miles without any water—the skeletons of horses were constantly seen along the trail. "Hourly expecting to find water, we continued to press on, until toward midnight, when, after a hard and uninterrupted march of sixteen hours, our wild mules began running ahead, and in a mile or two we came to a bold running stream—so keen is the sense of that animal, in these desert regions, in scenting at a distance this necessary of life."

The next day was spent in camp that the animals might rest and food. Indians were about them con-

stantly, and apparently tried to steal their horses. They were very bold and insolent, but the whites bore it all, being unwilling to be drawn into a fight. These were the same people who had murdered the Mexicans; they were bare-footed and nearly naked; the men were armed with bows and arrows, each carrying a quiver of thirty or forty shafts. The arrowheads were made of clear, translucent stone, and Fremont says, "Shot from their long bows are almost as effective as a gun shot." A chief came into camp, and declared his confidence in himself and his people; and his belief that they could destroy the white men, merely on the ground that they were many, while the whites were few. The Indians were seen hunting lizards, which they dragged from a hole by means of a long stick hooked at the end. The next day they followed the party, and promptly picked up every animal that was left behind to rest and feed. That night one of the best men, Tabeau, was killed by an Indian, having been shot with arrows not far from the camp. These Indians did not appear after this day. A day or two later the party met Jo Walker, the trapper, who now became guide for the expedition. With him were eight Americans, who, having started with the Spanish caravan, had heard that a party of white men were ahead, and had left the caravan and overtaken the explorers. On the way they had an encounter with the Diggers that had troubled Fremont, and killed two of them.

May 23, they reached Sevier River, a tributary of the lake of the same name. Here they were obliged to ferry themselves across, in boats made of bundles of rushes tied together and bound to poles. Here, too, Bateau, a good man, was killed by accident; he dragged toward him a gun by the muzzle and the gun was discharged. Not far beyond they reached Utah Lake, which Fremont imagined to be the southern end of Great Salt Lake. He was much puzzled, however, that the northern end of the lake should be a saturated solution of salt, while the southern end was fresh. It does not appear to have occurred to him that these were two different bodies of water.

Having crossed the mountains, to the valley of White River, he reached, on the 3d of June, what he calls the winter fort, a trading post belonging to Mr. A. Roubideau, on the principal fork of the Uintah River. On the 7th, they found themselves on the verge of Brown's Hole, a name well known to all old-timers in the west; and thirty years ago one of the greatest game countries in the world. Here, mountain sheep were found, and some killed. Two or three days later, buffalo were killed; and we may imagine the delight with which the travelers found themselves once more back on the range where fat cow was to be had. From here they went north into the Three Parks, traveling in pleasant weather through a country well watered, where grass and wood were to be had, and where buffalo, antelope and elk were hardly ever out of sight. On June 14, they were in New Park, now called North Park, going southward up the Platte River. A day or two later they came upon parties of Arapahoes and Sioux, and the camp was full of Indians. On June 22 they crossed the mountains, and found themselves on the headwaters of the Arkansas. A day or two later they were present at a fight which took place between Utes and Arapahoes. The Ute women urged the white men to take part in the fight; but they felt that it was no concern of theirs, and were quite uneasy lest they themselves should be attacked. They kept traveling, and before night had put fifteen miles between themselves and the Indian village, and fortified themselves. They were now traveling rapidly down the Arkansas, meeting Indians constantly. Among these were a large village of Pawnees, who received the white men "with unfriendly rudeness and characteristic insolence which they never fail to display whenever they find an occasion for doing so with impunity." The Pawnees, indeed, seem always subject to the animadversion of the early traveler.

The party journeyed down the Arkansas for nearly 300 miles, and on the last day of July reached the little town of Kansas, now Kansas City, on the Missouri. Fremont's second journey was over.

GEORGE BIRD GRINNELL.

## Floating Down the Mississippi.

### Wiles of the Medicine Man.

UNTIL we got to Greenville, Miss., a week later, the Gambler was on our hands. He was coughing night and day, and it was the long, rasping cough of a weak-lunged man. He had broken down a wiry constitution by riding the cattle range for many years, living months in the open air, sleeping with a blanket over him and a saddle under his head—his cheeks and his complexion betrayed the presence of lung weakness—hence the remark of the Medicine Man that we were likely to have a man "die on us."

We drifted down stream. On the second night we came to the big store boat, a 90-footer, run by a man named Young—a tall, long-armed individual who had a numerous family on board his boat, mostly children. He called his boat the Sunny South, although he was an Ohio river man. Once before he had dropped down as far as Greenville, but he did not know or like the lower river. The up-stream man has a horror for the lower reaches of the stream. "The further down you gets the wusser it is on this yere ole stream!" men said frequently. But to this the Medicine Man always gave the lie at the first opportunity. To his mind, the south was always pictured as a land of luxury and of ease. If the wind was cold, he said the south had nothing like that. Of poverty there was none, and one could "live like a gentleman down there." The Gambler had never been down the river before, but the Medicine Man had made several trips. Now that he was sick, the Gambler blamed the Medicine Man for the rosy picture he had painted of the river life.

"You call this easy living!" the Gambler burst out one day as we lay waiting for the Young boat to start down stream with us, "I'm double blest if this wind ain't colder right here than it is in Ohio!"

So it seemed on some days. The wind was a chill,

moist breeze when it swept down from the north. It seemed as though the weather was as blue as the gang. We were in Rowdy Bend, at Gaine's landing. The storeboat man, with the natural propensity to get all he could out of every one, prevailed on the Medicine Man to stay with him. He had a log raft, caught by "drifting," which he wanted to get down to Greenville. The crew of his boat, consisting of a grown son and two boys, and himself, were not enough to handle the 90ft. craft and the \$60 worth of logs. He wanted us to stay with him "for company's sake." We remained. I got some ducks as they flew over some low willows to a lake half a mile up stream, and saw countless other birds. In wet or foggy weather, I presume Rowdy Bend to be as good a place for duck shooting as one would wish for. On the river, it is noted among the cabin boaters.

One curious phase of the Medicine Man's character came out when he moved his boat down to the storeboat, and tied outside of the raft. Young asked him to move down to help look after the raft. We moved down in a wind storm, and tied up outside the raft, where the waves swept us against the logs in a way that made the boat pound as though falling to pieces. But it was an accommodation to the storeboat man, for we were handy in case the raft got to weaving or otherwise needed our care. We ran lines and hauled lines and tied lines for hours one day, as the exigencies demanded, our boat breaking the waves from the raft like a wave-break.

Young came to Gaine's landing and found that pecan nuts were selling at from 1 to 3 cents per pound. He began to give 5 cents in trade, and in two weeks he had put on about 9,000 pounds of them. On top of his boat were bones, iron, ropes, bottles and other junk which he and his sons had gathered along the stream. He was going to Greenville, where he would take a tow up to Evansville, from which port he hailed. Everything was salable or buyable, and the size of his boat gave him an opportunity to carry anything he wanted to take, whether railroad iron or a cotton gin works. "Tradin' makes me feel high-steppy, like a blind hoss!" Young said, speaking of his business.

We left the landing on Sunday, Feb. 14. The resolution to start was made in true river fashion, on the spur of the moment.

"Hit looks pretty to-day, don't hit?" the Medicine Man remarked.

"Yassir, yassir," Young replied, nasally; "be a good day fo' floatin'. I 'low we could."

"I'd like to," the Medicine Man said.

"Mout's well. Hay, you boys—we're goin' to pull out—watch them lines now!"

With that, there was a great to do. The store boat had ropes leading to logs, stakes and anchors. They were gotten in and coiled down on the roof of the big cabin boat. The raft was untied, too, and our boat was run in on the starboard side of the big boat, and the Gambler's ran along the same side and fastened just astern of ours. The Gambler took possession of the Medicine Man's bed, and coughed and sputtered by turns. We made quite a fleet—the long storeboat, our own craft and the Gambler's, with the 100ft. raft floating nearby. The raft was kept independent, manned by two boys. The other three boats were handled by a great oar on the port side, and a rudder at the stern. The oar was a 45ft. sapling, and the rudder a still longer one. A stroke of either required eight steps on the part of the oarsmen, and a stroke seemed to have no effect upon the great mass of stuff, amounting to dozens of tons. It was galley-slave work, handling those sweeps. Nevertheless, we worked out of the eddy, and the storeboat man, at the rudder, used the wind and the current and the crew to such good purpose that we were soon floating away down stream with the "wind jes' a-ca'min' pretty" and the water showing only faint ruffings at intervals.

As we came down the lower end of Rowdy Bend, the Medicine Man called my attention to a caving bank 30 rods distant.

"There's the greatest institution in the South," he said. "See that hole, walled with bricks?"

There was a cavity in the bank which looked like a big bottle with a small opening at the top and coming to the shape of an egg-end at the bottom. It was 25ft. deep apparently. Nearby was the ruin of a fine plantation.

"I ain't a river rat all the time," the Medicine Man said. "I clean cisterns for a reg'lar occupation. I clean a cistern for \$5, and many's the day I've cleaned four or five. That's why I like the South. Them old planters is easy money. My cistern cleaner is a bucket, on the end of a long, folding handle. I poke the bucket down into a cistern, the plunger hits the bottom, and a cork comes out the top of the bucket. That lets the air out, and a valve at the bottom of the bucket lets the dead leaves, dust and dirt what's in the bottom come up into the bucket. When I lift the handle, the water shuts the valve and I pull the dirt off the bottom of the cistern to the surface. One bucketful, in warm weather, will show them plantation men they ought to have their cistern cleaned—Gee, but it does smell! Everybody down here has to drink out of cisterns in the summer, and they don't like to have the smell. They pay \$5 quick. But cistern cleaning isn't what it used to be. Italians have got so they clean cistern for a dollar. I tell you it ain't right to let them foreigners come yere like this. They spoils business."

The Gambler said that the trick of the cistern cleaning trade was to take a few buckets full off the bottom, and then hit the plunger on the side, instead of the bottom. The water that was caught in the bucket half way to the bottom of the cistern was sweet and lacked the cistern smell, compared to the water and dirt from the very bottom. On producing the bucket full of sweet water, the planter would be satisfied, and would pay the \$5 without a murmur.

We dropped down the river for two days, the wind preventing us from going far each day. The Medicine Man wanted to drop in at Luna, but he got past the landing before he knew it, so he wanted to get to Greenville. Making a landing with the boats was a remarkable operation. Young had a handy line nearly

half a mile long. It was 1 1/4 in. rope. Instead of rowing the boat inshore, when it was desired to make a landing, Young sent a couple of boys in a rowboat toward the bank, dragging the end of the handy line. The boys ran ashore, and took a turn around a tree-stub, or half a dozen saplings, and then took half hitches with the end of the rope around the line, fastening it securely. This done they jumped away a few yards, while the whole weight of the boats came on the little line and whipped it up taut. The boat end of the rope was fastened around two bulkheads with four or five turns made criss-cross. The old boatman slacked the line, as the strain increased almost to the breaking point, and the current swung the boats ashore, broadside to, into some eddy chosen by the appearance of the land from a distance of a mile or so. The rope smoked and screamed and frayed where it dragged on the posts in a manner that was most entertaining to the Medicine Man, river rat that he was. It was a new idea to him. He thought of getting a handy line for his own boat, as a saving-of-work measure, but he forgot it when we reached Greenville.

We came into Greenville with a rush. We discovered the town across a point, and sight of it caused Young to make up his mind to land. He sent the handy line ashore, and we were thrown in on the starboard side, threatening to crush our cabin boats against a caving bank. The Medicine Man and I shot our boat clear, while the Gambler created a mighty fuss getting his little shack out. The Medicine Man and I went on down with the current, and found an eddy above Greenville, where we tied in for the night.

There had been hungry times on the boat. The flour was nearly all gone, in spite of rigorous economy. We had only a little salt pork, and not enough other stuff to make a meal from when we reached the landing. The first thing the Medicine Man and I did was to go down to a restaurant and get a meal of Gulf of Mexico oysters. The price was high, but there were plenty of the oysters, considering that we had eaten what was left of our grub before going to town.

Greenville was another behind-the-levee town, but a much neater looking one than any of those we had stopped at above. Neat houses, streets laid out in rectangles, and the atmosphere of prosperity were conspicuous.

In the morning we bought temporary supplies after walking around a while in order to get the lay of the land as regards stores and their prices. No one is more careful than the river man in finding the best bargains a town affords. We found Nolen's store, and were surprised at the low prices. Our few purchases made, we walked back up the levee toward our boat, which was moored in one of the stone-lined eddies above town, where the river's eating into the bank has threatened the existence of the city.

We had gone to the upper cabin boats with which the waterfront of Greenville is lined, in and out of the water, when the Medicine Man exclaimed: "There's the Fines' boat!" It was a little green craft, and on our going down to it, we found Mr. and Mrs. Leon Fine, of Dixon, Ill. Perhaps no more interesting couple was on the Mississippi River at that time. Fine was a painter by trade. Neither he nor his wife had ever been a hundred miles from their own home town when the Rock River, flowing past their home, suggested that they go traveling. They had heard of a cabin or houseboat, but never had seen one. They talked with Fred Watermans, Fine's Partner, and Mrs. Watermans. They decided to go on a cruise down the river to the Mississippi and perhaps go as far as St. Louis. They built a cabin boat from an idea they had formed of what cabin boats were. It was simply a shallow box, with a cabin on it. The forward and rear decks of the boat were not a part of the boat box. It was so small that the men could lift it out of water and carry it around the dams known to be down the Rock River. They got it ready in a barn, put it on a wagon, carried it to the river and launched it in the presence of a great crowd. The boat was christened Dixon with a bottle of wine, and the four floated down stream to where they were going to put in the supplies, stove and other things. Suddenly it was discovered that the bottom was more than half full of water. The craft was hastily run ashore and hauled out. Instead of the slanting end boards of the hull having been flattened off, just the corners of the boards pressed on the bottom of the boat, and the water poured through the joining. This was remedied by putting in the boards properly and caulking them. The dry pine swelled, and thereafter not a drop came in, not even when the wind drove waves up on the overhanging decks in the wide lower reaches of the Mississippi, for the doors fitted like weather-stripped windows. In this craft, which was not 12ft. long by 6ft. wide, inside measurement, the two couples traveled to Memphis, Tenn., whence the two Watermans turned toward home, having seen enough of the world. The Fines kept on down the river.

They met the Gambler and the Medicine Man, and as Mrs. Fine had a voice much better than is usually heard at the river bank, the four gave a concert and made some money that way. Then the Medicine Man got Fine to sell some medicine, and he made more money at this than at painting. Fine traveled, working at towns for the money he needed. Mrs. Fine kept a diary of her experiences, and of the wonderful things she had seen—"awful big steamboats," St. Louis with its "houses" so much larger than anything they had ever seen, and finally the negroes of the plantations. "We don't want to go home yet," Mrs. Fine said. "We want to see some more, but if we have to go home from here, we will not complain any. We are just common country village folks. We never expected to go anywhere. We don't expect to go anywhere again. But if we never do go anywhere, we'll feel contented for the rest of our lives. You can imagine what it was like to us, to all of a sudden be transported into a new and different country—to go somewhere and see something we had never seen the likes of before. It seems just like a dream."

The Medicine Man and I got a quart of oysters, and Mrs. Fine cooked them into a delicious stew, with which we celebrated the Medicine Man's fortieth birthday—a day that was otherwise very gloomy for him.

"My!" he exclaimed. "Forty years old! It seems only like yesterday when I was a little boy. I don't want to be old. They ain't no fun in being old." However, the stew and the banjo and French harp music afterward cheered him up, and we went to our boat feeling much more jovial than at any time since leaving Arkansas City.

It was said in Greenville that that is a "farming" country. Groceries and manufactured ware were cheap and of good quality. But owing to the fact that "farming" referred to cotton growing almost exclusively, there was a condition of affairs notable there as throughout the lower valley of the Mississippi. Eggs, butter, milk, vegetables and other farm produce were most expensive. The whites raised cotton, and a few negroes supplied the home-grown "market stuff." I found a negro market gardener a few miles above Vicksburg who was taking advantage of his opportunities, with the result that he was growing rich supplying the city with vegetables, for which there was a steady and increasing demand. I did not hear of a white man who realized the fact that there is money in some of the cotton regions on the Mississippi to be made raising chickens and farm produce as well as in raising cotton. Cotton is at once a very great blessing to the South, and a blinder as well. If a couple of the dozen negroes who tend the cotton fields or each of the great plantations were put to work on two acres of garden patch, the plantation owners would live on better provender, or at least would get the table stuff at a quarter of the expense.

On Monday, Feb. 21, we got some supplies, and at noon the Medicine Man and I pulled out into the stream again. The Gambler's thanks to the Medicine Man for taking care of him for days consisted of a cussing for bringing him down the river on such a jaunt. The Medicine Man looked back on Greenville from a distance of a mile and said:

"I'm glad I ain't there any more. Now I can get some money. We'll watch for some place where we can sell some medicine. There's a log camp down here somewhere. I must make some medicine. I got to work now. I supported that Gambler all the way down the river, and I'm sick of that."

He went to the bow of the boat, and lifted a plank in the deck. He took from the hold a bushel of bottles that would hold a pint or more and lugged them to the stern of the boat, where he put them in a wash boiler filled with water from the river. The bottles were of all descriptions, round and flat, and of various colors, from clear white to a pale green and dark brown. Into the boiler he dumped some concentrated lye, and stirred it in with a stick.

"Now I got to make the medicine," he said. He had an old five-gallon lard can in which we had been washing our clothes for weeks back. He rinsed this out and filled it full of water, which he let stand for an hour "to settle it." Into the water he dropped a broken bitter apple, and stirred in the pieces thoroughly. Then he burned a pound of sugar in a frying pan—burned it black, and then washed the pan in the lard can. It changed the water to a molasses hue.

"Now ain't that a pretty medicine?" he asked. The bitter apples cost 40 cents a dozen, the sugar 10 cents, and the water the trouble of dipping it out of the stream. The total cost of 4 1/2 gallons of the stuff was less than 15 cents. To this must be added the cost of the bottles. Half of them had been picked up on the sandbars, and the other half purchased of Young for 2 cents each. The corks were also garnered on the sandbars, and along the river banks.

The bottles, having soaked in the lye, were rinsed out and allowed to drain out. Some were discarded because the sun had "cooked the dirt into them," and some because the label would not cover the dirt that still remained inside where the customer could see it. The Medicine Man's pride was a "line of patent medicines"—two dozen bottles of a much advertised cure. He filled them first, and corked them tightly, and then got out some labels. The labels were pink in color and had the picture of a smooth-shaven man wearing a high hat and a dress suit. The label read:

ZAMLA-YA BITTERS.  
The Great BLOOD AND NERVE TONIC.  
A POSITIVE CURE

For Rheumatism, Blood Disorders, Stomach Troubles, Liver and Kidney Complaint, Sick Headache, Malaria, Indigestion, Dyspepsia, Constipation, Catarrh of the Stomach, Nervousness, Skin Disease, Salt Rheum, Scrofula, and Neuralgia.

Price, \$1 Per Bottle.  
Address: J. W. CARPENTER, Benton, Ill.

This is not an exaggeration—it is copied literally from one of the labels which I have before me. The Medicine Man said of it: "Now that's a good label. It catches a man every time. Blood and nervous disorders, stomach, liver and kidney complaint, malaria and headache—why, dod blast it, a man's just got to have some of them things down in this climate. I tell you that's the best label I ever saw. That Carpenter, he's an old-timer. He's my father-in-law. He thought that label up, and I don't b'lieve there ever was a better one. We used to sell this medicine together. We worked every town in Arkansaw—had a 60ft. circus tent. We'd go to a town, and give a reg'lar play. I'd fiddle, and he'd fiddle, er play the banjo. The crowd would come into the tent, and then we'd give 'em a talk. Talk 'em right up good. Pretty soon they'd go to the drug store—you see we had to have a drug store sell our stuff, else they wouldn't stand for us. We'd give a druggist ten cents a bottle for selling it. We cleared \$25 in some towns. In other towns we'd strike a big trade, and sell all the bottles we could buy—would have a hundred dollars to show for a day's trading. You see that \$1 sign? Well, we worked the best bluff you ever saw on that. We offered the medicine for 50 cents just to introduce it. That fetched them. They were getting it for half-price, and they always do like that. We said we were introducing it, and that when it was put on sale regularly, it would cost \$1 a bottle. It was just bully the way they come up to that."

"I tell you my father-in-law was a schemer, he was. I expected to meet him or hear of him down here some where. After we'd get our money in, we'd blow it—oh, my! but we went on some awful drunks. He got so he wanted to go right down into the yellow fever country to sell the stuff. It'd been all right—we'd been selling yet, only he wasn't satisfied. He had to go making the medicine without any acid into it in the middle of the summer. Of course it soured, and we staid too long into one place. The bottles begun to blow up—pop went the corks. Luckily for us they was a cyclone hit that Arkansaw town when it did. It lifted our tent, just about the time visitors was expecting to come in on us. Me an' him was drunk when the tent come down, and we didn't know them men was coming, but a feller told us. We went down Black River into a skiff—didn't have a bloody dollar, nor a bottle with us. Then we hit another town, and we built a boat out of packing boxes—rattiest cabin boat you ever saw. We was into that when that sleet storm come two years ago. The sleet got so heavy on the roof she capsized, and we had to go out on the bank. We was there all night, in that sleet without even our pants. I punched him, and then he'd punch me. Then we'd lie on our backs and hold our feet in the air, they was so burny with the ice on the ground—four miles from the nearest house—Law! Law! That was a night. Me and him parted soon after that. I worked south, and he hit for old Kaintuck. Gracious! there's a lumber camp! Let's make it! I'll raise a stake there!"

RAYMOND S. SPEARS.

## Instructions for Life-Saving from Drowning.

*Editor Forest and Stream:*

There are so many lives—about 1,200—lost every year by drowning in the United States that might be saved by a knowledge of how to act in cases of emergency, that we are constrained to request you to publish our summer bulletin of advice. First, do not go out in any pleasure boat of small or large dimensions without being assured that there are live-saving buoys or cushions aboard sufficient to float all on board in case of an upset or collision, or festooned with life-saving ropes.

Second, with a party, be sure you are all properly and satisfactorily seated before you leave the shore—particularly so with girls on board. Let no one attempt to exchange seats in mid-stream, or to put a foot on the edge or gunwale of the boat to change seats, or to rock the boat for fun. This, by rollicking young people, has upturned many a boat and lost very many lives every year. Where the waters become rough from a sudden squall or passing steamers never rise in the boat, but settle down as close to the bottom as possible, and keep cool until the rocking danger is past. If overturned, a woman's skirts, if held out by her extended arms, while she uses her feet as if climbing a stairs, will often hold her up while a boat may pull out from the shore and save her. A non-swimmer, by drawing his arms up to his sides and pushing down with widely extended hands, while stair-climbing or treading water with his feet, may hold himself up several minutes, often when a single minute means his life, or throwing out the arms, dog fashion, forward overhand and pulling in, as if reaching for something—that may bring him help, may at least keep him afloat till help comes.

Third. In rescuing drowning persons, seize them by the hair or the collar, back of the neck; do not let them throw their arms around your neck or arms. If unmanageable, do not strike them, but let them drop under a moment until quiet, then tow them in to the shore. If unconscious, do not wait a moment for a doctor or an ambulance, but begin at once; first, get the tongue out and hold it by a handkerchief or towel to let the water out; get a buoy, box or barrel under the stomach, or hold them over your knee, head down, and jolt the water out, then turn them over side to side four or five times, then on the back, and with a pump movement keep their arms agoing from pit of stomach overhead to a straight out and back fourteen or sixteen times a minute until signs of returning life are shown. A bellows movement pressure on the stomach at the same time is a great aid if you have help. Of course you will at first loosen collar and all binding clothing. Let some one at once remove shoes and stockings, and at the same time rub the lower limbs with an upward movement from foot to knee, occasionally slapping the soles of the feet with the open hand. Working on these lines our volunteer life-savers have been successful after two hours' of incessant manipulation, but are generally successful inside of thirty minutes. Spirits of ammonia to the nostrils, or a feather tickling in the throat, often helps to quicken, but we rarely need anything more than the above mechanical means. Use no spirits internally until after breathing and circulation are restored; then a moderate use of stimulants or hot tea and a warm blanket or bed is of the first importance.

The U. S. Volunteer Life-Saving Corps has distributed several thousands of its illustrated "Rescue and Resuscitation Cards" through its life-saving members, and, per mail, it will furnish them to anyone on receipt of the cost of postage and mailing tube, five cents. But if any of your readers will cut out this article from your paper and study its instructions and carry it with them, they will be able to meet any emergencies that may occur upon the waters.

Whenever, in any State, or any waterways, where people gather for swimming or boating, three or more expert swimmers will form a volunteer live-saving crew, we will furnish them, free of expense to them, life-saving buoys and flags and signs to designate their station, and button and badges to denote their official positions, and also boats and medicine chests where needful, containing all remedies to resuscitate the drowning at half their cost.

For the Board, Very truly yours,  
J. WESLEY JONES,  
President and General Supt. of the U. S. V. L. S. C.  
General offices, where all inquiries for information of life-saving work or information of life-saving crews in any State may be addressed, 63-65 Park Row, New York City.

# NATURAL HISTORY

## A Cute Curlew.

NEW YORK, July 10.—*Editor Forest and Stream:* I have just come back from a hunting trip to the Rocky Mountains, and though I failed to get the bear I was looking for I had some good fishing, and saw a number of things that were of great interest to me. Among these was the nuptial strutting of the dusky grouse and of the fool hen, both of which performances were new to me. I was interested, too, by something told me by one of the natives who came into our camp one night, carrying a bird with him which he called a female willow grouse, the bird being a female dusky grouse. He dressed it at our camp, and I was sorry to see that it was full of eggs, one of them about ready to be laid. The man said that he had gone out to get a bird for a sick member of his family, had come upon this bird strutting on a log with dragging wings and expanded tail, and supposing from its actions that it was a male, had killed it. He said that if he had known it to be a female he would not have shot it.

Coming back over the prairie we passed by many little ponds about which there were waterfowl of one sort and another, a few ducks, but many waders, and among them avocets and curlews.

We are all aware that many of the sandpipers, like some of the grouse, feign injury for the purpose of leading enemies away from their nests and young, and most of us, I think, at one time or another of our life have been deceived by these simulated injuries and have followed the parent, making its effort to draw us away from its young a successful one.

Not far from a pond which we passed, I saw a very large sickle bill curlew alight on the ground and stagger about, and then rising on the wing, take a short flight. As the bird flew, I noticed something moving on the ground near it, and at once recognized this animal as a kit fox, which was pursuing the bird. The bird took a short flight, and the fox made a swift rush after it, and as it lowered its flight, sprang into the air in the effort to seize it. The bird was a little too high for the fox, and seeming frightened by the attack scaled on a little further, and then once more came down nearly to the ground, and the fox again made a swift rush toward it, but before reaching it the bird fluttered forward once more and again escaped. This continued for a long distance, until finally the bird and the fox were quite a distance from me; so far, in fact, that I could not have told what either was. When they passed out of my sight the curlew was still coming down near to the ground every few yards, and the fox was still making rushes and trying to seize it. On the edge of the pond which we passed a few moments later, stood another curlew, apparently not interested in the proceedings at all. It seemed clear to me that the curlew was occupied in toling the fox away from its nest or its young, and certainly the bird appeared to succeed admirably and to be wholly deceiving the fox.

J. J. W., Jr.

## Zoological Park's New Bird House

THE new bird house, which has just been opened in the New York Zoological Society's Park, is a beautiful building and admirably adapted to the uses for which it is intended. There are abundant room, light and air, the cages are large, and arrangements have been made to have the houses full of growing plants, so that the birds' surroundings will be very natural in appearance. The building consists of two large halls built in an L, one of which is sixty-five feet long by fifty feet wide, its greatest height being thirty-six feet. The roof is of ribbed glass, so that the building is really like a great conservatory, and when filled with the plants and vines, the effect will be very beautiful. There are no less than thirty-four large windows in the hall, besides which a large part of the roof can be raised at one end so that there will never be any lack of air. The exhibition cages which line the halls are very large, from nine to twelve feet in height and from four to eight feet square. Each is provided with a separate drinking cup and bathing basin fed by individual water pipes. The central perches are small trees.

In the middle of the great hall is a flying cage thirty-six feet long, fifteen feet wide and about twenty feet high. In it is a large bathing pool, fed by a fountain, the depth of the water varying from 1½ to 4 inches. Besides the indoor cages are nineteen outdoor cages in which the hardier birds may be kept all the year round. The total number of cages in the building is eighty. The mesh of the cage wire is as large as possible, consistent with the size of the birds confined in the cage, and wherever it is possible the wires are vertical and horizontal, thus interfering as little as possible with the spectators' view.

As in some of the other buildings at the Zoological Park, the doors of the cages are all at the back, and open into a keeper's passage which extends around the entire building. This arrangement adds much to the convenience of feeding and watering the birds and cleansing their cages, and enables the keepers to get at them without disturbing visitors who may be in front of them. Dumb-waiters running from the cellar carry supplies to the upper floors, and a tunnel leading from without into the cellar enables needed material to be brought by cart or wagon into the building, and refuse to be carted away without being seen. At the north end of the building is the Curator's office, and above this a glass roofed laboratory. At the south end of the building are rooms for keepers and for feed, and above these other rooms which may be used as hospitals or as breeding places.

Although the bird house already holds many interesting and beautiful birds there is yet room for many others.

One of the large halls has been called the parrot room because it will be largely devoted to the most beautiful birds of this class; yet it is not intended to attempt to bring together a very large series of parrots, which, however great their beauty, are so noisy as to make them disagreeable to many people.

An effort will be made to secure a large and typical collection of North American birds, and already Mr. Beebe has secured a very considerable representation of our more familiar birds. In one cage may be found such beautiful native species as the bobolink, the orchard and Baltimore orioles, the scarlet tanager, rose-breasted grosbeak, red-winged blackbird and others of our bright plumaged but familiar birds. Another is occupied by birds hatched this year but now of full size, such as robins, brown thrashers, catbirds and a number of other species familiar to all bird lovers.

The bright colored finches from Africa and other distant lands will, no doubt, attract more attention from the uninformed public than our own more soberly colored species, which, to many of us, are so interesting because more familiar, and because they are native birds. These old-world species are of all sizes and shapes and colors, and are so curious and beautiful that each one would well pay careful study. The beautiful Japanese robin, a relative of the English robin redbreast, but not of our robin, is one of the notable exotics here. Its soft gray plumage is charmingly variegated with red and yellow, and, unlike most birds of brilliant plumage, it has a beautiful song. Foreign birds are here in great numbers—all that we have heard of and many that we have never heard of before. The central flying cage is to be occupied by little ducks, among them our own teal, the garganey teal of Europe, a tree duck from the Philippine Islands, which is much like one of those that enters the United States from the south, a pair of young flamingos, terns, a skimmer or two, some rails and foreign gallinules. These terns have an odd and interesting history. Some years ago Mr. Beebe went south to visit certain bird rookeries on the Virginia coast and brought back with him a number of eggs of terns, gulls and skimmers. Some of these eggs, put in an incubator, hatched out, and the birds were reared by hand and now seem to be well and as contented as can be. The skimmer, with his curious bill, the under mandible of which projects three or four inches beyond the upper, has taught himself lessons of captivity and feeds here without difficulty.

In the bird house there are a great multitude of doves and pigeons, some of them no larger than a sparrow, others almost as large as a hen turkey—the crown pigeons. Some are dressed in the duller, soberest gray, others—the fruit pigeons—brilliant with an iridescence which shines like metal. The odd blood-breasted dove from Luzon, in the Philippines, bears in the midst of the white feathers of its breast a curious drop-shaped spot of deep crimson which fades away at the edges and looks precisely as if the feathers were stained with blood, so as to remind one a little bit of the old-time pictures of the pelican, which was supposed to nourish its young on blood drawn from its own breast. The plumed dove from northwestern Australia very closely resembles a quail in appearance and in habit. Its life is spent almost wholly on the ground.

Among the many recent arrivals of East Indian birds are two concave casque hornbills, singular for the size of their bills and heads, and for their general ungainliness.

Of birds interesting to sportsmen there are the francolins, pheasants, tinamous and the curious horned screamer. A pair of these birds are very striking. They stand high on the legs and except for feet and bill remind one somewhat of the geese to which they are allied. They are from South America. One species lives in the swamps and lagoons of Argentina. Though not web-footed they swim readily enough, and though rising from the ground slowly and with difficulty their powers of flight are great and they are fond of soaring in spiral circles to great heights, almost disappearing from sight. A curious characteristic of this bird is that its body seems to be covered under the skin by a thin layer of air which, when the skin is pressed, causes an odd crackling noise to be heard. From the loud cry which the birds utter they are called screamers, and some of them bearing on their wings strong sharp spurs or horns have been called horned screamers. When tamed and associating with domestic fowls they are said to be useful in protecting them from the attacks of hawks.

Far from the screamers, both in the zoological system and in the land which they inhabit, are a pair of black-footed penguins from the coast of South Africa. They are small birds, not larger than a duck, black above and chiefly white below, sitting and walking absolutely upright and holding their flippers—wings—a little out from their body. They walk with something of the waddle that may be seen in the gait of a man of extraordinary fatness. In diving for food they do not enter the water head first, but fall off the shelf or rock on which they are standing, striking the water on the breast and at once disappearing diagonally under it in search of food. The wings are the chief means of progression under the water, and little bubbles of air seem to rise constantly from the body. After coming up out of the water the birds shake themselves and erect their feathers, which, as they stand on end, look not in the least like feathers but like coarse hair. There is a curious similarity in actions and in appearance between these birds and the seals.

Over in the ostrich house are a number of other new and larger birds which are interesting. Of three cassowaries one is said to be from the extreme north cape of Australia, another from the Island of Ceram, near New Guinea; there are also two young emus from Australia,

the first young ones, we believe, that the Society has had.

The cassowaries live in the forest and the emus in the open grassy plains. Both are large birds and yet they are very different in color and in general appearance. The emus are grayish, while the cassowary is almost black, with highly colored wattles on his neck and a tall helmet of horn covering the head. As in most of the birds in which the breast bone, or sternum, lacks a keel, the wing has almost disappeared in both birds, but on the other hand they are tremendously swift runners, and if cornered have a very good idea of defending themselves by means of their tremendously strong feet, the toes of which are armed with large hard claws which might deal a very serious wound.

Mr. Beebe, the Curator of birds at the Zoological Park, is devoted to his work and gives unending time and thought to the study of the collections in his keeping and to the improving of their condition. It is interesting to see that of the birds under his charge a considerable number seem to know him, and on his appearance to hurry to the bars of the cages in the hope that they may receive a word or a touch of attention. Much may be hoped for in the way of an increased knowledge of our birds when the time shall come for breeding the species confined here. This will be one of the matters undertaken when the work of the Park is further advanced. There is here a wide field for investigation and study.

## Fooling a Fox.

HAMAR, Norway.—*Editor Forest and Stream:* The article in the FOREST AND STREAM a short time ago on "The Imitation of Animal Sounds," reminds me of an experience I had some three years ago with a fox.

It was early in the spring, one evening about dusk. I was sitting by a clearing in the woods waiting for the flight of woodcock, when suddenly I heard the short bark of a fox a short distance off. I slipped into the gun the two B.B. cartridges which I always have along when hunting, and waited for him to appear. He seemed to be passing by, however, when the thought struck me to try and fool the cute fellow. Stooping underneath a pine I did my best to imitate the death cry of a hare, repeating it two or three times, and ending with a despairing wail.

The barking had stopped and everything was still and silent until I commenced to think the trick was not going to work, when I caught sight of the fox sneaking along the edge of the clearing, and when right opposite me he came out into the open and sat down within twenty yards, looking around as though to say, "Where the deuce is that hare?" I watched him for a while, and he seemed completely unconscious of danger until the gun ended his chicken stealing days forever.

It was an old dog fox, and the skin about worthless, but it makes me grin yet to think how completely fooled he was.

CHR. G.

## In the Pittsburg Zoo.

*Editor Forest and Stream:*

In the Highland Park Zoo Pittsburg has probably one of the finest public zoological gardens west of New York, and the city authorities are adding to it every summer. The thousands of visitors that take in the show every Sunday were given an exhibition on last Sunday that was not down on the bills. The two polar bears began a fight and kept it up for ten minutes, tearing each other, while the keepers dare not go near them to separate them. At last the smaller of the two bears whipped his big brother, who returned to his cage, refusing to be seen again all day. The park is doing its share to prevent the buffalo from becoming extinct. They have three buffalo in it now, and Howard Eaton, an old Pittsburg man, who has a ranch at Medora, N. D., has given them two more, a bull and a cow, that are expected to arrive every day now.

CABIA BLANCO.

## Elk Antlers in Growth.

AT a social meeting of the Royal Society, recently held at the rooms of the Society, Burlington House, London, Mr. H. Irving showed an interesting series of photographs of deer antlers. The animal chosen for photography was a full-grown elk or wapiti. The first picture showed the animal on the second day after he had cast his antlers; and every two weeks thereafter, during the four months of the antlers' growth, pictures were taken. One of the last pictures shows the velvet hanging from the horns in strips, and the last of all shows them clean, hard and white.

## It Will Interest Them.

To Each Reader:

If you find in the FOREST AND STREAM news or discussions of interest, your friends and acquaintances who are fond of out-door life will probably also enjoy reading it. If you think of any who would do so, and care to send them coin cards, which, when returned with a nominal sum, will entitle them to one short-time "trial trip," we shall be glad to send you, without cost, coin cards for such distribution, upon receiving from you a postal card request. Or, the following blank may be sent:

Forest and Stream Publishing Co.,

346 Broadway, New York.

Please send me.....FOREST AND STREAM Coin

Cards to distribute to friends.

## A Kangaroo Hunt.

BUT a short time after my arrival in Melbourne, Australia, I fortunately made the acquaintance of a party who owned a sheep run, at the foot of the Australian Alps. So soon as he discovered my love for field sports he gave me a cordial invitation to accompany him, on his return home, and enjoy a kangaroo hunt, which he would get up for my delectation. I promptly accepted his kind offer and impatiently waited until he had finished the details of selling his crop of wool and purchasing supplies for his run, to last for the ensuing twelve months. In a few days we started with the wagons, filled with provender, etc., and passed in the vicinity of the famous Fern Tree Gully. We camped over night but a short distance from this noted locality, and my host and self cantered through the whole of it. I had seen and admired a number of these trees, in the public squares of Melbourne, but the conglomeration of them at this far-famed locality fairly astounded me. About noon on the following day we passed a small wayside tavern where I had my first interview with the white-backed piping crow. The landlord had a pet one, which flew about the premises, and when its master called it it perched on his shoulder, while he walked out into an adjoining inclosure, where he sprinkled several handfuls of grain. The crow immediately fluttered off to the fence and began to call for the members of its species, which dwelt in the neighborhood. In a very short time quite a large flock had assembled which quickly devoured the grain, while the pet showed his gratification by sundry highly pitched notes, resumed his perch on his owner's shoulder, and accompanied him back to the house. Singular to relate, but a short time subsequently, while passing along the streets of Sydney one evening, I caught the sound of something whistling "Sherman's March Through Georgia," and tracing it to a barroom I entered, and at the cost of a glass of ale, learned from the bar-maid that several years previously a panorama of the American war had been exhibited in the city, and the music caught the town and very naturally nearly every one was whistling it, consequently the pet white-backed piping crow caught the tune and had whistled it regularly ever since.

The sheep run was located at the foot of the Australian Alps, along the slopes of which it was my host's intention to introduce me into the process of kangaroo hunting. His first movement was to dispatch several of the natives in his employ to hunt up a posse of their fellow countrymen to serve as beaters, and as this would take several days, he proposed that I should go with him on one of his customary visits to one of his shepherds on an outlying run. We accompanied the wagon, which took out stores to last for several weeks. On our arrival I was surprised to find that the shepherd's sole companions were the collies, which assisted him in the care of the flock. His abode consisted of a small shanty, which could be lifted on to a wagon and moved as the occasion required. The intelligence of the collies was amazing. They seemed to know just what was expected of them and attended to the care of the flocks with all the skill and judgment of a human being. Finding everything in good order we made but a short stay with the shepherd, and hurried back to headquarters, anxious to commence our foray on the kangaroos.

The morning after our return the native contingent began to arrive, and by nightfall the entire posse, numbering about fifty, put in an appearance, consequently early in the forenoon of the following day we started to climb the slopes of the mountains, and by noon arrived in the vicinity of our game, as war scouts, who kept a small distance in advance, hurried back and reported to us. A temporary camp was formed and all the preparations completed for a foray early on the following morning.

We were away betimes, going directly up the ascending land for about a couple of miles, when we turned sharply to the right, and after proceeding some little distance secreted ourselves in the undergrowth and feverishly awaited the appearance of the game, which would be driven in our direction by the natives, who were slowly advancing in a semi-circular cordon, thus forcing the animals into our immediate neighborhood. My host and myself were located some distance apart, and the scheme was to compel a greater portion of the game to pass through the space between us. I had impatiently awaited its appearance for some time, when my attention was caught by a flash of brownish color, but a short distance to my right, and I was taken by surprise by the appearance of a pair of lyre birds, busily engaged in scraping quite a depression in the ground, similar to those formed by our common barnyard fowls. My attention was so completely fixed by the actions of the birds that I became oblivious to my original purpose, when I was startled by a continuous thumping approaching in my direction, which caused a responsive action under my ribs and frightened the birds, so that they immediately disappeared. Instantly becoming watchful, I did not have long to wait before I spied a small group of kangaroos, which were evidently the advance guard of the throng, bounding along in full sight, but too far away to insure a sure shot.

In spite of my anxiety to begin a fusillade I concluded to wait for an opportunity which would insure a successful termination. I did not have to remain quiet but a very short time before my locality became fairly alive with fleeing marsupials. Fortunately for me, my host got in the first shot, which caused the throng of thoroughly frightened animals to swerve in my direction, giving me an excellent opportunity to single out a sure shot, about every time that I pulled the trigger. By making a firm stand against what I thought were precarious shots, I pulled the trigger six times, while the game were flying past me, and managed to gather up three red and two

great kangaroos, as the result of my broadside. I had just finished dragging my game into a heap and was congratulating myself on my good fortune when my companion put in an appearance, accompanied by three natives, carrying one red and two great kangaroos, which made his bag. In a short time a number of other natives joined us, who shouldered my portion of the game and we tramped back to our camp much pleased with the result of our sport.

After our return I was entertained by an exhibition of boomerang throwing by the natives, and completely taken aback by the dexterity of a young colonist, who far exceeded the aborigines in the dexterous handling of this singular weapon. At his request I stood alongside of him while he cast one from him, and was forced to make an expeditious side movement in order to escape being struck by it on its whizzing return.

The next morning we moved our camp several miles along the foot of the hills and started the scouts out to hunt up a fresh instalment of game. Early in the afternoon two of them returned and reported the discovery of an emu's nest but a comparatively short distance away, and I accompanied them to it, not for the purpose of plunder but simply to make an examination of it and its surroundings. On our near approach the male bird sprang up from the nest and ran away, thus verifying what I had read, that the male performs the duties of incubation. After closely inspecting the nest, which contained eleven dark green eggs, without disturbing it or its surroundings, we withdrew and left the male to resume his assumed duties.

On our return to camp we found that a majority of the scouts had returned and reported that there was a strong probability of making a good drive on the following morning, as they had found quite a number of indications of game in the neighborhood, besides seeing several specimens.

We hurried off early the next day to the blinds, which had been selected for our concealment on the previous day, and anxiously waited for the appearance of the kangaroos. My patience was not severely tested, as in a short time a batch of black wallabys put in an appearance and gave me an opportunity of getting four shots, three of which were successful. Making so good a beginning caused me to imagine that I would make a heavy bag during the drive, but I was much mistaken, as my volley frightened the game off in the direction of my friend, and I only succeeded in dropping one great kangaroo during the remainder of the drive. I had just finished gathering up my game when my friend turned up with four great kangaroos and one black wallaby as his booty, and we returned to camp thoroughly satisfied with the result of our hunt.

The next day saw us at the homestead and I began to make preparations for my return to Melbourne when my host informed me that on the following morning he would furnish me with an interview with a duck bill (*Ornithorhynchus paradoxurus*) as the finale of my visit. No one but a natural history enthusiast can imagine my feelings at this announcement, and I freely acknowledge that for the remainder of the day my actions would have convinced anyone that I was somewhat mentally unbalanced. After spending a restless night we started early the next morning on about a mile's ride in order to reach a small creek which was the habitat of the duck bill. A brisk canter soon brought us within about a hundred yards of the spot frequented by the animal, when we dismounted, tied our steeds to some overhanging branches, and stealthily crawled down the banks of the rivulet until we reached a screen, which was formed by weaving together the foliage of numerous living shrubs. Hastily handing me his binoculars and pointing out the nook where the animal usually made its first appearance, my friend wished me success and hurried away leaving me in a somewhat discomposed state. Hastily bracing up I leveled the glasses on the nook and impatiently awaited developments. In a short time there was a series of small ripples and a pair of mandibles gradually appeared followed by the body of the animal, which seemed about eighteen inches in length and of a dark brown color. It immediately began dabbling with its bill along the muddy margin of the stream, evidently in search of aquatic insects, until it approached within about thirty feet of me, when an incautious movement on my part caused an immediate disappearance of the animal, much to my annoyance and sorrow. After waiting for some time for the reappearance of the frightened animal I gave up my vigil in despair and hurried back to my friend, breakfasted, bade him farewell, and started for Melbourne much pleased with my trip.

FRANK J. THOMPSON.

AN amusing anecdote illustrating Chinese politeness is told in "Chinese Life in Town and Country," recently published by the Putnams: "A Chinaman, wearing his finest gown of silk, called at a house where he happened to disturb a rat which was regaling itself out of a jar of oil standing on a beam over the door. In its flight the rat upset the oil upon the visitor, ruining his fine raiment. When the host appeared the visitor suppressed his rage and said: 'As I was entering your honorable dwelling, I frightened your honorable rat, and while it was trying to escape it upset your honorable jar of oil over my poor and insignificant clothing. This explains the contemptible condition in which I find myself in your honorable presence.'"

"Oh yes, he's quite an enthusiast. He goes in for things in real earnest."

"Yes, if some one were to send him on a wild goose chase he'd speak of himself afterwards as a sportsman."—Philadelphia Press.

## Game Protection.

THE Year Book of the Department of Agriculture for 1904, which has just come from the Government Printing Office, contains a review of game protection in 1904, by Dr. T. S. Palmer, of the Biological Survey. Of the game law decisions of the year, he writes:

"Rarely, if ever, have so many important questions in game protection been decided in a single year as in 1904. Eleven game decisions of more or less general interest were rendered by the higher courts in Arkansas, California, Colorado, Georgia, Illinois, Minnesota, Nebraska and New York. In Arkansas the provision absolutely prohibiting non-residents from hunting in the State was held by the Supreme Court to be unconstitutional in so far as it interfered with land owners hunting on their own premises (*State v. Mallory*, 83 S. W., 955). In Illinois an equally important license decision was rendered by the Supreme Court of Illinois in the case of *Cummings v. The People* (71 N. E., 1031). In this decision the right of the State to discriminate against non-residents was also sustained, and in addition it was decided that lands owned or rented as game preserves were not farm lands in the meaning of the law, and hence owners and tenants were not entitled to hunt without a license. The Colorado decision (*Hornbeke v. White*, 76 Pac., 926) upheld the constitutionality of the game law of 1899. This case, the first game case in the State ever carried to the Court of Appeals, involved the possession of 300 deer hides, and resulted in a vindication of the authority of the State to maintain its title in the game and to prescribe the conditions under which game should be killed or held in possession.

"Two important decisions were handed down in Minnesota, one sustaining the right to prevent trespass on private land used as a duck pass (*L. Realy Co. v. Johnson*, 100 N. W., 94), the other considering the question of excessive fines (*State v. Poole*, 100 N. W., 647). In the latter decision a fine of \$10 to \$25 for each bird illegally in possession was held to be not excessive, even though the minimum fine for the possession of 2,000 ducks would amount to \$20,000.

"The Supreme Court of Nebraska likewise handed down two game decisions, one holding, among other things, that a fine of \$5 for each prairie chicken unlawfully in possession was not excessive (*McMahon v. State*, 97 N. W., 1035), the other that the provision of the game law authorizing confiscation of guns and other hunting paraphernalia was unconstitutional in so far as it permitted such property to be confiscated without due process of law. (*McConnell v. McKillip*, 99 N. W., 505.)

"Two adverse decisions were rendered in New York, one by the appellate division of the Supreme Court in a case involving the possession of thirty-six snow buntings (*The People v. Cohen*, 86 N. Y. Supp., 475), and the other by the Court of Appeals, finally dismissing the case against the Arctic Freezing Company (*The People v. Bootman*, 66 N. E., 1113). The latter had been before the courts since 1901 and had attracted widespread attention on account of the large fines involved. The main question at issue was whether the State law applied to game imported from other States. The court held that, although the law in force at the time the seizure was made did not apply to imported game, nevertheless it was competent for the State to enact such a law. This has already been done in chapter 141 of the acts of 1902.

"During the calendar year 330 mammals and 271,342 birds were imported into the United States under permit. Among the mammals were eleven beaver from Canada and 106 squirrels from Europe. Of the birds 232,617 were canaries, 942 pheasants, 3,568 quail, 1,043 other game birds, and 33,172 miscellaneous species. Among the last-mentioned species were several from India seldom brought to the United States, a horned screamer and several other rare species from South America, and a Somali ostrich (*Struthio molydophanes*), the first ever brought to this country. Two shipments of fifty Madagascar weavers (*Foudia madagascariensis*) are also of interest, as they belong to a species which might become injurious should it once gain a foothold in this country.

"Several entries, both of eggs and birds, show the progress of efforts to stock covers with foreign game birds, chiefly pheasants, partridges, quail, capercaillie and black grouse. The total number of eggs imported was 2,858, of which about 660 were those of partridges and the remainder those of pheasants. Among the consignments of game birds was one containing 192 Hungarian partridges, destined for South Carolina. In spite of repeated attempts, the introduction of the European partridge into the United States has not yet been satisfactorily accomplished, and experiments with eggs are not more successful than with birds, less than 50 per cent. of those imported in 1904 having hatched. The importation of Chinese quail for market purposes in California was practically stopped early in the year by the enforcement of a provision in the State law prohibiting the sale of these birds. Two shipments of Mexican quail, one for California, the other for Bowling Green, Ky., also deserve mention. By far the most interesting game birds imported, however, were about 100 capercaillie and twenty-five black grouse. These birds were liberated on Grand Island, Mich., which a private corporation is converting into an important game preserve. This experiment marks a notable step in the introduction of the capercaillie into America, and its result will be watched with even greater interest than that made by the Fish and Game Commission of Ontario in 1903.

"The interest in private preserves continues to increase in all sections of the country. The record of the year shows the establishment of at least twenty-five private preserves in a dozen or more States. In California, par-

ticularly, ducking grounds are in great demand, and the number of preserves has increased rapidly in recent years. In southern California, where suitable grounds are scarce, artificial ponds have been constructed and lands overflowed in some cases to make conditions more attractive to the birds.

"The movement toward establishing State game refuges and parks received added impetus in several Eastern States. In Indiana the forest reserve at Henryville was stocked with Mongolian pheasants. In Minnesota some 20,000 acres of land in St. Louis county north of Lake Superior were given to the State by act of Congress of April 28, 1904. This reservation, while primarily for experimental forestry, may in time become a forest, fish and game preserve. In New York the Legislature fixed the boundaries of the Catskill Park and set aside all lands now owned by the State within these limits. In pursuance of the policy of restocking the Adirondack Park, it made an appropriation of \$500 for the purchase of beaver, and seven of these animals were obtained as a nucleus for future colonies. Better success is anticipated than in the case of the moose, which have already disappeared, although liberated only a year or two ago. The herd of twenty-two elk introduced in 1901 has increased to about 200.

"Progress in the matter of Federal game refuges was quite as marked as that in the case of State parks. On Pelican Island Reservation, Florida, established in 1903, conditions were unusual. The pelicans arrived at the reservation early in the season and began to nest on two small flats adjoining the main island, but in February a storm destroyed many of the eggs and young, and the birds left the reservation early in the spring. In November, however, they returned in considerable numbers and began nesting as usual on the main island, where they are guarded by a warden and are protected by the State law. A second small reservation comprising Breton, Old Harbor and Free Mason islands, off the coast of Louisiana near the mouth of the Mississippi River, was set aside by order of the President on Oct. 4, 1904, as a game refuge and breeding ground for birds. Large numbers of ducks resort to these islands in winter and certain species of terns breed there in spring and summer. A bill to create a game refuge in the Wichita Forest Reserve was favorably reported by the Committee on Public Lands of Congress and passed the House of Representatives on Dec. 12. A few weeks later it passed the Senate, and on Jan. 24, 1905, became a law. This is the largest game refuge of the kind in the United States. When the general bill authorizing the President to establish game refuges which has been pending before Congress for two

years or more is finally passed, similar refuges will undoubtedly be established in other forest reserves in the West."

## The California Bear Lingers.

According to the newspapers, July 4 last was the hottest day experienced in San Francisco in thirty-four years. The hot wave got here from the Golden Gate yesterday, the thermometer reaching 120 degrees Fahrenheit at 5 o'clock in the afternoon. It declined rapidly after sun-down, however, and between midnight and break-o'-day of this morning, it was necessary to cover with woolen blankets! That's one beauty about this climate—no matter how hot it gets in the day time—the nights get so cool that refreshing sleep can always be indulged in, and one arises recuperated. Snow banks are in sight on the peaks 2,000 feet higher than the camp. Our Fourth of July lemonade was cooled by snow from one such bank. And by the way consider a Fourth of July dinner in the high altitudes of the Sierra Nevadas, the menu of which included roast spring lamb, broiled mountain trout, boiled new potatoes, young onions, mulled claret, white strawberries, ice cream, black coffee, Grenoble walnuts (California grown), cigars!

On Monday I started on a horseback trip to Gold Lake and Gold Valley, going by way of Gibraltar (note the nomenclature), Poker Flat, Deadwood, Solomon's Temple, Monte Cristo, Fir Cap, etc. Most of this is a high, wild, rough country where the bears count more in the population than do the human animals. I have lost no bear, however, and if any exciting ventures crop out from the trip, they will not be of my creation or seeking.

Speaking of bears—that reminds me that that is about the only big game left in some large portions of California. In the past fifteen months I have traveled over a considerable area of Butte, Nevada, Plumas and Sierra counties, and what struck me most forcibly was the almost total absence of game except bear. Bear, if anything are getting more numerous, bruin being almost common, while deer, once very plentiful in the ridges and ravines of the region named, are quite scarce. But of this I may write in more detail some time in the future. At present I am on a mineral campaign, but look forward on its completion, to a season on the beach, sniffing the briny breezes of the Pacific and subsisting on pompano, stuffed artichokes and alligator pears. That's my dream of the future.

For the now, it is the strenuous life of the mountains (including encounters with woodticks, mosquitoes, fleas, gnats, buck-flies, etc.), with a big share of the simple life in the way of bacon and beans for sustenance, because there will not be much time for hunting or fishing before the autumnal equinoctial storms drive me out of the mountains. WM. FITZMUGGINS.

## Propagating Quail.

BOSTON, July 16.—In a recent letter I spoke of the efforts of Mr. Louis E. Morse, of North Attleboro, in breeding quail. He has considerably written me giving details. He hatched thirty-three chicks and raised ten to full-grown birds. Seven of these through carelessness escaped. He made the mistake of putting broods of different ages together and the older ones killed the younger ones. Thus fifteen of the thirty-three were lost otherwise than by natural death. He says he considers them very hardy birds and comparatively easy to raise.

"If I can raise ten," he says, "it proves it can be done." He has turned over to the State the three birds he had left. Considering the fact that he was almost a green hand at it he thinks the result very encouraging, and expresses the hope that the State will some day be able to hatch all it needs to keep the covers well stocked. The writer hopes he may hear from others who have facts touching the breeding of quail.

Mr. Morse writes that deer are quite plentiful in his section, as many as eight having been seen within a month. He had the pleasure of seeing a fawn two weeks ago, which stood for more than five minutes and watched the automobile go by on the State road. A short time ago a doe became entangled in a wire fence and was killed in Malden. A gentleman residing in West Newton reports seeing a deer there recently. One has, in fact, been killed by a train within the limits of Boston. This occurred last week in West Roxbury. There is no question that deer are multiplying quite rapidly in all sections of the State.

Mr. George M. Poland, of Wakefield, tells me that a young man in his town a few days ago came upon a brood of ten young partridges within a short distance of the village. Many similar reports seem to indicate that this has been a very good breeding season and gives promise of a good number of partridges in the covers the coming fall. About the quail there is more uncertainty. There are, doubtless, more in the State than there were a year ago at this time from the fact last winter was less severe than that of 1903-4. No one, however, expects to find them numerous this season. CENTRAL.

## The Tarpon.

DR. THEODORE GILL prints in the Smithsonian Miscellaneous Collection, a paper on "The Tarpon and Lady-Fish and Their Relatives." The family of Elopids, to which these belong, is, says Dr. Gill, one of the most remarkable of the families of fishes, yet comparatively little is known of the habits of any of the species. "Very much has been written about the tarpon, but most of it has been of a personal or subjective nature and not about the fish itself." The family of the elopids has four living species, which belong to two very distinct groups, which are usually considered the only genera—*Elops* and *Megalops*. The genus *Elops* contain two species, the wide-ranging *Elops saurus*, and the localized *Elops lacerta*, of the Congo and western Africa.

"The *Elops saurus* is common in the open sea along the coast of the southern United States, and is best known as the ten-pounder, though it has received many other names. The accepted name was current at least as early as the seventeenth century, for Dampier, in his 'Voyages to the Bay of Campeachy,' for 1676 records (p. 71) 'ten-pounders' among the fishes (including tarpons, parricootas, etc.) he found in 'the lagunes, creeks and rivers.' 'Ten-pounders,' he adds, 'are shaped like mullets, but are so full of very small stiff bones, intermixt with the flesh that you can hardly eat them.'"

Of the genus *Megalops* two very distinct forms are known—so distinct indeed that they have been referred to different genera—the *Megalops cyprinoides* of the Indian Ocean and northern Australia, and the *Megalops atlanticus* or celebrated tarpon of America.

We quote Dr. Gill's description of the tarpon:

The tarpon (*Megalops atlanticus*) has an elongated fusiform shape; the forehead slightly incurved (rather than straight) to the snout; the chin projects and is obliquely truncated; the dorsal (with twelve rays) is on the posterior half of the body, nearly midway between the ventrals and anal; its free margin is very sloping and incurved and its long hind ray reaches nearly to the vertical of the anal; the anal (with twenty rays) is about twice as long as the dorsal and falciform; the caudal fin has a very wide V-shaped emargination. The scales are in about forty-two oblique rows. It reaches a length of about six feet—sometimes more.

The oldest form of the name seems to have been tarpon; such is the guise it has in Dampier's "Voyages to the Bay of Campeachy" in 1675, and in Roman's "Concise Natural History of Florida" (1775). Dampier found that "the fish which they take near the shore with their nets are snooks, dogfish and sometimes tarpon. The tarpon," he says, "is a large scaly fish, shaped much like a salmon, but somewhat flatter. 'Tis of a dull silver color, with scales as big as a half-crown. A large tarpon will weigh 25 or 30 pounds. 'Tis good, sweet, wholesome meat, and the flesh solid and firm. In its belly you shall find two large scallops of fat, weighing two or three pounds each. I never," continues Dampier, "knew any taken with hook or line; but are either with nets, or by striking them

with harpoons, at which the Moskito-men are very expert." Such are the ideas of the fish gained by Dampier in its southern resorts. How different they are from those now prevalent in the United States will appear hereafter.

The name in most general use is tarpon and this may be considered to be the literary and accepted phase. *Tarpum* was also an early form, but is now obsolete. Along the Texan coast *Savanilla* is still in general use, but is gradually being superseded by tarpon on account of the influence of anglers. The apt descriptive name *Grande-écaille* (pronounced grandykye and meaning large-scale) was given by the French settlers of Louisiana. Other names of still more limited use are silver-fish (Pensacola), and jewfish (Georgia and parts of Florida). Jewfish it shares with many other fishes, and another fish of Florida, a gigantic Serranid, is better known by the term. Silver-king is a euphemistic designation. Caffum is a name current in the island of Barbados.

The tarpon may be briefly defined as a littoral fish of warm American seas often entering into rivers and acclimated in some inland lakes.

The boating excursionist along some favored shore of Florida or Texas during the spring and summer months at least—perhaps during all but the winter months—may be startled by the sudden projection from the water of a silver-like mass, which, after describing a low arch, will splash into the water again at a distance of maybe twenty feet from the starting point; that mass is the tarpon, or the "silver-king." Florida and Texas are the States in whose waters the fish is most frequently seen, because there most looked for, but its range extends far beyond those coasts in all directions. In summer wanderers visit the north as far as Massachusetts, where large individuals of the "big-scale fish," as they are there called, are "taken every year in traps at South Dartmouth" in the "latter part of September"; southward they may be found in Brazil and sporadically in Argentina. Around all the islands of and in the Caribbean Sea and Gulf of Mexico schools may be met with. Further, immigrants have found their way into rivers that enter into the tropical seas, and the Lake of Nicaragua has long been famous as the home of the species.

Being essentially a warm water fish, it is only in the warm months that the tarpon is to be found at its northern and southern limits. On the approach of cold weather it retires toward the tropics. Along the southern Floridian coasts some "appear in February, increasing rapidly in numbers in March, April and May"; in Texas, "early in March." At first they refuse the bait but "during the latter part of May and in June" bite freely. "About the first of December" they "disappear entirely" from the Texan waters. In the tropical seas they may be found always, and about Tampico, in Mexico, their "season is from Nov. 1 to April, the time when the tarpon practically disappears from Florida and Texas."

The tarpon is sensitive to sudden changes of temperature and especially to cold, and to such changes it is sometimes subject in its northern range. During a cold wave

which invaded Florida toward the end of January (26-27) 1905, according to a letter of E. J. Brown in FOREST AND STREAM, "the tarpon especially were affected by the cold." There were brought to "Lemon City between forty and fifty tarpon which had been so benumbed by the cold as to be easily speared by parties who were searching for them. The largest fish was in length seven feet one and three-quarters inches, girth thirty-nine and three-quarters inches, weight 194 pounds. Several others were nearly this size. \* \* \* The tarpon were salted, to be sent to Key West market, where there is a ready demand for them."

That the tarpon is a most active fish may be inferred from its form, which is especially adapted for swift and enduring action. Its life is spent in the enjoyment of its power and in pursuit of food; a carnivorous fish, it preys "eagerly upon schools of young fry, or any small fish that it is able to receive into its mouth, and in pursuit of which it ascends fresh water rivers quite a long distance." The schools of mullets contribute largely to the great fish's supply. Such it attacks by darting upon them and generally seizing them tail foremost. Its frequent leaps into the air, like those of the salmon, seem to be mostly in sportive manifestation of its intense vitality and not for food or entirely from fear. C. F. Holder tells that one leaping tarpon "fell headlong" into a "boat, passing through the bottom"; that another leaped over man and boat; and that still another sprung up to the "deck of a steamer" and "fell headlong into a passenger's lap." Other wonderful tales are told of the activity of the tarpon. According to Holder (at second hand from another), a fish made an "initial leap of twelve feet" and followed this up "with six leaps all equally high." The same observer believed that "the ordinary height a tarpon leaps is from seven to eight feet." While leaping, its gill-covers are frequently spread out and its blood-red gills visible. Withal it sometimes goes into very shallow water and seeks out a quiet nook in which it may rest, "perfectly stationary," for quite a long time.

The life history is very imperfectly known, but it does not appear to breed at any place along the continental coast of the United States, for none except large individuals have been recorded from those places most resorted to by anglers. For a very long time one of 30 pounds weight was the smallest obtained in Florida and one of 11 pounds in Texas. It apparently demands a temperature and conditions which the reef-forming coral animals require and sheltered brackish or fresh water for oviposition. In such localities about Porto Rico, in February, 1899, Evermann and Marsh found not eggs, but very young, and there "it evidently breeds." Thirteen fry, "2.25 to 3.25 inches" long, were collected at Fajardo; at Hucars, "in the corner of a mangrove swamp" in "a small brackish pool of dark colored water," "entirely separated from the ocean by a narrow strip of land, four from 7.5 to 11.5 inches long were seined." The smallest previously known was about nine inches long. All these are probably the young of the first year.

The very young or larvæ will doubtless be found to be,

## Newfoundland Notes.

AMERICAN anglers have been arriving at various points along the railway line during the last two weeks. The fishing reports received indicate that the sport is very good among the ordinary sportsmen who arrive—we get the usual mixed assortment. Some of them are disappointed if the fish do not leap into their baskets, others are pleased if they get an odd salmon or grilse or a creel of sea trout. There is still another class who imagine they have prescriptive right to certain pools and resent as an intrusion the advent of other sportsmen to interfere with them. We have been cursed for years with this class. They have the idea that the rivers and barrons are a private preserve and that they themselves ought to have exclusive rights. Still they do not pay one cent for licenses, rentals or individual advantages of any kind, and yet they talk and write a lot of rubbish about the fishing deteriorating and look askance at others who have just as much right as they have, and profess to regard them as trespassers. And, as a rule, these are the men who haggle with the guides over a few cents, or the remnants of the canned provisions. A worthy British General now gathered to his fathers, came regularly for years, and had the very best pools for his own exclusive rod. A couple of years ago he caught on the Upper Humber 300 salmon and grilse, and yet he decried the sport in the British sporting journals. He positively became indignant when some other sportsman "trespassed" on the pool that he had come to regard as his own personal preserve. According to the *Western Star*, a newspaper published in the midst of the fishing country, Sir Bryan Leighton has now donned the mantle of the late British sportsman and assumed the role of detractor-in-chief. I do not say this of my own personal knowledge, but give you the following clipping from the *Star* that seems to convey that idea:

"Sir Bryan Leighton, who is now on the Codroy River, has written the *Halifax Chronicle* that the outlook for the season's fishing on that stream is most unpromising, and that the fish caught there at any time are of a small run. We may say, not for Sir Bryan's information, for he knows his statement to be an evasion of the truth, that Codroy River affords the best fishing in the country, and if he calls a 32-pound salmon a small fish, we would advise him to take out a fishing-license for whales. We do not appreciate cheap holiday men coming here and, through avariciousness, try to monopolize a whole river, and send misleading statements to the outside world, thus preventing gentlemanly tourists from coming among us. If Sir Bryan finds fault with Mr. Murray for fishing at South Branch, Codroy, he certainly is not aware that Mr. Murray owns five acres of land in that vicinity, whereas Sir Bryan owns not one inch of the soil. If he were to go fishing on the Tay River, in Scotland, he would have to pay dollars for the cents that he is paying in this country. We want tourists who will not belittle us, and to the right class we will give every encouragement to come among us."

Complaints are coming in from all sides that the rivers are being poached and netted. The matter has been brought to the notice of the authorities, and they have issued strict orders to the wardens to put a stop to the practice, and bring the poachers before the magistrates. The time has come when the Fisheries Department will have to reorganize our whole game system, and put it on a similar basis to that which obtains in other countries. While there is, and will be, legitimate fishing in plenty for thousands of rods in this island, yet if through ignorance or indifference the rivers are allowed to be poached and polluted the fishing will be ruined, although I believe that even with all our carelessness and indifference the fishing cannot be totally destroyed.

W. J. C.

## Waterproofing Silk Lines.

Not long ago I referred to some experiments I had made in attempts to waterproof soft braided silk lines. Up to that time I was not very well satisfied with the results, but since then I have used several silk and linen lines saturated for a brief time in a solution of paraffin and benzine, and am quite sure they have been improved somewhat, or at any rate no harm was done.

An angling friend has suggested that I did not soak the lines long enough in the solution, but he believes that if they are soaked in it for twenty-four hours, then dried slowly, results should be quite satisfactory. This seems plausible to me, in view of the action of the lines so far tried after saturation for a half hour or more.

I have fished in salt water with a small braided linen line saturated for half an hour in benzine and paraffin a month previously, and which seemed to be perfectly waterproof when used immediately after drying, but which became wet through after using a short time. Subsequent use of this line surprised me, for it seemed to be improved a good deal, although when drawn through the fingers none of the paraffin came off the surface as at first. In long casts little water came in on the line when it was reeled in, and it would lie on the surface like a feather until strain was put on the bait. And although the business end of the line would get wet after continued use, it did not swell badly, as before treatment, nor did it seem to stick to guides and tip.

A favorite line of raw silk, used on a casting-rod, was also treated and used during a week's fishing. This is a very soft line, size "H," and soaked up water like a sponge before treatment. Since then, however, it shows some improvement—almost as much as the linen line referred to above. Fishing in waters in which there was considerable vegetable growth, either suspended in the water or on the surface, it did not seem to pick up matter to clog the top or guides. Altogether, there seems to be some merit in the treatment. At any rate, it seems that if paraffin and benzine will waterproof tents and the like, why will the solution not be good for fishing lines? As an example, I have a triangular awning which was originally used merely to shade my tent from the sun's rays. It is common bleached muslin, or sheeting. It was treated more than three years ago as an experiment. It turned water then like a duck. Within a month it was used again in camp. As it was suspended tightly between three trees, and also guyed between all corners, after a heavy downpour of rain a barrel or so of water

was caught in it and held until the weight was too much for one side or the other, when most of it would run off. But none of the water came through this thin muslin, which had alternately been carried in a wad in the bottom of duffle-bags, folded, whipped by the wind, etc., until one would think it little better than a sieve. Still, it is as soft and pliable as when it came from the store.

After the appearance of my previous communication on this subject Mr. J. E. Hindon Hyde sent me a small piece of a braided linen line that the manufacturers had waterproofed with a preparation on which he has secured a patent. He claims his preparation will not rot either silk or vegetable fibres, and will withstand the action of the holoïd salts contained in salt water. The line from which the bit sent me was cut had been submerged in Long Island Sound for six weeks, but he said he could not find that it had been injured thereby. It seems softer than an enameled silk line of equal size, and an examination shows that the waterproofing preparation penetrated to its core. I understand that the manufacturers have experimented with this line until they are satisfied with it, and that it will be in the hands of jobbers within a short time. It will be put up in coils on cards bearing two fishes, the trade-mark of the manufacturers, who do not sell lines in their own name, as they market all of their goods through the jobbers.

The braided silk lines called Saline, and sold under the trade-mark mentioned during the past year, are also treated under Mr. Hyde's patent, and were used in fresh water with success. Quite recently Saline enamel finish silk lines for use in salt water have been made, and it is my good fortune to own one. The claim of its makers, that it is absolutely unaffected by any alkaline substances, and will stand the ocean water as well as fresh water, is a very strong one, but after using one of these lines for a week I like it very much. Mine is size "H," and it was used in salt water where there was much vegetable matter. Water does not affect the line at all, unless it improves it in casting. It is more flexible than an ordinary enameled line, picks up no foreign matter, and runs off the reel smoothly without balling up. One thing I have noticed is the extreme sensitiveness of this line, the strike of a fish being communicated to the angler's hand very plainly through it. I hope it will wear well, for a line as small as this, which can be used in salt or fresh water, should prove to be a treasure.

PERRY D. FRAZER.

## The Sea Trout at Home.

We have read so much of sea trout in the rivers where they go to spawn and around the mouths of rivers whither they follow the smelts in the season of anadromy, that the student of ichthyology will really enjoy a new sensation when salient facts regarding his marine life and sea habits are presented for his edification. For such in abundance we of the *FOREST AND STREAM* are indebted to Edward Hickson, of the Intercolonial Railway, at Moncton, N. B., Canada, as they appear in the following résumé which were submitted with permission to print.

MONCTON, N. B., July 7, 1905.

Charles Hallock, Esq.:

Your very interesting letter of the 4th is at hand. A few days ago I mailed you a letter from Mr. Sydney Des Brisay, an educated fish merchant of Petit Rocher, on the Baie de Chaleur, in which Mr. Des Brisay said that, in his opinion, the habits of the large sea trout caught in and which frequent the Baie de Chaleur were much the same as those of the salmon. He also said they caught large sea trout, 8 pounds weight sometimes, in the lobster bait seines when catching bait in the early spring.

I have proved for your satisfaction, therefore, as well as in previous letters, that sea trout go to sea. First, by the fact that we have caught trout as large as 8 and 9 pounds far from the rivers in which these trout spawn. We have caught them at the mouth of Bathurst Harbor in May, large flabby trout, whose flesh is white when cooked, proving that they have not been long out of the rivers where they spent the winter. These trout come to the mouth of Bathurst Harbor and go up the Nepisiguit River feeding, as they go on the spring run of smelts which are going up that river, and all other rivers on the south side of the Baie de Chaleur, to spawn in the fresh water. There are two or three other rivers, which empty into the bay near the Nepisiguit, viz., the Bass River, the Millstream and the Nigadoo, and into the mouths and up as far as the head of the tide of each of these smaller rivers the smelts go, and also with the smelts and feeding on them go the large sea trout. Mr. Venning asserts that these trout, which feed on the smelts at the mouths of these rivers, belong to and have come down the river for that purpose. This is not a fact, for such trout are never caught in any of these rivers, and, on the contrary, they come from the sea with the smelts, and go away again with the little fish (smelts), still feeding on them. They also feed on small herring and herring spawn along the coasts, and it is while feeding on these that they are caught in early May in the lobster seines. As stated, the Nepisiguit River is one easily studied, and for that reason I quote it in particular. Twenty-one miles from its mouth there is a big fall which prevents any fish, salmon or trout, going up any further. There are trout, both sea trout and river trout, below the falls, but never a one of over 3 pounds. As Mr. Venning says, the trout which belong to the river come down to its mouth, and when the inhabitants are fishing smelts through the ice in the winter they also catch some trout, and an occasional grilse. These trout have spawned and moved down river. They play around the head of the tide, and may or may not go to sea. In June, when fishing for salmon at the Pabineau Falls, eight miles from the mouth of the Nepisiguit, we can catch river trout in the deep holes around the falls. They take bait generally, and most of them are white when cooked (at this time of year), and I do not much care for them for food. Later in the season they get fatter and are good for food. In July and August there is a run of bright sea trout which average perhaps a pound. These trout may be caught all along the river as far as the big falls (twenty-one miles), and are beautiful, clean silvery fish, with flesh as red as that of a salmon.

With all these things considered, where do the large

like those of Elops and Albula, elongate ribbon-like animals of translucent and colorless texture, with a very small head and small fins. They are probably so transparent that their eyes alone are apparent in the water unless a very close examination is made. The youngest of the specimens (2.25 inches long) observed by Evermann and Marsh, were probably not long before developed from the larval condition. Such are the little fishes to be looked for as the very young of the great tarpon.

Most of the large tarpons caught along the coasts of Florida and the Southern States have attained full maturity; of such the length is about six feet, and the weight approximates 100 pounds; they are probably nearly or over three years old. Growth, however, is continued in some much beyond the average, one of 383 pounds, it is claimed, having been harpooned.

"The silver-king is the greatest of game fishes." So declare Evermann and Marsh, and they echo the belief of many. Volumes and countless articles in periodicals have been devoted to detail of its excellencies. Its activity and gameness are proportioned to its size. The northern salmon affords tame sport compared with the "silver-king." Those of the average full-grown size (six feet long and 100 pounds in weight) are caught in numbers with the rod and line; one weighing 223 pounds closes for the time the record of feats with the rod, and it took the captor "three hours and a half before it was brought to gaff."

The tarpon is now considered to have little or no edible value. It has, indeed, been declared by Schomburgk to be "considered a delicate eating" in Barbados, and in the United States has been experimented with occasionally; one (W. H. Burrall) who did so in 1874, declared (in *FOREST AND STREAM*, II., p. 324) that it was very palatable, but his taste was exceptional. It has been frequently tried since but rejected for the table. An effort was made on one or two occasions in Massachusetts when considerable numbers had been caught, "to find a market for them," as at New Bedford, "but the people did not like them, owing to the toughness of the flesh."

Holder's negro oarsman aptly replied to the suggestion that it was "the finest looking fish in the world." "Yes, Sa, hit looks fine, so does hay. I'd rather eat hay dan tarpon, yes, Suh, I would." It is truly, as Holder remarks, almost the only great game fish "which is utterly scorned as a food fish." Dampier's opinion, expressed in 1675, and that of some Barbadians, has not been adopted by modern gourmands. It is "full of numerous small bones, which is a great inconvenience," says Schomburgk. In almost all cases where it has given anything like satisfaction the fish was of small size, and the truth may be that small ones are tender and savory but large ones coarse and tough, like overgrown individuals of other species. The results of unprejudiced judgment are still wanting.

It may be recalled here, however, that the Indian congener of the tarpon, the ox-eye (*Megalops cyprinoides*) is, according to Saville Kent, as well as others, "highly esteemed for food," and in the Malay archipelago, where it likewise abounds, it is cultivated in tanks after the same manner as the milkfish, *Chanos salmoneus*.

Far from being sought by the fisherman for the market, the tarpon is detested by him. "The Pensacola seine fishermen dread it while dragging their seines, for they have known of persons having been killed or severely wounded by its leaping against them from the seine in which it was inclosed. Even when it does not jump over the cork line of the seine, it is quite likely to break through the netting before landing." Nevertheless, even a dead tarpon yields some compensation for the trouble he gives. There is quite a demand for its great beautifully silvered scales, some of which may be as large as a lady's palm. They find customers who are willing to pay as high as from five to twenty-five cents apiece, and they are made up in various ways to attract the winter visitors to Florida.

A species congeneric with the tarpon, but not very closely related, is the *Megalops cyprinoides* which, indeed is the type of the genus. It is a less slender fish and the outline of the back and head is different from that of the tarpon; further, the dorsal fin is not so far backward, that fin and the anal have more rays (dorsal, 19 to 21; anal, 24 to 27), and the proportions of all the fins are more or less different. The size, also, is never so great as in the giant tarpons, for it rarely, if ever, attains to a length of more than five feet.

Like the tarpon, the Asiatic fish readily accommodates itself to fresh water. According to H. S. Thomas (1897), in India "they acclimatize very readily to fresh water, and grow fast," and also breed, he was told, "in ponds." The natives, too, "are fond of keeping them in ponds."

They are more prone to associate in schools or shoals—that is, close together like herring—than the tarpon, especially when young. Thomas came "across them coming up an estuary in a shoal, and it was like hauling in mackerel; and they run about the same size. There was a fish on as fast as ever you could get your line in the water. But the fun was very short-lived. It was in mid-stream, and they were all past the boat in a very little time." Thomas took them "on a May-fly and a Carnatic Carp-fly." In "thirty minutes," "on a light trout-rod," he "took six of three-quarters of a pound each, lost four among weeds, and had one fly bitten off. Some of them sprang a foot in the air, and all fought well."

The fame of the tarpon has, in recent years, been reflected on its eastern relative and the lesser species has found advocates for its pursuit as a game fish. "Enthusiastic anglers disposed to initiate" angling for it as for the American fish are referred by T. Saville Kent (1897) to the *Badminton Magazine* for 1895 for information. "There can be no doubt, in the writer's opinion," that the Australian fish, popularly known as the ox-eye herring, possesses "the most conspicuous potentialities for sport," and "would yield equally exciting sport on the same lines." Unlike its American relative, too, there might be the after satisfaction of seeing it on the table for, according to Kent, the ox-eye affords "most excellent eating." In India, it is raised to some extent for the table in tanks.

All communications for *FOREST AND STREAM* must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

sea trout which appear in the early spring with the smelts and feeding on them come from? My opinion is that these trout have recently been released from the large Newfoundland and Labrador rivers, where they were imprisoned by ice, and as soon as released they have gone out into the Gulf of St. Lawrence, struck the spring run of smelts and herring, and followed them into the Baie de Chaleur. No doubt, they are joined by thousands of their brethren from the Baie de Chaleur rivers, particularly the large rivers like the Cascapedia, Pabos, etc., on the north shore of the bay. These are, therefore, the trout which we find feeding on smelts and herring spawn in May and early June.

When the fresh run salmon come into the Baie de Chaleur during the latter part of May and all through June, large sea trout are found among the schools of salmon. These trout do not come into the Nepisiguit anyhow. Whether they go into the Restigouche, Cascapedia, Pabos and other large rivers of the bay I am not quite certain, but I do not think they do, for none are caught in the Restigouche anyhow, the only large sea trout caught in lower Restigouche in the spring are the ones which were feeding on the smelts, some of which may have come down that river, and some of which may have come up from the sea with the smelts. Certainly none of these big trout go up the Nepisiguit, although they are caught in the salmon nets four miles on each side of the entrance of the river. Some of these big trout are large enough to mesh in the salmon nets. Now, whether these which are caught thus are some of the same schools which were feeding on the smelts a few weeks before, or whether they are another lot I would not like to say. They are certainly more fat and plump—splendid big fellows as silvery as the salmon, with small bright red spots showing through the silver of their sides. They are also first class food, although some of them are not quite as pink as a salmon. Wherever these trout belong to they certainly do not spawn in any river within fifty miles of the place in which they are taken in the nets, and they appear to come directly from the open sea with the fresh run of salmon.

These facts being proved, we have the big sea trout, 8 and 9 pounds in weight, caught in the open bay. Then we have trout almost as large but different altogether in appearance taken far up the Nepisiguit, sixty and eighty miles from the mouth, and which trout never go to sea, but spawn and live on the upper reaches of the river. Three were caught last year at Indian Falls, fifty-two miles up river, which weighed in the aggregate 18 pounds. There is just as much difference between these two kinds of fish as there is between a landlocked salmon and a fresh-run salmon from the sea.

But again the fact remains that when sea trout have been in a river for several weeks they lose their silvery appearance and develop color very much like that of the brook trout. What conclusion can we come to therefore? You can draw it as well as I; better, in fact, for you have studied the subject more thoroughly. I have not the slightest doubt about what you say regarding sea trout depositing their spawn in the Godabout River, where the tide ebbs and flows, and covers up the spawn. Salmon would do the same thing. If a salmon comes into a small river to spawn and is stopped by a dam she will spawn below the dam, even if the tide comes up to that point. They do it in the Millstream, if they are not netted or speared before they have spawned. Whether the ova would mature is another thing. If the tide only came up, leaving running water most of the day, they would mature all right, I think.

All the same, it is the nature of both salmon and sea trout to deposit their spawn in clear fresh running water.

EDWARD HICKSON.

## On Fishing Gut.

A paper on fishing gut read before the members and friends of the Gresham Angling Society by the hon. sec., Mr. F. E. Eldred.

I THINK no discussion would be complete without some reference to the little animal, to whom we, as anglers, are so much indebted; for, in spite of various materials which have been tried, nothing so good as silkworm gut has been found to take its place. Its life history may be briefly given as follows: The silkworm moth lays a number of eggs, from 250 to 300, on the leaves, generally mulberry, which are to form the food of the grub when hatched. These eggs, which somewhat resemble spiders' eggs, are hatched by the sun's heat, and when the grub emerges it is about a quarter of an inch in length, and looks like a small black worm. It at once commences to feed, and in from eight to ten days it casts its skin and assumes a grayish color. This operation over, it continues to feed, and in five or six days it moults a second time, and after five more days, moults a third time. In the intervals between these processes it grows considerably, and when it moults for the fourth and last time, it has grown to be from one and a half to two inches in length, and is now a perfect caterpillar. Ten days later it searches for a convenient place where it can form its cocoon, and for this purpose it mounts upon, and attaches itself to, twigs by a number of fine filaments of silk.

Naturally, in the silk and silkworm gut-producing districts of Spain and Italy, every care is taken to assist the little creature, both in providing it with food and shelter, and in forming for the caterpillar layers of branches and twigs to which it can attach its cocoon. It is at this point that further development is arrested if it is to produce silkworm gut. If, however, it is to produce silk, it is allowed to form its cocoon, which it does by spinning around itself an oval-shaped dwelling; this operation takes four days. When the cocoon is finished it smears the inside with a silky kind of gum from its spinnerets. This hardens, and its house is made waterproof. During the whole operation of forming its cocoon it is gradually undergoing a change, and this change continues until it has become a more or less rounded ball, somewhat elongated, and covered with a smooth, shell-like skin. It is to all appearance dead, and is now termed a chrysalis. If left to itself, in about ten days it changes into a moth, and works its way out of its cocoon by ejecting from its mouth a liquor which dissolves the gum lining its dwelling, and then with its head and hooked feet it pushes its

way through its silky envelope, and emerges as a perfect moth, and thus the cycle of changes is complete. It is curious to note that the animal never dies—only a series of metamorphoses go on, by which, apparently, distinct forms of life are assumed.

Now, to return to the stage where its development is arrested, if it is to produce silkworm gut, and to us, as anglers, the most interesting. As most of the silkworm gut is obtained from Spain, Murcia being the center of the industry, it would perhaps be as well to follow the *modus operandi* which obtains there. The worms are bred by the country people in their cottages, consisting of but two rooms on the ground floor. This industry is the sole occupation of the villagers near Murcia, and while some of them breed the worms, others perform the initial stages in gut making. A number of bamboo rods are tied together by the breeder, in order to form a bed from twelve to fifteen feet long by four feet wide, and raised about a foot from the floor of the room. On this bed are spread the worms, which are fed five times daily with mulberry leaves. Great care is taken to pick out all sickly worms, in order that only good, sound gut may be produced.

When the worms are ready to spin the cocoon, they creep upon branches of trees which are placed over the bed. They are taken off these branches, and are killed by being put into vinegar, in which they remain for six hours, after which they are thoroughly washed in clean water. Girls take the worms from the water, break them in half with their fingers, exposing the one, two, or three yellow sacs which each worm possesses. This is a delicate but very sickly operation, and great care is necessary in the handling of the worm. The ends of each sac are taken between the thumb and finger, and gently but firmly pulled out as far as the sac will go without breaking, considerable skill being required in drawing to keep the now elongated sac and contents as round as possible. The ends of the sac are secured, and the gut and its envelope placed so that they may dry and harden. Each strand when dry has a yellow appearance, the color being due to the surrounding sac, its shape being more or less round, and tapering more or less according to the care taken in drawing from one end to the other.

It is interesting to note that, even in worms of the same size, there is not the same number of sacs, some worms possessing one, others two or even three sacs.

The strands, tied up in bundles, are now turned over to the finishers, and their first operation is to remove the outer skin or sac which surrounds the gut proper. This is done by steeping or boiling the gut in water, to which is added some soap and soda. The skin is then easily removed by drawing through the fingers. The color is now a dirty white. It is now washed several times in clean water to remove all traces of soap and soda, and then bleached. This bleaching process may be performed by damping and exposing the gut to the action of sunlight, or it may be chemically treated. The former process is the slower, but the more natural and the safer way, though from inquiries which have been made, it is ascertained that in the hands of a skillful operative no injury is done to the gut by adopting the chemical method.

It has now a rather dull, certainly by no means a shiny, appearance, and it is, from an angler's point of view, quite a question whether it would not be better to omit the polishing process altogether. This polishing is performed by rubbing each strand (held by the teeth and hand) with wash-leather. It is now sorted according to length, strength, and thickness into the various qualities, an operation requiring very great experience and judgment. It is now tied up in hanks of one hundred and made up into bundles of one thousand or ten thousand, and is ready for export. It is usually classified thus: Refina, very finest; Fina, fine; Regular, of a medium thickness; First and Second Padron, thick; Marana, Imperial and Hebra are very thick and strong, suitable for salmon fishing. All the above are undrawn, that is, they have not been through a drawing-plate to level them.

Drawn Gut.—In order to level the thicker, and to make finer the finer qualities for the market, the strands are drawn through steel plates, or even through minute circular apertures in precious stones set in the drawing-plate. This makes the strands perfectly parallel throughout and perfectly round, at the same time compressing and slightly elongating them. Thus gut of any desired fineness is obtainable.

Staining.—This process is performed by the action of chemicals, and the question is what chemical can be used to give the desired shade, and at the same time not injure the gut. In order to produce a neutral or slate color pounded logwood is steeped in water, to which is added a small quantity of copperas, but great care and skill are required or the gut is spoiled.

The Keeping of Gut.—Opinions on this are very much divided, and it would be presumptuous on my part to suggest, as some anglers do, that all gut should be discarded at the end of the fishing season, and a new lot obtained at the commencement of another. Personally, I have found that gut if properly stored—that is, placed where the light is excluded and where the temperature is even—will keep for several years without undergoing much diminution in strength.

Tying.—Into the question of knotting I do not propose to go, beyond remarking that whatever knot is used it should be as neat as possible, and that the cast should be tested knot by knot and then in its entire length with such a strain that it is estimated the gut should bear.

I desire to express my great indebtedness to Messrs. Allcock & Co., for their kindness in assisting me, and especially for the loan of such fine samples of gut in the raw, preparatory, and finished stages.

### The Discussion.

In the discussion which followed much useful information was elicited, and the following questions were proposed. In order that definite information might be given in answer to these questions, it was agreed to adjourn the discussion, and after various authorities had been consulted, and a number of chemical, physical and microscopical experiments had been performed, the following results were obtained:

1. Does drawing injure the gut?

Drawing, when performed by an experienced workman, injures the gut very little, but it tends to produce a lia-

bility to fray with usage. It decreases the diameter, but it is found that taking strands of equal diameters the undrawn will support no greater weight than the drawn. In the undrawn sample the surface is smoother, as may be seen by comparing specimens of drawn and undrawn gut under the microscope. Minute roughnesses are visible on the surface of the latter, and these roughnesses become accentuated in use, and small fibres peel off, thus weakening the gut as the diameter decreases. These roughnesses are to some extent got rid of by polishing the gut, and this should be done by rubbing in one direction only, that is, with the fibre. This polish, however, is just one of the things anglers do not require, as polished gut undoubtedly scares the fish. The principal reason why undrawn gut is not so dependable, size for size, as drawn, is that inferior qualities of undrawn gut are often drawn, and appear to possess, except to the experienced eye, the same characteristics as undrawn gut.

The only remedy which the angler has is to purchase from firms which will guarantee that the quality is of the best. If this be done one may now and then get a weak cast, but the chances of this happening are minimized. It is the safest economy to buy inferior qualities, in this, as in most things.

2. Is it not a fact that nearly all, and all the finer sizes are drawn?

From inquiries made of one of the largest gut importers in the world, there is no doubt whatever that nearly all the finer, and all the finest casts are made up from drawn gut which has passed through the drawing-plate a greater or less number of times. However, casts can be, and are, made from 6x drawn gut which will support a dead weight of one pound without breaking. A cast with less breaking strain than this would, in the hands of a skillful angler, be sufficiently strong to kill a trout of two or three times this weight.

3. Does boiling, to rid it of its sac, injure the gut?

This depends largely on the manipulator. In the hands of a skillful workman no injury whatever results.

4 and 5. Is the gut fibrous or homogeneous? Has it a second skin?

Transverse and vertical sections placed under a high-power microscope show conclusively that the only skin gut has is the skin of the sac, and this is only seen in the raw article. Microscopic investigation further shows, as one might expect from the evidence of frayed gut, that gut is fibrous, and not homogeneous throughout. The fibres, however, are very fine, and do not appear to be of any great length.

6. Does staining injure the gut?

The evidence on this point is that staining does more or less injure the gut, but in the hands of a skillful man this injury is reduced to a minimum. To show how careful one must be a prominent manufacturer volunteered the information that through some carelessness on the part of one of his employees over £200 worth of gut was spoiled.

7. Which colored gut is the least visible to fish, for example, trout?

There is no doubt whatever that gut which most approximates to water in color is the least visible to the eye of man, and probably to that of a fish. This color is a very light blue-green.

White gut when placed floating on clear water has a whiter appearance, where the water and gut touch, than gut of a neutral tint.

8. Does gut deteriorate with keeping?

Definite information on this head is fortunately forthcoming.

Gut can be kept several years if stored in a temperature of about 60 degrees Fahrenheit in a room from which the light is carefully excluded, but it seriously deteriorates if kept in too warm a place. Mr. Allcock says: "You need not discard gut unless worn out by use. Keep it in wash-leather in a drawer in your bedroom."

Whether soaking in certain preparations tends to increase the life of gut or not I am not prepared to assert or deny, as I have no experience on this point. I have tried soaking in glycerine, but I have not given it a sufficiently long trial to enable me to speak with certainty either one way or the other.

Commenting on Mr. Elder's lecture, Mr. R. B. Marston writes in the Fishing Gazette:

"With reference to the keeping qualities of gut, Mr. J. W. Martin, the fishing-tackle maker, sent me recently an old tin box containing flies on gut, with the maker's note referring to them, made over seventy years ago. I tested some of the gut, and it is perfectly sound, and the flies and hooks are as good as when made. The secret is that they have been all this time in an almost air-tight tin box in a dry desk, where the owner had put them about 1830 and forgotten them. I must refer to the flies again presently, but it is interesting to find gut keep good so long. I agree with Mr. Eldred that light seems to be prejudicial to gut, but damp and dust are worse. I think the best gut I ever saw was some unbleached gut, which evidently had never had the outer skin or sac removed by pulling between the nails, as described by Mr. Eldred—it came off as a brittle brownish skin, and left the gut exactly like threads of the purest colorless glass. Can no manufacturer put some gut like that on the market?"

"I remember being told by the manufacturer at the time that unless the gut was bleached there would be no market for it. It seems to me that this is a case where trade traditions stand in the way, and the consequence is that anglers have to resort to coloring the gut with ink or other dyes in order to get rid of the effect of the bleaching. Consequently the gut is rendered more or less opaque, whereas if unbleached it resembles nothing so much as colorless water. Several firms now claim to have gut manufactories in Spain. Can they not get over some best gut in all sizes before any bleaching has been done, and also before any skin has been removed?"

"If the skin peels off when dry, as it did in the samples sent to me, there is absolutely no difficulty about that, and no soda or soap is required—anything caustic must dull the natural transparency. Probably I shall be told I know nothing about the requirements of the gut trade, to which I shall reply that if gut is naturally transparent and colorless to bleach it and dye it shows the trade do not understand the requirements of anglers.

"I think it is probable that gut was originally manu-

factured for purposes which have nothing to do with fishing—possibly for use in surgery, where its transparency was found to be a drawback, and so bleaching was resorted to. If I could afford the time I would go to Spain to see if my theory is not correct—namely, that nothing but trade requirements stand in the way of our getting gut which is as transparent as colorless crystal, which is, of course, the ideal thing.”

## New England Fishing.

BOSTON, Mass., July 15.—*Editor Forest and Stream:* For those who like a combination of salt water fishing and sea bathing there is no place in Massachusetts, in my opinion, that goes ahead of Nantucket. This summer there is added interest from improvements making in the harbor. The visitors enjoyed what was to most of them a novel sight the other day when the fishing steamer *Waquoit* brought in seventeen large swordfish averaging from 200 to 300 pounds each. The crew reported them in great numbers in the vicinity of Block Island and Noman's Land. Large numbers of bluefish are being caught. A party that went out in the catboat *Winona* one day took twenty-eight, and a couple of amateur fishermen in a dory returned with thirty-one, averaging 10 pounds each.

At the Cliff bathing beach there are 400 bathhouses, and there is an instructor in swimming whose services may be obtained. A fine combination for healthful recreation is thus afforded by the facilities for both bathing and fishing.

Several cases of fish having been poisoned in ponds have been reported this season, and quite recently a report has come from Wendall, on the railway line to Hoosac Tunnel, that some one has been placing lime in the trout brooks of that region. Quantities of lime have been found and dead trout near by. We have laws enough to meet such cases, but the difficulty is in getting the evidence needed to convict the offenders. It is important that sportsmen in sections where such outrages are committed spare no pains to bring the perpetrators into court. Spite toward trout fishermen is probably the motive that led to the use of lime.

If reports from Becket are to be credited, our State has received a visit within a few days from a genuine turkey buzzard, such a bird having been recently shot on the Whitney place in that town. It is said that not more than half a dozen of the species have ever been killed in Massachusetts.

Among the many ardent devotees of sport with rod and reel (and with line and sinker as well) in Boston is our assistant postmaster, Mr. M. C. Millin. His favorite resort is Bear Island, in Lake Winnepesaukee. He says that is the best point for fishing in the whole lake. A short time ago he returned from a short trip with a number of very fine bass to show to friends who were skeptical.

The numerous school camps for lads and young men in Maine and New Hampshire are now in full swing. Many young men are there learning the secrets of woodcraft and getting a touch of the life of the woods, in connection with nature studies. In the country there are said to be more than a hundred such camps, and they should furnish a host of recruits to the ranks of the intelligent sportsmen to whom those interested in the protection of fish, animals and birds must look for aid in the near future. We need the young men in the army, ready to step into the places made vacant every year; yes, in fact, every day. Only yesterday the Massachusetts Fish and Game Protection Association lost a valued member, Mr. Gain Robinson, the well known lumber merchant of Springfield. Within a few months life members—J. Montgomery Sears and Charles E. Sanborn—have died.

Mr. and Mrs. Charles S. Eaton and their daughter opened their house at Belgrade, Me., July 1 to hold a house party for the holiday, and remain for a few weeks. In August they will occupy Mr. Eaton's elegant shore place at Clifton.

Hon. F. W. Dallinger, of Cambridge, with his family has taken possession of his cottage in Lovell, Me., where he can enjoy his favorite pastime taking salmon from Little Kezar Lake, or trout from some of the available streams not far away.

In a letter just received from Col. C. E. Billings, of Hartford, referring to my report of his taking a 7-pound salmon while at Billy Soule's camps on the Cupsuptic, he says: "It is all true and more might have been told." He reports taking a number of trout—the largest 3½ pounds—besides the twenty-five he took up at Cupsuptic Falls one day, and "we had them for dinner," he says, and "my thoughts went back to the time when you and I were there two years ago, and I wished you were with us then." He says he and Mr. Chapman during the ten days spent at Tim Pond after leaving Billy's, averaged a catch of some more than 100 trout a day each, 90 per cent. of which were "returned to their native waters."

While some of the guests at the hotels and camps having become for the time being satiated with fishing, are taking to the golf links, many of them are keeping their guides busy rowing them out to fishing grounds, and the ranks of the anglers are recruited every day by newcomers.

As a rule, the fly-fishing slacks off before the middle of July somewhat in the big lakes, but still-fishing is to be had all summer. There is no difficulty in raising trout to the fly in Kennebec nor Tim Pond all summer, and in several of the lakes reached from Eustis, and, I have no doubt, the same is true of certain waters in every section of northern Maine.

Mr. W. F. Kingsbury, of Randolph, had the remarkable luck to land a 11½-pound salmon recently at Upper Dam pool. To an angler from Lowell is credited a catch of eighty-three trout and four salmon in one week, while a Bostonian took a 7-pound and a 4-pound salmon on the afternoon of his arrival. W. W. Coolidge and wife of Salem, and Mr. H. C. Denison, of New Bedford, have taken salmon in good numbers.

Mr. Fred R. Cornell, of the Boston Symphony Orchestra, has joined Mrs. Comee and her friends in their new cottage. One of the guests is Mrs. A. W. Robinson. Mr. Robinson is an ex-president of the Megantic Club and is an honorary member as well as vice-president of the

Massachusetts Fish and Game Protective Association. Among the sportswomen of the east Mrs. Robinson stands very high. Her latest exploit was achieved last fall when, on a hunting trip with Mr. Robinson in the Megantic preserve, she killed a handsome buck and a 400-pound bear. Mr. Comee has christened his cabin the "Rouge-et-Noir," and the many friends of the host and hostess will find a hearty welcome within its portals.

Gen. E. C. Farrington, who has been an ardent angler as well as hunter from boyhood, remained to enjoy the sport for several days after the meeting of the Maine Sportsmen's Association.

Mr. and Mrs. I. N. Damon, the Fitchburg bridal couple, have had excellent luck, Mrs. Damon taking a 6½-pound salmon. They had Bert Herrick as guide.

A Boston party, consisting of Mr. J. W. Stewart and several friends, had the good fortune to see a big bull moose on Kennebec Stream besides taking plenty of fish.

Mr. Clarence W. Fisher with Mrs. Fisher, of North Attleboro, is passing his twenty-eighth season at the lakes. Mr. Thomas A. Bassett and several friends from New Haven and Bridgeport, Conn., are at Bald Mountain Camps for the summer. Mr. John S. McLean, daughter and maid, of New York, have taken Munyon Lodge for the season. For twenty years Mr. McLean has had George Thrasher as his guide, and he is with him this year.

In a Fitchburg party several well known families are represented by Mrs. Edward C. Crocker and her niece, Miss Mildred G. Sears, of Cambridge, and friends from Providence.

Dr. George H. Payne, president, and E. A. Phippen, of Boston, secretary of the Megantic Club, with several other members have just returned after passing a couple of weeks at Big Island Pond and other points on the preserve.

Mr. Hugh G. Brown's camp, the *Mayflower*, has been occupied by him and his brother, J. C. Brown, and wife for several days. Mr. Brown is to have a new steamer for his personal use.

Arnold and Crosby ponds have just received a planting of 20,000 landlocked salmon from the State hatchery at Winthrop. A new trail is to be made soon from the foot of Big Island Pond to Arnold, thus doing away with the one via Massachusetts Bog. Scores of old friends will recognize the names of these old-timers now at Upper Dam—J. C. Dougherty and wife, of Syracuse; E. F. Van Dusen and wife, of New York city; J. S. Doane and wife, Eugene Lynch, of Boston, and R. N. Parish, of Connecticut.

At Grand Lake Stream Prof. Wm. Lyman Underwood, of Belmont, is engaged in adding pictures to his wonderful collection of landscape views and snapshots of birds and animals. Here also a New York artist, Louis Akin, has been dividing his time between the use of brush and palette and that of the rod and reel. CENTRAL

## Fish and Fishing.

### New Brunswick Salmon Rivers and Fish Culture.

KNOWING as much as I do of the difficulties attending the successful control of fishcultural operations, especially when conducted under Government management, I am far from admitting such excessive results from them—at least as they were carried on in Canada during the first years of their history—as were originally claimed for the science. But this does not prevent me from cheerfully acknowledging the debt of gratitude which the fisheries of the Dominion of Canada owe to the operations of the Government fish hatcheries. It was, perhaps, only natural that there should have been serious mistakes in connection with the introduction of the practical working of the science into Canada, which, after all, was not so many years after it had outgrown its experimental stage, and the early disappointments, disagreements and fault-finders experienced by some of those to whom we are indebted for earliest efforts in its behalf, have not apparently disposed them too favorably toward it.

It is perhaps of more importance to the future of the fisheries than some of us may at first sight imagine, that the value of our existing fishcultural operations should be publicly discussed with the utmost fairness and frankness, since, while the amount of money expended upon them is far too large to be uselessly thrown away, it would be little less than a public disaster to close the hatcheries because of reckless criticism and unfounded argument, if they are really doing the work which is now claimed for them.

My reference, in *FOREST AND STREAM* of May 20 last, to the official report of one of the New Brunswick inspectors of fisheries, which clearly showed that "the salmon supply of some at least of the rivers of New Brunswick" was not decreasing, was, to my surprise, taken exception to by your very interesting and very versatile correspondent, the "Old Angler," in such a manner as to indicate that he is at present as much opposed to the continuance of fishcultural operations in Canada as he was in favor of them some time ago.

Now, while there is something to be said upon both sides of the question, the "Old Angler" has, now, nothing that is good to say of the science which he so strongly urged upon the attention of the authorities some years ago. His incomplete figures, as I shall presently show, are so selected and presented as to convey impressions very wide of the actual facts; while against his authorities—Messrs. Malmgren and Whitcher—who recommended a discontinuance of fish breeding operations as a Government work, I might cite the equally competent foreign authorities—Dr. Frank Buckland, of London, and the late Prof. Spencer F. Baird, of Washington—besides many local authorities, whose practical knowledge of the subject and whose good faith he will not venture to question. While upon this matter of local authorities, allow me to introduce the "Old Angler" to the following official recommendations made to the Government of Canada in 1869 by Mr. W. H. Venning, then fishery inspector for the Provinces of New Brunswick and Nova Scotia, an officer in whose judgment there is reason to believe that the "Old Angler" has every confidence, and whose advice to the Government in this important matter was no

doubt largely responsible for its adoption of Mr. Wilmot's system of fish hatching, since he was also appointed, in company with Mr. Whitcher, to visit and inspect Mr. Wilmot's hatchery at Newcastle, Ont., and presented a most favorable report upon it. Upon the third page of his 1869 report to the Minister of Fisheries, Mr. Venning wrote: "The results produced in the hatching house at North Esk, described in my last report, and those in the piscicultural establishment at Wilmot Creek, in Ontario, prove beyond a doubt the perfect success with which millions of fish-eggs can be artificially hatched, and point to a speedy and cheap mode of increasing our fisheries to an unlimited extent, by restocking rivers now deserted, and introducing fish into streams and lakes adapted to their habits and sustenance."

In 1873 Mr. Venning wrote to the Minister: "Fish-culture has been so successful, and has produced such beneficial results in other places that I cannot but recommend every facility and encouragement to its introduction in our Provinces. The complete success of Mr. Wilmot's operations in Ontario, and of Mr. Holliday's on the Moisie, leads me to hope that similar establishments may be conducted in each of the Lower Provinces."

In 1878 Mr. Venning wrote: "The only remedy I can suggest (for the falling off in the salmon supply through overnetting, etc.) is the extension of artificial hatching." And later in the same report: "Everywhere, except where artificial culture has arrested the decrease, the salmon fishing is in the same danger."

In the same year Mr. Venning warned the authorities that the salmon fisheries of the St. John River must become extinct unless the weirs and seines were done away with.

The same efficient officer pointed out in 1886 that he expected to see a steady decrease in the catch of future years unless the excessive fishing was curtailed. The fishing was not to any appreciable extent curtailed. And yet there has been no decrease in the catch, that of the two last years reported being in excess of the year in which the warning was issued, while in the course of the sixteen years which have since elapsed, the average catch has been 1,505,727 pounds in the Province of New Brunswick, against 1,268,855 in 1886. It is impossible to come to any other conclusion than that the "steady decrease" foreshadowed by the inspector of fisheries for that Province was only prevented by the beneficial results of the fish hatcheries for which he had so eloquently pleaded. Without this constant supply of artificial aid to the comparatively few spawning salmon which were permitted by the poachers, net fishermen and others to reach the upper stretches of the rivers, the almost total extinction of the salmon anticipated by Mr. Venning must have become an accomplished fact. Year after year we follow him in his annual reports to the Minister, faithfully pleading the cause of the fish. The number of the nets, he frequently says, is excessive, and out of all proportion to the number of salmon ascending the rivers. The effects of this excess had long been seen, he says, and were becoming more and more evident. Vainly did he urge, time and time again, that since it was apparently impossible to limit or reduce the number of nets, there should either be a shortening of the season, or a lengthening of the weekly period (from Saturday night till Monday morning) during which the nets have to be taken up. Again we find him saying: "With the excessive fishing that has been done since the opening of the Intercolonial Railway but few fish reach their spawning beds. Of these a large number are killed before spawning. The powers of those that remained to multiply fall short of the annual drain made on the diminishing stock. In former years, before railways made it easy to reach our rivers, but little angling was done. After the netting season closed those fish that escaped the coast and river nets had only a few poachers and adventurous anglers to fear; these having no market for their catch, contented themselves with what they required for food on their visits, and the few they could carry home unspoiled. But since the advent of railways has made the headwaters of our rivers easy of access, angling has been pursued on an extensive scale, and poaching on a still larger scale, up to the last of October, and sometimes until the fish have finished spawning. The facilities offered by railways for the exportation of illegally caught fish are so great that no vigilance on the part of officers can do more than make an occasional seizure, while large quantities are annually exported."

Who will say that in view of all these discouraging circumstances the devoted inspector was not fully warranted in anticipating the very worst possible results, or that the total destruction of the salmon fisheries has not been averted by the operations of the hatcheries? What other beneficent agency could have preserved them? The views of numbers of practical men might be cited in support of this belief in the good work done by the fishcultivists of the Dominion. Mr. Sheasgreen, writing in 1888 in regard to some of the New Brunswick rivers, says: "When the enormous drain upon our salmon fishery is considered—the almost endless number of nets from the mouth of the bay to the rapids—which are year by year doing a remunerative work—along with the facts that the waters are abounding with parrs, smolts and grilse—it points to the conclusion that artificial hatching is the feeder that keeps up this supply, and is one of the greatest boons and benefits that can be granted to the fishermen of any river; certain it is that the natural sources could not supply the enormous demand—men of all opinions agree in this—and I may here add that the uniform good catches of fish for the past five years are now convincing the most skeptical of fishermen that the artificial breeding is most beneficial as supplementing the products of natural-laid ova with millions of healthy, artificially-bred fry, which are the surest safeguards against the depletion of our waters of these most valuable fish in future years."

### What Figures Show.

I have said that the "Old Angler's" incomplete figures have been so selected and presented as to convey impressions very wide of the actual facts. The most deliberate determination to prove that fishculture in Canada was a failure could not have been better accomplished than by

the selection and presentation of the incomplete figures furnished by the "Old Angler." There are available for purposes of fair comparison, the official returns of all the salmon reported to have been taken in New Brunswick waters during the last thirty-five years. The total of the catch during the whole of this period was 54,372,850 pounds, or an average of 1,553,714 pounds per annum. The largest catch on record was in 1874 and amounted to 3,214,182 pounds. The smallest was in 1881 and amounted to 620,461 pounds. Now, for purposes of comparison, the "Old Angler" persistently bases the condition of affairs, so far as the supply of salmon in the New Brunswick rivers is concerned, upon the yield of the most exceptional year in the whole recorded history of salmon fishing in that Province. Could anything be more unfair or unreasonable? The excuse for this selection is the statement that this was the year in which the hatcheries were built. But no explanation whatever is made as to the very remarkable exceptional catch of that year, nor yet of the facts that neither during that year nor yet for some few years afterward could the hatcheries possibly have had any influence upon the output of adult salmon; and that because of a series of mishaps in connection with some of the hatcheries, which prevented them from being fully operated for a few years, it was foretold by Mr. Wilmot, in one of his reports, that he did not look for any results of consequence from the output of the hatcheries until 1882, when he did anticipate quite an increase in the catch. Mr. Inspector Venning's report for 1882 admits the increase in that year from 620,461 pounds in 1881 to 1,065,118, an increase which the official figures show has been more than sustained in every succeeding year up to the present time, with the single exception of 1883, when the catch temporarily fell to 784,622 pounds, several of the guardians claiming that the low water in the rivers accounted for the small run of fish. In any case, the take of the next year, which showed an increase of nearly 50 per cent., proved that the small catch of 1883 was not due to a steady gradual decrease in the number of fish frequenting the coasts and rivers. And it would be quite as fair to take the catch of the year preceding that date—1881—as the basis of the salmon supply in New Brunswick waters, and in fact very much fairer, than to utilize for the purpose, the figures of 1874. The total catch of 1881 was the smallest on record, namely 620,461, or less than half what the same rivers produced last year. But as my only desire in this discussion is to endeavor to arrive at scientific facts, and, moreover, as I have no pet theory to support and no taste whatever for juggling with figures, I beg to submit for the consideration of those who are prepared to take a calm and dispassionate view of this whole matter, a yearly statement of the annual catch of salmon in New Brunswick waters, for as far back as the official records go. I will merely premise that I shall be glad to accept any correction that any of my readers may be able to make in these figures, for though they are as nearly perfect as I can make them, it is barely possible that some very slight errors may have crept in, for in some instances, calculations have had to be made, such as reducing the amount of fish in barrels to pounds, while for the year 1869 numbers of fish were in some instances given, and in these cases, lest I should appear to have striven to make the catch in those pre-hatchery days seem smaller than it really was, I may explain that I allowed an average weight of 20 pounds to each fish, which will certainly be admitted to be sufficiently large. The output was as follows:

	Pounds.		Pounds.
1869.....	1,136,160	1887.....	1,256,307
1870.....	1,499,187	1888.....	1,224,340
1871.....	1,608,496	1889.....	1,139,779
1872.....	1,599,977	1890.....	1,093,545
1873.....	2,853,722	1891.....	1,345,170
1874.....	3,214,182	1892.....	1,430,118
1875.....	2,996,551	1893.....	2,484,190
1876.....	1,005,427	1894.....	2,280,462
1877.....	1,593,297	1895.....	2,079,395
1878.....	1,763,772	1896.....	2,651,825
1879.....	1,636,342	1897.....	1,383,680
1880.....	856,155	1898.....	1,199,967
1881.....	620,461	1899.....	1,255,110
1882.....	1,065,118	1900.....	1,235,350
1883.....	784,622	1901.....	1,436,230
1884.....	1,110,745	1902.....	1,456,175
1885.....	1,407,598	1903.....	1,300,540
1886.....	1,268,855		
Total for 35 years.....	54,372,850		

Aiming only at arriving at a correct estimate of the result of the fish hatchery operations in New Brunswick, I will not ask those who are following the discussion of the matter to base their opinions upon the return of the catch in 1881—the year prior to that in which the promoter of the hatcheries, Mr. Wilmot, looked forward to the evidence of appreciable results from their operations, since he showed that it was only in 1877 that they commenced to work satisfactorily—though it would be much more fair to do so than to take the exceptional product of 1874 as any indication of what the waters of New Brunswick were in the habit of producing prior to the operation of the hatcheries, especially as it will be seen by the figures given above that two years prior to that exceptional year the output was less than one-half of what it was in 1874, while two years after it, and long before it was possible for any result from the hatcheries to manifest themselves—namely in 1876—the product of New Brunswick's waters in salmon was less than one-third of the output for 1874.

An examination of the annual returns printed above will show that the average product of the New Brunswick rivers for the last thirty-five years, including the period before the work of destruction had brought about the ruinous results which the fishcultivists sought to overcome, has been 1,553,714 pounds. For the first period of five years, from 1869 to 1873 (both years inclusive), the average catch was 1,739,508 pounds per annum. In the decade following, namely, from 1874 to 1883 (both years inclusive), there was an average catch of 1,553,592 pounds. For the next ten years, namely, from 1884 to 1893 (both years inclusive), the average catch was 1,386,064 pounds, while the last ten years, 1894 to 1903 (both years inclusive), show the gratifying average of 1,627,873 pounds—quite an increase, as comparison will show, from that of the decade in which is included the famous exceptional yield of 1874. The "Old Angler" has frequently declared himself, and very correctly so, too, that it is incorrect to form any hasty conclusion as to the supply of salmon from the result of a single year's catch.

and as the thirty-five years for which we have the official figures before us naturally divide themselves into periods of five and ten years, it cannot be fairly denied that taking the average yield of these various periods—than which no more reasonable method of gauging the fluctuations in the annual catch of salmon suggests itself—it is as unfair as it is incorrect to claim "that as artificial culture has increased in New Brunswick, the catch of salmon has decreased." On the contrary, there is a small—but in view of the frightful destruction of this fish still unfortunately permitted—a gratifying increase in the catch of the decade just ended, over that of the ten years in which the first of the hatcheries was built.

E. T. D. CHAMBERS.

### Pennsylvania and Southern New York.

SAYRE, Pa., July 15.—The fishing in this section has scarcely been worth mentioning for the past four weeks. As a matter of fact, strictly first-class conditions have not prevailed at any time since the season opened. Proliferous rain, and occasional destructive storms have combined to keep both trout streams and the rivers hereabouts in a high and roily condition; and as a result the catches that usually win a flaring headline in the daily papers have been few and far between.

Some of the local grounds along the Susquehanna have yielded a few bass despite adverse fate, and local bass anglers are at present anxiously waiting for the water to subside in order to really test the supply of bass and pike. Several local anglers have enjoyed an occasional day's trout fishing on some of the streams in the vicinity of Richford, Speedsville and Slaterville, which were productive of a few nice trout. But on the whole, and surveyed from a local point of view, the season has been below the average. What the season may later afford depends very largely upon the weather. At Lake Carey, a few hours' ride from Sayre via Lehigh Valley Railroad, good bass, pike and perch fishing is now being enjoyed along with many of the pleasures incident to ideal surroundings.

M. CHILL.

### Camp-Fire Flickerings.

"That reminds me."

### Prof. Muller's Tame Whales.

HERE is a hot weather story from the Bangor Commercial. It reads like a product of the fertile fancy of Virgil Eaton, editor of the Bangor Daily News:

PORT-AU-BASQUES, Newfoundland.—Not the least of the triumphs of modern scientific methods in man's utilization of natural resources is forecasted in the brief announcement just received from the Balena whale fisheries to the effect that Professor Muller has succeeded in domesticating a herd of fifty sulphur bottom cow whales and has perfected an apparatus for milking the mammoth cetaceans.

The yield of milk from the full-grown whale is from five to seven hogsheads a day. The milk is fresh and sweet, and peculiarly rich in nutritive and medicinal qualities. It is much thicker and richer than the best Jersey milk, and possesses a peculiarly pleasant and distinctive flavor which those who have tasted it pronounce superior to any known product of the lacteal variety. Chemical analysis has shown that the milk of the sulphur bottom whale is rich in those same fats and proteids which give to codliver oil its value as a remedial food.

Professor Muller's experiments with whales, which have been carried on in comparative secrecy for several years, have resulted in many remarkable discoveries in the lines of utilizing the different parts of the huge carcasses which have hitherto gone to waste.

He has devised a process for curing and preserving the tons of meat which has always been considered worse than valueless. This meat, which compares favorably in texture and flavor with the average beef, will soon be put upon the market. The company has assurances that it will find ready sale in the West Indian islands and other tropical countries which now depend for their meat supply on the South American jerked beef.

Professor Muller has invented and patented a process for making leather from the intestines, pleural sacks, heart coverings and other internal membranes of the whale, which, when tanned and finished, is of greater durability and finer texture than any known leather. Beside its superior quality, the whale leather furnishes single pieces of much greater dimensions than it is possible to procure from any other animal. It is possible, according to the inventor, to obtain from the intestines of a full-grown sulphur bottom a strip of leather nearly 300 feet in length and 3½ feet in breadth. From the pleural lining a piece of leather twenty-five feet in diameter can be obtained.

Processes for grinding the mammoth skeletons into bone meal for fertilizer and of converting the gristle and cartilage into glue and like products are among the minor inventions of the expert, who has secluded himself for the past five years at the little fishing village and turned his attention to the study of whales.

But by far the greatest triumph yet attained by the erudite Professor lies in the domestication of the cow whales. Like all scientific men, Professor Muller would rather conserve than destroy. The whales are still abundant in Newfoundland waters, but under the old system of killing them for their oil and casting the carcasses adrift, it was a question of only a few years at most when they would become so rare as to make their pursuit unprofitable. It will now be for the financial interest of whalers to capture the young whales and keep them alive because of the promise of richer reward from the dairy products than can be realized in their destruction.

It is impossible to give an adequate idea of the infinite care and patience which it has required to tame the whales. The whale, as every school boy knows, is a warm blooded animal of the mammalian group, more nearly related to the seal and walrus than to the fish. The whale at times displays a high degree of intelligence and reasoning from the analogy of the seal. Professor

Muller, several years ago, made up his mind that the difficulties in the way of domesticating the largest of all animals were only those which arose from the unwieldy size of the subjects.

The Professor looked about until he found a suitable inlet, a salt water lake about an eighth of a mile across, giving on the sea a narrow strait about fifty feet across. He arranged a gateway of iron bars by which the inlet could be completely closed. Late in the fall about two years ago a herd of whales was sporting in the offing, and it was noticed that there were a number of young heifers in the herd. By careful work ten of these heifers were separated from the main herd and coaxed and driven through the strait into the lake.

Then began the work of taming them. They were watched and studied until their favorite kind of food was learned. This was a peculiar kind of kelp or rock weed which grows in abundance in about twelve fathoms of water off the coast. Large quantities of this rock weed were gathered and stored near the Professor's headquarters at the upper end of the inlet.

Twice a day this food was put outside, where the young whale heifers could get it. Within a month they had learned to come to the feeding place for their meals. Within another month the creatures were quite tame and a name was given to each one. Gradually the cetaceans learned to respond to their names, and after six months of training could be summoned from any part of the inclosure.

The problem of teaching them to permit the operatives to milk them was a more difficult one. An apparatus was devised to do the work, but when an effort was made to try it there was trouble at once. It was necessary to drive the whales up on the flats at low water to do the milking, and it has been this part of the work which has absorbed the attention of the Professor for more than a year.

Patience in the face of all discouragements with a determination to succeed finally conquered. The first captives learned gradually to go of their own accord to the milking ground. The herd has been increased a few whales at a time until it now numbers fifty, and it requires the services of a staff of sixty men to carry on the daily milking.

Just what the plans of the company are is not generally known, and none of the officials will say. It was learned on good authority, however, that as soon as the dairy experiments in the way of butter and cheese making are complete, and the canning plant is ready the herd will be driven down to an inlet on the Maine coast, which has been fitted for a pasture. There the dairy will be established permanently.

Experiments have been made recently in permitting several of the tamer cows to go outside the inlet. These experiments have been peculiarly gratifying. In every instance the cow has returned, indicating clearly her preference for domestic life, and on two separate occasions cows of the herd have brought back with them strange companions. The strangers are now thoroughly domesticated and have become valuable members of the herd.

If, as is now believed, the whale milk is of rare medicinal value and proves to be a palatable substitute for the nauseous cod liver oil, it is easy to see the possibilities which lie in the new industry of whaleculture. The butter and cheese products are said to be of exceptional delicacy.

### July Days in California.

JOHNSVILLE, Cal., July 8.—*Editor Forest and Stream:* I see another interesting item anent the pompano and hasten to apprise you of it. Pompano is not worth its weight in gold, but is a whole lot rarer. The item I refer to is a despatch from Capitola, California, dated July 2, and says that the biggest run of pompano in fifteen years had just occurred there; that the Italian fishermen sold their catch at the beach at 25 cents a pound, realizing \$250, and that by the time these delicate fish would reach San Francisco they would possibly retail at \$1.00 a pound.

I shall, however, for the present content my palate and appetite with trout at a cost only of the trouble and patience to cast a line in the streams and lakes in the Sierra Nevada Mountains. Trout fishing in these mountains is not all what it is cracked up to be, as there are long stretches of river which are barren of trout, but now and then a section is found in which they are plenty. The lakes generally are fine grounds, but there is complaint this year from many points that the trout are unusually afflicted with parasites.

Lake Tahoe, however, is yielding its usual fine specimens of its speckled beauties, and the globe-trotter whose fortune it is to include Lake Tahoe in his itinerary always has a happy surprise in store for him at the hotels in the resorts along the lake. It is the serving to the guest of a single goodly seized trout, expertly cooked by a chef, the excellence of the fish and the perfection of the cooking thereof causing fond memories to linger long after the tourist has left Lake Tahoe.

But as soon as I make a "stake" in the mines—I am out on a prospecting trip—I shall go down to Monterey or Santa Catalina, and "fill up" once more on pompano. At present writing I am situated in a little old mining camp, at one mile's altitude above sea-level, to which I had come for mail and fresh supplies. The inhabitants are just getting over the Fourth of July celebration. They are mostly of foreign extraction—Italian, Slavonian, Greek, etc.—and were quite zealous in the celebration, especially the Italians, who always remember that this country was the discovery of "Christopher Columbus." An American, who was most enthusiastic, had his cause for rejoicing based mostly upon the outcome of the fight at Reno, on July 3, between Hart and Root. He had picked the winner. When he returned to his placer mine in the gulch on Eureka ridge on Friday, he was minus many an ounce of good dust as the result of "whooping it up" for his favorite.

WM. FITZMUGGINS.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

# YACHTING

## Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

### JULY.

- 19. Seaside Park, club.
- 19. Rhode Island, N. B. Y. R. A., open.
- 20. Rhode Island-Sachem Head, team race.
- 20. Royal St. Lawrence, Seawanhaka cup.
- 21. Fall River, N. B. Y. R. A., open.
- 22. Knickerbocker, power boat race to Marblehead.
- 22. Knickerbocker, one-design power boats.
- 22. Winthrop, M. Y. R. A.
- 22. Bristol, N. B. Y. R. A.
- 22. Rhode Island, cruising race.
- 22. Seaside Park, club.
- 22. Royal Canadian, Canada's cup trials.
- 22. Beverly Y. C., club.
- 22. Marine and Field, second championship, Y. R. A. G. B.
- 22. Unqua Corinthian, Molineux cups.
- 22. Corinthian, club.
- 26. Seaside Park, club.
- 27. Eastern, power boat races.
- 27. Sea Side, club.
- 28. Eastern, power boat races.
- 28. Seaside Park, Bay Head and Island Heights, cruise.
- 28. Sea Side, open.
- 29. Eastern, power boat races.
- 29. New Rochelle, ladies' race.
- 29. Chicago, race to Mackinac.
- 29. Country Club of Detroit, race to Mackinac.
- 29. Seaside Park, open.
- 29. Edgewood, club.
- 29. Knickerbocker, one-design power boats.
- 29. Hampton Roads, cruise.
- 29. Rhode Island, cruising race.
- 29. Royal Canadian, cruising race.
- 29. Beverly, club.
- 29. Corinthian, club.
- 29. Boston, club, Marblehead.
- 29. Indian Harbor, annual.
- 29. Bensonhurst, Childs trophy.

### AUGUST.

- 1. East Gloucester, club.
- 1. Morrisania, cruise.
- 2. Seaside, club.
- 3. Boston, M. Y. R. A., Hull, open.
- 4. Boston, M. Y. R. A., Hull, open.
- 4. Shinnecock Y. C., association.
- 5. Shelter Island, annual.
- 5. Boston, M. Y. R. A., Hull, open.
- 5. Knickerbocker, one-design power boats.
- 5. Knickerbocker, cruise.
- 5. New Rochelle, cruise.
- 5. Squantum, club.
- 5. Rhode Island, cruising race.
- 5. White Lake, open.
- 5. Seaside Park, power boat.
- 5. Royal Canadian, club.
- 5. Chicago, club.
- 5. Edgewood, club.
- 5. Shinnecock, association.
- 5. Wollaston-Squantum, inter-club.
- 5. Beverly, club.
- 5. Corinthian, club.
- 5. Huntington, annual.
- 6. Morrisania, ladies' race.
- 6. Larchmont, club.
- 6. Lakewood, Cleveland, club.
- 7. Boston, M. Y. R. A., Marblehead, open.
- 7. Old Mill, open.
- 7. Sachem's Head, club.
- 8. Eastern, M. Y. R. A., open.
- 8. Seaside, power boat races.
- 8. Sachem's Head, club.
- 9. Corinthian, M. Y. R. A., open.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

**KNICKERBOCKER Y. C.'S LONG DISTANCE POWER BOAT RACE.**—The conditions governing the Knickerbocker Y. C.'s power boat race from College Point, L. I., to Marblehead, Mass., are as follows

**Prizes.**—First prize, a \$250 cup, presented by the Rudder Pub. Co.; second prize, a \$100 cup, presented by the Knickerbocker Y. C. The Knickerbocker Y. C. will also present a souvenir cup to the owner of each launch that finishes within 24 hours of the first boat.

The officers of the Eastern Y. C. have very courteously placed at the service of the participating launch owners their anchorage, landing and house at Marblehead, and will arrange a series of power boat races, to take place on the days following the arrival of the racers, to which the visiting craft are invited to enter.

**Conditions.**—The race is for cruising boats, not exceeding in the greatest length 40ft. This measurement to be taken on deck, and to include projecting ends, either at bow or stern.

A cruising boat is one that is built for and is used for cruising. Must have stationary cabin house, not standing roof or canvas covered. Cabin must be water-tight and capable of resisting a sea; must contain sleeping, cooking and general living accommodations for crew.

**Propelling Power.**—A motor or engine operated either by gasoline or kerosene. The motor to be of the explosive type.

**Crew.**—To consist of not less than four persons; one of these may be a paid hand. No paid navigators or pilots allowed.

**Equipments.**—Boats must carry fuel in fixed tank or tanks and not in cans. Amount of fuel optional. Drinking water and stores sufficient for five days. Two anchors and rode, side-lights, ice-preservers, compass, charts, lead-line, etc.

Rating and allowance will be calculated under the rules of the American Power Boat Association.

**Course.**—From off College Point, Long Island, through the East River, Long Island and Block Island, Vineyard and Nantucket Sounds, around Monomoy, up Cape Cod and across Boston Bay to Marblehead. Distance, 280 nautical miles.

**Entries.**—All boats must be measured and rated before starting. No unrated boat will be allowed to start. All entries will be accepted subject to an inspection by the committee.

**Protest.**—No protest covering eligibility will be accepted unless made in writing 24 hours before the start.

**Rejection.**—The committee reserves the right to reject any entry if in their judgment the boat is not a bona-fide, seaworthy cruising craft.

**Inspectors.**—The following have been appointed inspectors, and have the committee's authority to inspect and pass upon the eligibility of boats: Mr. George J. Stelz, measurer of the Knickerbocker Y. C.; Mr. J. H. McIntosh, measurer of the Columbia Y. C., and Mr. E. W. Graef.

**Inspection.**—Upon an owner notifying the committee that he desires to have his craft inspected and rated, an inspector will be sent to examine and report upon the boat. Plans of boats designed to be built for the race can be submitted to the committee for their approval.

**NEW YORK Y. C. CRUISE.**—Mr. J. D. Jerrold Kelley, Fleet Captain New York Y. C., has issued for Commodore Frederick G. Bourne, General Orders No. 2 relative to the cruise. They are as follows:

The squadron will rendezvous off station No. 10, Glen Cove, on Thursday, Aug. 10.

Captains will report on board the flagship at 5 P. M. The programme for the cruise, weather permitting, will be as follows:

Friday, Aug. 11, squadron run, Glen Cove to Morris Cove.

Saturday, Aug. 12, squadron run, Morris Cove to New London.

Sunday, Aug. 13, at New London. The squadron will dress ship at morning colors.

Monday, Aug. 14, squadron run, New London to Newport.

Tuesday, Aug. 15, at Newport. Astor Cup races. In the evening the squadron will illuminate.

Wednesday, Aug. 16, squadron run, Newport to Vineyard Haven.

Thursday, Aug. 17, squadron run, Vineyard Haven to Marblehead.

Friday, Aug. 18, at Marblehead.

Saturday, Aug. 19, at Marblehead. Eastern Y. C. regatta.

The preparatory signal for squadron runs will be two guns fired in rapid succession by the flagship and the display at the foretopmast head of the code letter "P" over the signal, indicating the next port. The start will be made promptly one hour later from a line previously established by the Regatta Committee, at which time the preparatory signal will be hauled down.

The date and place of the races for the owl and gamecock colors will be announced later.

The Regatta Committee will issue instructions for the runs from port to port, and for the other racing events.

The flag officers' cups will be sailed for during the cruise.

Captains are requested to supply their vessels with New York Y. C. night signals.

Captains and their guests will be welcome on board the flagship at all times.

Particular attention is invited to the changes in the club routine and to the rearrangement of the signal code.

**THE HOUSEBOAT CEAIR.**—Mr. Charles M. Blydenburgh, of Riverhead, L. I., has had built at Dimon's shipyard

the houseboat Ceair, which was designed by himself, and she contains many original ideas. She was put together under his supervision, in the strongest manner possible, and of the best materials. One of its most striking original features is a long overhanging bow, which is cut back so far that one will be able to step upon the beach without the use of docks or attendant skiffs. Ceair is 12ft. wide, 35ft. long and 7½ft. high. She is being built on the Mississippi River style, with a roft, stern paddle. She will be propelled by a 10 horsepower gasoline engine. Four staterooms, each with two berths, a dining and reception room, a kitchen and motor room are provided for. The forward deck is 8 by 12ft., the after deck 6 by 12ft., each covered by an awning. There are four windows on each side of the cabin house. The craft will be christened Ceair, a most appropriate name, indeed—and Mr. Blydenburgh and his family expect to "take lots of it" during the coming months in cruising about Peconic and Gardiner's bays and through the canals to the Great South Bay.

**AMERICAN TURBINE FOR GERMAN EMPEROR.**—According to German sporting papers, the Kaiser is having a turbine motor boat built at an American shipyard. The turbines are said to be of an entirely new design, invented by a German-American of the name of Grabart Sellin. It is asserted that these turbines will revolutionize the building of such craft. The yacht will be 78ft. long. Her engines will be 3,000 horsepower, and she will have a speed of nearly 60 miles an hour.—New York Sun.

**WARRIOR ARRIVES.**—The twin-screw steam yacht Warrior arrived at New York on Sunday, July 9, from Marseilles via Gibraltar. She was one of the last vessels designed by the late George L. Watson, and was built last year by the Ailsa Shipbuilding Company, at Glasgow, Scotland. She is 282ft. over all, 238ft. waterline, 32ft. beam, breadth, and 14ft. 3in. draft. Her tonnage is 1,097.80. On the passage over Warrior averaged 14 knots, which is two knots below her average speed. Captain McLean is in command, and she has a crew of forty-six men.

**MINEOLA-VIRGINIA MATCH RACE.**—The amateur match race between the two 70-footers, Mineola and Virginia, will take place off Oyster Bay on Wednesday, July 26. Both boats will be sailed and manned throughout by amateurs.

**VEGLIA PURCHASED BY AN AMERICAN.**—Mr. George W. C. Drexel has purchased the steam yacht Veglia from the estate of Baron Nathaniel de Rothschild. Veglia is a steel screw steam yacht 248ft. over all, 31ft. breadth and a draft of 18½ft. She was built at Glasgow in 1895 by David W. Henderson & Co. from G. L. Watson's designs for Baron Nathaniel de Rothschild, and belonged to the port of Trieste.

**CLUB BOOKS RECEIVED.**—We are indebted to Mr. J. Q. Litchfield, Secretary and Treasurer of the Lake Winnepesaukee Y. C., for a copy of their club book, and to Mr. Everett Paine, Secretary of the Corinthian Y. C., of Marblehead.

**COURIER AND LOUISE CHARTERED.**—The steam yacht Courier, Mr. B. F. Keith, owner, has been chartered for the season to Mr. James W. Friend, through the office of Henry J. Gielow. The same agency has also chartered for the season the 76ft. motor yacht Louise, Mr. Donald McNeil, owner, to Mr. Walter Herrick.

**THE RACE FROM CHICAGO TO MACKINAW.**—The next important event in yachting circles at Chicago will be the race from Chicago to Mackinaw. The race starts at 2 o'clock July 29. There is a larger number of entries than there were last year, when there were ten starters, the record time being 37h. 40m., made by Vencedor, which boat beat out Vannena for first prize by 4m. 40s. actual time. In addition to the boats which sailed last year it is expected that the new yawls, Juanita, Arcadia and Delight, will enter, and with Mr. Gillett's schooner Uncas, there will be at least fifteen starters.

**NEOLA II. SAILED BY HER OWNER.**—Credit was given to Mr. Addison G. Hanan for having sailed the New York Y. C.'s one-design boat, Neola II., to victory in the race at the Larchmont Y. C. on July 4. This was not correct and the boat was sailed in that race, as in all others, by her owner, Mr. George M. Pynchon.

**VANDERBILT CUP FOR MOTOR BOATS.**—Commodore W. K. Vanderbilt, Jr., of the Seawanhaka-Corinthian Y. C., has presented a cup to be raced for in the latter part of September. It is for motor boats driven by international combustion engines. The race is to be run without time allowance, on the Sound. The distance will be 100 miles, and the only restrictions are that the boats must be propelled by international combustion engines. The exact date of the race will be announced later.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

it was blowing hard and there was a lump of a sea on. The tide was ebb.

The start was made at 1:40, off Scotch Caps. The weather mark was the buoy off Mott's Point. Once around, 8 miles. The course was covered twice.

Mr. Clinton Work sailed Nike in the absence of Mr. Cumnock. Four seconds after the whistle Mimosa III. was across. Nike was next and Alert last, well behind. All were on the starboard tack as they went over, but all took the port tack as the wind freed a little. Mimosa III. simply lost her two rivals on the wind, and the race was hers from the start, as had been the other.

Nike split tacks with Alert and went off on her own hook; but she proved a bunder and she lost thereby. The times for the first leg follow, start, 1:40:

Table with columns: Boat Name, Weather Mark, Elapsed. Rows: Mimosa III., Alert, Nike.

Mimosa III. overtook the mark, but she had plenty of time in which to make blunders. She gybed at the mark, and after rounding gybed her boom back to port and set her spinnaker to starboard. Alert was next around, and Nike well behind. The times for the leeward leg:

Table with columns: Boat Name, Weather Mark, Leeward Mark, Elapsed. Rows: Mimosa III., Alert, Nike.

Mimosa III. and Alert held the port tack after hauling on the wind and benefited, as it was backing to the W. Nike again went luck hunting, and experienced the usual misfortunes when on such expeditions. Nike made better time on this leg than Alert. The times for the leg:

Table with columns: Boat Name, Leeward Mark, Weather Mark, Elapsed. Rows: Mimosa III., Alert, Nike.

On the run back to the finish the wind was coming in heavy puffs, and those on Mimosa III. took in their spinnaker, in order to avoid a possible accident. As she neared the New York shore the wind let up a little, and her spinnaker was reset. The times for the last leg were:

Table with columns: Boat Name, Weather Mark, Leeward Mark, Elapsed. Rows: Mimosa III., Alert, Nike.

The summary, start, 1:40:

Table with columns: Boat Name, Finish, Elapsed. Rows: Mimosa III., Alert, Nike.

Mimosa III. beat Alert 10m. 36s., and Nike 13m. 33s.; Alert beat Nike 2m. 57s.

The following is a record of the races held since the cup was put up for competition:

Corinthian Y. C.

Marblehead, Mass.—Tuesday, July 4.

AN open race was given by the Corinthian Y. C. off Marblehead, on Tuesday, July 4, for rating and restricted classes, in which there were forty-four starters. The breeze was S. at the start, but was S.E. outside, and the boats that were sent to the S. mark had no windward work. Meemer was first to get away in Class M, but Setsu took the lead soon after the start and held it to the finish. Opitsah III. led all the way around in Class P. In the 22-footers Medic had the start at the windward end of the line. All the boats at this end went in under the shore. Tyro crossed at the leeward end and stood across to Cat Island, catching the S.E. breeze first and taking the lead. At the outer mark she was followed by Chewink IV. and Medic II., and this order was maintained to the finish. Bat started away first in the 18-footers, while the others were hung up at the line in a mix-up, and she led all around the course. Vera II. took her usual win in the 15ft. class. In the special handicap class Tabasco won by a good margin. The summary:

Class M. Table with columns: Boat Name, Elapsed. Rows: Meemer, Cossack, L'Aiglon, Louise, Dorel, Kit.

Class N. Table with columns: Boat Name, Elapsed. Rows: Setsu, Jingo, Opitsah, Myrtle, Owaisa.

Class P. Table with columns: Boat Name, Elapsed. Rows: Opitsah III., Carina II., Sally IV., Tunipoo, Sea Fox.

22-footers. Table with columns: Boat Name, Elapsed. Rows: Tyro, Chewink V., Medic II., Rube, Peri II., Nutmeg, Myrtle, Clorinda, Opitsah III., Jingo, Medic.

18-footers. Table with columns: Boat Name, Elapsed. Rows: Bat, Hayseed, Bonitwo, Otter, Boo Hoo, Myrmidon, Mirage II., Aladdin, Hayseed II., Moslem.

15-footers. Table with columns: Boat Name, Elapsed. Rows: Vera II., Cigarette, Nibelung, Little Misery.

Special Handicap Class. Table with columns: Boat Name, Elapsed, Corrected. Rows: Tabasco, Muleykeh, Tartar, Crusoe, Gee Whiz.

Saturday, July 15.

The third championship race of the Corinthian Y. C. was sailed off Marblehead on Saturday, July 15, in a fresh N.W. breeze. In the 22-footers Nutmeg was first across the starting line, but Tyro had the weather berth, and she took the lead soon after the start, holding it to the finish. Medic I., in this class, was dismasted at the outer mark. In the 18ft. class, Hayseed got the start and led all over the course. Nibelung won handily in the 15ft. class. In Class M, Chewink IV. got the start and led to the outer mark,

but Cossack beat her out on the windward leg and took the race. It was all Carina II. in Class Q. The summary:

22ft. Class. Table with columns: Boat Name, Elapsed. Rows: Tyro, Rube, Medic II., Nutmeg, Chewink V., Peri II., Medic I.

18ft. Class. Table with columns: Boat Name, Elapsed. Rows: Hayseed, Otter, Moslem, Boo Hoo, Fritter.

15ft. Class. Table with columns: Boat Name, Elapsed. Rows: Nibelung, Little Misery, Cigarette.

Class M—Handicap. Table with columns: Boat Name, Elapsed. Rows: Cossack, Chewink IV., Setsu.

Class Q—Handicap. Table with columns: Boat Name, Elapsed. Rows: Carina II., Sea Fox.

Eastern Y. C.

Marblehead, Mass.—Monday, July 3.

THE first of a series of three special open races of the Eastern Y. C., was sailed off Marblehead on Monday, July 3, in a very light and fluky breeze from the S.W. It was so light at the start that the boats drifted across the line. They were sent into the wind, S.E., for the first leg, but before they had been long sailing, the wind hauled to S.W., and they laid the course. The breeze later fell again, and the yachts drifted toward the finish line, only eleven crossing out of about thirty-five starters. In Class M, Meemer got the start and led her class over the whole course. In Class N-O, Kit got the start, but soon after, Tyro took the lead and held it. Mirage II. got the start in Class O-P, but the little Lynn Y. C. one-design 15-footer Winniadhin went out ahead in the light air and was first across the finish line. The summary:

Class M—Over 33ft. and Not Over 40ft. Table with columns: Boat Name, Elapsed. Rows: Meemer, Chewink V., Cossack, Chewink IV., Rube.

Class N-O—Over 25ft. and Not Over 33ft. Table with columns: Boat Name, Elapsed. Rows: Tyro, Medic II., Peri II.

Class O-P—Over 18ft. and Not Over 25ft. Table with columns: Boat Name, Elapsed. Rows: Winniadhin, Bat, Boochoo.

Clorinda and Louise in Class M, and Hayseed II. in Class O-P, withdrew. Others did not finish within time limit of one-half hour after sunset.

Tuesday, July 4.

The second in the Eastern Y. C. series of special open races was sailed on Tuesday afternoon, July 4. In this event what started out to be good racing was spoiled by falling breeze. All classes were given a short course, 4 miles to windward, to the S.E. mark, and return, and in a dead end beat to the outer mark, there was as pretty a contest as one could wish to see; but on the last half of the course, the wind fell and kept hauling to the southward, thus spoiling all that the leading boats had accomplished. In Class M, Meemer had the best of the start in the weather berth, and she sailed a beautiful race to the windward mark, beating handily the Bar Harbor 31-footer Cricket and the Y. R. A. 30-footer Chewink IV. When she was held up by the falling breeze on the homeward course, she was passed by the whopper Redskin. Cricket was given first place on corrected time in this class, but it has since been learned that Cricket had assumed greater length than Meemer, and the latter is now believed to be the winner. In Class N-O, Medic II. got the start, with Rube second, Tyro third, and Chewink V. fourth. These four boats had a pretty race all the way out, Rube turning the outer mark first, closely followed by Chewink V. and Tyro. With a larger spinnaker than the others, Chewink V. led the class across the finish line, with Tyro second and Medic II. third. A protest was entered against Chewink V. for carrying her larger spinnaker, the 22-footers having agreed to race as a class within a class, all using spinnaker poles of uniform length. Upon this protest will be decided Chewink's place, although Medic II. is at present credited with first on corrected time. Class O-P got away with Boo Hoo, Hayseed I., and Bat, 18-footers, at the head of the bunch. Boo Hoo led across the finish line, with the 25-footer Carina II. second; but Carina II. is credited with first on corrected time. In the following summary all yachts not credited with corrected times, have not been measured:

Class M—Over 33 and Not Over 40ft. Table with columns: Boat Name, Elapsed, Corrected. Rows: Cricket, Meemer, L'Aiglon, Rofel, Cossack, Kit II., Redskin, Louise, Chewink IV.

Class N-O—Over 25ft. and Not Over 33ft. Rating. Table with columns: Boat Name, Elapsed, Rating. Rows: Medic II., Setsu, Rube, Tyro, Chewink V., Urchin, Peri II., Nutmeg, Myrtle, Clorinda, Opitsah III., Jingo, Medic.

Prizes, \$50, \$30, \$20. Table with columns: Boat Name, Elapsed, Rating. Rows: Carina II., Aspenet, Mirage II., Aladdin, Hayseed I., Bonitwo, Vera II., Tunipoo, Bechoo, Bat, Myrmidon, Theorem, Aurora, Winniadhin, Moslem I., I, 17, Baggarah, Sally IV., Nibelung, Sea Fox.

Class O-P—Over 18 and Not Over 25ft. Rating. Table with columns: Boat Name, Elapsed, Rating. Rows: Carina II., Aspenet, Mirage II., Aladdin, Hayseed I., Bonitwo, Vera II., Tunipoo, Bechoo, Bat, Myrmidon, Theorem, Aurora, Winniadhin, Moslem I., I, 17, Baggarah, Sally IV., Nibelung, Sea Fox.

Prizes, \$50, \$25, \$15. First three only measured.

Power Boats—Tuesday, July 4.

THE power boat races of the Eastern Y. C. sailed on the morning of July 4, were not as successful as desired. There were only six entries all told, and one of these took a sailover. Essex, a first-class boat, sailed with the third-class boats. In this class the first three boats finished in the same positions they started. It started last and Weewin fourth. The summary:

Second Class. Table with columns: Boat Name, Elapsed. Rows: Highball, Richard Hutchison.

Third Class.

Table with columns: Boat Name, Elapsed. Rows: Essex, Omeomi, Little Egypt, It, Weewin.

The average speed per hour was: Essex, 11.51 miles; Omeomi, 10.63; Little Egypt, 9.87; It, 9.76; Weewin, 9.46; Highball, 7.52.

Beverly Y. C.

Wing's Neck, Buzzard's Bay—Saturday, July 8.

THE Beverly Y. C. sailed its three hundred and sixty-seventh regatta from its club house on Saturday, July 8. The event was the first Corinthian race of the season—that is, the first race counted for the championship of the club.

The weather was somewhat thick all the morning, with a light breeze from the S.W. At 1 o'clock, the hour for starting, the wind had increased somewhat, so that at times there was a whole-sail breeze. Throughout the afternoon, it maintained its direction fairly constant from the S.W., but its velocity varied greatly, often falling to a very light breeze, and again breezing on in sharp puffs. Fog came with the wind, and during much of the afternoon it was impossible to see one-quarter of a mile.

In the 21ft. class, Quakeress appeared for the first time, but as Illusion did not turn up, the number of entries was the same as it has been throughout the season. Commodore Dabney's Terrapin took the lead shortly after the start, and maintained it throughout the race. The contest for the other positions, however, was often in doubt and afforded good racing. At first Quakeress was in the second place, but she left the other boats and stood on a long tack over to the Marion shore, and when she met the bunch again off Bird Island, she was in fourth place. Barnacle and Amanita III. had a close race all the way to the windward mark, in which Barnacle finally won and rounded the buoy a short distance ahead of Amanita. From the windward mark the boats reached across the bay to Scraggy Neck buoy No. 8, and during this reach Amanita got away from Quakeress and Barnacle drew away slightly from Amanita. On the run home the chief excitement was furnished by Amanita and Quakeress. These two indulged in several luffing matches, which carried them often dangerously near the rocks. Here Quakeress had the advantage, for she draws much less water, and she finally secured the windward position and seemed sure to take third place; but Amanita got a puff just before reaching the line, and beat Quakeress by 2s.

In the 18ft. one-design class there were four entries. These boats were sent first to Bird Island and then across the bay to Scraggy Neck Buoy No. 8, and then home. Margaret finished first, 24s. ahead of Wanderer, who had a lead of over a minute over Jap.

The 15ft. one-design class was sent to Bird Island and back. There were seven entries, and Maurice H. Richardson, Jr., took first place with his Ranzo, beating Miss Dabney in Fiddler by 29s., and Miss Dabney beating F. W. Sargent, Jr., by only 55s.

The race was distinguished by the appearance of a new class, the fifth class cats. Several times during its history the club has had entries from this class, but for a year or two none have appeared. Last Saturday four of the Cataumet one-design catboats, commonly known as the Cataumet Pups, abandoned their usual practice of staying in their own harbor, and came down to the club for a race. The boats were all sailed by amateurs, but the skippers were not all members of the club, therefore, the race was more in the nature of a self-arranged brush than a formal contest. Mr. Frank Paine, Col. C. J. Paine's youngest son, won in his Water Baby, beating Minnow, which was sailed by Mr. George Nichols, of New York, by 40s.

The judges were Messrs. L. S. Dabney and Charles Whittemore. The times in detail follow:

21-footers—Course 12—13 1/2 Miles. Table with columns: Boat Name, Elapsed. Rows: Terrapin, Barnacle, Amanita III., Quakeress, Radiant, Arethusa.

18-footers—Course 16—8 1/2 Miles. Table with columns: Boat Name, Elapsed. Rows: Margaret, Wanderer, Jap, Hindoo.

15-footers—Course 18—8 1/2 Miles. Table with columns: Boat Name, Elapsed. Rows: Ranzo, Fiddler, Vim, Fly, Compress, Jub Jub, Flickamaroo.

Fifth Class Cats—Course 19—6 1/2 Miles. Table with columns: Boat Name, Elapsed. Rows: Water Baby, Minnow, Mullet, Folly.

Knickerbocker Y. C.

College Point, Long Island Sound—Saturday, July 8.

THE third series race of the Sea Skunks was held on Saturday, July 8. A 7 1/2 sea mile course was covered by the seven boats that started. The wind was light and the water smooth. Mr. F. L. Kramer won, and Mr. A. E. Kirker was second. The summary, start 4:30 P. M.:

Table with columns: Boat Name, Finish, Elapsed. Rows: No. 1, No. 5, No. 6, No. 11, No. 9, No. 12.

Saturday, July 15.

MR. A. L. KERKER'S one-design power boat ran on a rock and injured her propeller in the race held on Saturday afternoon, July 15, for the Sea Skunks. Mr. J. Cassidy's boat won, and Mr. F. L. Kramer's boat was second. The wind was fresh from the N.W., and the water was lumpy. The summary:

Table with columns: Boat Name, Elapsed. Rows: J. J. Cassidy, F. L. Kramer, E. P. Sands, S. H. Mason, J. Sulzbach, A. L. Kerker.

Bayside Y. C.

Bayside, Long Island Sound—Saturday, July 15.

THE Bayside Y. C. held a club race on Saturday afternoon, July 15. There were six starters in two classes, and all the boats went over an 8-mile course. The wind was strong from the N.W. The summary:

Table with columns: Boat Name, Elapsed. Rows: Rubber, Easy Mark, Ivy, Kangaroo, Imbree, Runaway.

Seawanhaka Corinthian Y. C.

Oyster Bay, L. I. Sound—Saturday, July 15.

ON Saturday afternoon, July 15, five of the 15-footers raced over an 8-mile triangle in a strong N.W. breeze. Sabrina won and Imp was second. The summary, start, 3:11:

Table with columns: Boat Name, Elapsed. Rows: Sabina, Imp, Chipmunk, Fly, Grise.

Annual Cruising Race, Macatawa Bay Y. C.

THE annual Lake Michigan cruising race of the Macatawa Bay Y. C. 2ft. raceabout class, which was held Sunday, June 11, proved to be a most exciting and sporty contest.

The course was from the piers at Grand Haven, finishing between the piers at Macatawa, a distance of 20 miles. The regular Lake Michigan Yachting Association raceabout rules were in force, with the exception that balloon jibs were permitted and the regular crew limit of five was removed.

The morning of the race was cold and foggy, with half a gale from the W.N.W. Grand River was in flood, brown and turbid, carrying trees and driftwood, with a six or seven mile current swirling out between the piers.

The starting gun was fired at 10 A. M., and the fleet went over the line in the following order: Elvira, Colleen and Hobo near the pier. Madcap, Zeta and Snipe well out in the Lake.

At 10:30 the Twin Sisters, a solitary pair of sand hills, were abeam, showing about 4 miles had been passed. Here Elvira was in the lead, while Madcap had worked into a close second and was leading the windward division.

Then a dirty, cold fog came sweeping in and blotted out the shore line, so for some time we steered by compass. Before long the wind shifted a point to the N., and it gradually cleared.

Colleen and Hobo now began to jump up on the leaders. With two men on the spinnaker poles, and spinnaker and balloon as hard as iron, they were fairly leaping through the seas.

The wind came stronger and stronger, and before long, with a crash Colleen's spinnaker pole went up in the air. It was quickly secured and the remaining 10ft. piece put out again, with three of the crew to hold it down.

At 11:10 the entrance to Port Sheldon rushed past through a smother of foam, seeming to disappear astern as soon as sighted. Half of the race was run.

Hobo was now closing up on Colleen's weather inch by inch. Elvira and Madcap were slowly dropping behind without the pull of their spinnakers. Snipe was coming up. Hobo attempted now to get Colleen's wind, but the latter luffed from under, with spinnaker slatting and banging, and took a position on Hobo's weather.

As the lighthouse at Macatawa grew plainer into view, the wind began to come in angry squalls, lifting the tops off the waves and making the boats fairly jump from under with a creaking and straining that seemed sure to take out the sticks.

When we had time to look back, we saw one of Snipe's men bobbing up and down in the big combers at the mouth of the channel. He had gone overboard on the gybe. He seemed to be swimming strongly, and Elvira rushing past next, threw him a life buoy.

We now learned why Snipe had squeezed us so at the pier. It was her main sheet man who had gone overboard, helped by an extra big sea. He had hung on to the sheet, and dragging through the water at a 10-mile clip, had pulled in the boom till she wouldn't bear away.

Madcap finished 29s. behind Elvira. These two boats did remarkably well, considering they did not carry spinnakers.

Table with columns: Name, Start, Finish, Elapsed, Corrected. Lists boats like Hobo, A. W. Hompe, Colleen, A. Baxter, Snipe, R. W. Irwin, Elvira, D. C. Miller, Madcap, C. W. Baxter, Zeta, E. E. Dryden.

Hobo wins the C. M. Camburn cruising cup, and holds the record time for this course, 2h. and 27m.

New Rochelle Y. C. Race, July 15.

Echo Bay to Stratford Shoal Light and Return. THE second annual race to Middle Ground Light and return, a matter of 66 miles, brought out a fleet of ten starters, boats of all rigs, sailing in one class, and rated for T. A. on the basis of W. L. length, plus one-half overhang at 10s. per foot per mile.

The race was a reach both ways, with the exception of a short leg to windward between the South and North buoys on Stratford Shoals, and the wind free enough to enable the boats to carry balloons on both legs.

The idea of having the start and finish at the home port was an excellent one, and might well be adopted for some of the longer races.

The wind at the start was fresh N.W., and Thora crossed the line first, overlapping Escape. Off Milton Point, after a sharp luffing match, Escape took the lead, and at Stamford Light had gained about one-quarter of a mile on Thora and Fleetwing, with the rest of the fleet one mile astern, closely bunched and sailing a very even race.

The wind held true all the afternoon, with the leaders in the same relative positions. At 8:28 Escape luffed around the red buoy to the south of the light, followed by Thora at 8:34, and Fleetwing about 10m. later. Thora rounded close to the light instead of standing on to the northerly buoy, which disqualified her, her owner having misunderstood the instructions.

After 9 o'clock in the evening the wind moderated, but freshened again about 10 o'clock, and at midnight the leaders were off Newark Islands, Escape still in the lead.

Fleetwing rounded second, and the catboat Nymph third; the others too far astern to be distinguished.

Escape finished at 3 A. M., the first boat to complete the course. Following is a summary of the race:

Table with columns: Name, Start, Finish, Elapsed, Corrected. Lists boats like Nymph, Escape, Susie, Thora, Fleetwing, Kismet, Gaychen, Grace, Io, Katharine.

According to the committee's time, Nymph was first, Escape second, Susie third, and Thora fourth, but protests have been entered against Nymph, Susie and Thora for not rounding buoys at outer marks, which made a saving of 1 1/4 miles of windward work in a light breeze.

Hartford Y. C.

Hartford to Fenwick—Saturday, July 4.

THE long-distance power boat race given by the Hartford Y. C. on Saturday, July 8, was a great success. The course was from Hartford to Fenwick, 46.06 miles. The weather was cloudy, and the boats encountered a head wind and a lumpy sea.

The Race Committee was made up of Messrs. C. H. Symonds, chairman; F. A. Law, N. C. Brainard, John MacFadyen and Joseph Merritt.

The winners were: First Division—Rita, first and Swastika second. Second Division—Iris first, and Ruth second. Autoboats—Flip first and Fantana second.

Some of the boats ran very close to their rating. Three boats with a difference in starting times of 53m. 36s. in one case, and 1h. 23m. 12s. in the other, over the first boat, finished the 46 miles within 16s. of each other.

It showed also that a cruising boat should be measured in cruising trim, as she cannot make her rating if measured light and loaded down for a cruise before starting in the race.

The time of the autoboats was slow, as Flip and Fantana both had their engines installed the night previous, with no time to tune up. The actual time of Flip was 11m. less, as she was delayed that time after her starting gun was fired.

Columbia, of which so much was expected, failed to make good, and withdrew, disabled within sight of the finish line.

The particulars of the boats follow:

Table with columns: Name, Sailing Length, Handicap. Lists boats like Rita, C. D. & A. D. Franeis, Swastika, A. H. Brooks, Jessie F., J. F. Foster, Caprice, W. H. Kinney, Iris, J. E. Cowbshaw, Ruth, E. S. McAll, J. O. S., T. H. Smith, Rocket, D. S. Morrell, Flip, C. H. Holmes, Fantana, Hubbard Motor Co., Columbia, F. E. Dayton.

The times were as follows:

Table with columns: Name, Start, Finish, Elapsed. Lists boats like Rita, Caprice, Iris, Ruth, Swastika, Jessie F., J. O. S., Rocket, Flip, Fantana, Columbia.

Quincy Y. C.

Quincy, Mass.—Saturday, July 8.

THE annual Y. R. A. open race of the Quincy Y. C. was sailed off the club house, Hough's Neck, on Saturday, July 8, in a wholesail breeze from the S.W. In the 22-footers Kube got the start and led all over the course. In the 18ft. class Nicknack got the start, but Hayseed soon went into the lead, and was leading at the end of the first round. On the second beat to windward, Bonitwo went out ahead and led to the finish. Zaza II. did about all the leading in the sailing dory class. Stranger got the start in the Cape cats, with Argestes second. On windward work, however, Marvel took the lead and she held it during the rest of the race. The summary:

Class E—22ft. Cabin Yacht Association.

Table with columns: Name, Elapsed. Lists boats like Rube, H. L. Bowden, Nutmeg, A. C. Jones, Tyro, W. H. Joyce, Chewink V., F. G. Macomber, Jr., Clorinda, Cheney & Lanning, Medric, George Lee.

Class I—18ft. Knockabout Association.

Table with columns: Name, Elapsed. Lists boats like Bonitwo, G. H. Wightman, Hayseed, H. L. Bowden, Dorchen, A. W. Finlay, Aladdin, Keith Brown, Mirage II, J. W. Olmstead, Moslem, John Tyler, Little Miss, B. S. Permar, Nicknack, E. B. Holmes.

Class X—M. R. D. A. Class.

Table with columns: Name, Elapsed. Lists boats like Zaza II, Gordon Foster, Bessie A, J. R. Hodge, Elizabeth F., H. W. Dudley, Frolic II, W. G. Torrey, Bugaboo II, H. B. Ingalls, Spray, H. T. Wing, Barbara, Blaney & Wardwell.

Class D—Cape Cats.

Table with columns: Name, Elapsed, Corrected. Lists boats like Marvel, I. W. Whittemore, Hustler, H. W. Robbins, Stranger, Dr. F. E. Dawes, Argestes, G. H. Wilkins, Josephine, F. H. Smith, Noturus, C. O. Whitney, Dorothy III, F. F. Crane, Moondyne, Shaw Brothers, Saltair, C. C. Collins, C. C. George Carey, Tomahawk, S. W. Leighton.

Saturday, July 15.

IN a race for Cape cats given by the Quincy Y. C. on Saturday, July 15, Argestes was first across the finish line, but lost to Marvel on time allowance. There was a strong N.W. breeze. The summary:

Table with columns: Name, Elapsed, Corrected. Lists boats like Marvel, I. M. Whittemore, Argestes, G. H. Wilkins, Josephine, F. H. Smith, Moondyne, Shaw Brothers, C. C., G. H. Carey, Dorothy III, F. F. Crane.

Columbia Y. C.

South Boston, Mass.—Saturday, July 8.

THE second interclub race between boats of the South Boston, Winthrop and Columbia yacht clubs was given by the Columbia Y. C., on Saturday, July 8, a fresh S.W. wind prevailing. Violet won in Class A. Early Dawn finished first in Class B, after having started five minutes late, but lost on time allowance to Alpha. Marion won easily in Class B, but was protested by Poor Boy, which finished second. The summary:

Class A.

Table with columns: Name, Elapsed, Corrected. Lists boats like Violet, H. J. McKee, Thialfi, Dr. Soule, Melca, J. Embree, Hilda, S. L. Haskell, Tourist, Verman & Stebbins, Rival, W. J. Nickerson, Grandee, A. H. Baker, Chieftain, John E. Holland, Lotne, Wm. Garrett.

Class B.

Table with columns: Name, Elapsed, Corrected. Lists boats like Alpha, A. F. Leary, Early Dawn, J. E. Doherty, Hevnes, C. A. Heaney, Mistral, Geo. Hannon, Arbutus, W. L. Young, Emma C., F. D. Perkins, Abrash, M. L. J. Girdany, Janice, Minerva, Walter Shaw, Laura N., Nickerson, Nancy Hanks, Geo. W. Lane, Kit, H. B. Whittier.

Class C.

Table with columns: Name, Elapsed, Corrected. Lists boats like Marion, J. Gahan, Poor Boy, Jas. Jerry, Elf, Owaissa, Walter Kelly, Uncom, C. H. Lothrop, Echo, W. A. Purdy, Magdalene, Geo. Nash.

Wollaston Y. C.

Quincy, Mass.—Saturday, July 8.

A CLUB race of the Wollaston Y. C. was sailed in Quincy Bay on Saturday, July 8, in a moderate S.W. breeze. Eclipse won in Class A, Sheila in Class B, and Alpha in Class C. The summary:

Class A.

Table with columns: Name, Elapsed, Corrected. Lists boats like Eclipse, Geo. Sawyer, Marguerite, F. L. Groce, Harold, E. B. Robbins.

Class B.

Table with columns: Name, Elapsed, Corrected. Lists boats like Sheila, F. L. Hewitson, Goblin, Roy Lothrop.

Class C.

Table with columns: Name, Elapsed, Corrected. Lists boats like Alpha, E. F. Drew, West Wind, Wm. Chase, Peacock, F. Gardner.

Tuesday, July 4.

A CLUB race of the Wollaston Y. C. was held in Quincy Bay on Tuesday, July 4, in a light E. breeze. Sheila won in Class and West Wind in Class C. Mischief won easily in the motorboat class. The summary:

Class A.

Table with columns: Name, Elapsed, Corrected. Lists boats like Sheila, L. F. Hewitson, Marguerite, F. F. Groce.

Class C.

Table with columns: Name, Elapsed, Corrected. Lists boats like West Wind, W. M. Chase, Peacock, Frank Gardner, Alpha, E. F. Drew.

Motor Boats.

Table with columns: Name, Elapsed, Corrected. Lists boats like Mischief, Henry Nelson, No Name, A. T. Barstow, Sober, A. C. Bryant, Esther, G. W. Topham, Norma, A. C. Gardner, Curley, C. W. Dill, Endymion, A. T. Nichols, Juniata, W. H. Bean, Puff, J. F. Merrill.

Mosquito Fleet Y. C.

South Boston, Mass.—Saturday, July 8.

A HANDICAP club race of the Mosquito Fleet Y. C. was sailed off City Point on Saturday, July 8, in a strong S.W. breeze. In the first class Sentinel was first by a big margin. In the second class a very close race was sailed between Reveille and Supero. In the first class of power boats Schemer won and Davie won in the second class of power boats. The summary:

First Class—Sail.

Table with columns: Name, Elapsed, Corrected. Lists boats like Sentinel, Geo. R. Crawford, Myth, Jas. T. Powers, Triton, T. J. Kelley, Grace, David Byford, Flirt, A. Dalrymple.

Second Class—Sail.

Table with columns: Name, Elapsed, Corrected. Lists boats like Reveille, J. McAuliffe, Supero, A. Le Forte, Cresceus, J. Shaw, May M., G. Magunseen, Sporty, J. Mitchell.

First Class Power Boats.

Table with columns: Name, Elapsed, Corrected. Lists boats like Schemer, C. E. Paget, Jessica, P. F. Higgins.

Second Class Power Boats.

Table with columns: Name, Elapsed, Corrected. Lists boats like Davie, J. Alexander, Rutch, J. Devine, Progress, J. Kovar, Mabel, Geo. F. Barry.

Lynn Y. C.

Lynn, Mass.—Saturday, July 8.

A RACE for sailing boats and power classes was given by the Lynn Y. C., on Saturday, July 8. In the first class Essex had things practically all her own way. In the second class of power boats Admiral was the first to finish, but lost to Edith E. on time allowance. Winniahdin won, as usual, in the one-design class of 15-footers. The summary:

First Class Power Boats.

Table with columns: Name, Elapsed, Corrected. Lists boats like Essck, E. G. Young, Edith M., J. F. Moore, Vim, J. Boyle, High Ball, Hutchinson, Kazardy, E. E. Winkley.

Second Class Power Boats.

Table with columns: Name, Elapsed, Corrected. Lists boats like Edith E., F. Mink, Admiral, W. Hall, Jennie M., Grover, Niobe, E. E. Winkley, Aspirant, S. Howe.

One-Designers.

Table with columns: Name, Elapsed, Corrected. Lists boats like Winniahdin, Spratt, Haymaker, Johnson, San Toy, Reddon.

Highland Beach Motor Boat Races.

NAVESINK Highlands, New York Lower Bay—Saturday, July 15. OWNERS of motorboats who live in the vicinity of Highland Beach, N. J., arranged for a series of motorboat races for Saturday, July 15. The winners were Anna, Greylock, Edith and Dream. The courses were laid out in the Horseshoe. The summary:

Class 1—Boats Under 17ft.—Course, about 2 Miles.

Table with columns: Name, Start, Finish, Elapsed. Lists boats like Anna, Waikihi, H. McVicker, Outing, J. H. Bush.

Class 2—Boats from 18 to 24ft.—Course, about 4 Miles.

Table with columns: Name, Start, Finish, Elapsed. Lists boats like Sea Robin, W. McCullom, Greylock, F. Freund.

Class 3—Boats 24ft. and Over—Course, 5 Miles.

Table with columns: Name, Start, Finish, Elapsed. Lists boats like Edith, John Cornwall, Gertrude, Peter Cornwall, Clara B., W. Johnson.

Class 4—High Power Boats—Course, 15 Miles.

Table with columns: Name, Start, Finish, Elapsed. Lists boats like Dream, Charles Peterson, Ludo, McKenzie Brothers, Flying Dutchman, Chas. Peterson.

Edgewood Y. C.

Narragansett Bay—July 15.

THE 30ft. cats of the Edgewood Y. C. sailed the first race in the series for the Ford cup, Saturday afternoon, July 15. This is a challenge cup for the class, offered by Mr. Henry Ford. It is to become the permanent possession of the winner of the three races unless challenged for within one year. The boats will score on the percentage system, as in the Possner cup races.

The first race was a fine one, there being a stiff single reef breeze from the N. that sent the five boats over the 16-mile windward and leeward course in fast time.

Wanderer IV. gave another fine specimen of sailing, and won handsily by more than 7m. actual time. She has a new sail that seems to make an improvement even over her work in the previous week's race. Scatt lost so much time in laying to to put in another reef that she was hopelessly distanced, and withdrew. The summary:

Start 2:50—Course, 16 Miles.

	Finish.	Elapsed.	Corrected.
Wanderer, H. J. & D. W. Flint.	6 04 05	3 14 05	3 14 05
Elizabeth, W. D. Wood.	6 12 06	3 22 06	3 16 46
Mblem, G. E. Darling.	6 13 45	3 23 45	3 18 25
Emeline, W. J. Rooks.	6 11 42	3 21 42	3 19 39
Scatt, H. B. Scattergood.	Withdraw.		

F. H. YOUNG.

Unqua Corinthian Y. C.

Amityville, L. I.—Saturday, July 15.

THE Unqua Corinthian Y. C. held a club race off Amityville on Saturday, July 8. A fresh W. wind held throughout the match, and the eleven starters all covered an 11-mile course. The winners were Alcen, Skip, Cecil, Grace R. (on corrected time), and Florence. The summary:

Class A—Sloops—Start, 2:00—Course 10 Miles.			
	Finish.	Elapsed.	Corrected.
Aleen, E. F. Bleeker.	4 08 51	2 08 51	2 08 51
Ceuree, J. C. Curley.	4 09 23	2 09 23	2 09 23
Lone Star, F. R. Macqueen.	4 11 49	2 11 49	2 11 49

Jamaica Bay Y. R. A. Ocean Race.

Rockaway Inlet to Sandy Hook Lightship and return—Sunday, July 16.

NINE yachts started, and eight finished in the ocean race given by the Jamaica Bay Y. R. A. on Sunday, July 16. The course was from can buoy No. 2, Rockaway Inlet, around Sandy Hook Lightship and back to the finish line off the Jamaica Bay Y. C. The race was for first and second class sloops. The wind was light from the S.E. Class A boats were sent away at 10:35, and the other class 5m. later.

It was a broad reach out of the Inlet, a beat to the lightship and a run home. Rough Rider carried away her topmast in rounding the lightship and Cornelia broke the jaws of her gaff. Cornelia won in Class A and Anne Arundel won in Class B. The summary:

Sloops—Class A, 30ft. to 40ft.—Start, 10:35—Course 20 1/2 Miles.

Cottage Park Y. C.

Winthrop, Mass.—Saturday, July 8.

A RACE for sailing yachts and power boats was given by the Cottage Park Y. C., off Winthrop, on Saturday, July 8. In the sailing class Katrina won easily. In the power boats the feature was the close race between Alice and More Whiz. Anita won in this class on time allowance. The summary:

Winthrop Y. C.

Winthrop, Mass.—Saturday, July 15.

A CLUB race of the Winthrop Y. C., was sailed off Winthrop on Saturday, July 15, in a strong N.W. breeze. In the 25ft. class Noturus finished a long distance ahead, but lost on time allowance. Evelyn had things easy in the 21ft. class, after Opechee had withdrawn. Wink won in the Crystal Bay class. The summary:

Canoeing.

American Canoe Association.

SUGAR ISLAND MEET, AUG. 4 TO 18, 1905.

ARRANGEMENTS will be made to furnish members and guests of the American Canoe Association with transient lodgings at headquarters, where a cot, blankets, toilet ac-

commodations, soap, towels, etc., will be provided at \$1 per night. Beds will be ready at 10 P. M., and must be given up at 7 A. M.

It is expected that an illuminated canoe parade will be held one evening during the meet. Members are requested to bring their paper lanterns, decorations, etc., as it is earnestly desired that all canoes at the meet should be in line. Mr. W. S. Abbott, of Gananoque, has a full line of Japanese lanterns, umbrellas, flags, etc., at reasonable prices, full information concerning which can be had from the Camp Site Committee.

The proprietor of the camp store, George A. Ryan, of Gananoque, has arranged to have a supply of home-cooked cold meats, such as corned beef, ham, tongue, sausage, etc., and a good assortment of fresh fruits, vegetables, ice cream and soft drinks for sale at the camp store. Orders will be taken for anything not in regular stock.

There will be a barber in attendance at the camp on Wednesday and Sunday mornings, with whom appointments can be made. Address C. T. Munroe, Gananoque, Ont.

All members who intend coming to the meet are requested to communicate with Frederic Andreas, Chairman Camp Site Committee, 1 Broadway, New York City, so that sites may be assigned to them. Full details, with prices of floor and tent rentals were published in FOREST AND STREAM of June 17, 1905.

Time-table of the steamer Valeria, subject to change:

Leave Gananoque	8:10 a. m.	3:30 p. m.
Stop Sugar Island	8:35 a. m.	3:55 p. m.
Arrive Clayton	9:20 a. m.	4:40 p. m.
Leave Clayton	10:30 a. m.	6:30 p. m.
Stop Sugar Island	11:15 a. m.	7:15 p. m.
Arrive Gananoque	11:40 a. m.	7:40 p. m.

Time-table of the Gananoque Inn launch, Louise, subject to change:

Leave Gananoque	6:00 a. m.	5:00 p. m.
Stop at Sugar Island on signal		
Arrive Clayton	7:20 a. m.	6:20 p. m.
Leave Clayton	8:00 a. m.	7:00 p. m.
Stop at Sugar Island on signal		
Arrive Gananoque	9:20 a. m.	8:20 p. m.

Time-table of the American Canoe Association launch, Rob Roy:

Leave Gananoque	6:30 a. m.
Stop Sugar Island	7:00 a. m.
Arrive Clayton	8:00 a. m.
Leave Clayton	8:30 a. m.
Arrive Sugar Island	9:15 a. m.

The launch will then be available for charter during the day, and make trip to Clayton in the afternoon if required, returning and leaving Sugar Island at 6 P. M., arriving at Gananoque at 6.30.

A. C. A.'s 25th Anniversary.

BROOKLYN, N. Y.—Editor Forest and Stream: The forthcoming camp of the American Canoe Association at Sugar Island, in the St. Lawrence, convenes one day after the twenty-fifth anniversary of the Association's organization, i. e., Aug. 3, 1880, at Crosbyside, Lake George. It would be a mighty pleasant thing to celebrate the rounding out of the first quarter century of the A. C. A. at camp, and if enough of the old guard and new members are on hand on the 3d of August this year, I respectfully suggest that some suitable action be taken. I know of several who will be in camp ahead of the opening day.

J. K. HAND.

A. C. A. Membership.

STAMFORD, Conn., July 15.—New Members Proposed.—Atlantic Division: William Stark, Jr., Kingsbridge, N. Y. city, by F. W. Lohr; William H. Conrad, Beverly, N. J., by F. P. Rifle Range and Gallery.

Fixtures.

July 24-29.—Newark, O.—Second annual of the Ohio State Rifle Association.  
 July 26-Aug. 1.—Creedmoor, L. I.—Second annual of New York Rifle Association.  
 Aug. 7-8.—Springfield, Mass.—New England Schuetzenbund.  
 Aug. 11-18.—Fort Des Moines.—Iowa Rifle Association annual meeting.  
 Aug. 24-28.—Sea Girt, N. J.—National rifle and revolver matches.  
 Aug. 29-Sept. 9.—Sea Girt, N. J.—National Rifle Association and New Jersey State Association.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of the Cincinnati Rifle Association at Four-Mile House, Reading Road, July 2. Conditions: 200yds., offhand, at the 25-ring target. Hasenzahl was champion for the day with the good score of 227. Payne was high on the honor with 66 points. We were very much pleased at having Mr. F. M. Garden, of the Willow Rifle and Gun Club, as a visitor at our range to-day. He spent a pleasant afternoon, but regretted very much at not having brought his rifle with him. The scores:

Hasenzahl	227	225	221	220	217
Payne	219	219	215	213	209
Hofer	219	211	211	205	205
Nestler	215	214	211	206	205
Freitag	210	208	204	201	199
Roberts	210	208	201	200	198
Odell	196	191	187	185	169

Badisches Volkfest.

DURING the festival of this society in Harlem River Park, 127th street, and Second avenue, this city, there will be prize shooting, in which rifles fitted with telescope sights will be allowed without restrictions, but only .22cal. cartridges can be used, as the park is in the heart of the city. There will be ten cash prizes on the 18-ring target, best two tickets to count, and three premiums. Shooting will commence at 11 o'clock, Aug. 23.

Zettler Rifle Club.

THE regular shoot for July was held in Union Hill Park on the 7th, and should have been more largely attended, considering the fact that it was the occasion for competition for the national marksman's badge. Louis P. Hansen, the veteran match rifleman of Jersey City, was the winner, with the good score of 83 out of the possible 100 points at 200yds., offhand, on the Standard American target. The scores follow:

National Marksman's Badge Shoot.

L. P. Hansen	7	6	7	10	10	10	7	7	9	83
A. Hubalek	8	8	10	7	7	7	9	8	9	81

**The Zettler Annual.**

THE Zettler Rifle Club, of this city, has fixed the dates for its annual outdoor prize shoot. This will be held in Union Hill Park, New Jersey, Sept. 27 and 28. The club's president, Gus Zimmerman, with his family, is now in Europe, and the club did not wish to hold its annual festival until his return. So far as his friends have heard, Mr. Zimmermann has not been doing as much rifle shooting as usual while abroad, evidently because no important matches have been held over there so far.

**Trapshooting.**

If you want your shoot to be announced here send a notice like the following:

**Fixtures.**

- July 20-21.—Grand Forks.—North Dakota State Sportsmen's Association. C. A. Hale, Sec'y.
- July 22.—Chicago, Ill., G. C. tournament. C. P. Zacher, Sec'y.

- Oct. 11-12.—Dover, Del., Gun Club tournament; open to all amateurs. W. H. Reed, Sec'y.

**DRIVERS AND TWISTERS.**

The merchandise shoot, first of its kind or any other kind arranged to be held on the Boiling Spring Gun Club ground at Rutherford, N. J., in many moons, will take place on Saturday of this week. Address Mr. Hugo Brugmann for programme.

The trapshooting tournament to be held at Capon Springs, W. Va., Aug. 3-4, will begin at 3 o'clock P. M., each day. The programme consists of three events at 10-targets, \$1 entrance, and one event at 25 targets, \$2.50 entrance, targets extra, 2 cents.

In the 5-man team race, held on July 13, the second day of Malone's eleventh annual summer tournament, the Baltimore Shooting Association's team No. 1 won with a score of 234 out of a possible 250, over a 93 per cent. gait. The members were Messrs German, Lupus, Storr, Hawkins and Malone. Mr. German scored 50 straight.

A. A. Schoverling, Sec'y-Treas., writes us under date of July 13 as follows: "A new gun club has just been organized to be known as the Palisade Gun Club, of Edgewater, N. J. Mr. H. W. Bissing is President, Mr. Carl Richter is Vice-President and Mr. A. A. Schoverling is Secretary-Treasurer. This club will shoot on the well known grounds of the North River Gun Club the first Tuesday of each month beginning Aug. 1, and tournaments will be held on the last Thursday of each month."

The programme of the North Dakota State Sportsmen's Association amateur tournament, July 20-21, at Grand Forks, provides ten events on the first day, each at 15 targets, \$1.50 entrance, \$5 added, and one event, a 4-man team shoot, at 25 targets per man; \$6 per team, \$10 added. There are ten events on the second day, eight at 15 targets, one, the State championship, at 25 targets and one at 20 targets. The annual meeting will be held on the first day at 8:30 P. M. Rose system sliding handicap. Shooting begins at 9:30.

At the Interstate Association tournament, given for the Menominee, Mich., Gun Club, July 12-13, a special incident was the breaking of 100 targets by a squad of five, the members of which were Messrs. Hirschy, Crosby, Host, Kaufman and Loud. Each made a 20-straight. Mr. H. Hammersmith won the League

championship event with a straight 25. The amateur general average was won by Mr. Guy Deering with 380; second, Mr. W. H. Schultze, 374; third, Mr. A. Molle, 371. Professionals, Messrs. H. C. Hirschy and W. R. Crosby tied for first with 391; second, Mr. C. A. Young, 387; third, Mr. R. O. Heikes, 386.

We have heard some gossip concerning the short flight of the targets at the recent G. A. H. To settle the matter, we wrote concerning it to Mr. Elmer E. Shaner, the Secretary-Manager of the Interstate Association, and he replied as follows: "The targets in the recent Grand American Handicap contest were thrown as near to 50yds. as possible to do so, and this applies to all five sets of traps. Each morning I went down the line with Mr. Clark, Superintendent of the Indianapolis Gun Club grounds, and saw to it that all traps were set to throw the regulation 50yds., and this means 50 measured yards—no guesswork about it. I have always been a firm advocate of a 50yd. target (when others have advocated 40 to 45yds.), and I am quite sure that I would have noticed it if the targets were short of the regulation distance."

The fifth annual tournament of the Dominion of Canada Trapshooting and Game Protective Association, Aug 16-18, has a voluminous programme. On the first day there are ten events, of which nine are at 20 targets, \$2 entrance; the tenth is at 50 targets, \$1 entrance, for the individual championship of Canada. The programme for the second day is similar, except event 10, at 50 targets, is the Grand Canadian Handicap, and event 11 is the 2-man team championship. The third day is also similar in nine 20-target events; the tenth is the Mail trophy 5-man team event; the eleventh is the 8-man team championship. The corresponding 20-target events each day, that is No. 1 of the first, No. 1 of the second, No. 1 of the third day, and so on, constitute 60-target events, which have trophy prizes. There are high averages each day. Shooting begins at 9 o'clock. The competition is open to Canadian amateurs, who are members of an affiliated gun club. Targets, 2 cents. Agents and non-members, "targets only." Rose system. Surplus moneys added. Guns, ammunition, etc., forward express prepaid to Geo. Easdale, care Ketchum & Co., Ottawa, Ont., will be delivered on the grounds free. Reduced rates over many roads, all enumerated in programme, for which address the Secretary, George Easdale. BERNARD WATERS.

**Manning Two Day Tournament.**

MANNING, Ia., July 15.—The Manning Tournament was a decided success. The attendance was large, far beyond the expectations of every one who was here. Manning is favored by good railroad facilities, is centrally located and has good hotel accommodations. The management of the shoot is more than pleased with the attendance and assures the shooters that they will put up a better programme next year for their annual tournament. Professional shooters here were F. H. Lord, from La Grange, Ill.; Mr. Borden, of Lincoln, and W. A. Waddington. We had some of the best amateurs in this part of the country present at our shoot, such as Harry Taylor, of Meckling, South Dakota Railroad; Barber, winner of the Grand American Handicap, from Paulina, Ia.; Russell Kline and John Burmeister, of Spirit Lake, Ia.; R. L. Slimmer, Clarksville, Ia.; T. M. Farney, Baxter, Ia.; Fred Vermilya, R. Adams, C. Talbot, H. Petty, Mr. Wilson, Mr. Anderson, Dr. Brooks, W. W. Talbot, R. Talbot, all from Audubon, Ia.; Dr. and Mrs. Haughawatt and Joe Kantsky from Ft. Dodge, Ia.; Mr. McDowell, Mr. Henkle, Thos Baker and Mr. Burger from Adair, Ia.; H. Baughman and E. Auen from Breda, Ia.; B. Hart, N. Olgon, and F. Ruhs from Ross, Ia.; H. Auen from Arcadia, Ia.; Mr. Handy, Mr. Johnson and C. F. Drier from Portsmouth, Ia., and H. V. Fenstra, Arcadia, Ia.

Adams	200	86	Burger	200	27
C Talbot	200	182	Petty	200	135
Wilson	200	176	Frahm	200	63

On the second day, Mr. Barber and Mr. Taylor put on their shooting clothes and smashed targets as though they wanted to smash them all, Mr. Taylor's straight run being 164 and Mr. Barber's 119.

The special event on the Stevens gun was pulled off with ten entries, and Mr. Taylor won out with a straight score of 20. High professional average was won by W. A. Waddington with a score of 384 out of 400; second professional average was won by Mr. Borden with a score of 380 out of 400. The silver cup, donated by the E. I. Dupont Co. for high amateur average, was won by Taylor, also the Smith badge for longest run at targets. The Mullerite badge was won by H. Hoffmann for best score of Manning club members.

High amateur average, H. Taylor, score 391 out of 400; second, R. R. Barber, 386 out of 400; third, R. Kline, 369 out of 400; fourth, F. Vermilya, 364 out of 400; first low average, P. Ohrt, 302 out of 400; second low average, G. A. Rober, 326 out of 400.

Manning has held a tournament that they can feel proud of. Everything worked well. Weather was good; a little too warm, but the shooting went on just the same. The club hereby extends thanks to all shooters that were present, to the sporting press, the firms that had representatives present, and everybody that helped to make Manning's shoot the second largest that was held in the State of Iowa this year.

G. A. ROBER, Sec'y.

**Trap Around Reading.**

LEBANON, Pa., July 11.—The Keystone Gun Club, which has a membership of 200, held an election of officers for the ensuing six months, at which President Francis H. Reinoehl was defeated by Chief Engineer McAdam for re-election. The officers elected are as follows: President, Frank W. McAdam; Vice-President, James Horgan; Secretary, H. U. Dettra; House Committee, James P. Gates, J. H. Spayd; Captain, Monroe Rapp; Treasurer, W. H. Bollman; Steward, Warren Reinoehl.

Ashland, Pa., July 8.—Over 2,000 men saw the shooting match between Pechtel, of Ashland and Bodman, of Locustdale, here to-day for a purse of \$300. The latter won by 10 birds to 9.

Shamokin, Pa., July 8.—A pigeon match for a purse of \$200 was shot at Edgewood Park to-day between L. A. Erdman and Samuel Foust, this place, the former winning by killing 6 birds to 4 for his opponent.

DUSTER.

**IN NEW JERSEY.**

**Bound Brook Gun Club.**

BOUND BROOK, N. J.—July 15 being a nice day for trapshooting, several outsiders came and took part in the interesting programme of the Bound Brook Gun Club. The day being just right for trapshooting, several good scores were made. Sim Glover did the best shooting, only dropping two targets out of the 50. Dr. Gardiner did some fine shooting, 112 out of a possible 120 shot at.

The first event for a mug was won by Dr. Talbot, of Newark. The second was won by Dr. Lucky, of Plainfield, and the last two events were won by Haddins, of Tottenville.

The third was for a cup, and the fourth a gold medal of a very pretty design.

An extra event for a solid copper cup with silver handles and base was next shot for, and was won by Mr. C. Van Nuis, of New Brunswick on a score of 25 straight.

These were all handicap events and the shoot-offs were very interesting. The club cup and medal was won by Dr. J. B. Pardoe.

**Lawrence Gun Club.**

LAWRENCE, Mass., July 8.—The invitation shoot of the Lawrence Gun Club, held at the club grounds July 4, proved very interesting to the few gunners and friends that assembled at the club house. The fact that it is considered a misdemeanor to shoot an eagle, or the fact that the game warden was present, was the only thing that spared a few of these honored birds from the guns of the baked clay smashers; but later in the afternoon the music from their band drifting across the field on the light breeze, added a new charm to this finest of American sports and a most enjoyable afternoon was spent in spite of the intense heat.

A trespasser was discovered crossing the grounds in the form of a huge green snake, was hotly pursued by the captain, seized by the tail and hurled into that vast blue vault above, when lo! a report from the president's gun and the green form vanished into the endless blue even unto eternity, much to the amazement of the spectators.

The first prize was easily captured by Dr. Niles, of Davers. The treasurer of the club, Hamel, succeeded, after borrowing the president's gun, in making good for second place, thereby most graciously according third place to the president.

Events:	1	2	3	4	5	6	7	8	Shot

### Interstate at Menominee.

THE Interstate Association tournament at Menominee, Mich., July 12 and 13, under the auspices of the Menominee Gun Club, was an unqualified success. Sixty-five different shooters took part the first day, of which number fifty-four shot in all events, and sixty-one took part the second day, fifty-four again shooting through. Two sets of traps were used, and 23,050 targets were trapped during the two days of the tournament.

Few gun clubs are as conveniently located as is the Menominee Gun Club, its shooting grounds being on the shore of Green Bay, within 100yds. of the court house and just one-half of a block from the main street of the city. In fact, when you step from the rear entrance of the National Hotel, one of the leading hotels of the city, you are on the shooting grounds proper. The visitors were one and all loud in their praises of the fine location. There is hardly another shooting ground like it in the country.

The first day of the tournament passed off in a very satisfactory manner, and the fine scores made were a credit and satisfaction to all concerned. There was also a good attendance of spectators, and the day could not have been more perfectly adapted to the purpose had it been made to order. A feature of the day's shooting was the 100 straight made in event No. 7 by squad No. 5, composed of Messrs. Hirschy, Crosby, Host, Kaufmann and Loud. Each man broke his 20 targets, and the squad was loudly applauded at the finish. Among the amateurs Mr. Guy Deering was in first place for the day with 190 out of the 200 shot at; Mr. W. H. Schultz was second with 188 and Messrs. Geo. Premo and A. Mollie tied for third with 185. Mr. W. R. Crosby was high manufacturer's agent with 197, Mr. H. C. Hirschy being second with 196 and Mr. C. A. Young third with 195.

Nearly all the men who took part the first day were on hand for the second day's events. The weather conditions were excellent, with the exception of a heavy shower of rain during the shooting of events Nos. 9 and 10, which somewhat delayed the wind up. A feature of the day's programme was event No. 10, known as the championship event of the League of Gun Clubs of Wisconsin and Upper Peninsula of Michigan, a trophy valued at \$50 being given by the League to the member making the highest score in this event. Mr. H. Hammersmith was the winner with a straight score of 25. Among the amateurs Mr. Guy Deering was again in first place with 190 out of the 200 shot at; Messrs. W. H. Schultz, A. Mollie and R. F. Babcock tied for second with 186, and Messrs. W. W. Barr and F. Mellins tied for third with 183.

For general average among the amateurs Mr. Guy Deering was first with 380, Mr. W. H. Schultz second with 374 and Mr. A. Mollie third with 371. Messrs. H. C. Hirschy and W. R. Crosby tied for first place among the manufacturer's agents with 391, Mr. A. C. Young being second with 387, and Mr. R. O. Heikes third with 386.

During the progress of the tournament Mr. H. C. Hirschy had a straight run of 159, and Mr. W. R. Crosby one of 140. Mr. R. O. Heikes also had a straight run of over 100.

The cashier's office was ably handled by Mr. H. C. Hirschy, assisted by Mr. F. H. Siefken, and winners of money received the amounts due them with twenty minutes after the last gun was fired each day.

Messrs. Carl Moore and Fred. S. Foster rendered valuable assistance in keeping the tournament working smoothly, and Messrs. Robert A. Kane, President; W. W. McQueen, Secretary, and A. A. Juttner, of the local club, made every person feel at home.

The scores of both days follow:

WESTERN TRAP.

Cincinnati Gun Club.

July 15 was some warm; Gambell's thermometer climbed to 80 in the shade. On the firing line the boys perspired, but stuck it out bravely, and some of them smashed a whole lot of mud saucers. Peters was high gun in actual breaks in the Schuler contest with 46. Pohlar second with 45. Gambell broke 47 out of the 50, but was not shooting his score to-day. Gambell got a shooting fit on and made a run of 42 straight. Ackley is getting ready to start for the Soo on the 17th, where he will put in the hot spell, fishing. Faran has left the city for a two weeks' trip. Williams is once more with us, and his score was not the lowest by a number of points.

The boys are beginning to talk tournament. The tournament committee promises good things. The idea is Mr. Luther J. Squier's, and was given a trial at the Wawasctt's annual tournament last May. It proved entirely satisfactory, inasmuch as every amateur who shot in all the events received his entrance back. A prospectus of the shoot will be ready for mailing about the second week in August. Programmes will be ready Sept. 1. Schuler prize shoot, 50 targets:

Table with columns: Hdcp., Brk., Tot'l. for Peters, Andrews, Keplinger, Harry, Risley, Maynard, Jones, Williams, Bullerdick, Lytle, Pohlar, Faran, Steinman, Jack, Herman, Barker, Harig, Myers, Falk.

Team match, 50 targets: Hesser 44, Gambell 42, Bullerdick 40-126. Faran 38, Maynard 39, Pohlar 40-117.

Team match, 50 targets: Gambell 45, Barker 43-88. Peters 45, Hesser 46-91.

Team race, 50 targets: Gambell 42, Barker 44-86. Peters 43, Hesser 48-91.

Ohio Notes.

At the regular shoot of the Springfield, O., Gun Club, Wm. Poole won the medal with a straight score of 25. Downis and Schmidt second with 22 each. Poole was also high gun for the day with 89 out of 100. Foley second 88. Snyder third, 86. The club's regular shoot will be held on Fridays for the balance of the season.

The De Graff, O., Gun Club will hold a tournament on July 20 at which clubs representing Clark, Madison, Union, Champlain, Shelby, Logan and Miami counties will be present. The individual and five-man team cups for championship of above counties will be shot for. Capt. Ben Downs, of Springfield, speaks the truth when he says that "everybody was pulling for him to win," meaning Prof. Heikes, at the G. A. H. Rolla Heikes is deservedly popular among both amateurs and professionals in all parts of the country, and he had the sincere good wishes of every shooter that he would continue to break 'em after he had smashed his first 60.

The members of the Dayton clubs are recommended to practice shooting at doubles by a press writer, because of the fact that the State shoot will be held there next year, and that in shooting for the Phellis trophy, such practice will stand them in good stead. The Phellis team trophy is shot at 50 singles per man, no doubles. The Shooting and Fishing team trophy was formerly at 30 singles and 10 pairs, but this rule was changed nearly two years ago, and that trophy should now be shot for at 50 singles, although the old rule prevailed at this year's State shoot.

The Cleveland Gun Club's matinee shoot on July 8 was not largely attended. Some members are out of town and others have not wholly recovered from the Fourth. Five silver cups are in competition, one being donated by each of the following firms, and two being given by the club: Dupont Company, Austin Cartridge Company, Scribner & Loehr Company. To-day's shoot was the third in the series, and Riley and Hastings tied on full scores of 50, including their handicap. Pocock was high in actual breaks with 45. Conditions are 50 targets, added targets as handicap. Preparations are being made for the Labor Day tournament, at which cash and merchandise prizes will be given.

The attendance at the regular shoot of the Dayton Gun Club was better than for a long time. Ten 25-target events were shot. Oswald finished high gun with 172 out of 200. Carr second with 171.

Twelve members took part in the regular handicap medal shoot of the Greenville, O., Gun Club, on July 10. In Class A, McKeon won the medal with 46. Lambert won in Class B with 44. Gilbert and Wolfe second with 28 each. McKeon defeated Kirby in a 100-target race, 83 to 78.

A little missionary work done by a shooter at Portsmouth, O., has resulted in much good. Interest has been reawakened, and the club now has over fifty members, among them a number who give promise of becoming good ones. The club will be represented at the Cincinnati Gun Club tournament in September.

The Forest Gun Club, of Upper Sandusky, O., will hold its first tournament in September. The dates will be given later. Contests for both amateurs and professionals will be held, and the club expects to offer inducements which will insure the presence of some of the best shots in the country.

The Dayton Gun Club will give a two days' tournament on Sept. 4 and 5. Added money \$100 for the five high averages shooting entire programme. No one except trade representatives will be allowed to shoot for targets only.

The Pleasant Valley Gun Club, of De Graff, O., has decided to call off their tournament advertised for Aug. 9 and 10, as it would follow too closely the shoot given on July 20.

Good sport, as usual, was had at the regular shoot of the Rohrer's Island Gun Club, of Dayton, on July 12, several of the members bringing their families with them and making a picnic of the occasion. The medal event was first shot off, and was won by P. Hanauer with a score of 25, no one tying him. C. Smyth was second with 24. The medal stays in the Hanauer family another week, with the chances about even that Carl Hanauer will win it again next week. To-day's contest was the sixteenth of the season, and sixteen more will be shot, the last one on Nov. 1. Chas. F. Miller, who has won the trophy for the past two years, is in the lead, having three wins. Ed. Cain and W. Oldt have each two wins to their credit. The balance of the day was devoted to sweeps, of which nine were shot, each at 15 targets, 50 cents entrance, three moneys. D. D. Gross was high with 124 out of 135. E. Cain second with 121, and H. Oswald third with 113. James McConnell shot in the medal race and broke 25 straight.

In Other Places.

The shoot at Portland, Ore., was better attended this year than any previous meet. We have a list of names comprising twenty-two squads, and are sorry that they do not give addresses in full so that same could be published in our columns, as such an array of western shooting talent was never previously assembled.

The Meshawaka Gun Club, South Bend, Ind., is doing itself proud, as per individual scores. M. M. Clark secured prize at the last shoot with 36 out of 50. The county treasurer, Hunberg made 9 out of 10.

The Leighton, Pa., Rod and Gun Club, the city's crack social organization, last week furnished the club room with three leather cushioned rockers, each costing \$25, and two leather cushioned couches, each of which had cost \$16.

The Juvenile Gun Club at Brenham, Tex., is keeping up the interest and holding shoots that will keep the boys in good practice. Next to the last shoot held Guy Chishold and Albert Tucker tied, on the shoot-off Tucker won, and then he won it again in the regular contest. The cup, which was generously donated by a powder company, will become the property of the one who wins the most times during the year.

Mr. Schaeberle was the high gun at the Pastime Gun Club, of Detroit, Mich., with a 25 straight.

At the last meeting of the Detroit, Mich., Gun Club, Clyde Sipe was elected to fill vacancy as president. Regular shoots are held Sunday at Hubert's Ten-Mile House, at Royal Oak.

Many of the July 4 shoots were not reported, but some of the best held were those where merchandise prizes were awarded. One of the clubs adopting this line was that of Le Mars, Ia.

At Memphis, Tenn., A. H. Frank, Jim Canale and W. H. Joyner, shooting at 300 targets, only lost 8, Joyner making 99. Memphis has some extra fine shots.

The Northern Allegany Rod and Gun Club has placed 100,000 pike and same number of trout in Flannigan's Pond. This should find a responsive chord in all club organizations. It is only by a united effort that the lakes can be kept stocked with game fish. Messrs. Charles Keer, George Harvey, and Samuel Clark, of Middletown, O., were guests for a day of the Hamilton Club.

Harry Brinsmade, Frank G. Miller, Dave Krott and Frank Le Fever comprised the committee who had charge of the last shoot held by the Defiance, O., Gun Club.

There was quite an array of shooting talent at the July 4 shoot at Bloomington, Ill., viz.: John Boa, Frank Riehl, H. W. Cadwallader, Ward S. Burton and W. Tramp Irwin. The weather was stormy, and the entertainment thus was not the feature promised.

Pictures make good prizes for members of a gun club to contest for. Such has been adopted by the Freeport, Ill., Gun Club.

The following members of the Princeton, Ill., Shooting Society were in attendance at the Davenport, Ia., tournament: C. G. Cushing, J. F. Wagner, Judge R. M. Skinner, Clarence H. Delano, A. Oppenheim, Dr. William Keller and Harry Burr.

Dayton, O., is making a bid for the next G. A. H. Should this place be selected, there would be a good time assured, as good meals and the best of street car service would be at hand. What is much needed is an amphitheatre.

The Florence, Neb., Gun Club held a shoot last week. Harry Lane and George W. Craig were the leaders, and they were aided by some of the Omaha good shots who were present.

The Raleigh, N. C., Gun Club held a very enjoyable event at Cameron Field on Saturday last. The club was out in full force, and with their twenty-five friends and invited guests, enjoyed an "old-time barbecue." The toast had all the added refreshments that heart could wish.

The social feature of gun club meets demand the attention of tournament promoters. For instance, will all please take notice that all the visiting shooters at the shoot held at Tomah, Wis., were well entertained at a grand ball, given in their honor by the united efforts of the Tomah sportsmen. The social feature should be entered into by all the clubs throughout the country.

There will be "something doing" at the town of Paris, Ill., as a gun club will be organized there in the very near future.

The club at Janesville, Wis., is spreading out, the new name adopted being the Badger Gun Club. There will be a shoot in August that is destined to be one of the largest ever held in the west, if planning will bring that end about. There are a number of good clubs in southern Wisconsin to draw from, and there will be shooters present from all parts of the State if a date chosen does not interfere with the Indian shoot.

The Shoot Slow Gun Club, St. Joseph, Mo., is coming on in a not "so very slow" order. Last Sunday, Wade and Schultz tied for first place with 23 out of 25. On the shoot-off at 10 targets, Wade won.

You would not think that the great shooter you meet at many of the tournaments, and who works so hard trying to beat "T. Bill" Crosby, was written up in his home paper as "Dude" Gilbert. Oh, yes, he was a "dude" in his home town when in his teens.

The East Side Gun Club at Racine, Wis., has sold its club horse to the Business Men's Outing Club, and the same will be improved and an athletic park will be fitted up.

One of the handsomest programmes issued during the mid-summer was that of the late shoot held by the Martinsville, Ind., Gun Club. It was printed on deckle-edged paper of the finest quality. We appreciate the one sent us, as there were only 200 printed.

At Haidley, Idaho, the gun club has ordered a supply of targets and with the new magazine traps will keep the guns popping during the summer.

Some of the powder companies have donated many cups to the gun clubs throughout the country.

Shooting at the South Side Gun Club, Milwaukee, Mr. Fraser and T. M. Drought averaged 95.4 out of 90 targets, and in the shoot-off Mr. Drought won.

Herman Hirschev was by special request delegated to shoot at the friendly meet of the Fort Atkinson and the Janesville, Wis., trap shots. Mr. Hirschev is heralded as the holder of the live-bird championship.

And now comes a report from a full-fledged newly organized gun club in the great Sunflower State. The following members were enrolled at Augusta, Kans.: H. Hamblett, R. W. Stephenson, J. D. Robson, E. R. Mooney, J. A. Grant, F. A. Garvin, H. A. Hill, J. T. Marsh, R. A. Sisco, T. E. Carter, E. Safford, R. C. Ruland and E. S. Withrow.

Garfield Gun Club.

CHICAGO, July 15.—The appended scores were made on our grounds to-day on the occasion of the sixth trophy shoot of the second series. Dr. Meek, L. Thomas and W. Einfeldt tied for Class A trophy on 24. Dr. Reynolds, Stone, Horns and L. L. Smedes tied for Class B on 21, while George won Class C on 22.

In the Dupont cup shoot W. Einfeldt won in Class A on 19 out of 20. T. L. Smedes won Class B on 18. Ostendorf won Class C on 15.

In the Hunters Arms Co. trophy shoot at 10 singles and 5 pairs W. Einfeldt tied with L. Thomas in Class A on 19. Stone won in Class B on 17. Ostendorf Class C on 14.

The day was a favorable one for trapshooting, there being little wind and plenty hot.

Table with columns: Events, Targets, Dr Reynolds, Dr Meek, Thomas, McDonald, Stone, Eaton, Gould, George, Ditt, Kamp, Horns, Einfeldt, T L Smedes, A Smedes, Ostendorf, Lasure.

No. 1 is trophy event. No. 2 is Hunter Arms Co. trophy, 10 singles and 10 pairs. No. 3 is Dupont cup.

Table with columns: Team shoot, McDonald, Thomas, Stone, Dr Reynolds, Gould, Meek, Einfeldt, Eaton, T Smedes, A Smedes.

Boston Gun Club.

Boston, Mass., July 12.—J. A. R. Elliott, accompanied by Mr. E. B. Thompson, visited the grounds of the Boston Gun Club to-day, and after donning shooting togs, etc., proceeded to show just what a trapshooter can do in the way of breaking targets at 21yds. or 16yds., nothing made any difference, 29 out of 30 at the former distance in the prize match being a sample of what shooting was going on.

Dr. Gleason, with his gun stock done up like a broken limb in splints, managed to tie, though it necessitated a 79 out of the last 80 to do so, but we are always expecting something wonderful from the Doctor, and very seldom it is that he fails at least to help out in some way or other.

A. H. Baker, of Brockton, one of the old stand-bys paid us his yearly visit, and with strange gun, etc., proceeded to liven matters not a little and showed that he had lost none of the old skill that was in evidence at the time of his old side partner "Servy." Rule, Frank Blinn and Carver all got into the honor class, with the latter leading just a trifle.

Table with columns: Events, Targets, Frank (19), Bell (20), Baker (19), Rule (18), Blinn (16), Carver (16), Elliott (21), Gleason (21), Muldown (16), Taylor (16), Temby (16), Dickey (16), Nye (16), Kirkwood (20).

Merchandise prize match: Elliott (21), 29, Kirkwood (20), 27, Blinn (16), 26, Carver (16), 25, Gleason (21), 24, Muldown (16), 24, Baker (19), 24, Frank (19), 23, Rule (18), 21, Bell (20), 19.

Thirty shooters assembled at the Boston Gun Club grounds July 8 to inaugurate a series of shoots for the cup donated by the Laffin & Rand Powder Co. Good scores were hardly in evidence for various reasons, but enthusiasm was up as usual to concert pitch, and the crowd was kept in good humor by the ludicrous scores at times. W. H. Heer was a welcome visitor and seemed to be the only pebble to find them, but after starting good, was forced to give up, a previous injury to his face making

shooting exceedingly painful. A future visit to the grounds will now be looked forward to and straight scores will be the rule on that day.

High average for the afternoon was taken care of by one of the home club, though there might have been another story told if "Jimmie Climax" had not got some iron targets in his last event.

Roy, with 38 (wholly out of sorts with himself for such a score) had no trouble leading in the prize match, Blinn or Kirkwood with 34 being next in line with Churchill and Gleason with 23 in third position.

Every one now waits for their next chance, hoping for good conditions, and as the next shoot will be held at the Middlesex Sportsmen's Club, it is needless to say that the traps will be in finest kind of trim for good scores.

Table with columns: Events, Targets, Climax (16), Heer (16), Straw (17), Miller (17), Edwards (16), Frank (19), Roy (19), Allison (19), Rule (19), Worthing (19), Churchill (18), E Cavicchi (18), H Cavicchi (18), Kirkwood (19), Burns (18), Temple (19), Blinn (16), Adams (16), Harlow (16), Muldown (16), Smith (19), Buffalo (18), Baker (16), Gleason (20), Bryant (16), Temby (16), Philbrook (16), Taylor (16), Dickey (16), Carver (16), Laffin & Rand Powder Cup Match; distance handicap.

Malone's Tournament.

THE eleventh annual tournament given by Mr. J. R. Malone, of Baltimore, was held at Betterton, Md., July 12, 13 and 14. Shooting at 200 targets on the first day, Mr. E. H. Storr broke 192 and was high. Messrs. L. German and W. Foord tied on 187 for second. On the second day, Mr. German was high with 96; Mr. Storr, second, with 95 out of 100.

The five-man team race was held on the second day. Mr. Storr was high on the third day with 193 out of 200. Mr. J. M. Hawkins was second with 188. The scores:

Table with columns: First Day, Second Day, Third Day, Shot, Broke, at, Broke, at, Broke, at. Includes names like Storr, German, Foord, Hawkins, Lupus, Squier, England, Clark, Hunter, Miller, McHugh, Kirk, Gifford, J. Malone, C. Malone, Dixon, Sampson, Silver King, Chew, Simon, Hartlove, Atwell, Bowen, Mordecai, Banks, Tydings, Pohlman.

Table with columns: Team race, 5-man, held on June 13; Baltimore Shooting Assn. No. 1, Rising Sun, Md. Includes names like German, Lupus, Storr, Hawkins, Malone, Alexander, Miller, Kirk, Gifford, England.

Table with columns: Wilmington, Del., Prospect, Balt. Includes names like Banks, Foord, Squier, McHugh, Hartlove, O G O, Adams, Pohlman, Regester, Monath.

Table with columns: Baltimore Shooting Assn. No. 2. Includes names like Silver King, Sampson, Chew, Mordecai, Dixon.

Independent Gun Club.

EASTON, Pa., July 8.—The Independent Gun Club held the first of a series of five shoots for the Laffin & Rand cup presented to the club. Mr. E. Markley was high man with 48 out of 50, he having run his last 34 straight. There was a small attendance on account of a thunder storm just about the time to start the programme. The next shoot will be held July 22, when we expect a good crowd of shooters.

Event No. 3 was a handicap for trophy. Handicap in parenthesis. Below are scores made July 8:

Table with columns: Events, Targets, Markley (0), W Maurer (0), J Maurer (0), Elliott (6), Sommers (2).

W. R. IVEY, Sec'y.

"Now," chortled the amateur Sherlock Holmes to his lady partner, "it is easy to see that gentleman yonder is not married." "Pray, how can you tell?" "By his neglected air; his frowzy appearance. No woman would let a man go about like that. His coat lacks two buttons, you perceive, and he is not brushed." "Still," said the lady, "he is married." "You know him, then?" "I am his wife."

PUBLISHERS' DEPARTMENT.

The Automatic Weedless Hook advertised by Mr. Chas. P. Krus, of Chicago, should prove a most useful device for the angler who fishes in the quiet waters of Western and Southern lakes, ponds, bayous and streams. We all know how constant is the danger of getting one's hook among the weeds, and how much care, time and patience is required to free it and to save the hook and line. These annoyances would seem to be avoided by Mr. Krus' device, which we should certainly suppose, if well worth investigating by every angler who fishes in weedy waters.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR, 10 CTS. A COPY.  
SIX MONTHS, \$2.

NEW YORK, SATURDAY, JULY 29, 1903.

VOL. LXV.—No. 5  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

*The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.*

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

### SOME PRIMITIVE PLANT FOODS—I.

WE are accustomed to speak of the Indian as a hunter, to think that his food consisted solely of flesh, and that he lived purely on the products of the chase. This impression is very far from true. The Indian—like man everywhere except in the Arctic regions—is an omnivorous creature, and while he may subsist chiefly on flesh he also greatly relishes vegetable food. As a matter of fact, the great majority of the aboriginal tribes of North America were cultivators of the ground. The popular idea that the Indian was a nomad wandering from place to place and never camping twice in the same spot arises from an entire misconception of facts. We have been told for years by the newspapers and other equally ill-informed authorities that the Indians were wanderers, and we have come to believe that this was true. It was not. The Indians lived in very large measure in permanent villages, near which they had their cultivated fields, and which they occupied for the greater part of each year. At certain seasons special absences—more or less protracted—were necessary for the purpose of hunting some particular game or of gathering some special sort of wild roots or fruits.

This permanency of habitation was true even of some of the tribes inhabiting the semi-arid plains who depended for support on the buffalo, and to-day, one who visits one of the plains tribes and asks the old men how their fathers used to live will everywhere receive the same answer. They will say that they used to grow corn, beans, squashes or pumpkins, and tobacco, and that besides this they gathered an abundance of wild crops which gave them a certain amount of vegetable food all through the year.

Of the Iroquois we are told that the crops they harvested were so large that they frequently had in their storehouses two or three years' supply of corn, beans and squashes. The Pawnees, occupying the arid West, like the Delawares of the moist sea coast, stored their crops in great pits dug in the ground which they lined with mats, and in which their corn was perfectly preserved all through the winter, or until the supply was exhausted. Very different was the situation of the Cocopahs inhabiting the desert away to the southwest. They scraped aside the rocks that covered the dry mountainside and, uncovering a little soil, planted there a few hills of corn and squashes, carrying on their backs from the distant spring the water which should moisten the ground to cause the seeds to sprout and to refresh the plants until the crop matured, and when it was gathered they at once consumed it.

Within the memory of living men, and while there were yet buffalo in abundance, the Western Indians of many tribes continued their primitive culture of the stubborn soil. The Pawnee women used to hoe their corn with hoes made from the shoulderblade of the buffalo lashed to a wooden handle, and about the same time the warlike Cheyennes were planting their little cornfields on the Little Missouri River.

We know that in early days, when wooded Minnesota was much farther from the center of things than Alaska is to-day, the Indians of that territory planted little crops of corn, loosening the soil, either with hoes purchased from the traders or with the hardened sharpened branch of a tree. Their fields were small, from a quarter of an acre to an acre in extent, and produced a small corn the ears of which were from three to eight inches long, and which was chiefly consumed green as roasting ears. A

part of the crop, however, was boiled on the ear while green, cut from the cob and dried in the sun to be kept for winter use. Boiled with meat it made a nourishing and palatable dish. There was no food more delicious, and none better to work on than dried corn and buffalo meat.

Over the whole of North America, wherever the climate permitted it to ripen, corn was cultivated by the Indians and constituted an important part of their subsistence. Loskiel, who in the eighteenth century wrote interestingly and at great length of the Indians among whom the United Brethren worked, enumerates no less than twelve methods employed by the Indians in preparing their corn for food. A concentrated form of nourishment much employed when traveling on the warpath, or where it was necessary to go swiftly or with light loads, was citamon, an interesting analogue of the pemmican used in old prairie travel. Pemmican consisted of pulverized dried meat mixed with melted fat, but, as those will remember who have read the old works of travel in the Northwest, or even those "Trails of the Pathfinders," which have recently appeared in FOREST AND STREAM, there was another sort of pemmican made of the pulverized flesh of fish also mixed with fat. Citamon, on the other hand, was finely pounded cornmeal mixed with powdered maple sugar, and then packed in a sack so tightly that the air could not enter it. While pemmican was purely a flesh food, citamon was wholly vegetable.

It is well understood that the Indians had discovered the art of making maple sugar long before the coming of the whites, and that they taught first the French in Canada and later other white people how to manufacture sugar and syrup from the sap of the maple tree. They used not only the sap of the hard or sugar maple but also that of the soft or white maple, though of the latter much more sap was required to make a given quantity of sugar. In the western country, even out on the plains, sugar was made by Indians from the sap of the common box elder tree.

### A JULY SUNDAY.

"O DAY most calm, most bright," apostrophized George Herbert, Izaak Walton's friend, when he sang of the Sunday of the England of his time; and the picture called up by the line is still a grateful one. The ideal has not changed with the centuries that have intervened. One who would celebrate Sunday in verse or prose would still hail it as the "day most calm." But no such conception of Sunday could possibly be drawn from the current records of the day as given in the newspapers of the next morning. As there described, Sunday is anything but a day of calm. Here, for an example, is a partial list of the happenings of a July Sunday, as told by a New York paper on the Monday following:

Two white women and two white men were shot in a race riot of whites and negroes in a New York street.

A Princeton student was drowned in the surf at Coney Island. Two bathers were drowned in Jamaica Bay. On the St. Lawrence River a steam yacht collided with a skiff and a seventeen-year-old boy of Clayton was drowned. A woman was drowned in Nassau Lake, near Albany, by the capsizing of a skiff. Two boys were drowned in the Belle River, at Memphis, Mich.

Lightning caused a \$60,000 fire in Tennessee. A Riverside, Conn., electric car loaded with passengers bound to a ball game was struck by lightning; no one was hurt, but the phenomenon was interpreted as an omen of Divine displeasure, and the party went home by the next car without attending the game. A Detroit trolley car smashed a wagonload of people returning from a drive in Belle Isle Park, injuring nine persons, two fatally. In New York city a trolley car ran down a sixteen-year-old girl and crushed her feet, one of which had to be amputated. A five-year-old boy lost a foot while playing with a trolley car on a side track; and a whole line of cars was held up by the visit of the stork to a trolley car, until an ambulance came and removed the mother and boy baby to a hospital.

In Philadelphia a retired banker committed suicide. In an Ontario village an Indian recluse was found dead in her home, beaten and strangled, and the officers set out in pursuit of the suspected murderer.

In Chicago several hundred Greeks made a rush to the

polls to vote for church officers, and many were injured in the crush. In the Union Bethel African Methodist Episcopal Church of Brooklyn the Rev. Joseph Stiles preached, armed with a writ of the Supreme Court restraining the trustees from interfering with him.

Five performers in a Coney Island fire-fighting show were badly burned by a premature explosion of powder; the audience was not perturbed, taking it to be a part of the show. Near Harrisburg, Pa., eight men were blown to pieces by a premature explosion of a dynamite blast. At another place a dynamite explosion wrecked a dam.

A Newark, N. J., man was accidentally shot in the leg by a friend. At Meriden, Conn., a woman was shot in the back by a seven-year-old niece; the child was playing with papa's revolver, and did not know that it was loaded.

A "rabid" dog on the Williamsburg Bridge created great excitement by snapping at everyone who approached it, and frightening horses so that they ran away. A policeman shot it to death, and for a wonder did not kill a human being before killing the dog.

And so the record runs. This is by no means all of it; but enough has been quoted to illustrate how disquieting is the story of Sunday as told on Monday. Its character thus indicated by the news columns of the press, a July Sunday in 1903 is the furthest possible remove from the "day most calm" sung by Herbert. And not less far removed is it from the actual Sunday of to-day. The current chronicle of disorders, drownings, burnings, explosions, collisions, shootings and other casualties in the news columns of the day after is in no sense a true picture of the day. The press concerns itself with the unusual in nature and the abnormal in human nature. Of the mountain peak in reposeful majesty it makes no note; the avalanche or the volcanic eruption command the attention of the world. The peaceful repose of a people on Sunday is not news; it has no place, or but secondary attention in the columns of the Monday paper.

### AFRICAN GAME PICTURES.

In a recent issue note was made of the remarkable pictures of African game secured by a German collector, C. G. Schillings—pictures which were then characterized as being the most striking contribution to the literature of this subject. From the volume containing the results of Mr. Schillings' work we have reproduced some of the most noteworthy pictures for the illustrated supplement of to-day. They are of extreme merit, because they show in a way never before equalled the actual home life of the creatures of the African jungle.

Some of the views, as that of the lioness about to spring on the calf, were secured by tethering a calf or an ass or a goat as bait to attract the beasts of prey. In other cases, as with the picture of the lionesses at their drinking place, the work was done under absolutely natural conditions, and these are to be regarded as the greater achievements. It was exciting sport, all of it, each new shutter snapped a triumph.

"With beating heart," writes the author, "I watched the giraffe coming closer to the water and to my hiding place." Of the nerve-trying onrush of the elephant here shown, he tells us: "Only the death-plunge of the mighty bull saved us at the last moment from imminent danger \* \* \* otherwise we would have been crushed by the twenty-five enraged giant beasts." "Indescribably great was my joy when I succeeded one night in catching on the plate three old lionesses drinking at the brook." And again, of the night photograph of the rhinoceros: "I never dreamed that I would be fortunate enough to show on one plate, at a few feet distance, a female rhinoceros and young, at her watering place in the night."

These are achievements far surpassing in interest and gratification the simple stalking of game or lying in wait for it to kill it. The world is indebted to this German camera-hunter, and it is to be hoped that his success and the rich prizes he has won may be inducements to others to undertake a like work in the same field.

THE many friends of Dr. Barton W. Evermann, Chief of the Division of Scientific Inquiry and Ichthyologist of the United States Bureau of Fisheries, will be pleased to learn that he has been appointed Curator of the Division of Fishes, United States National Museum. He still retains his connection with the Bureau of Fisheries.

## THE SPORTSMAN TOURIST

### On the Desert.—I.

PETE was a good partner, and would stay by you, no matter how far you went; but he was unfortunate, in that he was always finding things that would not amalgamate. That Chink, his pet, was one; the next was a geological and ethnological professor from some university up San Francisco way. Now one would think that a professor of those things would know all about the common things of life that are within the knowledge of every man. But that professor didn't—not he. I don't know what all he did know, but I know a few things that he didn't know.

He could look at a formation and tell you, offhand, how old it was, but he did not know that the moss grew on the north side of the rocks. He could tell you about the formation of a contact and how a true fissure vein was filled, but he did not know that gold was where you find it. He could look at a queer-shaped butte and tell you it was cut that way by erosion, but he didn't know a prospector's monument from an Indian water sign. He could look at a piece of rock and give you its book name, but by the same look he couldn't tell the sulphurets in it from free gold; he had to make a fire assay or acid test. If the sky was overcast at night when he camped, he did not know enough to cut a notched stick and point it in the direction the sun went down, so he could get his bearings in the morning if it proved to be cloudy. He knew all about rattlesnakes, the book kind, but he didn't know that the little sharp-toothed gray desert "sidewinder" can strike quick and hard without coiling. He did not know enough to coil a hair lariat about his blankets at night, nor take his shovel and scrape away a smooth place for his bed in a clump of turkey foot cactus to prevent a snake getting at him. He could lie on his back and call all the big stars by their first names, but he couldn't come within two hours of the time of night by the big dipper. If water was scarce, he did not know enough to strain to-night's dish water through a gunnysack and save it for morning, then strain it again for the burros; if there was no water to spare, he did not know enough to dry wash the dishes. He knew enough to fill a book about things that were of no use to a man, but what he didn't know about everyday things on the Colorado desert would fill two. Why, he did not even know that on leaving one water hole he must always carry enough to do him to the next one and back, in the event that he should find the second one dry. That is how Pete came to find him, and if he hadn't found him there would have been a vacant chair in geology and ethnology.

We were chloriding out in the Chuckawalla Mountains in Southern California, and were camped at Chuckawalla Wells, about forty miles west of Ehrenberg, on the Colorado River; you can locate it on the map. By "we" I mean Paystreak Crawford, Chloride Sam, Pete and myself, same old crowd that was up on Barley Flats, where the Chinese cook saw his first grizzly. We had been partners for years, and hereafter when I say "we" I mean the four of us, unless otherwise specified. That five-inch seam of hematite ore, some of it going a dollar a pound, proved to be wedge-shaped, but with the wrong end up, and we worked it out before the snow in the higher mountains shut us in. We didn't do so bad, though, for the summer, cleaning up altogether about a hundred ounces of gold. When the snow fell to such a depth that the burros began to paw it away to get at the forage, we packed for home. Now, our "home" as we called it, was the Desert of the Colorado, a strip of country about 250 miles long and 100 miles wide, lying just west of the Colorado River, and from Death Valley on the north to the Mexican line on the south, where it is joined by the Cocopah Desert, but the junction point is invisible, and the same desert extends on down through the Peninsula of Baja California, as far as one cares to go. Some time I will tell you about that unsurveyed country that "God made in His anger and forgot," for I know it. Many is the night that I have held to a burro's tail as I plodded across its broad mesas. Trust a burro every time to avoid cactus and rattlesnakes. A country where the bighorn sheep is making his last stand.

Pete had gone to Salton, eighty miles, for a supply of grub. Why Pete went instead of one of the rest of us was only a little detail of camp life. The night before we had played cut-throat seven-up, winner drop out and the last, loser, to go. Paystreak and I had dropped out, and the finale was up to Sam and Pete; Sam had five to go, and turning a jack and holding the ace of trumps, Pete was due to make a 160-mile trip across the desert.

On his way to Salton, Pete found the Professor at Dos Palmas, the first water hole six miles out from the railroad. The little oasis gets its name from two big date palms. How they came there no one knows. Chemihueva Joe, an Indian ninety years old, says they have always been there, and he was there before the white man came. Dos Palmas is on the old Taos trail that was traveled before Madoc, the Welshman, discovered America, and that was 350 years before Columbus sailed. Fifty years ago, the old Butterfield stage route followed the Taos trail, then the railroad crossed to the south, and the trail was abandoned save for a few prospectors and Indians.

The Professor was camped at the spring, and Pete

saw him as soon as he turned the last clump of bean mesquite. He wore blue goggles, was dressed in buff khaki, had laced leather boots to match, a tan-colored hat and "neglijay" shirt with buff tie. He was clean and neat, and had two little forked sticks in the ground and a third across the top, on which was swung a dinky nickle-plated teapot about six inches above the tiny smoky blaze of some green twigs.

"A stranger and a pilgrim," said Pete, as he swung from the back of old Nig, our big, black burro. Now a prospector is the most generous person on earth; he will split his blanket with you and divide his last half pint of water; but when he meets one of those fellows that carries a scatter load of knowledge of everything under, on and above the earth, he is a bit gun shy. Pete camped about fifty yards away, but before he unsaddled he took his six-shooter off the horn and buckled it about his waist. In the mountains or desert, you know, you can't afford to let trouble get the drop; you must always see it first. But a little while afterward, Pete got ashamed of himself, dropped his gun on his pack and hummed "Oh, where is my wandering boy?" as he kicked up some dead sage roots for his fire. The Professor saw him at it and came over.

"Good evening," says he.

"Howdy," replied Pete, who said the Professor looked him over until he saw the tooth brush in his jumper pocket, then he introduced himself and held out his hand. He was young, big and husky, stood straight up and down, and used only his feet and legs when he walked.

"Is that the way you do?" he asked, as Pete jammed his old coffeepot down on the blazing roots and turned to drop some slices of bacon in a frying-pan. "I have been trying for an hour to boil tea water, but the green twigs do not burn."

"Yes, I see your fire," said Pete; "it's an awful purty scene in a picture, but it won't do for a hungry man. Your supper is likely to run into breakfast time. The sand around here is full of dead sage roots, that make a quick, hot fire."

Pete learned that the Professor intended spending a couple of months on the comparatively unknown desert studying the formations and paying particular attention to the Indian hieroglyphics.

"What's that?" asked Pete. "Indians are mighty apt to catch anything a white man has the minute they are exposed, and they have diseases of their own; but I never heard of 'em havin' that." Pete had a good poker face, and one could never tell when he was "joshing" or in earnest. The Professor went on at length to cast a light on Pete's ignorance:

"Oh, you mean picture writin'. Why, there's a lot of it up at Corn Springs, and some around Chuckawalla. You can find it around the water holes, where there is a smooth face of granite. They cut 'em with jasper or chalcedony chisels; you can find bits of their tools lying around. Indians nowadays can't read the writin', though old Jose, a Chemihueva Apache, will set down in front of it for an hour at a time and then tell you that one bunch of pictures says where the next water is; another tells of a battle, and another bunch of criss-crosses, stands for a lot of men on horseback wearin' steel clothes and carryin' spears, bows and swords." The Professor was certainly interested, and asked a lot of questions, as he pulled a little bottle from his pocket and began bathing red blotches on his hands and face.

"What's the matter?" asked Pete.

"Mosquitoes. Millions of them around my camp, but they do not seem to bother here."

"No, only 'round the water; that's why I camped here."

The Professor moved his things to Pete's camp and boiled the tea water on the sage root fire. Pete said that when he got through unpacking and looking for things it looked like he had come out to start a trader's store—canned goods all around, and dried beef.

"Who told you to bring dried beef on the desert; somebody with a grudge?" asked Pete.

"Dried beef is very nourishing, and takes up very little space," replied the Professor.

"Yes, but to eat it, you've got to have a four-horse team to pull a big water tank along. 'Ceptin' whisky or brandy, it is the worst thing you could carry. Take my advice, and chuck it to the coyotes." But the Professor only laughed, and then Pete kept still and let him do the talking.

"This is Monday," said Pete the next morning. "I am going in to Salton to send my order. I will leave my burros here and come back. My grub will be out Tuesday evening on the freight. I will go in after it, pack and come back here to camp and pull out on Wednesday for the long hike. You'd better stay here and wait for me."

"No, I will go on to camp and tell them you are coming."

"I've come across sundry shapes of things that were once men and thought the same. You'd better wait." But again the Professor laughed.

"I have a good map of the country and the water-holes."

"You laugh because you do not know—just as you laughed last night at my ignorance of those square meals pressed into the little tablets and the women's and babies' food that you've brought along. Now, I

know, but will not laugh. Your map is so much worth less paper. The desert has never been explored or measured thoroughly by men who knew how to draw a map. I know what your map is. It shows a little do on a wavy line that stands for a cañon and the do stands for water. You will find dozens of cañons, all looking alike, and your tongue will be hanging out before you find the one with the water. The next water is at Cañon Springs, twelve miles; if you leave there you had better leave your address and the names of your next of kin in a can at the water, where I can find it. It is sixty miles from there to Chuckawalla Wells with one water between, and I've known tenderfeet to go stripped, stark crazy in eight hours without water."

But the Professor packed and went on, and it was Thursday night before Pete saw him again.

Pete had left Cañon Springs, and was nearing Dry Camp, about three miles above Big Clay Butte, when a file of burros came stringing out of the brush of a greasewood-covered mesa into the big wash. Pete recognized them at once as the Professor's. They were thirsty, there was no denying that; so Pete tapped his water kegs and gave each a gallon, but did not camp for noon. He roped the bell burro, and leading him passed on up the trail. The sun had just dropped behind the 12,000-foot peak of old San Jacinto, ninety miles to the west, when he neared Coyote Holes. His jaded burros stopped, threw up their heads, and with their long ears forward, gazed across the flat dry waste covered with greasewood and cacti. Pete's eyes followed theirs, and saw a man, bareheaded, stripped to the waist, his limbs covered with shreds of khaki trousers, his bare feet and body blistered in the sun, and bleeding from many lacerations by thorns. He was waving his arms and uttering hoarse, inarticulate sounds as well as his cracked, swollen and protruding tongue would permit.

"Poor devil; I told him so, and now I reckon he knows," said Pete, as he hurriedly undid a cinch rope, made a running noose, coiled it and started toward the Professor. It is a peculiar fact that men, temporarily insane from thirst, strip themselves and go racing across the country. Some will run from rescuers and fight like tigers before they will submit to succor, while others will be as inert as a sick animal. Pete saw the type of madness with which he had to deal and took no chances. He gave chase to the running, staggering man, and as he neared him, the Professor turned, his bloodshot eyes blazing. Pete made a quick cast, the noose settled, was drawn taut, and the arms pinioned. He was then half led and half dragged back to the burros, lifted into the saddle and taken on a half mile to a broad sandy wash. There Pete laid him in the shade of an ironwood tree and scooped a shallow hole in the sand with his shovel. This hole was soon half filled with cool, sweet water. There was the Professor's camp, not over 200 yds. away. He had run all over that very spot, dying from thirst and water within eighteen inches of him. Even coyotes had been there, scratched a hole, watered and gone on; yet he did not know. That was how it was discovered, and is now known as Coyote Holes. An underground flow or seepage from a mountain range ten miles away, and the times when one cannot obtain water there are rare.

Pete poured a few spoonfuls of water down the cracked and swollen throat, and then thoroughly soaked a rag and laid it across the parched lips and tongue. This he repeated every minute, owing to the fever, and it was not long until the swelling subsided. Then Pete scooped a long, narrow hole in the sand and laid the Professor's body in the water, but holding his head so he could not drink. Gradually the fever left the body as the thirsty pores drank up the water, and reason slowly returned; but as yet the Professor could not speak intelligently. Before night he was sufficiently recovered to realize that he must drink a little at a time, and when made to understand that, he was left with a canteen of water while Pete attended to the burros and himself. All the Professor was allowed that night was a pan of thin, rolled oats gruel. Luckily among his "women's fixin's" he had a jar of cold cream, and with the aid of Pete, he rubbed it all over his body. The next morning he was able to wear clothes and eat. "I dug holes here for hours, but could find no water," said he.

"You missed the channel," said Pete. "Instead of digging up and down the wash you should have cross-cut, and even then, if you did not know, you would miss it. The bedrock is uneven, and the water settles in long, narrow pools. I don't know why the water is right here; fifty yards above and you won't find water for miles, and a hundred yards below, it is the same way."

"I had ten gallons of water when I started from Cañon Springs, two five-gallon cans in canvas bags; but the straps of one bag broke or pulled off, and the can burst on the rocks; then the pack saddle turned, throwing off the other, and it had a hole knocked in it. The burro was behind, and I did not know it until he came racing up with the pack saddle under him."

"Do you mean to say that you did not have those water aparajos cinched on? Professor, I'll have to lasso you again and tie you on the saddle."

"The last thing I remember was scooping a hole that I thought was my own grave, but all the time I was praying for life at the bottom."

ATLANTIC

Photo by N. L. Stebbins.

The smaller pictures were taken by Mr. Frederick M. Hoyt on Atlantic during the race for the German Emperor's Ocean Cup.

They reached camp the evening of the second day after that, the Professor stiff, sore, his flesh as tender as a baby's, and Pete talked to us worse than he did to the Chink every time he saw us grinning at the stranger, who did not know on which foot to limp.

[TO BE CONCLUDED.]

## Camping in the Mississaga Region

It would be difficult to find a wilder and less explored region than the land for 200 miles along the shores of the Mississaga River. A canoe trip down that river starts north of the watershed at Winnebago, on the main line of the Canadian Pacific Railway, and thence runs south to Lake Huron. A few miles after leaving Winnebago, which is absolutely wild, not having even a single settler's shack, a great forest reserve of 3,000 square miles is reached. In this reserve no one may build (unless it be a fishing and hunting camp), and no clearing of the timber can be done. Only the ripe timber will be cut, and that under the supervision of Government officials. For 200 miles there is no habitation along the river. Then, a few miles before reaching beautiful Lake Waquakobing, an odd settler's house can be seen from the banks. Half of these are now deserted as the wild country has been found to be hardly fit for agriculture. Our illustration on page 101 is a typical bit of forest and stream in that Mississaga region, which for boldness of outline and infinite variety of scenery is unexcelled.

The camp in the picture is at the spot at the Narrows of Lake Minnesinqua, where that peculiar fish, the red pike of the Mississaga, and the great *Salvelinus namaycush* abound in greater numbers than anywhere else on the route. On either side of the river the country is absolutely unexplored, except such exploration as was necessary in running the boundary line of the great forest reserve. A day's journey by canoe beyond the reserve will bring the tourist to Aubrey Falls, 165 feet high, and then follows swift water, in which fifty-nine rapids are "run" in one day. This feature above all others is destined to make the Mississaga canoe trip popular. Another most important feature of this great trip is that its beginning is taken direct from the railway train at the upper end, and the train is again easily reached at the other end. There is no weary poling up stream, except a short day's paddle up the Winnebago to its source at the commencement of the trip. A further great consideration, particularly to the men who are putting on weight, is that the portages are comparatively easy. There is never more of this work than is sufficient to give variety to the day's occupation.

## Lewis Wetzel's Flintlock.

MORGANTOWN, W. Va.—*Editor Forest and Stream:* There has recently been received at this place what is perhaps one of the most interesting relics of pioneer days in existence, and is the property of Mr. H. Maxwell, historian and editor of the Morgantown Chronicle. It is the old rifle used by the great scout and Indian fighter, Lewis Wetzel, with whose exploits all who are interested in pioneer history are familiar. It is the rifle which was carried by him in his solitary raids through the Indian country. The arm remains as it was when he used it except that the flint lock has been replaced by a percussion lock. The barrel is now forty-two and a half inches in length, but has probably been cut off at the breech at the time of making the change to the percussion, and with its great clumsy full stock would seem now to be a very burdensome weapon to carry through the woods. The initials of the great scout, L. W., can be plainly seen on the barrel, and there is a very noticeable gash cut in the barrel which it is said was done by the tomahawk of an Indian at the time Wetzel had a hand to hand encounter with one of the three Indians which he killed at one time in a running fight.

This was the gun which the Indians declared was always loaded, owing to the fact that Wetzel had learned to load his gun while running at full speed, and was thereby able to wipe out several pursuing Indians in a single race. We do not know that this feat was accredited to any other of the early-day Indian fighters, and considering the weight and length of the gun, the manner of loading and the nature of the race, when chased through the woods by savages, it was indeed a feat which excites our admiration.

Born about 1764, Wetzel came upon the stage of action right in the thickest of Indian hostilities in what is now West Virginia, where the Wetzels moved in 1772. When his father was killed by the Indians in 1787 Lewis and his four brothers swore eternal vengeance on the Indians, and the life of Lewis especially was thereafter devoted to the execution of that vow. He has well been called the "Boone of West Virginia," and we West Virginians feel more than a passing interest in his life and exploits. Many incidents of his life are recorded, but no doubt others which have never been written would fill a large volume of most interesting reading. One story will serve to show the fearless man he was.

In 1786 the Indians became so troublesome in the neighborhood of Wheeling that a subscription was made up and \$100 was offered to the man who would bring in the first Indian scalp. A company of about twenty, among whom was Wetzel, started early in August to invade the Indian settlements to inflict punishment upon them for their depredations. The advance scouts discovered a camp of Indians far too numerous for them to attack. A consultation was held and an immediate retreat was determined upon. During the conference Wetzel sat upon a log with his gun resting across his knees. When the party started in hasty retreat they noticed Wetzel still sitting on the log, and asked him if he was not going along. He said he had come out to hunt Indians, and now that they were found he was not going home like a fool with his fingers in his mouth. He said he would take an Indian scalp or lose his own. All their arguments were unavailing, and they left him, one man in a wilderness surrounded by an enemy vigilant, cruel, bloodthirsty and of horrid barbarity.

After he was left alone he started on his stealthy hunt to find a savage or a small party which he might successfully attack. Not until late the next day did he find

what he was looking for. A smoke was discovered, and going toward it he found a camp, but it was tenantless. It contained two blankets and a small kettle which he knew to be the camp of two Indians who were doubtless out on a hunt. Concealing himself nearby he awaited their return, intending to kill them as they slept. About sunset one of them returned with a deer on his shoulder and set about preparing supper; soon the other came in, and they ate their supper, but about 9 or 10 o'clock one of them wrapped his blanket about him, shouldered his rifle and took a chunk of fire in his hand, doubtless with the intention of watching a deer lick.

Of course Wetzel was disappointed but waited in the hope that the absent one would return before morning. He waited until the birds announced that morning was near at hand, then he crept to the sleeping Indian, killed him with his knife, scalped him and set out for home, where he arrived one day after his companions. He claimed and received the reward.

We have a peculiar feeling of reverence as we handle the old weapon, and think of the wild savages who were sent to the "happy hunting ground" by the great scout, and of the great unwritten and unknown history in which it played some part in the long ago. This rifle and a pipe are the only relics of Lewis Wetzel that are known to exist. The pipe is the property of Mrs. Cranmer, widow of the late Judge Cranmer, of Wheeling. The gun became the property of Mr. Maxwell in 1881, and in September of the next year was placed on exhibition at the Fort Henry Centennial. It was left in Wheeling for exhibition, and the flood in February, 1884, washed away the building it was in and all trace of the gun was lost. It has long since been given up for lost, but now, after twenty-one years, it has again come to light, and has been restored to its owner at this place.

EMERSON CARNEY.

## Lake Tahoe.

SACRAMENTO, California.—Lake Tahoe was a distinct disappointment. Not as to scenery; "grand," "wild" and "rugged" are merely pygmy attempts at description. Walk in any direction whatsoever and down to your ankles you bog in soft lush, sweet-smelling pine needles, gum leaves, and other flora covering the earth with a carpet more exquisite of design, more velvety of pile than ever grew in loom of Turk, or Persian, or Daghestan. The woods fairly shout aloud the "call of the wild." More than once, dog-like, I threw myself upon the pine needles and rolled upon my back, kicked up my legs and writhed and twisted in wanton exuberation upon my belly. It took me back to my boyhood days among the red hills and tall pines of Georgia, when "we young 'uns" proudly fashioned rough sleds, and, in lieu of ice and snow, tobogganed joyously down the needle-covered hillsides.

The lake: did you ever hold a real blue diamond under an are light and drink in its liquid violetness? That's Tahoe; a giant cup of distilled violet juice nestling in the peaks and crags of mountains whose emurpled heights are as a cup rim. Half a mile deep, twenty miles and better long, a dozen miles wide—mayhap more. I am a poor hand at statistics when the aroma of the wilderness invites my senses. Every step we took—the Novitiate and I—we found new material for camera. Precious moments we squandered on sundry flashing and bright-eyed chipmunks. The Novitiate discovered—all unassisted—a pair of scolding, chattering gray squirrels, who, saucy as magpies, skurried from their tree-home to within a few feet of her picture hat, described by a glib-tongued milliner as a "poem in autumn shades," and curving their radiant tails into living interrogation points, seemed to ask: "What in thunder do you wear a squirrel-nest on your head for, anyway?" A single step off the veranda of our tavern and into the depths of uncivilized nature we plunged. And the tavern at Tahoe—as meet in a land where appetite attains full growth every three hours—proves to be no mirage of the desert. The Blisses, two grown generations and a younger one already well started—have long owned miles of timber land surrounding Tahoe, having purchased much of it from the original Indian owners. Many of these latter linger about, adding to the picturesqueness of the scenery.

They—not the Indians—first broke into this Arcadian preserve with lumbering ox-team; the "mule-skinner" displaced the ox-driver. The latter has now given way to a powerful narrow gauge, equipped with pretty, wide-open, observation cars, whose destination is that truly marvelous place of rest and recuperation and recreation—the Land of Nowhere. The road arrives at its destination by way of the Truckee, a river without childhood or youth—born full-grown of its blue-eyed mother, Lake Tahoe. Lumber was the object of the elder Bliss. When you alight from the Union-Central Pacific "Overland Limited" at Truckee you need no Baedeker to learn that you are in a lumber camp.

It's fifteen "pipes" to Tahoe City—a "pipe" is a mile, that is, if you don't loiter on the way and don't "smoke up" too vigorously. The run up from Truckee to the place in the woods where nature assumes sway, is made in an hour and a half, and the leaving time is "any delightful old time" that will get you there in season for a piping good dinner with silver trout—not à la maitre d'hotel, but camp style—as the pièce de résistance. There was a congestion of "overlands" on the main line the morning we arrived, and a trivial delay on account of a "hot box." We could not get our trunks transferred, and, would you believe it, that charming conductor (the Novitiate's language) just held his train, United States mail and all, till that precious baggage was safely run to cover. This accommodating official cheerfully discharges the duties of chief baggage agent, train dispatcher, express agent and messenger, brakeman and train man; he finds time besides to answer hundreds of questions of curious passengers. And the way these Blisses and their hired help dismiss the title "Mr." and get down to "Buck" and "Harry" and "Tom" made one really feel that he was in a lumber camp where men were "sized up" on their merits, whether in blue denim or black Tuxedo.

When visitors began to invade Tahoe City beyond its power of accommodation, the Blisses built a modern caravansary, placed it in the hands of a competent manager and continued their simple lives in their simple homes in Tahoe City, pursuing their old calling of "sawing wood" and converting it into that silence which is

golden and passes current at all commercial and savings banks.

Of course, reader mine, you have already seen that Tahoe could not have been altogether disappointing, but we had journeyed from far-off Colorado, over the great snow-covered divide, for the purpose of toying with some of those masterful specimens of *Salmo tahoensis*, *Salmo clarkii* or *Salmo henshawii*, and no amount of scenery, braising air, or well prepared dinners could console us. Our ease of willowy rods, tried and proved true over many waters, our new Vom Hofe, our carefully tied and more carefully tested leaders were to avail us nothing. The "Novitiate," whose inoculation with the serum of things wild was not yet complete, consoled herself with a second portion of "sure enough" ice cream and admonished me "not to cry, little boy, don't cry."

Was the season over? No. Had the trout quit biting? No. Were none being taken? Yes, indeed; the fisher folks of the village were coming in daily with boats laden. Then why not hire a boat and do likewise. Oh, that was the rub. Hand-line fishing has no charms for me, and everybody tells me this is the only possible method of connecting. Just imagine substituting for light, springy lance-wood, delicately balanced reel, light yet strong cuttyhunk and leaders capable of standing the severest strain any leader ever stood; imagine, I say, discarding this sort of toggery for three or four pounds of electric light cable, wound round about a double-crank windlass of the "old oaken bucket" brand, and a hook capable of yanking an eighteen-foot South American caiman clean to Kingdom Come without turning a hair. Wouldn't that disappoint you—and jar you a bit, too? I once helped turn the crank of a pile driver for the Colorado Fuel & Iron Co., but they paid me \$3 per day for the use of my portion of the aforementioned jack power. No, I side stepped, sunfished and bucked at the proposition of derricking those silver kings from the depths of Tahoe with a telegraph line.

Yet, tons, aye a hundred tons of these royal Tahoe trout are taken—slaughtered seems to be the meet expression—every season by the mercenaries who patrol the deep waters and pry their trade ruthlessly. It is work with these rough, hardy fellows; I decided it would have been work for me. Hence the disappointment. Again, I have personal and private ideas about the manner of my final taking off. I should no more care to die an ignominious death than to lead such a life, and would not a Tahoe trout—a truly blue-blooded piscatorial Castilian of the bluest extraction, gasp with added anguish at the thought of being gibbeted out of his native element like a common malefactor? To fight the good fight, to pit skill against skill, that were one thing; to murder in cold blood, ugh! So I journeyed to one of the score of small lakes within five to a dozen miles of Tahoe City and had some rare sport with the pretty little brook trout which so plentifully abound. Of these one may keep taking till the limit is had. Nor is there danger of waste—you always find other guests to help you digest them.

A strange thing about the people one meets at Tahoe; they remain strangers no longer than it takes bread to rise—good humor and good cheer are in the atmosphere. But I am digressing from the main issue which was to give others the benefit of my experience, so that those who later fare Tahoeward may profit.

There is a smiling, and blond Scandinavian at Tahoe. The blood of Vikings most likely courses in his veins, but he is a good fellow "for a' that an' a' that." He is Chris, Nelsen, Commodore Nelsen if it please you, captain of the staunch little steamer Tahoe, which makes a daily trip of some seventy miles around the lake. "Chris" has charge of a flotilla of rowboats, hence knows the regular habitues of the lake. One of these is a Californian, resident in Chicago, Mr. William Kent, of a charming and quite ambitious bungalow on the shores of the lake; also a serviceable launch.

A couple of years ago, according to "Chris", Mr. Kent made up his mind that he could take these kings of all trout on light rod and light spoon troll in the right water with the right spoon, under right conditions. "Chris" has frequently acted as Mr. Kent's boatman and displays photographic evidence of the prowess of the latter in the shape of three handsome fellows of 9, 9½ and 3¾ pounds, all taken before one July breakfast just off the Point, which is not more than one-quarter of a mile from the tavern. The "cut-throat" (*S. clarkii*), "pogy" (*S. henshawii*), and silver trout (*S. tahoensis*), are all one, so on the fish sharps at the hatchery in Tahoe City told me. Their apparent differences is the result of merely local conditions; personally I had not the opportunity to study them very extensively in life. Some of the attachés of the local hatchery insisted that the scientific name of the Tahoe trout is *Salmo mykiss*, but Dr. David Starr Jordan, in his invaluable "American Food and Game Fishes," states that the latter fish is only encountered in the waters of Kamtchatka. The same authority has catalogued the silver trout as *Salmo tahoensis*, and I am willing to let it go at that. What's in a name, anyhow, if the trout fights like a thoroughbred?

The principal thing—at Tahoe—is to entice him from his depth of one, or two, or three, or more hundreds of feet, or fathoms, or find him when he is surface feeding and take him on light tackle. Mr. Kent has done this; so has another certain enthusiast, a lawyer of San Francisco, Mr. Archie Treat. In trolling, as near as I could learn, Mr. Kent uses a steel salmon rod, a Kentucky reel, bass size, a light cuttyhunk line and a red-star spinner attached to a selected nine-foot leader. He trolls with two such rigs, crossing the butts and resting them under each leg. I understand the spinner was weighted with the equivalent of a Rangeley sinker No. 5. The troll follows the boat at about sixty feet.

There is much local testimony anent the stirring fights that this lure led Mr. Kent into last summer and the summer preceding. When the silver trout strikes he does it so emphatically that it's dollars to horseshoes you'll imagine you are snagged. And the fight that follows is a battle of both endurance and skill.

The only other successful manipulator of light tackle so far known to the people of Tahoe is Mr. Treat. Mr. Treat got his ideas from Mr. Kent and then went him one better. I am going to try the Treat method when I can revisit Tahoe. I have great faith in it from the fact that that veteran angler, rare good fellow and globe-trotter, Judge D. C. Beaman, of Denver, has tried it repeatedly and always successfully. But for my limited stay

at Tahoe I should have sent to San Francisco for the spoon so successfully used by Judge Beaman on the big Mackinaws in Twin Lakes, near Leadville, Col. This is a western device known as the Golcher spoon, so-called after the inventor, an enthusiastic sportsman of San Francisco. For the benefit of those who have not seen it I may say that the No. 4 spoon is about two inches long and one inch wide; it is of copper, brass or silver. The ends are concaved in opposition; to one end are attached two hooks, to the other a ring into which the leader loops. There is no swivel. The spoon does not revolve; as it is drawn through the water it darts off first at one tangent then suddenly at another, just as we have often seen a wounded herring, roach or young bluefish do. The Golcher spinner must be weighted to sink it a few feet.

Both Mr. Kent with his red-star spinner and Mr. Treat with his Golcher outfit were signally successful and, like true sportsmen, they are willing that others shall profit by their genius and industry. Already I know of several local anglers now "laying up" to have a try at the new method. If it prove equally efficient in the hands of the newcomers as in those of the pioneers it will surely mark an epoch, a new departure in trout fishing at Tahoe, and soon one may count on seeing anglers from every point of the compass in valiant combat with the silver kings of Tahoe's icy depths. The trout run in size from a pound to 30. The season for fishing begins in June and is best from then till the middle of August, but good even in early September. Open season on Tahoe is peculiar. On the Nevada side of the lake the law gives one the right to fish from April 1 to March 15, the California law runs from April to October, though one may not fish in the waters contiguous to Placer and El Dorado counties, California, till June 1. Nevada supports no fish commission and does nothing to help California protect the fish. Last year California placed in the lake about 1,000,000 fry and about the same number the year before.

It is estimated that the market fishermen send to the city markets each year no less than 100 tons of trout. Those who follow their vocation in Placer and El Dorado counties evade the law by filling their tanks in May and waiting till June 1 to ship. Of course, this could not be done without connivance, and it should be stopped.

One thing the tourist to Tahoe is not slow to learn; these professional fishermen view him with contempt, regard him as an interloper come to rob them of their vested rights. Few, if any of them, will take a stranger out in their boats. One young man told me that he earned \$17.50 in a single day last summer, and that his average for four months was \$175 per month.

Now that Governor Pardee has signed the game and fish law limiting a single day's catch of trout to 25 pounds or fifty trout, it remains to be seen what these market men will do. But they are less blameworthy, in my opinion, than the fellow who kills just for the sake of killing. California public opinion is waking up on the subject of game preservation, and the pot hunter, the pot fisherman and game butcher are beginning to read the handwriting on the wall.

Speaking of pot hunters and sporting gents—not sportsmen, if you please—what class does this fellow of whom I was trustworthily told the following, belong: He came to the tavern one summer from San Francisco. He said he was fond of angling and spent hours on the lake daily. Each day he shipped a big box of fine trout to the city. Did he offer a trout to a fellow guest or have one cooked for himself? No, indeed, and thus meanness proved his petard. A shrewd fellow guest took the trouble to have him looked up in the city and lo, our enthusiastic angler turned out to be a well known fish commission merchant in the California market. That was a combination of sport and spondulics for fair,

wasn't it? By going to work early and fishing late I can see how it would be possible for a business gent to make a thrifty dollar or two over and above his vacation expenses and at the same time earn the reputation of being a "devilishly enthusiastic angler." But the California public are rapidly being educated up from this sodden and sordid spirit.

J. D. C.

## The Upper Mississippi Forests.

AITKIN, Minn., July.—*Editor Forest and Stream:* Some time last winter I wrote you of the Government giving permission to the lumbermen to raise the water in Itasca Park two feet in order to float their logs. The sequel of such permission is now in evidence. Many thousand acres of the Upper Mississippi Valley are under water. For nearly nine months past the lumbermen of the upper woods have been storing every drop of water they could hold by damming the outlets of various lakes. The United States Government aids in the work with its four great reservoirs at Sandy, Pokagema, Leech and Winnebegoshish lakes. In these lakes hundreds of square miles of water are held to a depth in some cases of ten or twelve feet. This makes what they call a driving head for carrying the logs to Minneapolis. There is the claim that the Government reservoirs are for the purpose of supplying water for navigation purposes below St. Paul and for the prevention of floods, but in the case of the floods it works the wrong way. In very dry seasons it works all right, but in very wet seasons it results in just such disastrous floods as are now on. If this country were well developed and a rich farming community this condition would be remedied very quickly; but the country is poor and ill-developed on account of repeated floods, while the lumber barons own the State and apparently the United States Government as a side property. So complete is their control that not a county paper in all the line will so much as hint that the operations of the loggers have anything to do with the conditions. The commercial clubs of all the small towns and even Duluth and St. Paul hold indignation meetings and send committees to investigate the Government reservoirs and the flooded districts, but let anyone so much as hint that the lumbering operations are to blame and the fire of their enthusiasm goes out in a cloud of steam as quickly as if a Niagara had been poured upon them.

If the Government wanted to do so, it could easily prevent the damage to this lower country by cutting canals across the bends of the river at various places and increasing the carrying capacity of the stream. One canal of nine miles in length would relieve fifty miles of river. A tax of a few cents per thousand on all the lumber the river carries to the mills in a single season would pay the cost, for indeed the traffic is something wonderful. From the time the April sun first opens the way to navigation till November closes it again, there is one almost continuous string of logs rushing on to the grasping mills. In canoeing about, one often has to wait some time for an opening in the logs sufficiently wide to force a canoe through. The controlling of the floods is directly in the hands of the Secretary of War, and through him the President, as by ordering all waters out of the reservoirs until such times as the carrying capacity of the river is overtaxed, it would be possible to hold absolute control of the flood. A reverse order brings a reverse of result.

Cruising about over the flooded district one sees cattle and horses grazing from the tops of the tallest grass half up their sides in water. There are many timothy meadows where the tallest heads just reach the surface of

the water. Others were covered entirely out of sight. One farmer, whose farm was entirely covered and who had water in his house, took the roof off his log barn and using part of the house as material raised it one story higher and lives up there. Another queer thing was sprinkling the streets in the town of Aitkin when perhaps one block away the same street would be two feet under water, and there was water in some of the houses. It is a curious mixture of sunshine and flood, smiling weather and treacherous waters, and puts one in mind of Byron's "Mildest-mannered man that ever scuttled ship or cut a throat." The property lost is not so great as one might expect from such a flood, as the farmers are not wealthy as a rule, but such as they had it was their living and their opportunity. There are some fine properties, however, devastated. Nor is the loss confined to the farmer; the local lumbermen lose heavily by reason of scattered logs, closed mills and lumber damaged by water. One firm, Hodgeden & McDonald, who, aside from their lumber business, had sought to develop the country and had cleared much land, lose heavily all round. One field of oats in particular of a hundred acres or more, which was as fine a field as I remember ever to have seen and just getting green across the entire field when the flood came, would now make a fine place to hold a rowing regatta. Gyde, the stove mill man, is also said to be damaged \$5,000. But these people are in no stress. It is the poorer people, whose labor has been the source of all the wealth of the community who, losing a few dollars, lose their all, who are the real sufferers.

If the traffic on the river is of sufficient importance to allow its continuance in the face of the damage done, it is of enough importance to pay a log tax equal to the damage done or at least enough to pay a goodly part of the expense necessary to increase the carrying capacity of the river.

Since the prairie chickens (pinnated grouse) have been almost driven from the prairies of western Minnesota and Dakota by excessive shooting, they have adopted the marsh lands of this section as their home. About fourteen years ago the first of them were seen here, according to Mr. Kempton, local game warden, and since then they have gradually increased until this spring their booming could be heard in any and all directions, morning and evening, through April and May and up until the beginning of the flood, after which time I have heard nothing of them, but I suppose the old birds will come back after the water recedes.

Of young birds I think there will be none. The burrowing animals of the wood are all drowned out and woodchucks, skunks, porcupine, mink, muskrat and others can be seen in all manner of curious places. I saw a woodchuck adrift on a piece of plank the other day and immediately my bulldozing instinct took possession and I paddled up to it and raised my paddle as if to strike, and shouted. The chuck did not leave his plank and start to swim as I expected, but simply stood his ground (plank) and showed his teeth. I then bombarded him with small pieces of bark. At this I read his thoughts by his expression as being, "You have the advantage, Mister, but I can't help but say you are a contemptible rascal for thus abusing me," and I left him his bit of plank and departed. Yet I doubt if the lumber companies who have their eyes fastened on the last pine snag in Minnesota would have done as much.

This is said to be the record flood in point of duration, and only lacks a few inches of being the record for height. Ten days after the last drop of rain fell and eight days after the water stopped rising it has only fallen two inches. A glance over the records of the past show that it is not the times of greatest rainfall that greatest floods occurred.

E. P. JAKES.

# NATURAL HISTORY

## A Feathered Joker.

THE yellow-breasted chat reaches the northern limit of his range in central New York. He is found there only in favored localities and is not a common bird as in New Jersey and from thence southward. Probably this accounts for his being held in superstitious awe by some of the people. An amusing incident was brought to my notice last summer. Two laborers were engaged in cleaning out an old ditch in one of the back meadows. They were close to the boundary of the field which was marked by a rail fence overgrown by vines and bushes. About noon I observed that while one well polished shovel still showed the presence of a red-shirted workman, the other was missing. The disappearance of Conners, the best ditcher between the lakes, caused me no little concern, for the sluice was flooding half an acre of corn land and needed immediate repairs. I went over to the red-shirted man with the question:

"Scott, where is Conners?"

Scott's grin was bounded only by his ears as he answered: "Pat's quit the job and you'll have to get another man."

"No!" I exclaimed. "You must be joking. He was all right this morning. Why did he quit?"

Scott leaned on his shovel and explained. "There's a bird in the bushes yonder. He's not much bigger than one of these 'ere sparrers, but he's a hull circus. Pat's as full o' superstition as an egg is o' meat, and he was scart. 'That's no canny bird,' says he, 'tis the devil come to harry me.' Bimeby he couldn't stand it no longer. He clum' out of the ditch and went home, vowed he wouldn't stay and work where the critter was, not if all the saints was in the medder to keep off the evil eye. That's him now."

I listened attentively as a chat began his medley of squawks, whistles, caws and clucks from the nearby thicket. It was a remarkable performance, for the bird used his powers of ventriloquism and his notes seemed

to come from a distant tree, from the ground, and indeed from every place except the right one. The racket only ceased when I abruptly approached his hiding place.

"Well," I said laughing, "is that all? That's only a chat, Scott. Sometimes he is called the yellow mocking-bird."

"Mockingbird," commented Scott "I've seen mockers out in Missouri where they're common as chippies, and they kin sing, too, but this feller's smart. Wait a bit and he'll do some of his stunts."

Although annoyed over the defection of Conners, I felt a lively interest in this low comedy actor, the chat, and strolled down by the fence. Of course, he saw me, although he was hidden, so I quietly seated myself under a tree and awaited developments. In five minutes his curiosity got the better of his caution and he followed full-tilt from tree to tree just to let intruders know that this was his bailiwick. Finding that I paid no attention to his sharp "quit, quit," he settled himself on a limb and entertained me as long as I cared to listen. Except for a few rapid trills and a clear, flute-like whistle, there was nothing musical in the performance. It was a mixture of weird, uncanny noises including a peculiar creaking sound like the turning of a rusty hinge. He was decidedly good to look at with his neat figure, quick movements and bright yellow waistcoat, but when he launched himself from a tree and came over our heads in jerky flight with his legs dangling, I could think of nothing but the parti-colored clown at the circus who essays the high jump along with the other acrobats. I was satisfied from his behavior that the nest was not far off, so after a little I began to search for it. From a chat's point of view, it was an ideal nesting-place. Wild blackberry, elders and sumac made a dense thicket on both sides of the fence. It was almost impossible to penetrate into the mass overgrown as it was in many places by vines, but I persevered and, regardless of scratches, made a careful search of the whole line. I found nothing.

Twice in the following week I went over the ground, foot by foot, with the same result. The male bird was constantly about the place. How he jeered as he watched me tearing my way into the jungle! Clearly he had a purpose in his vigil. Was the nest really there, or was he fooling me into that belief to better conceal its location? I saw the female several times but she slipped in and out of the thicket without giving any clue to the mystery. At last, I gave it up, and left the chats to their housekeeping. In the press of work I quite forgot the birds until the harvesting of the hay commenced.

In order to reach the meadow from the farm buildings, it was necessary to pass through a narrow lane. This opened into the field near the lurking place of the chats. Max, the big black setter, followed the men, ranging through the bushes and tall grass. At a point in the lane about five rods from the meadow, he ran into a clump of bushes at the side of the track. Out he came again instantly with two enraged chats pecking and diving at him, flapping about his eyes, and using all the bad language in the chat vocabulary. At the same moment the four youngsters which somewhat resembled young bobolinks, fluttered out of the bushes and took refuge in the nearest tree. The dog's discomfiture was amusing. He made no attempt at defending himself but scudded down the lane with tail and ears drooping exactly like a sable gentleman when caught in the act of robbing a henroost. The chats pursued him for some distance, then returned to their brood. A moment's search in the bushes revealed the clumsy nest in the crotch of a small tree.

It may be a futile matter to compare a bird's mental processes with our own, but it would be interesting to understand the motives actuating the chat's behavior in this instance. His home, as I have related, was safely hidden at some distance. A cuckoo or brown thrasher would have simply used more slyness in concealing his presence and would have avoided the point where the

men were at work. The chat seemed to boldly court their observation. Was he performing a parental duty by drawing the attention of the intruders to himself and away from his offspring, or was he excited by the unusual audience, and being conscious and indeed vain of his powers, was he displaying them to the best of his ability?

M. E. COLEGROVE.

## Birds from Over Sea.

ONE day late in May, 1893, while passing near the old Block House in Central Park at its northern end, I came across two boys who had just taken a nest from a tree. Its contents consisted of three fledglings within a day or two of flight. The old birds were hovering near making their piteous protest to this cruel vandalism.

Much to my surprise they were European goldfinches. I bought the youngsters and started to see how they could be returned to their solicitous parents. The fork that they had been taken from was high, and the nest was badly torn. I was no longer young enough to climb, while the tree was slender. I brought them home and succeeded in rearing all three, setting free two of them when strong enough to look out for themselves, some weeks later.

The third, a male, I kept for his song a couple of years and then turned him loose. These goldfinches are increasing slowly, breeding each year in the Park as well as in the surrounding country. I have noticed them with our own goldfinches on two occasions, and in each case they were male birds, two in one flock of natives, one in another. That they were males only is easily explained, as a thousand males of any species of old-country song birds are imported into the United States, to one female, excepting those isolated cases where an estate is stocked, when presumably even numbers of both sexes are ordered.

The bird importers buy only the male birds for their song, so that the female of any foreign bird is a rarity in our land, excepting the starling and skylark. The male must perforce seek his mate among our own birds of a kindred species. This, in time, is likely to give rise to some rare hybrids by form, color and song, puzzling many a naturalist not in the secret.

Between Pelham Bay bridge and Bartow, two years after the episode of the goldfinches, I noticed an English chaffinch perched on a low branch by the roadside. The bird, a male, was quite tame and seemingly alone, though there were song sparrows and an indigo bird close by. He allowed an inspection at short range, leisurely retreating as I walked up to him. Very likely this was an escaped cage-bird or some one's pet turned loose.

The following summer we moved from New York city into a park near one of the small towns of Westchester. This place was partly wild, having woods on two sides of it and a meadow on the third, while the front faced the highway. Native birds were numerous. One spring morning I heard a clear mellow whistle perhaps a hundred yards from my door coming from the edge of the woods. Now we were quite familiar with the whistle of the orchard and Baltimore oriole, the unrivaled strains of the wood thrush, the loud carol of the robin redbreast, and ringing cadence of the Wilson thrush dwelling amid the skunk cabbage in the swamp hard by. But these notes belonged to none of them, yet they seemed familiar enough.

I racked my brain for a solution of this puzzle, when light dawned and I knew who the singer was before he came into vision—an English blackbird. Sure enough it was, black body, yellow bill and yellow slippers, sitting on a stone wall evidently trying to attract the attention of a robin whom we suspected to be a lady. Why not? They were first cousins, and a blackbird from abroad is a black thrush, as the robin is the red-breasted thrush. They both resented my attentions to their courtship, flying deeper into the woods where I lost sight of them. Two or three more times that summer I heard that blackbird, which, as carpenters were making much noise putting up new buildings nearby, seemed to prefer an old-fashioned garden a quarter of a mile away which we sometimes passed. I looked for a nest but could not find it, though I felt sure that it was somewhere in this vicinity, as the robin was with him.

Later in the same season, among a flock of English sparrows in Bronx Park, I saw a bullfinch. I thought he had probably escaped from the Park aviary, as it was the only specimen of the bird I have ever seen at large.

So much has been said lately in FOREST AND STREAM about the starling I will only add that after the ubiquitous English sparrow it is the most common of all the foreign birds here. There are large colonies of them in Mt. Vernon, Yonkers and New Rochelle; in fact, they are to be found all over Westchester county. There have been several importations of the English larks for the purpose of stocking country places, notably one on Long Island and a second in New Jersey. These birds, like the starling, have stood the winters well, and their worst enemy so far has been the field mole, which broke up some of their nests in New Jersey.

One summer, when on the Maine coast, I purchased a South American cardinal from a retired sea captain. The bird could imitate a robin to perfection, though he dwelt longer on the last notes, drawing them out with a tender sweetness more akin to the rose-breasted grosbeak. He was very tame, and I kept him until the following spring at my home in the park. One day he, too, was allowed his freedom. For a couple of weeks he remained in the vicinity, being seen and heard every day. At first quite tame, he gradually became wilder, and at last disappeared.

Besides the cardinal I have caged at different times most all the best foreign songsters, turning loose at varying intervals the following, all males: English song thrush, blackbirds, Japanese robin, linnets, sky and Russian shore lark. This last bird I bought of a Russian sailor, constructing for it a round cage twenty inches in diameter and three feet high, having a thin piece of light blue cloth across the top instead of wire, for a double purpose—to represent the sky and prevent hurting my captive, who proved the most untamable bird I ever possessed. His song was as wild as himself, weird notes that reminded me at times of a seagull's cry and at others of a plover's call. The kindest treatment for a year made not the slightest difference in its behavior. Its nature was so untamable it seemed cruel to keep it longer.

I had taken the cage to the edge of the meadow and the moment the cloth was lifted the wild creature sprang straight up and away on its powerful wings till a height was reached enabling it to overlook the surrounding country, then it made a bee-line for the Sound and Long Island, and in a moment was beyond my vision.

Each of my other pets showed characteristics peculiarly its own. The Japanese robin, a very restless bird, when liberated flew into a neighboring apple tree in full bloom, and at once proceeded to give each petal a hurried examination. Being a native of the land of the chrysanthemum and cherry blossoms, no doubt this was his habit at home. He stayed in the tree perhaps five minutes and was all over it, and probably would have stayed longer if a Baltimore oriole, which resented having a stranger in a tree he considered his own personal property, had not noticed him and made a savage attack at the Jap, who left instanter.

At different times I possessed two English song thrushes. The first one was an ancient bird when he came to me and died soon after, just as the mating season was on. As I wanted one of our own thrushes, a Wilson, to study his ways, I mounted the dead bird on wires and used him as a toiler in a trap cage. In half an hour I had a male Wilson, which a year later was returned to his own woods. The second thrush was allowed to leave early in May, just after our wood thrushes had arrived. While it is a larger bird than ours, its habits are much the same, though it is not so shy, so I hoped it would mate with a bird of this species.

My European linnets (I had a pair) were peculiar in so much that they could not bear a separation. In the house I had occasionally given them the run of the room. The male would go hopping around on the floor with the female behind him, the two never more than six inches apart. When at large, the male, followed closely in his first flight by the female, flew to a bush a short distance away, lighted on it, rested for a moment, and then hopped down to the ground, commencing to scratch about in the leaves for all the world as our handsome fox sparrow does in March when on his northern migration. I watched for some time as they gradually moved off on the ground, and in their usual order of going; a little couple, bright, cheery and entertaining, and as his notes grew fainter and fainter to my listening ears, I wished them good cheer in the new country now their own.

W. WARREN BROWN.

MT. VERNON, N. Y.

## Warden Guy M Bradley.

THE cause of bird protection in Florida has just received a severe blow in the death of Guy M. Bradley, a warden of the Audubon Society at Flamingo, Fla. Mr. Bradley had charge of the Florida Keys and was earnest in his efforts to put down plume hunting and the destruction of the bird rookeries. On July 8 last he attempted to arrest a poacher on Oyster Key and was killed by the poacher. Walter Smith was arrested for the crime, and taken to Key West, where he was committed to jail to await the action of the Grand Jury, which does not sit until next November. While evidence to convict the slayer of the warden of murder in the first degree is not to be had as yet, the National Association of Audubon Societies has engaged Mr. L. A. Harris, one of the best criminal lawyers in the State, to assist in the prosecution, and no stone will be left unturned to bring the man to justice.

During his trip to Florida last November Secretary William Dutcher saw Bradley and traveled about with him from key to key in the Association's steam launch Audubon, which was in charge of the warden. At that time Bradley said that his life was in danger and that he was likely to be killed at any time by the lawless element with whom he had to do. This belief, however, did not affect his action in any way, and he was steadfast in the performance of his duty.

Mr. Bradley, who was about thirty-five or forty years old, was especially adapted to the work in hand, for he possessed a strong constitution, abundant energy, and indomitable courage. A thorough woodsman and perfectly acquainted with the country, he could tramp more miles in a day, carry more of a load and do more work than most men. He was a quick and good shot, and it is believed that the man who killed him must have shot him from behind. The plume hunters and poaching negroes of that region are a lawless and desperate class, and while they have had a wholesome respect for Bradley and his rifle, there is no doubt that he was in constant danger from them.

Guy M. Bradley leaves a wife and two young children. His parents are still living.

Of Mr. Bradley, Mr. William Dutcher, Chairman of the A. O. U. Committee on the Protection of North American Birds, said in his report for the year 1903: "Our warden in Monroe county, Mr. G. M. Bradley, has been continuously employed since the last report, during which time he has cruised hundreds of miles along the coast and among the keys where thousands of birds still breed. He has also patrolled on foot the swamps where boats could not penetrate. He has every part of the territory under his care posted with warning notices, and has watched and warned many boatloads of cruising tourists and hunters. Many visits have been made to the city and island of Key West, which is in Monroe county, although over seventy miles from his home. His excursions have extended as far north as Chokoloskee, on the border of Lee county, sixty miles away, and eastward his patrol has extended to Key Largo. There is no doubt that it is well known in all that district that a deputy sheriff is continually on the lookout for game and bird law violations, and the moral effect is excellent."

In the same year Messrs. A. C. Bent and Herbert K. Job, members of the A. O. U., sent in a report to Mr. Dutcher, in which they said: "You are certainly fortunate in your selection of wardens for the protection of this inaccessible region, and it will be hard to find better men for this work than Bradley and Burton, and again the Bradleys have the reputation of being the best rifle shots in that vicinity."

In his last annual report, that for the year 1904, Mr. Dutcher says: "Warden Guy M. Bradley is employed by the year and is continually cruising in the launch Audubon among the keys and islands at the extreme southerly point of the State or else is patrolling on foot

the swamps and everglades in that wild section. He covers some hundreds of square miles. Frequent reports are made of his travels, with notes about bird conditions. It is impossible to give the details in a public report, but the committee are satisfied that the results achieved are most excellent. The warden writes that there are no less than nine nesting places—rookeries—within ten miles of his home. With the exception of the Cuthbert rookery, these have not been disturbed. Formerly they were shot out and robbed of eggs quite often by pleasure parties, pot hunters and plume hunters. The section is a most interesting one."

A friend writes of him: "I have always considered Bradley as one of the most ideal men I had ever met; he was so strong and fearless and seemed capable of almost anything requiring those qualities. It does seem as if death always picks off the best, and his death in this way is one of the saddest things I have heard of for a long time. \* \* \* By his death it would seem as if that whole section was doomed to a serious setback."

## A Colorado Beaver Colony.

NOR a few interesting observations have been lately published on colonies of beavers which in recent years have taken up their abode close to the homes of man. Maine has its beavers which are protected, the Adirondacks have been stocked in one or two places, certain portions of New Jersey have been occupied by escaped beavers, which we believe have run over into Pennsylvania. Most interesting observations have been made in Colorado and Montana.

One of the latest from Colorado is by Mr. Edward R. Warren, who recently before the Washington Academy of Sciences read a paper on certain beaver dams in Gunnison county, Colorado.

In this district the Slate River is a clear mountain stream, at an elevation of nearly 9,000 feet. Several dams and a few lodges have been in existence for some years, but in 1902 some very extensive new work was noticed further down stream. So large, indeed, was this work that, in order to arrive at an estimate of its extent and general effects on the valley, it was necessary to resort to surveying. With the exception of a couple of dams all the recent work is on the south side of the river, the land on the north side having been raised above high water mark and converted into a meadow—now covered with willows—by the labor of the beavers in past years. The lower dam is seventy-six feet in a straight line, but is curved twice, so that it is really larger; it does not quite reach the left bank, where there is a subsidiary oblique dam some distance down of about twenty feet in length. The effect of these two dams is to maintain deep water on the left side of the stream; and they head up the water for more than a couple of hundred feet, thus forming a pool which is inhabited by a large colony of beavers. The second dam, which is about 350 feet from the first in a straight line, is nearly 100 feet long, and extends right across the stream, which flows over the north end. It heads up the water for a distance of nearly 500 feet. Some 200 feet above this dam is a large lodge, formed, in the usual manner, of mud and logs. Some 170 feet above this dam is a backwater, across which are two dams, one new and the other old, the former being about twenty feet in length by eight feet in width, and mainly composed of mud. Other dams also occur in the neighborhood.

All the dams are constructed of willow, although further up stream the beavers have used spruce brought down from the mountains by avalanches. The author of the paper finds it difficult to assign an object for this extensive damming of the stream, especially as there are only three lodges in the district. It is suggested, however, that the main idea was to afford a large extent of deep water in which the beavers might swim in safety beneath the ice in winter; but this does not explain the necessity for such a large flooded area, in which, with the exception of the ditches, there would not be much water of the required depth, although nearly all would be available for the numerous muskrats of the district. Possibly the beavers had to work out the capacities of the valley by actual experience, and found that the shallow flooded areas are failures. It is satisfactory to learn that in Colorado beavers are protected by statute, and although the law may not be enforced so strictly as might be desirable, yet it is quite sufficient to deter people from molesting a colony so near a town as is the one on the Slate River.

The author discusses also the food collected by the beavers. The paper is illustrated by maps and beautiful photographs.

## Dovekie in North Carolina.

ON several occasions recently we have noted the occurrence of the dovekie (*Alle alle*) on the North Carolina coast on the outer beach of Currituck Sound. The first of these, which we recall, was picked up nearly twenty years ago by John Doxey, a local gunner of Poplar Branch, in Currituck county. Much more recently Mr. T. Gilbert Pearson recorded the finding of one or more specimens on the beach in northern North Carolina, and this year, in January, 1905, a living specimen was picked up on the beach near the Currituck Shooting Club, North Carolina, half a mile south of the life-saving station. The specimen was sent to Mr. John E. Thayer, of Lancaster, Mass., and is now in his collection.

## Audubon's Birds.

WE are informed that Mr. Fred H. Boardman, Minneapolis, Minn., has a complete set of seven volumes of the smaller size of "Audubon's Birds of America," colored. The set is in perfect condition and is bound in half-morocco. It formerly belonged to the late George A. Boardman, of Calais, Me., and thus has a peculiar interest for all ornithologists. Of course these books have long been out of print, and their precise value is uncertain. Anyone who is sufficiently interested in the subject should apply to Mr. Boardman, whose address is 537 Andrus Building, Minneapolis, Minn.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

### The Wild Ducks of Erie Harbor.

Editor Forest and Stream:

For a good many years, during the season when the fall would not allow me to shoot ducks, and when I was in some parts of the West where the ducks were not protected, but I would not shoot them then when they ought to be protected, I have made the ducks and their ways a close study, but it remains for me this spring to "meet up" with a duck that seemed to act differently from any I have before seen. At the eastern end of Erie harbor and just to the left of the breakwater is a small bay covering about 200 acres, that goes under the name of the mud flat. The water only averages about three feet in depth. Misery Bay, a larger and deeper one, is just across the main channel from it. The ducks use the shores of Misery Bay for their nests, and use this mud flat for a feeding ground. I have counted as many as forty of them on it at one time, though generally there are not half as many.

I have a small boat landing on the shore of this mud flat, and out from shore about sixty yards have a three-foot section of a pine log anchored to a sunken box of stone. I use the log to moor my sailboat to in the summer season; but I won't need it this year; the ducks can have it. For a night or two after I had put my boat in the water this spring the harbor thieves paid it a visit and stripped it of its sail, halliards, gaff and boom. They left me the mast because I had it fastened in, and the rudder was secured to the floor with a lock and chain; they left it also. The jib sheet I did not happen to have on. The monetary loss is not so great, only the cost of the canvas, about 200 feet, and the halliards. The sail and everything about the boat I had made myself, but they have prevented me from having any use of the boat this year. I have forgotten all about my pet duck.

These ducks began to come over here in less than two weeks after the close of the season, and in a short time they became quite fearless of us. They will paddle around now within a few yards of where I stand watching them.

One of the first to come was a male redhead, that looks to be a year old. He did not begin to feed, but took up his station on my anchor buoy, where he would stand motionless for hours at a time. I at first took him to be a lookout for the other ducks, which were feeding, but soon noticed that he would often be there alone. He generally comes about 9 o'clock in the morning, stays until noon, then returns about 2 o'clock and does not often leave before sunset.

When he first began to come, if I showed myself on the beach he would swim off a few yards, then return as soon as I was out of sight, but he soon quit that and now does not take any notice of me at all.

When I saw that I would be likely to have him as a visitor all summer, I began to think of some way to feed him, and getting a small shallow wooden box that was nearly water-tight, I filled it with soaked bread and scraps of boiled beef and tied the box to the log. He went to work on it as soon as he came that morning; and the other ducks finding it also, they soon emptied it. I refilled it next morning and they cleaned it out again. Then that night the box was stolen, so I quit; but I sometimes carry our stale bread and drop it on the water around his perch. That seems to work as long as no wind is blowing. CABIA BLANCO.

### A Domestic Hunting Cat.

PLAINFIELD, Mass.—Editor Forest and Stream: It has been to me an interesting pastime to make a list of the *feræ naturæ* which our head barn cat brings in from the hunting field; and as it is not only an evidence of its marked ability as a feline marauder but of the varied fauna of the country, I think it worth placing on the minutes of your Natural History Department. It comprises the following varmints: Two rabbits, several robins, and other birds, chipmunks, red squirrels, barn rats, field mice, house mice, moles, one star-nosed mole, frogs, several green and brown grass snakes, and a checkered adder. The catch has been considerably increased since the fields were mowed. I have not found any bats or barn swallows in the collection, although both are to the manor born and bred. Neither have I observed any woodchuck, trophies which are tough subjects for any but a trained dog.

This cat's name is Theodore Thomas, from its musical talent, and its upper register comprises the gamut of all the roofs and ridgepoles of fourteen connected buildings (which would have a hard chance in case of fire). It is a composite creature, a combination of Manx, Angora, Maltese and Tiger. Among its hybrid progeny there are to-day on our farm three tailless half-grown kittens of tiger stripe pattern, two Maltese grown females without tails, a black and white grown female with two-inch tail, and three tiger-stripe kittens with full length tails. The collection would win at a cat show.

I will mention incidentally in the interest of natural science, that Maltese, Angora and Manx or rabbit cats, have been bred in this township for seventy years at least. As long ago as 1847 there was a pure white strain of fluffy Angora, but it has since been merged into side varieties and complexions. The real thing would command a good price from pet stock fanciers.

CHARLES HALLOCK.

Postscript, July 24.—Do not fail to add to the list of game caught by our cat one full-grown young woodcock. C. H.

### The Wild Life.

MR. ALDEN SAMPSON, student, traveler, big-game hunter, and recently Game Preserve Expert of the United States Biological Survey, has recently printed an 80-page pamphlet, entitled "Three Essays on the Wild Life." These papers, which were read before the American Philosophical Society in Philadelphia in 1904 and 1905, are entitled I., "On Thought Transference by Scent and Touch," II., "A Deer's Bill of Fare," III., "The Establishment of Game Refuges in the United States Forest Reserves." The three are dedicated to John Muir, "whose genius, patience and endurance have revealed for our enjoyment the wisdom of the forest." In the first paper Mr. Sampson discourses very pleasantly and acutely of the senses of touch and smell, and on the mental sensations called up by these senses. The aim of his essay

is to bring his readers into closer contact with other creatures sharing organic life with us.

"The Deer's Bill of Fare" gives a freely annotated list of the plants on which the deer feed, and the enumeration of these plants and the writer's comments on them are certainly very interesting. Yet we can hardly agree with all that he says. He more than once refers with a seeming contempt to the cow which eats "grass" as contrasted with the deer which feeds largely on herbs and shrubs, and intimates that the food of antelope, elk, mountain sheep and mountain goats consists chiefly of grass. We fancy that this difference is more imaginary than real. The cow in its "grass" diet may include a hundred different plants, and, as is very well known, it eats the leaves of trees and their tender twigs just as horses do. We know too little about the food of wild ruminants to generalize very much about them.

It is not safe either to measure the tastes of animals by the human taste, for we all recognize that what we may like may be very distasteful to certain other animals. The tendency to personify the mammals, the birds, the reptiles, and even the fishes has come to be part of the popular natural history of the day, and need not be discussed further than to say that it will run its course and die a natural death.

The paper on "The Establishment of Game Refuges" holds much information of worth and appeals especially to all the FOREST AND STREAM family, and all three essays are scholarly and interesting.

### Chapman on the Flamingo.

MR. FRANK M. CHAPMAN has already given us a great deal of information with regard to the breeding habits of the flamingo, for he is the first man who has carefully studied these birds on their breeding grounds for a considerable length of time. It is true that Mr. C. J. Maynard and Sir Henry Blake something more than twenty years ago had an opportunity to see these birds on their breeding grounds, but they were not able to spend much time with them, although they did correct the erroneous impression as to the manner in which the flamingo sits upon its nest. In 1904 Mr. Chapman spent a week studying a flamingo colony consisting of about 2,000 nests. In all this 2,000 nests there were but two which contained two eggs. All the others contained a single egg or a single young one. The nests, as is well known, are built of mud, rising but a little distance—from five inches to thirteen inches—above the ground, the diameter at the top is from twelve to fourteen inches, and the top of the mud pile is hollowed out a little to receive the egg. It is evident that long continued rain storms would tend to break down these nests, and Mr. Chapman states that during his visit continued heavy rains flooded the ground on which the nests were placed and every nest became an islet, while numbers were submerged.

When the egg is hatched, the young bird is covered with white down and has a bill which is straight. At the age of one month the bill begins to show a bend, at the age of two months it is quite a little bit bent, and at the age of four months almost as much bent as in the adult. The young birds are so strong and so well able to take care of themselves that as soon as they are out of the egg they will leave the nest under the stimulus of fear. Persons interested in birds should not fail to secure copies of Mr. Chapman's paper, which is printed in the Bulletin of the American Museum of Natural History, Vol. XXI., pages 53 to 57.

### The Great Auk.

MR. JOHN E. THAYER has recently purchased for the Thayer Museum at Lancaster, Mass., a specimen of the great auk (*Plautus impennis*). The specimen, which was once the property of Gould, the naturalist, is said to be the best, or one of the very best specimens, in existence. It was purchased in 1838 from Gould for Viscount Hills' Hawstone collection, which was later sold to Mr. Beville Stanier, and when he determined to sell, it was purchased through Roland Ward for the Thayer Museum.

Besides this specimen, the Thayer Museum has recently secured three eggs of the great auk, all of which came from the collection of Mr. Robert Champey, of Scarborough, England. Of these three, one was purchased by Mr. Champey in Paris, while the other two came from the collection of ten eggs discovered in the Museum of the Royal College of Surgeons more than forty years ago. Four of these were sold at Steven's salesroom, London, July 11, 1865, and brought from £29 to £33 per egg, or not far from \$150 apiece. Great auk eggs, as is well known, are usually  $4\frac{3}{8}$  to  $4\frac{7}{8}$  inches long, and from  $2\frac{7}{8}$  to  $3\frac{1}{4}$  inches broad, and are white or yellowish in color, beautifully marked with black or brown dots and blotches. Sometimes these are more or less evenly distributed over the whole egg, at others they are collected chiefly at the larger end.

### A Colony of Martins.

Editor Forest and Stream:

Justice of the Peace Creelman, of the Borough of Wilkesburgh, a suburb of Pittsburg, has a colony of purple martins on his place that he has been making a study of for the past fourteen years. He has had built a two-story and attic house for them, and they have occupied it each season for that length of time. There are porches around the house for the purpose of giving the old birds a chance to take their young out for an airing. They have twenty-eight young birds at present and are now preparing them to take their annual trip south. They leave on the 27th of August each year, never going a day sooner or later, and return on the first of every April.

Previous to their return each year a single bird, an envoy, comes on a few days in advance, seemingly to inspect the house, as that is what he does do. Then he returns south again and in a few days the whole family arrives.

Each of the seven pair of birds have a suite of two rooms. One of them they use for a nursery for the young birds. The colony never increases in size, the young of the previous year being sent out to the world by their parents the following spring to hunt up quarters for themselves. CABIA BLANCO.

### Hybrid Wild Duck.

It is a well known fact that the hybrids among different species of ducks are not very uncommon, and in Grinnell's "American Duck Shooting," a list is given of the species which have been known to breed together. Mr. Ruthven Deane, in the last Auk, has noted the recent discovery of a hybrid between the shoveler and the blue-winged teal, the specimen now being in the possession of Mr. James P. Catlin, of Ottawa, Ill. The bird was killed by a keeper of the Green Wing Gun Club on their preserve along the Illinois River last April. It is smaller than the shoveler—about midway in size between that and the teal. The bill is like the shoveler's and the plumage partakes of the characters of both species. Mr. Deane points out that every specimen of hybrid duck that has ever come under his eye was a male bird, but draws no conclusion from this fact. It is to be remembered that the plumage of the male bird being so much more conspicuous than that of the female, an unusual combination of characters in the latter sex might escape observation much more easily than in the male. Mr. Manly Hardy, of Brewer, Me., has in his collection a number of hybrid ducks.

### Placer Mining in Alaska.

A VERY large number of persons engaged in mining will feel a deep interest in Bulletin No. 263 just issued by the United States Geological Survey, which deals with "The Methods and Cost of Gravel and Placer Mining in Alaska," by Chester Wells Purington. The work fills more than 275 pages and is very fully illustrated by maps, diagrams and photographs. It discusses the conditions of placer mining in Alaska, prospecting, water supply, the various methods of mining together with their appliances, the quality of the gold, labor, lumber, fuel, roads, freights, customs and many other subjects a knowledge of which is essential to the miner, but important and interesting to one who is merely a traveler in or student of the Arctic Province, which for the last few years has proved so important a possession to the United States. Very many books have been written about Alaska; at first general works like Hallock's "Our New Alaska," but more and more tending toward the consideration of special subjects. Of these Mr. Purington's work on placer mining is the latest and perhaps the most useful.

### Camp-Fire Flickerings.

"That reminds me."

### A Horrible Experience.

I WAS in the woods driving along a lonely road when my attention was attracted by the peculiar action of some birds excited over something in a small pile of brush.

Alighting and securing my horse, I approached the spot to investigate the cause of the commotion. I soon found it to be a large snake of the deadly rattler species. Securing a long pole I attacked the snake.

My first blow inflicted no injury, owing to the brush which protected it, but seemed to arouse and anger the snake, which immediately left the brush heap and advanced upon me. A more horrible sight no one could imagine than that presented by the enraged reptile.

Its eyes—a pair of bright sparks—almost seemed to reach to where I stood, they flashed so. Its hisses were loud and continuous, while the buzz of its rattles kept time with every movement. I had read that the rattlesnake was sluggish and moved slowly, but this vicious reptile advanced upon me as fast as I could retreat, keeping my face to it. I was backing off with pole raised watching an opportunity to deal an effective blow, and at last believing it had come, prepared to do so with all my strength when to my horror I found my weapon entangled in the limbs of a tree overhead, while in my blind terror I had backed up against a large brush heap that prevented further retreat.

My situation was one of deadly peril, and there was but one possible chance of escape. Summoning all my strength I leaped entirely over the snake. It struck at me as I did so, narrowly missing me.

Immediately securing another weapon I turned on the snake, which had followed me, and knowing it to be a fight for life, began raining blows upon it, but through excitement and fear could not succeed in disabling it. It steadily advanced for twenty or thirty steps in spite of the blows rained upon it, then—apparently in a frenzy of rage—it made another rush, and as I stepped hastily back I tripped and fell full length, catching my foot under the root of a tree fast and firm. In its rush the snake passed over my body and only checked itself within a few inches of my face. Its eyes burned me, and the terrible odor which an angry rattler emits, made me deathly sick.

I was helpless and completely at its mercy. In fascinated horror I lay wondering at the rapidity of its movements as it assumed the deadly coil preparatory to striking. I wished that its venomous bite might be instantaneously fatal, my imprisoned foot pained me so. Then seeing the snake was about to strike, I closed my eyes and waited. An instant later and it came—a shock, and a stinging sensation upon my throat—and I awakened to find the sheet twisted around my feet and the blanket wrapped around my head and neck, and to vow I never again would eat sardines, cheese, pickles and mince pie at late bed time. One such dream will last a man a long time. LEWIS HOPKINS.

N. B.—With apologies to Mr. Gregg.

The American in the corner of the non-smoking first-class carriage insisted on lighting his cigar. The indignant Britisher in the other corner protested, and protested in vain. At the next station he hailed the guard with hostile intent; but the placid American was too quick for him. "Guard," he drawled, "I think you'll find that this gentleman is traveling with a third-class ticket on him." Investigation proved him to be right, and the indignant Britisher was ejected. A spectator of the little scene asked the triumphant American how he knew about that ticket. "Wall," explained the imperturbable stranger, "it was sticking out of his pocket, and I saw it was the same color as mine."—London Chronicle.

# GAME BAG AND GUN

## The Point of View.

AITKIN, Minn., July.—*Editor Forest and Stream:* I have been reading with some little interest your correspondence on the "Point of View," but it does not seem to me that the case demands such scientific splitting of hairs as has been indulged in by both sides, though I think it is the first discussion I ever read where my sympathies were on both sides of the question. Man is hunter of necessity and by instinct, and hunting for sport after the necessity has been eliminated is but the turn of the man to farm, shop or office after the necessity for doing so is past, or even the repairing to shop, field or office where his grandfathers earned a fortune is but to experience what his ancestors experienced before him. After that it is a mere matter of how the sport is conducted. Men are supposed to be educated, and to understand that new conditions prevail, and that there are new places and conditions where shooting game would be a criminal. A man hunting for sport is supposed to make good use of his kill or cause it to be turned to some useful purpose, otherwise the killing would be purely gratuitous. If a man returned to the shop where he had made a fortune at wagonmaking and made a wagon just for amusement it would be wanton to destroy it just because he did not need the money it would bring. There is a little too much sentiment and not enough sense mixed in with this subject. The man who went far into the wilderness and killed two bull elks he did not do, and could not care for (with ink), some time ago, and then went into raptures over the beauties of nature, and then too much of the former, while in the latter he was wholly lacking. The people who made such a howl over the killing of a buffalo for a barbecue recently are much the same. Why is it worse to kill a buffalo than a beef? It is not supposable that the killing was to be done in a particularly brutal manner. The men who breed and care for the animals may safely be left to take care of that. It is much safer than in the hands of the collection of individuals without occupation who have taken up the prevention of cruelty to animals. The protection of wild and game birds for the purpose of maintaining an equilibrium is a very important matter, but abolish guns and their users and we should soon be eaten up by the birds. Take from man the power of making guns and two centuries he would be getting his precarious livelihood by the chase again, and hunting with a club at that. The gun has been the great civilizer. While I do not think it at all necessary to have game to practice our rifles on, I do think the instinct for firearms has much to do with the making of a soldier. Neither do I think men are less liable to enjoy a gun than young men, and as their infirmities make them so. Some men have spots, but usually the first opportunity finds them coming strong again. Watch "Flint Lock" and I think you will see him ahead the first of the season, and I could most insure him to do nothing to be ashamed of.

E. P. JACQUES.

## Massachusetts Game Breeding.

BOSTON, Mass., July 20.—*Editor Forest and Stream:* From a town not twenty miles from Worcester a friend writes that a few days ago he saw where a brood of quail had been hatched out in the middle of a hay field. The nest had been left a few days before the farmer cut the grass. Another man reported seeing one covey, and my informant feels confident there are many broods we don't know about, and further, "we hear them calling all about," having heard no less than three different birds the day before yesterday. This is in a town where great pains were taken to feed the quail last winter, and our friend is much gratified by seeing tangible results. He reports good prospects for partridges good. I am in receipt of a letter from far-away Iowa, from a Mr. Gay, who says he now has seventeen birds eighteen years old, which were hatched under a hen. He says he has lost but one quail of the brood. A friend writing from Springfield, says: "I think I can safely say there will be more partridges this season than for the past three." He declares that it has been a splendid hatching season. He has seen numerous broods, and the chicks are now well grown. A friend of his put four separate broods in a walk of not more than 300 yards. "If we can only prevent the snaring and marketing of these birds," he says, "there will be good partridge shooting this fall." He speaks encouragingly also of woodcock, and is of the opinion that the number of this breed here is increasing. He is confident the birds breeding here move on before our hunting season begins, and if they are as plentiful north of us "we should have good shooting on them." He tells me that quite a number of quail came through the winter all right, and expresses the hope that sportsmen will refrain from shooting them this season and see that they have plenty of food next winter, and the result, he thinks, will be an increase in their numbers. The writer of the letter is well known among the sportsmen of Massachusetts, and his opinions are based on careful observations. From all sections the information obtained thus far is on the whole favorable as regards partridges in our State. Some of our gunners tell me the young grouse are now as large as full-grown quail. Essex county, first of the Massachusetts Bay colony to be settled by the Puritans, seems to have become one of the best game regions in the State, especially for pheasants (if they may be classed as game birds), and deer. I learn that the latter are quite numerous in several sections of the county. It is reported that on a farm in the north, near the boundary line of Topsfield, the deer have destroyed several acres of farmer Wakefield's cabbage. As he has been unable to frighten the deer away,

he has requested a deputy game warden to consult with the commissioners as to means of getting rid of the deer or recovering damages. The law in Massachusetts providing for payment of damages in such a case is patterned after that which provides for damages caused by dogs, and provides that one of the selectmen make an examination and estimate the loss, but if the damage is more than \$20 the estimate must be made by more than one man.

Fortunately for our commissioners they are not annoyed by having to make awards. In this respect they are more fortunate than the Maine commissioners, who, by the way, have found their duties in such cases very annoying, and the system in vogue there has been the cause of no little friction between them and the farmers. The farmers of this State got what they asked for in the deer law, as they are very apt to do, and so far as the writer is informed, are entirely satisfied with it, although it involves no little red tape to secure cash for damage done.

CENTRAL.

## Shooting Preserve Rights.

In Chancery of New Jersey, *Simpson vs. Moorhead, Syllabus.*

1. When a lessee assigns his lease, and delivers possession of the demised lands to his assignee, he may not subsequently intrude upon them and against the assignee's prohibition occupy them for their only use.
2. Where lands subject to ebb and flow of tides, are usable only for shooting of ducks and other game, intrusions day by day upon such lands for the purpose of shooting will be enjoined. The injury suffered by the owner, in the lessening the quantity of game, increasing the danger of accidental shooting, and interfering with his exclusive shooting rights, is not adequately remediable in damages.
3. The title to the belt of land lying at high water mark within the tidal waters of the State and thence out into the sea or river, so far as there can be any ownership of lands, was originally in the State of New Jersey, in its right as sovereign.
4. Where such lands have been reclaimed by the riparian owners by excluding the tide water therefrom by erecting a bank, the title thereto becomes vested in the reclaiming owner, under the local common law of this State as declared in the case of *Gough vs. Bell, 3 Zab.*, 624.
5. If his lands can be identified, the title of the reclaiming owner is not taken from him by the breaking of the banks which exclude the tide water from the reclaimed lands and the admission of the tide water, whether the submergence be for a long or a short period.

Grey, V. C. (Orally). This is quite an interesting case. The complainants are a number of gentlemen who have associated themselves together for entertainment and sport, in a gun club, and have acquired in their private capacity the ownership of some uplands, and also of some considerable quantity of banked meadow, lying in the county of Cumberland. They complain that the defendant Moorhead comes upon their lands, of which the meadow part is largely overflowed by the tide at certain portions of the day, and guns for birds which come on the meadow and on waters thereof, and for birds flying over the same, thus interfering with and depriving the complainants of their land, subjecting them to loss by reason of the lessened quantity of game; and also to the danger of accidental shooting from the increased number of gunners on the lands, and they allege that the defendant declared his purpose to continue so to shoot on their lands and intends so to do. They pray that he may be enjoined from hunting, gunning, shooting, fishing on the said lands or the waters thereof, and from entering thereon for any purpose whatsoever during the term of the complainant's ownership thereof.

The defendant files no answer, but presents affidavits in which he submits his rights and claims, and on them makes a very strenuous argument that no preliminary injunction ought to go in this case.

The lands described in the bill consist of \* \* \* lands which have been either conveyed or leased to the complainants giving them the right of shooting, fishing, etc., some of these were assigned by the defendant himself to one of the complainants, and by him jointly to the other complainants. \* \* \*

It is claimed that the terms of these leases, formerly held by the complainant, were mere licenses of a privilege of gunning and fishing; but they are not so expressed in the executed written lease.

The defendant also claims that though he assigned them they are not lawfully assignable, and therefore the complainants have no right. On looking at the leases I find they are not mere conferrences of privileges. The word of grant used is "lease," and that is sufficient to pass a term in the lands demised. It is true the leases do mention a purpose for which the lands may be used, but they do not prescribe that that shall be the only use to which the lands may be put, and the effect of the leases is to pass title for a term of years in the lands themselves.

So far as the challenge made of the assignability of the leases is concerned, the rule, I believe, is quite well established, that unless a lease of lands expresses on its face a limitation of the power of the lessee to assign it, or to sublet the lands demised, the power to assign or to sublet during the term, goes to the lessee.

The complainants insist that the defendant not only intruded on the lands which he had assigned to the complainant, Mr. Simpson, but that he has persistently declared that he intended and had a right so to do. \* \* \* Even yet it is argued for him that he has a right to go on these very assigned lands, because the tide ebbs and flows over them. His declaration of his future purpose is in conflict with his claim of right in the premises. At this time and for the next few months, the only value of these lands will be the privileges of duck shooting upon them. The defendant has without right exercised this privilege and has insisted he had a right to exercise it for himself and his friends. If he is permitted to do this, the complainants will be subjected to additional danger of accidental shooting, to the lessening of the quantity of game on their lands, and to the loss of that which they

bought from the defendant himself, the right to possess the demised premises free from the defendant's intrusion. They ought not to be left dependent upon the grace of the defendant, who argues that he has a right to intrude, but at present does not think he will do so. He may again change his mind and conclude to assert his claimed right to go upon lands under tide water, even if he has himself sold leases of them which passed to the assignee the right to their exclusive possession.

It is, I think, clearly shown, that as against the defendant, the complainants have an established right during the terms of the leases assigned to them by the defendant, to possess and enjoy for all purposes the meadow lands described in these leases. The situation when the bill was filed, exhibited an intent on the part of the defendant to insist on his right to intrude continuously day after day on the lands assigned by him, and to shoot ducks and other game thereon, now in season.

The injury suffered by the complainants is within the class called irreparable, for which they cannot recover adequate damages at law. To be irreparable, it is not necessary that the money loss shall be so great that it cannot be repaired. The loss which the complainants will suffer is not probably of great money value, if the computation be limited to the value of the ducks and other game which the defendant will take. But the acts which he says he has a right to do will deprive them not only of the ducks he may shoot; it will increase the danger of the sport, invite further and other intrusions, deprive the complainants of the exclusive possession of their property, and will indirectly tend to defeat the whole investment in their sporting club house and adjacent lands, for if the defendant and his friends may go there at will so may everyone else.

The question which has been very interestingly argued here, touching the ownership of the reclaimed meadow lands lying subject to the flow of the tides, and the effect of subsequent submergence, etc., or any other question challenging the complainant's ownership and right of possession, cannot be raised here by the defendant under the peculiar circumstances of this case. The defendant himself is the grantor of those privileges and rights to the complainants which he now disputes. He cannot be heard to deny the effect of his own deed. It is inequitable that he should be permitted to do so, and I cannot see that it lies with him to raise any question at all affecting the title or possession of the lands which he passed by assignment of his leases to the complainants.

The counsel for defendant contends that the lands leased by the owners of the meadows have been suffered to go out to the tide, and that this submergence re-establishes the State's title to those lands, and justifies all persons in going as they please upon the tide waters which may cover such lands. \* \* \* It seems to me to be unquestionable, that if the lands be once reclaimed, the title to such lands remains in the several reclaiming owners, whether the tide water afterward overflows them or not. \* \* \*

Some of the proofs address themselves to the question of the title of the private owner, outside of the bank which he has erected. The defendant's counsel claims that the complainants have no right to exclude the defendant from the shore or "guard" which lies between the bank by which the owner has reclaimed, and the bed of the tidal stream. I think this is correct. Wherever the line of the bank of the reclaimed land is, that is the line of the private ownership. Whatever privilege of removing mud, etc., for the bank the owner may take outside of the "guard," without interference from the State, does not give title. He has himself put the limit of the line to which his title runs, by his reclaiming bank. If he has been accustomed to exercise a privilege outside of the bank, to take mud to maintain the bank, that is not reclamation, and gives no title or exclusive right of possession enabling him to exclude other people from the "guard." The line of the ownership of the reclaimed land is the line of reclamation. No injunction should go against the defendant, prohibiting him from going upon the "guard" outside of the meadow bank.

## Summer Protection for Woodcock.

*Editor Forest and Stream:*

In an interesting article in FOREST AND STREAM a few months ago by A. K. Fisher, the scientist, attention was called to the danger of extermination of some of our migrating game birds, especially the woodcock and the wood duck that are fast disappearing. The beautiful plumage of the wood duck, called by Audubon the handsomest duck in America, makes it very attractive and much sought for by all gunners.

Were it not for the protection of the vast wildness of the North, where they go to breed, and the impenetrable canebrakes of the South, their winter hiding place, the woodcock would indeed have a hard chance to survive, as there are but two or three States in the South where they are protected at all. Shooting at both ends of the line is like burning the candle at both ends. Under these conditions there is but little wonder that they are fast disappearing.

Massachusetts stands at the front in regard to game protection. It was one of the first to abolish summer woodcock shooting. It took years to enlist public sentiment and get laws through the Legislature against summer woodcock shooting. Two weeks a year was all we could gain at first, and some years we could not get that, but gradually the close season was moved forward from July 1 to Oct. 1, where it stands to-day. It was a long, hard fight against the man who shot the half-grown birds to sell, as well as against those who bought them. Only by persistent efforts against adverse conditions and even threats of personal violence were the existing laws formed and maintained. The pioneers in this crusade

were all true sportsmen. If we could eliminate the element of selfishness, it would be very easy to save our fast disappearing game, but it is the old story of selfishness.

Prohibiting the sale of game was a hard blow to the market gunner and practically put him out of business, and also has saved many thousands of birds that would otherwise have been shot for the market. If our sportsmen friends of the South would give the migratory birds a close season during a part of their winter sojourn with them it would be of mutual benefit to the sportsmen of both North and South, as they could send us more birds in the spring and we could return them more in the fall.

We know there are a great many true sportsmen in the South as well as in the North who are not so selfish as to wish to see the birds exterminated, either in this generation or the generations to follow. The influence of *FOREST AND STREAM* against the sale of our game birds and the founding of the Audubon Society for the protection of our song and insectivorous birds has been the salvation of a large multitude of our feathered friends.

GEORGE L. BROWN.

Boston, Mass.

## Game Protection and the Farmer.

THE year book of the Department of Agriculture for 1904 contains a paper by Dr. T. S. Palmer on some benefits the farmer may derive from game protection. Of the direct financial returns from the game Dr. Palmer writes:

"That the game on the farm has a money value is not always recognized, or, if so, seldom receives due consideration. Rabbits, quail, grouse, and other game taken during the open season afford not only an important addition to the table, but may save considerable expenditure for other meat. The value of this game is, therefore, not merely the small amount it would bring in cash or in provisions at the country store, but rather what it saves in the cost of other meats; and it is greatly to the advantage of the landowner to utilize the game upon his own table instead of disposing of it at the store. It is true that without game laws a small number of rabbits, quail, or other resident game might be retained on a farm of sufficient extent. But on many farms the stock would soon be depleted, and in the case of migratory game adequate protection both northward and southward is necessary to enable anyone to secure birds in abundance, and this protection can be had only through the medium of State laws.

"Under some circumstances the game on the farm may be made to yield a higher cash return by utilizing it in other ways than for market or for the table. In the case of quail, dead birds are worth from \$1 to \$3 a dozen, but live birds for propagating purposes may easily be sold at \$5 a dozen. In fact, in 1904 the demand for live quail was so great that some sales were effected at \$10 a dozen, and even at this rate the supply was entirely inadequate. With the increasing scarcity of game it is more than probable that the demand for birds for restocking covers will show a steady increase. At present a supply of from 100,000 to 200,000 a year would probably be required to meet needs for this purpose; and there is no apparent reason why this demand should not greatly increase in the future. Still better prices may be obtained by the farmer if instead of selling the dead game for market or disposing of the live birds for propagating purposes he will lease hunting privileges on his farm. These privileges may be rented by the day or by the season, and may be accompanied with charges for board and lodging, the use of a team, or the time of a boy to act as guide, and will thus net a very profitable return. If the number of birds killed be limited, to prevent the stock from being permanently reduced, such leases may be continued almost indefinitely.

### Indirect Benefits.

"Reference has just been made to the demand for game for propagation. With the increase in private preserves and game protective associations it is probable that such demands will be greatly extended in the future, not only in the case of quail, but of other birds as well. The raising of game birds in captivity has not yet been reduced to a practical basis in this country, except in the case of pheasants, but that such will be the result of experiments now being made is scarcely open to question. In a few cases quail, prairie chickens, mallards, wood ducks, and wild geese have been satisfactorily propagated, and during the past season, in at least one instance, ruffed grouse were successfully raised in captivity. It is claimed by those who have experimented along this line that prairie chickens and pheasants can be raised with no more trouble or loss than turkeys. When methods have been perfected so that some certainty will attend such efforts the members of the farmer's family may find in this branch of game protection a new and profitable source of income. With pheasants ranging in price from \$3 to \$15 or \$20 per pair and wood ducks from \$15 to \$25 per pair it would seem that even with the special care required better returns might be received than from ordinary investments in poultry raising.

"Indirectly the systematic protection of game and fish may be the means of developing resources which will greatly benefit the farmer. Visitors who come to hunt, fish, or spend their vacations not only bring considerable sums of money into the State, but furnish employment of various kinds. They require board and lodging which can often be had in country homes to the advantage of the boarder as well as the owner. Their presence may also provide increased home markets for poultry, eggs, butter, milk, and other farm products and may render possible the maintenance of improved railroad and telephone service in outlying districts. A striking illustration of these conditions may be found in the case of Maine. In 1904 the license fees collected from non-residents who visited the State to hunt big game amounted to \$25,365. The reports show that 1,942 guides were registered, who were employed altogether 87,785 days, and earned at a fair estimate \$3.50 per day, or a total of \$307,247.50. Two years ago the commission of inland fisheries and game made a careful investigation of the number of non-residents who

visited Maine outside of the seaside resorts and the amount of money which they spent in the State. These figures showed that in the summer of 1902 the number of non-resident visitors was 133,885, that their presence gave employment to 1,401 men and boys, and to 2,564 women and girls, whose wages amounted to \$267,934. The amount spent for railroad fares and incidental expenses was not reported, but the expenditures for board alone amounted to \$1,371,201. The permanent financial benefits thus derived by the State from non-resident travel has been summarized by Senator W. P. Frye, as follows:

"In all times of business depressions and distress, financial panics and consequent unemployment of labor, so seriously affecting the country, the State of Maine has suffered much less than any other State in the American Union, mostly, if not entirely, due to the large amount of money left with us by the fisherman, the summer tourist, and the fall hunter—the seeker after change, rest, and recreation."

### Some Practical Illustrations.

"Several plans have been devised for bringing farmers into closer touch with sportsmen and increasing the practical benefits which the former may derive from impartial enforcement of the game laws. Of these plans three may be mentioned to illustrate the different methods of reaping the benefits of game protection.

#### Illinois.

"Under the name of the Rockford Township Farmers' Association an organization was effected in 1901 in northern Illinois for the purpose of mutual protection against indiscriminate hunting on farms owned or rented by the members. The constitution and by-laws are very simple. By one of the by-laws each member is required to post notices in five or more conspicuous places on his land prohibiting hunting or trespassing, and by another to interview any person found hunting on the premises whenever it is possible, and in case such person persists in hunting after being warned, to go before the nearest justice of the peace and cause a warrant for trespass to be issued against the offender. Each member retains the right to grant to any person the privilege of hunting on his farm in his company, and undertakes to promote the strict enforcement of the game laws of the State.

"The association has now been in existence for four years and numbers about 75 members. It has had under its care from 12,000 to 15,000 acres of rich farming land lying north of the town of Rockford, Ill. This land is rolling prairie planted in wheat, corn, oats, and orchards. The association has been remarkably successful in carrying out its objects. Unauthorized hunting has been stopped, not only on the farms, but also along the highways. Prairie chickens and quail are increasing in numbers and non-game birds are abundant. The members are personally interested in the increase of game birds on their premises, and guard their bevy of quail with jealous care. As an instance of this feeling it may be stated that one of the members, on being asked whether game was increasing on his place, replied that he now had a large bevy of quail, and added that he valued them so highly as insect destroyers that he could better afford to have his chickens killed than his quail.

"At the outset some trouble was experienced in having the lands properly posted. Difficulty was also encountered in apprehending and convicting trespassers on account of the time the complainant had to take from his work in case of an arrest, and the additional discouragement caused by frequent failure to convict or small fines. In 1899 a provision was incorporated in the Illinois game law imposing a fine of from \$3 to \$15 for hunting with dog or gun on the lands of another without permission. It also became the duty of the game wardens to enforce this law. Each county in the State has a game warden, and with the telephone system now extended in all directions from Rockford the members can communicate at a moment's notice with the local warden. Convictions have been secured with more certainty, and these have had a beneficial influence in deterring illegal hunting. The change in the law has required less active work on the part of the members in posting their lands and following up offenders, but it has enabled the association to carry out its objects so much more effectively that the members feel that they have a personal interest in the game law and are heartily in sympathy with a strict enforcement of its provisions.

#### North Carolina.

"The North Carolina laws prohibiting shooting on another person's land without permission of the owner, to which reference has already been made, were first enacted in the latter part of the eighteenth century. Not until recently, however, have the full benefits of these laws been realized. Within the past fifteen years a system of leasing has been inaugurated, which seems to meet with considerable favor, as it secures to the owner a substantial financial benefit. These leases have been most numerous in the north central part of the State, in the counties of Davidson, Forsyth, Guilford, Moore, and Randolph. It will be sufficient, by way of illustration, to describe the system as applied in Guilford county. The county comprises 680 square miles, a little more than one-half the area of Rhode Island. It contains two important towns, Greensboro and Highpoint, and its total population in 1900 was about 40,000. The farms average about 100 to 200 acres in extent. The principal crops raised are wheat, corn, cotton, fruit and vegetables. Quail and rabbits abound nearly everywhere; in fact, quail are probably more abundant in this part of the State than in any other section of the country east of the Mississippi River. This condition is due in part to the present state of agriculture and the acreage in woodland or thicket, which furnishes excellent cover for the birds. At present about 150,000 acres, or more than one-third the area of the county, are under lease for private game preserves. These preserves do not interfere in any way with the cultivation of the land or the rights of individuals. In most cases they have not resulted in the restriction of the ownership of the land to a few persons, nor has there been any attempt to restore the land to its original wild

condition; but, on the contrary, every encouragement is given for its cultivation, while in some cases cowpeas are freely distributed by the lessees for the purpose of improving the soil and at the same time affording better food for the birds. These preserves vary in size from a few hundred to 12,000 or 15,000 acres each. They are sometimes controlled by one or two individuals, though more frequently by several persons associated together for the purpose. Comparatively little land is bought, but nearly all is held under lease. An arrangement is entered into whereby the owners of adjoining farms agree to permit no hunting on their land, except by the lessee or his friends during the open season, and the lessee either makes a cash return for the hunting privilege or agrees to pay all taxes on the property. The ordinary tax rate outside of the towns averages about 7 cents per acre, and the amount paid for rentals varies from 5 to 10 cents. Some leases are good for only one year, others for five or ten years, with the privilege of renewal.

In the case of one of the earliest of these preserves, near Highpoint, the lessee owns no land, but leases nearly 12,000 acres on a cash basis, and his annual disbursements for rental alone reach \$1,200. More than one-third of the total real-estate tax of the county outside of the towns is now paid by hunting leases, and, in some cases, in which a special township school tax has been imposed, this is also paid by the lessees. In other words, the farmers, by merely keeping trespassers off their lands and joining their neighbors in leasing the hunting privileges to certain individuals or associations, are relieved entirely from their real-estate taxes or receive an equally large or even a larger amount in cash each year. Sometimes the lessees hunt very little or perhaps not at all during the season, in which cases the owners may for a year or more enjoy immunity from hunting as well as from taxation.

"The satisfactory working of the North Carolina plan will doubtless cause it to be adopted in other States. As a simple and comprehensive method of meeting the conditions resulting from the ever-increasing number of hunters and the growing scarcity of game it has much in its favor. It has the advantage of permitting the sportsman to enjoy his favorite pursuit, at the same time protecting the game from excessive slaughter, and it relieves the farmer from the annoyances to which he is often subjected by unprincipled or inconsiderate hunters. Finally, it brings a substantial return to the owner for the use of the hunting privileges of his land, and thus equalizes the obligations between the farmer and the sportsman."

## In the Northern Adirondacks.

It was in the fall of 1904 that three hopeful hunters started on an overland trip for the great park region of the Adirondacks, in quest of deer and incidentally any other game that might be found in that region. The party consisted of Owen Johnson, Frank Wilder and the writer.

We established our camp some 10 miles north of Loon Lake. Deer were quite numerous, but the hunting was difficult, owing to the dryness of the woods. Fortune did not favor our efforts to any great extent for the first few days, although Owen did succeed in killing one deer. The next day was election, and proved to be a lively one for me. I did not run for office, but I did run for deer. About two inches of snow fell during the night, and only a hunter knows what possibilities it brings. I was first to discover the snow, and rousing the others, hastily prepared for the hunt. Taking a small lunch and making sure I had plenty of cartridges for my repeater, I started out alone for whatever luck might come my way. The weather was ideal; high clouds hung thick overhead, effectually shutting out the sun and the temperature just above freezing, made a fine tracking snow, and not a breath of wind stirring. Traveling a southwesterly course, I had gone about a mile from camp when I sighted a large deer, which, having seen me first, was making for cover at a lively rate. I immediately formed a resolution to capture that identical animal, or follow him until night and started to carry it out. I had heard that a man will out-travel a deer in an all-day race. Taking the track I found, my game had made a bold run for about a mile, nearly straightaway before halting in a dense growth of underbrush, out of which I heard him hastily depart at my approach. Different tactics were now adopted by him, and I was obliged to keep close on his trail, which purposely led under large clumps of evergreens that had caught the snow, leaving no track. This trick was easily met by rounding the whole bunch and taking the track where he came out.

Many were the dodges this wily old chap tried in order to lose himself, a favorite one being to back-track himself for a short distance then make a tremendous leap sidewise, into a clump of bushes or a large patch of grass. But after about three hours of this cross-tag, evidences of fatigue began to show in his signs, and I caught an occasional glimpse of his fine figure as he would take a fresh start always now from his nest. He would make a run and gain on me, walk a short distance and then lie down with his eyes on his back track. Resting as long as he dared, he would leap about ten feet direct from his nest. This race was kept up until about 1 o'clock, when I saw an opportunity of outwitting my game by anticipating his hiding place and half-circling him, forcing him from cover across a meadow, where I hoped to get a fair shot.

Not having fired before, my plan worked and he came from cover like a rocket, making for the heavy timber across the meadow. My repeater spoke three times, the last shot bringing him down just as he was entering the timber on the other side. I was very glad the chase was over, and discovered it had warmed me up somewhat, and that my lunch was small indeed.

Preparing my game and hanging him up consumed nearly an hour. It then suddenly dawned upon me that I had been traveling without consulting my compass which I now discovered had been left in camp. However, not knowing the direction to camp, the compass would not have been of use. How was I to get back that night? Only one way—back-track myself. After traveling for about a mile, I was making a

big cut-off, when in passing some old pine tops a large fawn scudded from behind them into the jack pines near. I wondered how a fawn could make so much noise in getting through the brush, when to my surprise and delight I came across a track that I instantly recognized as that of a bear. I thought it good fortune to be on a fresh bear track; for of all the game in that region, I especially wished to get a bear. Not knowing so much about bears then as I did two days later, I started out after him at my best pace, and could soon hear him as he tore through the brush which he seemed to have a special liking for. I shortly discovered that the bear was more favorably built for brush traveling than I, and as long as he insisted on staying in it, my chances for sighting him were very slim indeed. But the race went merrily on. Finally, however, he left the brush to enter a tangled tamarack swamp, and all his movements were plain, and some of his tactics were identical with those of the deer I had so successfully followed, all but the side lunges. At one place he began at the top of a fallen tamarack, which was several feet from the ground, and started to travel its length; when near the middle the loose bark slipped off and he fell broadside into the slush and mud, leaving great nail marks on the log where he tried to save himself.

Presently I discovered that darkness was fast approaching, and I felt that I would not see camp that night. Taking a last look at that track, I wondered if man could out-travel a bear. Standing on a log I viewed the situation. Everywhere fallen tamarack caused by the terrible fires that swept that country the preceding seasons. Knowing no difference in directions, I struck for the most open looking country. Meanwhile it had grown dusk, and by the time I was fairly out of the swamp, the darkness was complete, excepting that I could distinguish objects on the snow. Expecting nothing but to lie out all night, I thought I might as well build and maintain a good fire, as in that way I could get some much-needed rest. I gathered a large heap of pine needles, which I suspect is now the favorite nest of some mouse or chipmunk, for look as I did through all my pockets I was unable to find a match. The only thing then was to move on, as it was already getting cold; and after traveling over a ridge about half a mile, I came across

two parallel strips of tall grass, which told me it had been an old toll-road. Thinking that by following this trail I might come to some shelter, I followed it for perhaps a mile, where it branched off and was lost. Looking to my right, I thought I discovered the outlines of a roof covered with snow, and going there, found an old logging camp; but fire had made ruins of all the buildings except what had evidently been the office.

This seemed to have been recently fitted up, as the door was barred on the inside and the place was deserted. A window in the end was nailed on the frame inside, and as I thought the situation warranted my getting in if possible. I pushed in the sash and crawled in. I was delighted to find a stove, wood, cooking utensils and provisions, and also noted that the cabin was well located near a small lake, where I procured water, but it was only after a half hour or more of groping that I found matches. I thought then that my cup of good fortune was certainly full. Making myself comfortable, I decided to take up the bear trail the next morning, and so lay down on the straw bunk to rest.

The first break of day found me on my back-track to where I had left the chase the previous night, but soon after dawn I sighted bruin's nest, where he had passed the night among the soft branches of a fallen balsam; but on sighting me he beat a hasty retreat. I took up the chase, trying to cut off his retreat. Although I rushed the bear all day, his only sign of weakening was that his feet began to bleed. But just before darkness I came upon him, and with two well-aimed shots made him mine.

After spending the night in the same cabin, I immediately started for our camp, and reached it about 3 P. M. I found that my companions were very much worried about me after my second night's absence and had sat up all night firing guns and keeping a fire burning. The luck my friends had I will tell another time.

J. P. FLETCHER.

GROVERSVILLE, N. Y.

Apropos of the foregoing are these notes on the bear, written by a Maine hunter who has had large experience with the animal: Sportsmen and hunters find it a diffi-

cult business to hunt the bear, although it abounds in all the vast unimproved wilderness of our State, as well as the border settlements, and is not only unprotected by our laws but is even considered outlawed and has a bounty placed upon its head, making it the lawful prey to everybody at all times and places.

If the poor beast strikes out into the open country to find food to appease his hunger the first person who sees him or even sees his track sounds the alarm, and at once scores of men are after him with all sorts of weapons, and if he escapes back into the forest it is by his own shrewdness and not the fault of the tumultuous crowd of humanity. The poor creature is hunted to the death if possible.

But bruin is no chicken nor tenderfoot; he is a tough customer, and most of those who hunt him find him so. He can creep through the dry brush with the least noise and calculate chances with the greatest precision possible, besides being a creature used to a rough life. He will go where no herbivorous beast would dare to go, creeping through pucker brush and rabbit salad and the most dismal swamps, and winding and outwitting his biped pursuers and getting away with the most "cold lead" of any animal.

It is not always deep snows that drive him to his den, but the scarcity of food will have the greatest influence. There is no set time of year that all bears go at once to their long winter home; neither do they always go back to their former den, but are governed much by circumstances. Sometimes they find a more comfortable chance to house up and sometimes find companions who seem to invite them to share their winter quarters with them.

They do not seem to be fastidious as to the lodging-place. A turned-up tree root, or a hollow log or standing tree is acceptable; or more commonly a cave in a ledge under or above the earth, in some solitary mountain in the deep recesses of the forest where no other creature will stay. In such a lonely, dismal spot the bear sleeps away the long, cold eastern winter.

Do we think bears are diminishing—growing less year by year? Well, no; not in Maine. They appear to hold their own wonderfully, and about as many are killed each year.

We respect the old fellow for his tenacity of existence in spite of his weakness for mutton, corn and apples, and forgive all his shortcoming and overdoings.

## Fly and Bait-Casting as a Game.

ONE of the commonest remarks heard by those who attend fly and bait-casting tournaments comes from anglers who watch but do not take part in the contests. If asked to do so they will admit that they love to fish and do fish whenever they have an opportunity, but express more or less ignorance concerning the fine points of casting for record or for prizes. If urged to try their skill they object to "making a show" of themselves, as they say. Some of them can never be induced to take part in any competition that is more or less public, and they say with more or less truth that fishing is one thing, but tournament-casting quite another.

With the object of making tournament-casting a school of instruction for anglers, and teaching anglers to handle their weapons with greater skill, clubs have from time to time been formed in various places, and tournaments held. Despite these facts there is a class of anglers who cannot be induced to take part, because of the publicity they dread and seek to avoid. They will look on and learn the little that is possible from watching others cast, but they will not take part in the events.

In view of these facts I wish to point out a few others for the benefit of anglers everywhere, and will attempt to show them how they may obtain valuable practice at a minimum expense of money and preparation.

Fly and bait-casting can be made a game, just as lawn tennis, golf or batting and catching a ball are, but with this exception—that it can be played by one person as well as ten, although at least two persons are needed to keep up the interest and make casts comparative. I hope other anglers will agree with me in this matter, and will take up casting as a game or pastime, for I can assure them that it is a very fascinating one in which a great deal of experience of real value in angling can be gained.

Granted that any angler who wishes to go into this pastime for his own amusement and benefit is the possessor of a rod, a good reel and a suitable line, let us cast about for an equipment. In the first place, it will not be difficult to find a bit of water entirely suitable for the purpose, but if this is not obtainable, a lawn, field or pasture will do, and some of the most enjoyable casting I have ever had was on smooth ice or a light fall of snow. With this in view, the game can be made one for all the year.

If there is a lake or small stream handy, a place can be selected without much difficulty, so that one can cast with the sun at his back or side, and in a direction so that the prevailing wind for the season will also be at his back or side, preferably the former, as it is discouraging at times to try to cast continuously against a fluky wind. If there is a little boat house dock or float handy, use it for your platform, and lay out the course alongshore, where the water is shallow. The marks can be made in a dozen different ways, but the following method is simple and will answer every purpose. To begin with, procure a tape 100 feet or more in length. Then, wading in the shallow water, stretch a line from the casting platform to a stake fifty yards or more distant, and you are ready to set the marks. For this purpose a number of sticks will answer. The assistance of a friend on the platform will be handy. Let him hold the tape, and reel-

ing off fifty feet, push the first stake in the mud alongside the line and distant just fifty feet from the edge of the platform. The top of the stake should be at the surface of the water, although this is not a matter of much moment, as one will seldom foul the stake while casting. This stake should be provided with a square or round bit of plank that will float, to be used as an accuracy buoy. An air-tight tin can or a corked jar will serve the same purpose, however.

Set the next stake at fifty-five feet, and the others every five feet, unless you do not wish to be so exact, in which case marks every ten feet will serve. Another buoy should be moored to the sixty-foot stake, and it will be well to employ two more, at seventy and eighty feet respectively. At first the extreme mark need not be more than 130 feet distant, but in order to be able to closely measure the work you will do and you gain through practice, it would be well to put stakes at least every ten feet up to 150 or even 160 feet. And in order to calculate the distance rapidly while casting, mark the stakes in some manner to distinguish one from another. A bit of board nailed on the top of a stake and numbered will be the best plan, or the ninety-foot mark can be daubed with red, the 100-foot mark white, the 110-foot stake blue and so on, so that one will soon know the distance by the color of the nearest stake. Various schemes may be employed to prevent counting the distance from the beginning, stake by stake, for each cast made.

Now you are ready to begin. All the accessories to the game are at hand save the weight to be employed. For bait-casting it is the custom at the present time to use either soft rubber frogs or wooden weights. The frogs are specially made for this purpose, and are fitted with a ring at the nose, but no hooks. The wooden weights vary, but perhaps the best form is in the shape of a bullet, with a ring or small eye at the butt end. Some are made with an upholstery tack in the nose to keep them point on. As silk lines will wear out and part in time, and one's enthusiasm often runs away with his caution, his bill for frogs may in time become somewhat like Bill Nye's expense account for razor strops when he began to shave himself. The next best thing is to whittle an old rubber eraser down until its weight is just a half ounce (or a quarter ounce). A bit of some heavy wood, like bethabara or hickory, if rounded and elongated, makes an excellent weight, but it must be borne in mind that longer casts can be made with smooth, dense weights than with rubber frogs, and one must not imagine that he is doing better work with his weights than are the expert tournament-casters with their soft rubber frogs, although weights are fair enough, since they are used in some tournaments, but not all. The line should be reversed on the reel often, to prevent excessive wear on the free end.

For the benefit of beginners a few words in relation to casting may not be amiss. In the first place, stand as near the water level as possible and do not try to cast from an elevation, merely seeing that there is nothing immediately behind you to catch the line and perhaps break a tip. Face the line squarely, with the feet spread a trifle. Grasp the rod close up to the reel with the right hand, with the thumb on the spool. Drop the tip of the rod until it is lower than the knees. Turn the rod over until the reel axle is vertical, and see that the line lies entirely in the guides, and does not touch the rod at any

point in its whole length. Let a little line out, so that the frog or weight is eight to ten inches from the tip. Hold it perfectly still until you see that the hand is in its proper place and the line free from kinks. Then impart a swaying motion to the bait—gently, like the pendulum of a clock, forward and backward, and when it is on its forward swing, raise the tip, so that the weight will begin its upward and backward sweep without any jerky motion. It must be stopped and started forward without touching the water or the platform behind you, and at the same time the pressure on the spool is decreased but never entirely taken off. At first it will be best to use little force in the forward sweep of the rod, and to aim at a spot less rather than beyond fifty feet, letting the bait describe a high curve and move slowly. The height of the curve may be increased without additional force by letting the line slip a trifle just as the forward curve begins, but if the cast is to be made with some force, the line is not released until it is well up on the forward sweep. In no case should the tip of the rod be lowered below the waist line in the forward curve; in fact, it should stop exactly in line with the unreeling line, and should be stiff enough to be rigid at that time, as vibration of the tip serves to stop the line from running freely through the guides.

At first the inclination will be to let the spool take care of itself during the cast, and to stop it short after the weight strikes the water. With a good reel, however, it is possible to thumb the line quite forcibly throughout the cast, increasing the pressure as the weight approaches the water, the reel spinning freely even under pressure. This requires practice, of course. Some reels have friction devices or drags capable of adjustment to prevent backlashing. Whatever is used, however, it will be found best to have the reel always the same, so that one may devote his efforts toward eliminating the personal error, and depend on his own skill rather than upon mechanical means.

After the beginner has found that he can cast fifty feet or more four times out of five without trouble with the reel, he should try five casts at the fifty-foot buoy and note the result. Then he may aim for higher marks, putting a bit more force into his casts, and lowering the trajectory of the weight. Most of the force is put into the cast just as the forward sweep begins, but the line is not released so soon as when a high trajectory and less force is desired. More care, however, is necessary to stop the rod without tip vibration, and to prevent backlashing. Nor should the spool be too full of line. A very good way to decide just how much line to use is to wind the favorite line on the empty reel, then over it wind a cheap cotton or other line, as a dummy. When enough of the dummy line has been wound on to fill the spool two-thirds or three-fourths full, cut the line, unwind it on the grass, and when both lines are off, wind the coarse line on the spool and the fine line over it. A braided silk line of H size will give the best service at first, but better work may be done after a little while with a regular tournament line, quite a bit smaller than H. Enamelled lines will not answer at all for this style of casting.

It is well to combine a series of casts for distance with say five each at two or three buoys, and especially when two or more persons cast together. Keeping score will prove very interesting and at the same time show how much improvement all are making. Little contests

can be arranged, and altogether the pastime is one that few dyed-in-the-wool anglers will tire of.

If it not possible to obtain water where the marks may be staked off, as described, because of deep water, a rather heavy line can be made to serve the purpose almost as well. Round cork floats can be obtained from dealers in commercial fish nets, or hollow rubber balls can be used, in any event the numbers to be painted thereon. It will then only be necessary to stretch the buoyed line from the casting point out, and the outer end can be made fast with an anchor-line and a stone. In some respects this would be a better plan, as the buoys can be kept clean and the numbers fresh, while mischievous small boys might carry it away or damage it if it is left afloat all the time.

For casting on a lawn, numerous marking devices might be suggested, as stakes, marked lines, etc., but if a long tape is available it will prove more satisfactory, since its readings will be exact and no estimates need be made.

Casting on the snow or ice has peculiar fascinations for the angler who grows weary of the long winter months and impatient to test new rods and tackle, and in some respects it is eminently satisfactory, as good casts may be paced off and marked. The exercise is sufficient to keep one's circulation up except on the coldest days, and one who practices casting throughout the winter will take still more interest in fishing than he ever did before.

The remarks set down above will apply to fly-casting as well as to bait-casting, with necessary qualifications. In fact, any angler who dislikes to "make a show of himself" in public tournaments can try his skill in some field or on some little stream where he may be sure no one will disturb him; but if he wishes to fully appreciate the pastime, let him invite some close friend to go along, so that they may cast, one against the other, and my word for it, there will be a third, or a fourth party the next time, and before many trials are held some place nearer home will be selected, perhaps the women folks invited to try their skill, and the "game" become better understood than it seems to be now. It is peculiarly adapted to trials in which women may take part, and no angler who takes wicked pleasure in poking fun at his wife for being awkward with rod and line in fishing should fail to see that she becomes more familiar with rod, reel and line in practice casting. She may become an expert as soon as he does, too. PERRY D. FRAZER.

## The Ladyfish.

In the current issue of the Smithsonian Miscellaneous Collections, Dr. Theodore Gill describes the ladyfish (*Albula vulpes*), an interesting species best known to anglers in Florida. Of it Dr. Gill writes:

"It is found in almost every tropical sea, but it is not confined to such for individuals not a few extend their wanderings quite far beyond the tropical zone, occasionally even roaming northward to Massachusetts. It attains a length of from a foot and a half to three feet and a weight of about three to ten pounds, but the average is far below the maximum mentioned.

"Notwithstanding its wide geographical distribution, it is in truth a shore fish and seeks its food close to the shore or on muddy or sandy flats where shellfish—especially small bivalve shellfish—most abound. When the flood tide begins and 'up to full tide' is the select time for feeding, and 'flats in water varying from a depth of eight to ten inches,' a choice place for hunting for food. "As the fishes feed in such shallow water, their heads go down and their tails come out of the water, and as they work in shorewards their dorsal fins cut the water, and the sunlight is reflected from their silvery sides." The actions of the fish thus seen have suggested to some the name 'grubber.'

"There is a beautiful correlation between the fish's food and the structural means for assimilating it. The dentition as a whole is quite peculiar—unlike that of any other animal. The bony roof of the mouth is closed in by the juxtaposition of the parasphenoid and pterygoid bones and covered with roundish molar teeth and the floor of the mouth has opposed teeth so that the fish is well provided with the means for crushing the shells which it takes; externally is provision for finding and rooting them up in the projecting conic snout, which is so prominent as to have suggested one of its early names—*Conorhynchus*, or cone-snout.

"A favorite region for the discharge of procreative duties is the Gulf of California. There the young may be found in immense quantities and they are 'often thrown by the waves on the beach in great masses.' But so different are those young from the mother fish that they would not be recognized by the casual observer. They are 'elongate, band-shaped, with very small head and loose, transparent tissues.' In the water in fact their eyes alone are visible. Gilbert tells that 'from this condition they become gradually shorter and more compact, shrinking from three or three and a half inches in length to two inches.' Then their form becomes much like that of maturity and from that stage they grow regularly till the proportions of ripe age are attained. Having at length shrunk to almost half the length of the longest esunculoid stage and acquired a roundness and compactness of body as well as shape of the adult, it starts anew in growth and continues till the size and other characteristics of the adult are attained. The history of the metamorphosis of the species is quite as remarkable as that of the butterfly. With diminishing length, with increased compactness, the myotomes or muscular folds grow closer together and less obvious, the dorsal fin and, to a less extent, the anal become better developed and advance towards the middle, and innumerable minor or, rather, less evident changes accompany such until the adult form in miniature is obtained.

"One of its haunts is the waters of Biscayne Bay and those extending some sixty miles further south," and by residents of that shore it is not known to be found anywhere else. There probably, at least, it is angled for as much if not more than elsewhere and is quite generally regarded as the gamiest fish that swims. There near Miami, August Thomas (1903) verified to his own satisfaction the verdict of the neighborhood. He approached a school, as is generally done, in a boat with a guide.

"Your guide works the boat toward them carefully,

for they are as timid as a deer, and once frightened are very difficult to approach. When within fifty or sixty feet, which is as close as it is possible to get without frightening the fish, you cast the bait to a spot in line with the direction the fish are working, and not nearer than twenty or thirty feet to them. The bait is one of the shellfish upon which the fish feed, and it must be absolutely fresh.' This bait must be allowed to 'lie immovable until the fish find it. The first indication is a slight nibble, for they are not vigorous biters, and they must be hooked, for they rarely hook themselves.'

"At length one is hooked. Then commences the sport. 'From three to five hundred feet of line is taken out on the first rush, and this is often repeated twice or even three times, making from one thousand to fifteen hundred feet of line in all that is taken out in this manner. When these bursts of speed are over it is fight, fight, fight, every inch of the way to the boat, the runs growing shorter as the fish fails. When at length he sees the boat the mighty struggle comes, but not having strength to make a dash, he circles about the boat at a distance of from ten to twenty feet, often making the circuit half a dozen times—when he finally comes alongside, belly up, he is dead—died as he had lived—dead game—and may be lifted into the boat with safety by the guide.'

"Fishes may be caught 'from November to April, but it is at its best in December.'

"There is much diversity of opinion respecting the culinary characteristics of the ladyfish. Thomas thought that 'as a table fish they have few equals, either planked or broiled.' Goode, 'from personal observation testified that its reputation is by no means a false one.' In the Bermudas, too, 'where large schools are taken' and where it is known as the bonefish or grubber, it is considered 'a most excellent food fish.' Others, however, hold it in little esteem. Goode himself tells that along the southern coast of California where it is 'found in some numbers,' on account of 'its beautiful color it sells readily, but it is not especially esteemed as a table fish.'

"But it is by all with common consent exalted as a game fish. The celebrated angler, Henshall, in 1884, declared that, of all the fishes he had caught in the Indian River inlet 'a bonefish of about 3 pounds gave more real sport than any of the others.' He found that it 'fights in the water and in the air like the black bass, but mostly in the air—a silver shuttle.'

## Fish Chat.

BY EDWARD A. SAMUELS.

### Plenty of Bait.

THE hand-line fisherman of the Maritime Provinces are getting all the fresh bait they need at the present time, for not in years have herring been as plentiful as they now are; all along the Nova Scotia coast from Sydney, C. B., southward come reports of enormous schools of these silvery little fish; in fact, so abundant have they been, great quantities have been carted on the land to be used as a fertilizer, the fishermen obtaining all they need at twenty-five cents a barrel.

At Lockport they have been so numerous seining them had to be discontinued, a single boat capturing as high as eight barrels at a haul. Such an abundance as this is very encouraging in view of the fact that in recent years this bait has been so scarce, freezers have been erected by Government and private enterprise to preserve the small stocks which were obtainable. These herring are not as large as those obtained early in the spring—large fish, indeed, are they sometimes, attaining the size of a small shad and chiefly caught at night by seines which are allowed to run out astern of the fishing vessels, being carried out and distended by the tide, which has no little movement even in deep water—but these inshore herring are in good condition, and in addition to their value for bait are a pan fish of considerable attractiveness.

If it is a fact that the enormous schools of herrings which formerly thronged the Atlantic coast are to be restored to us permanently, it is not among the impossibilities that the mackerel, one of the most toothsome of all the marine species, may again find its way back to our waters. Until now a good supply of herring bait has been considered a *sine qua non* by "bankers" and other deep-sea fishermen, but in consequence of the scarcity of this bait American fishermen, particularly those of Massachusetts, have in recent years found a substitute which seems to possess all the merits of the other and is obtainable in almost inexhaustible quantities. In the failure to obtain herring dependence has been made on the luscious clam, but the new bait,

### The Lance or Sand Eel

not only entirely supersedes that lure but has proved an exceedingly valuable acquisition.

Prof. George Brown Goode, in describing the lance or sand eel, says:

"Of all the small species of fishes occurring in the North Atlantic there is probably none more important to man than the lance—jaunce, as it is called in Europe. Although it is never used for food in this country, it is of great economic importance, since it constitutes one of the chief articles of food for the codfish, the halibut and other flesh-feeding species such as the bonito, bluefish, squetecague, flounder and mackerel. They swim in immense schools at the surface, and frequently imbed themselves in the sand, where they often remain above the low water mark when the tide is out. Why they do this is not well understood, for in their habits they are wanderers, sometimes appearing in immense numbers at certain points upon the coast and disappearing as rapidly as they come. With their sharp noses and slender muscular bodies they have little difficulty in imbedding themselves in the soft sand several inches deep. Captain Atwood has also recorded some curious observations concerning the manner in which these fish, with their sharp snouts, penetrate through the stomach of the codfish which has eaten them, into the walls of the body and there become encysted in the flesh, forming hard, black masses which are very inconvenient to the fishermen because they dull their knives which they use in dressing the fish before drying them."

The sand lance is also a favorite food of the salmon, in which fish they are very often found, particularly

those which are taken in nets in the tideways and along the shores; in fact, I have found the little eels in the stomachs of fresh-run salmon in rivers quite a distance from the sea.

### The Cod is a Wanderer.

But few persons realize how great a wanderer the cod really is; in fact, the general belief seems to be that it is local in its habits, and having selected an abiding place, is content to remain in it and not rove to any considerable distance away, but such is not the case, for the cod traverses great stretches of the briny deep almost, if not quite, as freely as does the bluefish, pollock and other of the more restless species. Several instances have recently come to my knowledge which show conclusively how wide a wanderer it is and how far it travels in a short space of time. In the latter part of June, in the present year, a very large cod was captured by a fisherman a few miles to the eastward of Liverpool, N. S.; it was an unusually heavy fish, being nearly six feet in length. On being dressed there was found imbedded in the walls of its stomach a large cod hook such as is used by the fishermen of Georges Banks. To this hook was attached a portion of a trawl line a the end of which was a swivel, such as is used on those fishing grounds; this was scoured bright by having been rubbed or dragged on the bottom of the ocean by the cod in swimming about, and the line must have been parted at the swivel by the great weight of the fish. The cod had not fallen away in flesh in the least degree, which shows that the hook was swallowed within a very short time, for with such an obstruction in its palate it could not have taken much of any food or even capture any of the fishes upon which it preyed. Now, the nearest point on Georges Banks to the place where the cod was landed was at least from ninety to one hundred miles, and the fish must certainly have traveled that distance if it had come in a perfectly straight line, which is entirely improbable.

As another illustration of the roving habits of the cod I will state that a vessel was wrecked on or near Cape Sable, on the southern extremity of Nova Scotia, and among the articles lost in the wreck was a lady's watch upon the case of which were engraved the initials of the owner's name.

Now the cod with all its other peculiarities has the curious habit of picking up and swallowing any metallic or shining object it discovers on the bottom of the ocean.

A few days subsequent to that on which the wreck occurred a cod was captured in Margaret's Bay, fifteen or twenty miles southwest of Halifax, in whose stomach was found the watch which had been lost over one hundred miles away.

### The Lobster is also a Great Traveler.

Now, while we may believe that a free-swimming fish like the cod can easily traverse long distances, one would hardly suppose that such a usually slow-moving creature as the lobster would be much of a wanderer, but that it is not the stay-at-home crustacean it is generally supposed to be has been proved beyond a doubt. In a recent issue of the Bangor (Me.) News I find some exceedingly interesting facts in relation to the habits of the lobster, a portion of which are well worth reprinting here.

According to the account given, about 400 lobsters were tagged at Wood's Holl and liberated by the United States fisheries officers. They were put out in the waters of Vineyard Sound about three years ago, in as nearly as possible the exact locality in which they were originally captured, and they were tagged with little copper tags, chiefly to ascertain how often these crustaceans change their shells.

Before the officers liberated any of the tag-bearers they issued notices, which were sent broadcast among the fishermen along the Atlantic coast, informing them of the purpose for which the lobsters were tagged, and asking their co-operation in carrying out the experiment. The fishermen were asked to send all the tag-bearing lobsters they caught to the hatchery station, and they were furnished with blanks which they were requested to fill out, giving the circumstances attending the capture of the lobsters.

Whether or not the lobster is migratory was a question which it was hoped the experiment would settle for all time, but most important of all was how often the lobster sheds its shell.

While there seems no good reason why these crustaceans should not crawl or swim from one region to another, proof was lacking that they do so until this experiment of tagging them was made, when it was definitely ascertained that they often make long journeys. The proof was furnished by a lobster fisherman on Long Island who was on the look out for lobsters bearing the station tags. He was the first to report having caught one in his traps. He found the lobster one morning about a month after it had been set free. This lobster was kept alive and sent to the Wood's Holl station as requested. So far as the Commissioners could tell there had been but a slight change, and that was the growth of the captive.

In a short time another of the tag-bearers was taken near the western end of Long Island, nearly one hundred miles from the point where it was set free. Subsequently many others were taken in the same region and in the vicinity of Block Island. None were caught to the eastward of the point where they had been liberated and the experiment seems to prove that the tag-bearing lobsters had all started south immediately after being put into the water.

Fifteen days after the last lot of lobsters were put into the waters of Vineyard Sound one of them was caught just fifteen miles from the point where it had been liberated, showing that it had traveled at an average speed of one mile a day.

Within a year after the tag-bearers were liberated more than seventy-five per cent. of the total number were heard from, and in almost every instance they were all found to the westward of Wood's Holl and from five to two hundred miles away from the spot where they were dumped into the Sound.

The fact that none of the lobsters were found north of Cape Cod has been a source of surprise to the Commissioners, for they believed sooner or later some of them would be caught by the fishermen who set pots along Cape Cod Bay shore and at Plymouth,

Lobsters are plentiful in the waters north of Cape Cod, but they undoubtedly belong to another tribe and so do not mingle with those which inhabit the waters south of the Cape and along Vineyard Sound.

These experiments, so far as determining the habits of these denizens of the deep, were a success, for they seem to prove that lobsters hatched south of Cape Cod do not go around to the northward of the Cape, and further that lobsters from Vineyard Sound wander down along the coast and probably spend the winter in the warm waters of the Gulf Stream.

#### Some Large Sea Trout.

One of my correspondents sends me the following clipping from the *Fredericton* (N. B.) *Herald*: "Mr. John W. Fairley returned yesterday from a fishing trip to Boiestown, bringing with him five trout, the aggregate weight of which was 25 pounds. The largest of the lot tipped the scales at 6¾ pounds. Mr. Fairley caught them in the Southwest Miramichi, near Boiestown, and has every reason to be proud of his success."

In commenting on this item my friend says: "These were the so-called sea trout on their way up to the headwaters of the river after leaving Indiantown at the mouth of the Renous River, the smelts having spawned and gone back to the estuaries. The sea trout of Restigouche, Jacquet, Charlo and other rivers on the north shore are now leaving the tideway and making their way up river. A party from St. John which annually fishes the Escuminac on the Quebec side of Restigouche, was too late this year, they found that the sea trout had all gone up stream.

Apropos of sea trout, is it not surprising that your Federal and State Commissioners, while destroying good fishing waters east and west by planting in them the hideous and worse than useless German carp, which have been a curse wherever introduced, have made no effort to introduce the *Salmo trutta*, or sea trout of the British Isles, which is so good a fish for the table and so gamy a one for the angler. Can you not induce your friends to direct the attention of the powers that be to this matter?" My friend further says:

"Preceding your article in *FOREST AND STREAM* is a chapter from 'Hallock's Fishing Tourist,' with which I fully agree. As an old angler I would rather see the salmon wiped out than the brook trout. I have had all the thrills that the salmon can give the angler, having caught them from eight to forty-five pounds on all our great rivers, but for real enjoyment give me the stream well stocked with trout."

Yes, my friend and Mr. Hallock are both right, and if the choice must come between losing the salmon and trout angling, the first named would have to go. While salmon angling is one of the grandest sports vouchsafed to man, it does not appeal to the poetic, the æsthetic feeling as does that which comes to one who follows the smaller yet equally gamy denizens of the meandering brook or the mountain stream or lake.

Let us hope that both will be left to us; we have none too many game fishes worth the striving for, or which can be taken with that most delicate lure—the artificial fly—and all of us should do everything that lies in our power to preserve these the grandest and the most beautiful species we have.

### The Susquehanna Bass.

SAYRE, Pa.—Susquehanna River fishing conditions have rapidly bettered during the past week, and within the last two days fishing tales have increased in dimensions and numbers. On the 19th inst., between Athens and Sayre, Ben Stone took from the Susquehanna seven black bass and as many pike, using lamprey eels for bait. Rhinebold, Fletcher and one or two other local river fishermen report excellent bass and pike fishing within two miles either way from Sayre. About one and one-half miles from Sayre, toward Owego, the Susquehanna spreads out a broad, fine bit of water, free from riffles and flowing smooth, from which some splendid bass and pike are being taken, the size of the latter fish running unusually large at this point. Following the river down past Ulster, where a number of notable bass grounds are to be found, and on through to Wyalusing and below, the bass fisherman should find plenty of good sport from now to the end of the season. The fame of Wyalusing seems to no wise diminish in the estimation of anglers who like fishing for the sake of the sport and who have no desire to turn an outing into a society function. There is sufficient of the ruggedness of primitive conditions about Wyalusing and its allurements that directly appeals to the man who likes to fuss about in old clothes and wear a slouch hat on the water when the sun swings high overhead. And perhaps better than all else the bass are in the waters at Wyalusing, and when the conditions are right the fish are to be had in plenty.

Not a few local anglers have this season gone to North Fair Haven, on Lake Ontario, and recently they have had exceptionally good luck, Messrs. Pieffer and Utter having caught plenty for themselves and friends at their last trip there, July 15. Pickerel, pike, perch, bass and an occasional maskinongé are the fish chiefly taken. Boats, bait, tackle and all necessary furnishings conducive to the angler's comfort and peace of mind are obtainable right at the water's edge, so that it is a comparatively easy matter for the novice to get into right fishing relations at North Fair Haven, and it is not all fishing to fish at that sequestered lakeside haunt. The far vistas of water reaching away to the horizon's edge and every now and then whipped into waves that break and shatter upon the shore with splendid energy, afford an inspiration and an uplift that inland waters fail to offer. Watermanship, and the fishing that requires live attention, are here to be learned.

From Cayuga Lake an occasional line advises that at Union Springs and at Cayuga village bass, perch, pickerel, pike and maskinongé are being taken in numbers very nearly, if not quite, up to the standard of former years at this time of the season. Outfitting at either of the above points gives easy fishing within range of all modern conveniences when one's fishing togs are off.

At the Ithaca end of Cayuga Lake conditions are not normal yet, and the bass fishing is not praiseworthy. The June flood that literally swept the university city off its feet played havoc with game fishing interests, although

it afforded many citizens an opportunity of going into their front door yards and grappling enormous carp from among the submerged rose bushes and flower beds. As the season advances the bass angler may get some pleasant sport a little distance north of Ithaca on the east side of the lake.

M. CHILL.

### Fish and Fishing.

#### Shipwrecked Salmon Fishermen.

SOME of the salmon fishermen who recently returned from the rivers on the north shore of the Gulf of St. Lawrence were treated to an experience which was altogether outside of their programme. On their way up to Quebec, on board the very excellent new steamship *Aramore*, the vessel ran upon rocks near Sheldrake, and as it was feared that there might be some delay in getting her off again, a steamer which was doing lighthouse duty for the Government upon that bleak and dangerous coast, was telegraphed for and took the passengers off, landing them, however, upon the south side of the Gulf, at Gaspé. Reports from the rivers are still incomplete, but many of the fishermen had fully average luck, and some of them much better than the average. Senator Proctor, who was fishing the Ste. Marguerite, was too early for the best of the sport, and left for home with only one fish to his credit. The Rev. Dr. Van Dyke, who was a little later on the same water, had excellent success, killing between a dozen and a score of fish, averaging over 18 pounds each in weight. The fish were more plentiful than for many years past. Lord Grey has also returned from his fishing excursion to the Cascapedia, where he enjoyed very fine sport, killing some seventeen salmon, some of very large size. He will shortly fish some of the Anticosti rivers as Mr. Menier's guest.

#### Ouananiche Still Plentiful.

Ouananiche are still reported plentiful in the Grand Discharge, and a number of very good catches have been had during the last few days. Most of the anglers who have fished there so far in July have been Americans. Most of their fishing was done in the rapid waters of the Discharge, and this fishing ought to be good for some time to come yet, before the fish take to the middle of the lake. Many of them have ascended the rivers tributary to the lake on the north side, and thither no doubt they will be followed by visiting fishermen who usually select the months of August and September for their canoeing and camping trips up the Peribonca, the Mistassini, the Ashuapmouchouan or some of their feeders. Since the setting in of the exceptionally hot weather of early July, the most killing flies are those which are tied in the small sizes, and these are what I am now recommending my friends to take with them into the Lake St. John country.

It will probably pay anglers and campers visiting this territory during August and September to take kodaks with them, for an unusually large number of moose, caribou and other game have been seen in the woods this summer, and are liable to be met at any time. The beneficial effects of protection have nowhere been more forcibly demonstrated than in this part of the country, where so many prosecutions have been taken, and so much careful detectival work and guardianship done by the officials of the Sportsmen's Fish and Game Protective Association of the Province of Quebec.

Mr. Boardman, editor of the *Railroad Gazette*, New York, has been a guest of the Metabetchouan Fish and Game Club, and has also gone to Lake St. John for ouananiche fishing.

#### Death of General Dashwood.

A friend sends me a marked copy of a paper containing a notice of the recent death, in the Isle of Wight, of General Dashwood, a well known English angler, who has fished in both Canada and Newfoundland for many consecutive years, since his first voyage across the Atlantic, as a young officer in the British army, in 1862. A book, descriptive of his sport, was published by him in 1871, under the peculiar title "Chiploquorgan," which is the Indian name, in the Milicite dialect, for the crooked stick on which the kettle is suspended over the campfire, and which is held by the red men in superstitious regard. He was, from all accounts, a most successful sportsman, though he boasted but little of his luck, and was rather given, on the other hand, to minimize the opportunities for sport in the lands visited by him, thus drawing down upon himself the intense hatred of the Newfoundlanders, many of whom go so far as to say that he was actuated by a desire to keep rival sportsmen out of the country. Be this as it may, however, there is no doubt at all that he did a real service to that country in pointing out the necessity of a proper system of fish and game protection.

E. T. D. CHAMBERS.

#### An Adventure with a Tarpon.

ON Saturday morning last, at Johns Pass, R. D. Jackson, M. L. Stoner and W. L. Straub, all well known and at least two of them reliable citizens—for this is no "yarn"—were fishing for tarpon in a good-sized dory taken on a cruise for such purposes. The tide was going out strongly, and they anchored the boat to save work. Jackson occupied the oar seat, Stoner the middle and Straub the stern seat, all facing the stern and watching their lines lying out with the tide, Straub with his feet sticking out over the stern.

Jackson got a strike, and, with a whizzing of the reel and whistling of the rushing line, his tarpon leaped high in the air about fifty feet to the stern of the boat. He gave a full view—a good, fair-sized tarpon, probably five and a half or six feet, and weighing probably 100 pounds. Stoner and Straub started to reel in to avoid tangles, when the crash came. In a seemingly incredibly short space of time after the tarpon splashed into the water again a cloud of spray and a gleam of silver flashed up about three feet away and came over the boat's stern. So terrific was the speed and lightning-like the apparition that Straub could not even throw up a defensive arm. He received the monster fish full and fair and went backward down into the boat as if felled by an ax, his feet and legs still upon the stern seat, the tarpon lying par-

tially between them and partially upon his body, thrashing furiously.

It was all over in a moment, the tarpon flopping over the side of the boat, throwing Jackson's hook as he went, and disappearing almost as he came. Straub was decidedly down and out, and when raised up by Stoner was found groggy, but not seriously injured. One ankle and leg were battered and bruised considerably, and his left side and head so banged that he was entirely out of business for the rest of the day.

Of course, as in all escapes, the danger lay in what might have been. The tarpon came up so close that it was in a vertical position and struck its victim broadside. If it had come up further off and struck him head on—100 pounds of fish at the terrific speed behind that pointed head would kill a stronger than the Times man. Or, if it had come from one side Straub would have gone out of the boat instead of into it, and in his dazed condition very possibly could not have stemmed the tide. Or, if the other boat—a light skiff—had been in use, it must certainly have been capsized with all hands.

The adventure is related at some length here, not to make conspicuous any names, but because it was a very remarkable occurrence, and one that, unless fully explained, could hardly be credited by our readers who are in no wise acquainted with the sport of capturing the giant tarpon or silver king.—*St. Petersburg* (Fla.) *Times*.

#### Tarpon Breeding in Florida.

Editor *Forest and Stream*:

In your July 22 number an article on tarpon states that "the tarpon does not appear to breed along the continental coast of the United States." On the Gulf Coast of Florida, from Cape Sable to Tampa, there are numerous creeks where tarpon spawn, and where, until the freeze of 1894-5, all sizes of young fish could be seen in schools—fish from 1 to 25 pounds. These young fish are found in either fresh or brackish water.

In 1891 a party of six, with guides, on two sloops visited Surveyor Creek in February, and fished for tarpon. We went up the creek in small light-draft boats until in the narrow part of this creek and saw fish from 10 pounds up. They would take no bait, but since then with spoons they have been caught as small as 5 pounds.

The writer of the article of July 22 estimates that a tarpon attains the weight of 100 pounds in three years. If such is the case, how is it that at the same season we find in the same section tarpon of 1, 3, 10, 25, 40, 50, 60, 70, 80, 90 and 100 pounds? I do not believe that a 100-pound fish attains that weight in ten years.

In the Myakka River there were hundreds of fish killed by the Dec. 27, 1894, freeze and left all along its banks, and they were of all sizes. I saw them myself. This river has just begun to contain a few tarpon, and it has been ten years.

The last freeze killed a few there which were all under-sized. These fish are not frozen, but a strong, cold norther blows out of this shoal stream most of the water, leaving only that in the deep pools, which is chilled to about 50 degrees and causes them to float, and thus they die and are with the incoming water blown ashore and are food for buzzards and eagles.

C. A. D.

#### Camp Candlestick.

TORONTO, Ont., July 15.—*Editor Forest and Stream*: I have used a candlestick such as that described by E. M. Johnson in *FOREST AND STREAM* of July 15, for years when camping. When birch bark is not available a piece of paper answers equally well. Soldiers in camp use a bayonet stuck in the ground, the socket, which passes over the muzzle of the rifle, forming a socket the right size to hold a candle.

J. J. B.

A PLANT of 30,000 salmon fry has been made in the Courtney River, on the eastern coast of Vancouver Island, B. C.

ONE of the bequests in Joseph Jefferson's will was of a Kentucky fishing reel to Grover Cleveland.

### The Kennel.

#### Iowa Field Trial Association.

THE announcement and entry blanks of the Iowa Field Trial Association may be obtained by addressing George C. Cooper, Secretary, Lock Box 55, Des Moines, Ia. There are three stakes provided, the Derby, the All-Age and the Subscription.

The Derby Stakes, for setters and pointers whelped on or after Jan. 1, 1904. Entries close Aug. 1, 1905. Purse \$300, divided 50, 30 and 20 per cent; \$10 forfeit; \$10 for starters.

The All-Age Stake is for setters and pointers which have not won first place in any open stake in any previous year. Entries close Aug. 1, 1905. Purse \$300, divided 50, 30 and 20 per cent; \$10 forfeit; \$10 for starters.

The Subscription Stake is for setters and pointers. Open only to dogs that have won a place in competition in field trials. Nominations to be made on or before Aug. 1, 1905; \$10 forfeit; \$15 additional to start. Purse, the forfeit and starting fees, divided 50, 30 and 20 per cent.

The trials begin on Aug. 15, near Grand Forks, N. D. The week following, at the same place, the North Dakota Club will hold their field trials, and will offer \$800 guaranteed purses, and a subscription stake.

This should appeal to the industrious trainers, the ones who are in search of business and reputation instead of for trouble or ease, or both.

The famous and excellent field-trial judge and handler, Mr. W. W. Titus, has consented to act as judge.

#### An Expensive Rabbit.

A NEW ROCHELLE, N. Y., man who visited Stroudsburg, Pa., last week, anticipated the rabbit shooting season, and for killing one rabbit paid to Squire Joseph Evans \$21.75.

# YACHTING

## Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

### JULY.

- 26. Seaside Park, club.
- 27. Eastern, power boat races.
- 27. Sea Side, club.
- 28. Eastern, power boat races.
- 28. Seaside Park, Bay Head and Island Heights, cruise.
- 28. Sea Side, open.
- 29. Eastern, power boat races.
- 29. New Rochelle, ladies' race.
- 29. Chicago, race to Mackinac.
- 29. Country Club of Detroit, race to Mackinac.
- 29. Seaside Park, open.
- 29. Edgewood, club.
- 29. Knickerbocker, one-design power boats.
- 29. Hampton Roads, cruise.
- 29. Rhode Island, cruising race.
- 29. Royal Canadian, cruising race.
- 29. Beverly, club.
- 29. Corinthian, club.
- 29. Boston, club, Marblehead.
- 29. Indian Harbor, annual.
- 29. Bensonhurst, Childs trophy.

### AUGUST.

- 1. East Gloucester, club.
- 1. Morrisania, cruise.
- 2. Seaside, club.
- 3. Boston, M. Y. R. A., Hull, open.
- 4. Boston, M. Y. R. A., Hull, open.
- 4. Shinnecock Y. C., association.
- 5. Shelter Island, annual.
- 5. Boston, M. Y. R. A., Hull, open.
- 5. Knickerbocker, one-design power boats.
- 5. Knickerbocker, cruise.
- 5. New Rochelle, cruise.
- 5. Squantum, club.
- 5. Rhode Island, cruising race.
- 5. White Lake, open.
- 5. Seaside Park, power boat.
- 5. Royal Canadian, club.
- 5. Chicago, club.

- 24. Morrisania, open.
- 24. San Francisco, cruise.

### Manchester Wins Seawanhaka Cup Races.

MANCHESTER, the American challenger, representing the Manchester Y. C. in the races for the Seawanhaka Cup, sailed on Lake St. Louis, defeated the Canadian defender Alexandra in three straight races.

The first race was sailed in a 15-knot breeze three times over a four-mile windward and leeward course. Manchester beat Alexandra by 3m.

In the second race Manchester won by 2m. 52s. This race was over a triangular course, and the weather conditions were very much the same as those of the day previous.

The third and deciding race was sailed in a heavy wind, and Manchester won by 9m. 37s.

A full account of the races will appear in the next issue of FOREST AND STREAM.

### K. Y. C.'s Long Distance Power Boat Race.

Four of the twelve boats that started in the Knickerbocker Y. C.'s Long Distance Power Boat Race from College Point, L. I., to Marblehead, Mass., finished and eight withdrew on account of the very bad weather encountered.

The start was made on Saturday, July 22. The preparatory signal was fired at 11:50 and at noon the boats started. The first ten boats crossed the line within 42s. of the gun, and the other two within 1m. 32s. The starters crossed in the following order:

No.	Rating.	Time Allowance.
7 May	39.90	4 19 00
3 Em Bee	32.22	11 17 58
4 Woodpile	34.50	9 20 11
8 Aquila	44.10	1 31 42
15 Igniter	29.25	14 57 46
2 Highball	37.27	6 21 08
11 Talisman	27.96	16 44 19
9 Glissando	32.83	10 37 56
6 Yeddo	32.54	10 57 46
5 Blink	46.80	Allows.
1 Aranca	28.65	15 47 42
10 General Bumps	29.5	14 36 32

At the time of the start the wind was S.W. and the water was choppy. Everything indicated a shift of wind to the E., and it did go to that quarter on Saturday night. The following is the order and time which the boats passed Gangway Buoy, which is 7¼ knots from the start:

5 Blink	12 50 00
7 May	12 51 50
8 Aquila	12 52 15
9 Glissando	12 55 40
1 Aranca	12 58 45
2 Highball	1 00 00
3 Em Bee	1 00 35
4 Woodpile	1 00 35
15 Igniter	1 00 35
6 Yeddo	1 00 40
10 General Bumps	1 07 10
11 Talisman	1 08 11

Igniter was the first boat to quit. She broke her thrust and retired. When five miles off New Haven May smashed her clutch and she was backed all the way into

New Haven. Em Bee ran into Stonington, while Yeddo and Highball put in to Block Island. Aranca ran in to Newport and General Bumps broke her gasoline pipe and in some manner managed to get into Cotuit. Woodpile retired at Cottage City.

The conditions changed for the worst on Saturday night and the boats had to buck an easterly storm. The weather continued bad all through Saturday night, but the wind moderated on Sunday afternoon.

The owners of the four boats that finished—Talisman, Blink, Aquila and Glissando—deserve great credit for going over the Shoals and around the Cape under the prevailing conditions, and we are inclined to believe that had they realized how bad it really was they would have waited for the weather to moderate.

In any event, it was a splendid test of the boats and their engines, and they will probably never be called upon to undergo so severe a strain again.

The Regatta Committee, composed of Messrs. O. H. Chellborg, Harry Stephenson and A. E. Potter, were on board the old schooner Ramona, which was used as a judges' boat. The committee had an uncomfortable night of it Sunday rolling around in the heavy ground swell.

Talisman, the first boat to finish, crossed the finish line on Monday at 9:24:56, having made the 280 miles in 45h. 24m. 56s. Talisman had a light northeast wind down Long Island Sound to Plum Island. Between Block Island and Point Judith the sea began to roughen. From Point Judith to Gay Head the boat met a heavy northeast wind and cross seas.

Blink was the second boat to finish, crossing the line at 5:31 Monday. She was 8h. 6m. 4s. behind Talisman. Aquila was third and Glissando fourth. The finish times follow:

Talisman, William Saville	9 24 56 A. M.
Blink, C. W. Esterbrook	5 27 10 P. M.
Aquila, Allen H. Chase	7 30 08 P. M.
Glissando, Frank L. Andrews	7 30 12 P. M.

Talisman wins first prize and Glissando wins second prize on time allowance.

The following are the crews and the clubs from which the different boats entered:

No. 1, Aranca (unattached—Arnold Schlaet (owner), Gerald A. Cooper, Harwood Wakeman, Chas. Forsberg.

No. 2, Highball, Corinthian Y. C., of Marblehead—Richard Hutchison (owner), W. V. Polleys, A. C. Larkin, C. W. DeMott.

No. 3, Em Bee, Columbian Y. C., New York—Louis Neumann (owner), George L. Macdonald, Allan F. Macdonald, James G. Worrall.

No. 4, Woodpile, Hingham Y. C.—A. L. Lincoln (owner), C. M. Scudder, W. W. Cook, H. D. Farrar, C. E. Barber, Geo. W. Stetson.

No. 5, Blink, Boston Y. C.—C. W. Estabrook (owner), Arthur B. Raymond, W. G. Miller, P. A. Jerguson.

No. 6, Yeddo, Tappan Zee Y. C.—Stanton M. Smith (owner), W. H. Aspinwall, Leland M. Burr, Joseph Van Vleck.

No. 7, May, Knickerbocker Y. C.—A. A. Low (owner, not on board), A. Wassman, Frank Shippers, George Robinson, Joseph Garcia, James Hunter.

No. 8, Aquila, Providence Y. C.—Allen H. Chase (owner), Robert Steer, Chas. F. Tillinghast, G. W. Searle.

No. 9, Glissando, Fall River Y. C.—Frank L. Andrews (owner), Walter E. Noble, Horace Hathaway, William Hiseox, William Lancashire.

No. 10, General Bumps, Riverton Y. C.—Paul D. Irwin (owner, not on board), Walter Page, C. A. Godshalk, Harold Wesson, R. B. Clark.

No. 11, Talisman, Boston Y. C.—Wm. Saville (owner), Arthur E. Colchester, Cyrus Ferris, Raymond W. Ferris, John K. Saville.

No. 15, Igniter, Jamaica Bay Y. C.—C. A. Mezger (owner), Arthur D. Francis, I. B. Owens, Walter Francis.

### A Book on Gas Engines and Launches.

THE Forest and Stream Publishing Company issues a neat volume entitled "Gas Engines and Launches," by Francis K. Grain, M. E., which will be sure to meet with a hearty welcome among the legion of power boat men. This volume is a collection of the articles written by the author and published from time to time in the FOREST AND STREAM, revised, enlarged and illustrated. It is the only work of its kind intended strictly for the marine gas engineer who does not care to trouble his brain with arithmetical problems or a too learned discourse on the subject. The first pages of the book give a very clear explanation of the internal combustion engine, then follows a description of both two and four-cycle types of engines with explanatory illustrations by the author. From these we are carried along with descriptions of the different parts and their functions. A few pages are devoted to launches in general, with some very good practical advice to the would-be purchaser of a power boat. One of the best features of the book is the matter following, which is a very clear and concise description of gas engine troubles in general, their cause and how to remedy them. This little volume contains a vast amount of practical knowledge boiled down in a small space and written in terse, every-day language, all technicalities being avoided. The author's long practical experience in all branches of the manufacture of gasoline engines and launches has enabled him to incorporate in these pages just the exact knowledge wanted by amateurs, and every page of the entire work holds one's interest to such an extent that the reader will hardly be content to lay down the book until it is read through. The book contains 125 pages, and is just of the right size to fit the pocket. It furnishes the amateur power boat man with a whole lot of good advice and wrinkles at the small cost of one dollar.

British Letter.

RACE FROM COWES TO THE CLYDE.—The handicap match promoted by the Royal London Y. C. from Cowes to Hunter's Quay, Clyde, which started on June 22, was a very long drawn-out affair, lasting over nearly five days. The winds were light throughout and for the most part baffling, and the sailing was consequently tedious in the extreme, yet the handicap worked out uncommonly well, for the difference between the six boats on corrected time was just over three hours—a very small matter when it is considered that the course is about 530 miles of coasting. The scratch boat, White Heather, which led throughout, was the winner, and some idea of the softness of the breeze may be gathered from the fact that she carried her jackyard topsail from start to finish and took ten hours to cover the last twelve miles of the course. The schooner Norlanda won the second prize by time, and the yawl Valdora, which kept Brynhild close company all the way, took the third prize. The corrected times of the prize winners read as follows. White Heather (winner), 8.0.16; Norlanda (second prize), 8.44.43; Valdora (third prize), 9.18.57; the times of the others being Adela, 9.39.48; Merrymaid, 10.56.0, and Brynhild, 11.2.3.

THE RETURN MATCH.—The big handicap class which finished their Clyde racing at the regatta of the Royal Clyde Y. C. on July 8, started from Hunter's Quay at 7:45 P. M. the same evening on the return match to Cowes under the auspices of the Royal Clyde and Royal Northern Y. C.'s. The same six boats were entered, but only five started, as Brynhild had towed away to the south the previous evening. The start was made in a light S.W. breeze which gave the yachts a beat through the fairway to the open sea. When darkness fell White Heather was leading with Valdora second, Merrymaid third and the schooners bringing up the rear.

THE CLYDE FORTNIGHT.—Not for many years has the Clyde been favored with such a large and representative fleet of racing yachts as has been the case this year. The success of the meeting has been in a great measure due to the presence of the big handicap class and the 52-footers from the south, but in addition to these factors many other things have contributed to the success of the fixture, and the weather has been for the most part summerlike and perfect. Irrespective of the six handicap boats which raced round from Cowes and the four 52-footers, there is a fleet of over sixty yachts belonging to the Clyde district, and the appearance of the Firth when all the matches were in progress was accentuated in the extreme. The big handicap class was made up of the six boats which came round from the south of England, the three 65-footers, Zinita, Ouda (formerly Tutty) and Carina, Vol-au-Vent and Nixie. In eight races sailed White Heather took three first prizes, Valdora and Adela two each, and Zinita one.

The doings of the 52-footers have naturally been followed with the greatest interest. Three of the boats are of Scottish design and build and the fourth boat—the American Sonya—had done so well in the last three races sailed in the south of England that she had scored three first prizes. Maymon had undergone some alterations to her keel, her draft being increased by six inches, and both Sonya and Moyana were supplied with new suits of sails by Laphorne & Ratsey. The effect of new canvas on Moyana was to place her at the head of the fleet. Out of ten races sailed the prizes have been distributed as follows: Moyana, six first; Maymon, three firsts and two seconds; Britomart, one first and seven seconds, and Sonya, one second prize. It is only fair to state that Britomart was well placed for another first prize on the opening day at the Royal Largs regatta when she sprung her mast and had to give up. This makes her the most consistent performer, for an accident only robbed her of what would have otherwise been her race. Had she won she would have been able to fly nine flags—two firsts and seven seconds—for ten starts. Moyana—the oldest boat in the fleet—has already won nine first prizes this season, or twice as many as any of the others, and this is spite of the fact that she sailed her first races under an old suit of sails. Maymon undoubtedly feels the loss of her last year's skipper, C. Bevis, who is now in charge of White Heather, and it can now scarcely be doubted that she owed her position at the head of the fleet last year to his superior handling. If Moyana continues to keep her present form, and there seems no reason to doubt it, the fact must be faced that our designers have come to the end of their tether as regards the present rating rule. It seems to be clear also that the Fife boat Magdalen, built in 1901 and which simply swept the prize list that year, would prove a far faster boat in anything of a breeze than any of the present fleet. She would simply drown them in a sea, she was so beautifully stiff and buoyant, and would in all probability win more prizes than any of the others in anything except very light airs. Unfortunately she never belonged to a British owner and has been sold to Italy.

Sonya's collapse is almost unaccountable unless her trim has been lost. She appears to be stiff but not fast, the others are fast but not stiff, and when the wind pipes up enough to press the Scotch boats Sonya shows to better advantage, but in light and moderate breezes she does not come up to their standard of speed. Perhaps some slight alteration in trim will help her.

DECLINE OF THE IRISH REGATTAS.—For many years past there has been a distinct falling off in the interest shown by yacht owners in the three big Irish fixtures at Belfast, Kingstown and Queenstown. The last named place, which possesses a beautiful racing course, has been neglected by the regular racing fleet for some time, although the Royal Cork Y. C., under whose burgee the south of Ireland fixture is held, is the oldest yacht club in the United Kingdom. The regattas of the Royal Ulster at Belfast and of the Royal Irish and Royal St. George Y. C.'s at Kingstown have also suffered severely the last five or six years and are shorn of almost all their former glory. So bad has this state of affairs become that the Royal Irish has decided to abandon its two days' fixture this year, and the dates have consequently been cancelled. It should be stated that the Royal Irish and Royal St. George take charge of the Kingstown fixture on alternate years, and this year happens to be the turn of the former club. It is a great pity that such a time-honored fixture should be allowed to lapse, but the cause is distinctly traceable to the disappearance of the first

class raters and 65-footers. The big handicap boats will in all probability hurry off to Dover and Ostend, and although it has been suggested that the place of honor might have been given to the 52-footers which are showing such excellent sport, this is surely too much to expect, as these little ships are only one stage removed from the small fry. Besides the experience of the last few years has shown that the 52-footers are not particularly desirous of taking part in the Kingstown fixture. The presence of the big handicap boats and the quartette of 52-footers would have been sufficient justification for the continuance of the regatta, but the Ostend fixture has had the same effect on the Irish regattas as Kiel has had upon the Clyde Fortnight, and the attractions of the popular Belgian seaside resort have hitherto turned the scale in its favor. Fortunately for Belfast and Kingstown there is plenty of yachting and yacht racing to be had out of the local classes, which increase yearly in popularity, but Cork harbor is not so fortunate, and it is to be feared that nothing short of a revival of pure class racing will restore the faded glories of the once famous Irish regattas.

HOLLOW MASTS.—The frequency with which these spars give out and the general unreliability of the spars supplied to our fleet of 52ft. raters shows that there must be something radically wrong with their construction. It also shows how ill-advised the Yacht Racing Association were not to pass a rule barring them, as they are quite unnecessary and are very expensive. However, the time has gone by now to do away with them because they have unfortunately come into very general use, and the only thing to do is to make sure that the spars supplied are what their makers claim for them—lighter, stiffer and stronger than the solid masts. It is a pity that no British firm has taken up their manufacture, for at present yacht owners are entirely dependent upon what they get from American makers and have no knowledge as to how they are constructed. This much is certain, that the spars supplied to the 52-footers are not what is claimed for them. Sonya has already had two, so has Britomart, and her second one was reported sprung on the Clyde. Moyana has had trouble with hers. Gauntlet, an ex-52-footer, was dismasted on July 1 in quite a moderate breeze, and I am not at all sure that this was not her second mast this year. The reason for these constant mishaps seems to be that the spar makers have reduced the diameter of the masts to a dangerous extent. When Magdalen came out in 1901 she was the first British rater to carry a hollow wooden mast. Hers was a beautiful stick. It certainly looked big enough in diameter for a 65-footer, but it was light, stiff and strong, and never gave the slightest trouble. That spar must have been at least 30 per cent. larger than a solid one, but it did not stop her, and did not lose her prizes (as do the more modern ones) by giving out at critical moments. If hollow masts are to be kept in use they must be made more reliable, because, in addition to minor accidents, there is always the great danger to the crew of a falling spar, and this danger should be reduced to a minimum.

E. H. KELLY.

The Sailing Rules.

When my approaching boat you see,  
And I'm close-hauled and you are free—  
The right of way belongs to me.  
Art. 17 (A).

But if close-hauled both vessels sail,  
Port tacks to yield must never fail,  
For, always, starboard tacks prevail.  
Art. 17 (B).

When both our boats are free, and find  
Upon their opposite sides the wind,  
The port-side boat must drop behind.  
Art. 17 (C).

But if, while both our boats are free,  
On the same side the breezes be,  
The windward boat avoids the lee.  
Art. 17 (D).

And when the winds blow up abaft  
And fill your vessel's sails from aft,  
You must avoid all sailing craft.  
Art. 17 (E).

Now, when these regulations say  
That either boat shall keep away,  
The other on her course must stay.  
Art. 21.

Lastly, this rule remember well!  
When steam, or "power" you see (or smell),  
Stick to the course your're on like—wax!  
Art. 20, 21.  
E. G. BENEDICT.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

SALES AND CHARTERS.—The steam yacht Cloelia has been sold by Mr. Edward Swann, of New York city, to Mr. Cornelius McLean, through the agency of Messrs. McConnell & Cook. The same agency has chartered the sloop yacht Banshee to Mr. Henry S. Daltenheim, and has chartered the sloop yacht Rita, owned by Mr. Wallace F. Durant, New York Y. C., to Mr. Gladstone Fassenberg, of Stamford, Conn. This agency has also sold the gasoline launch Phoebe for Mr. Raymond S. Porter to Mr. Harry Mabie, of New York. The sloop yacht Wapiti has been chartered by Mr. W. T. Douglass to Mr. William Leslie.

TEMERAIRE WINS FIRST TRIAL RACE.—The first trial race for the selection of the challenger for the Canada Cup was sailed on Saturday, July 22, and Temeraire defeated her two rivals. She was designed by Mr. William Fife, Jr. The first race for the Canada Cup will be sailed on Aug. 12.

HANDICAP RACE FOR NEW ROCHELLE Y. C. YAWLS.—In order to make a race, at least five boats must start with the full intention of completing the course. The course to be as follows: From the starting line off Echo Bay to the red can buoy (The Cows) off Shippan Point, leaving same on starboard hand, thence to the black spar buoy "E 1" off Week's Point, leaving same on starboard hand, thence to starting line, finishing in opposite direction to the start. All Government buoys to be left on proper side. Course may be reversed at discretion of Regatta Committee; same will be indicated by flag Y of the signal code displayed on committee boat. If course be reversed the turning marks must be left to port. Race must be finished within ten hours from starting signal.

Warning, a white flag, to be displayed at 10:30 A. M.; the preparatory, blue Peter, 10:35; the start, one red ball, 10:40. Boats are to be in cruising trim with full equipment and dinghy; dinghy must be large enough to carry crew and need not be towed. Crews to be amateur; one paid hand allowed, but he must not touch the wheel or tiller.

The race will be sailed as a handicap race, the handicaps to be announced by the chairman of the Regatta Committee at the club house at 9 o'clock on the morning of the race, July 29. Entry list will close on Friday, July 28, at 9 P. M., at the club house.

The probable entries are: Escape, Friendship III., Thora, Tamerlane, Fleetwing, Adelaide, Cavalier, Pohtasuch and two or three others.

DINNER TO CREWS OF TAMERLANE AND GAUNTLET.—The New Rochelle Y. C. will also give a dinner to the crew of Tamerlane, winner of the ocean race to Hampton Roads, and also to the crew of Gauntlet.

OLD BOAT LOSES HER IRON KEEL.—The long looked for accident which was predicted many years ago by the opponents of outside ballast has at last occurred. A boat in the New Rochelle harbor, of ancient vintage, lost her iron shoe, weighing about 500 pounds, and the loss was not noticed until some time afterward by her owner. It seems that the bolts rusted off between the wood and iron keels, but the loss of the shoe did not cause her to leak any more than usual.

SLOOP SUZETTE SOLD.—Dr. C. A. Herter, of New York city, has sold his sloop Suzette to Mr. A. D. Claffin, of Boston, through the office of Mr. Stanley M. Seaman. Suzette is a keel boat, designed by Mr. Arthur Binney, and built by Lawley in 1901. She is 55ft. over all, 36ft. waterline, 11ft. 8in. beam and 7ft. 6in. draft. Dr. Herter is using his new 40ft. waterline sloop built for him the past winter by the Herreshoff Mfg. Co. The same agency has also sold the sloop Marjorie for Capt. W. T. Benson, of Philadelphia, to Mr. Tracy Grey, of New York city. She is a shoal-draft, centerboard boat built by Van Zandt, of Atlantic City, in 1902. She is 35ft. over all, 28ft. waterline, 13ft. beam and 2ft. 10in. draft. She has been fitted out at Toms River and her new owner is now using her in Jamaica Bay.

AN UNFOUNDED RUMOR.—We find the following in the Yachting World of July 6: "Early this week one of the New York daily papers published a statement that Sir Thomas Lipton had decided to issue another challenge for the America's Cup. The further details gave it that Mr. Alfred Mylne had been commissioned to design the challenger which would be known as Shamrock IV. We are authorized by Sir Thomas Lipton to state that there is no truth whatever in either of these reports, and to say that for some months past no move whatever has been made on his side regarding another race in the future. Sir Thomas is quite content in the present state of affairs to sit still and await developments."

CLUB BOOK RECEIVED.—We are indebted to Mr. A. G. Mansur, Secretary of the Lake Champlain Y. C., for a copy of the club book for 1905.

Mosquito Fleet Y. C.

South Boston, Mass.—Saturday, July 22.  
A CLUB race of the Mosquito Fleet Y. C. was sailed in Dorchester Bay on Saturday, July 22, in a light S.E. breeze. Alcyone won in the first class by a good margin. Reveille finished first in the second class, but lost to Rebel on time allowance. Luella won in the first power boat class, and Erma in the second power boat class. The summary:

First-Class Sailboats.		
	Elapsed.	Corrected.
Alcyone, F. W. Coombs.....	1 08 01	1 13 01
U and I, A. Leach.....	1 14 50	1 19 50
Second Class Sailboats.

*Disqualified.	

Larchmont Y. C.

Larchmont, Long Island Sound.

Third Day, Tuesday, July 18.

THE third day of race week was given over to the launch and rowing races, the swimming matches and the water sports. The programme was a most complete one, and all the events went off smoothly, much to the satisfaction of the committee in charge and the hundreds of spectators present.

Fourth Day, Wednesday, July 19.

The racing on the fourth day commenced in a light W.S.W. breeze, and the last boats to finish encountered a stiff N.W. squall, which was the only one of the week. The winners were Yankee, Mira (sailor), Mimosa III., Memory, Dahinda, Tartan, Rascal, Dorothy, Quest, Orion, Ace, Kenoshi and Fritter.

The 70-footers Yankee and Mineola went twice over the 15 1/2-mile course. The first leg was a broad reach, the second a beat and the third a close fetch. Every one who saw the start of the 70-footers were lost in admiration for the way in which young Harry Maxwell sailed Yankee. He out maneuvered Captain Barr in Mineola at the start and outsailed him all during the race. This contest was one of the closest that boats in this class have ever sailed, and it was regarded as a very satisfactory and conclusive test of the two boats.

Yankee crossed almost with the signal, which was given at 11:40, and Mineola came along 28s. later, moving slowly. Balloon jib topsails were carried at the start, and later the wind freed enough to set spinnakers. Yankee increased her lead slightly on the run to the first mark. After rounding, the boats held in toward the Long Island beach on the starboard tack. The wind had gone more to the W. The skippers of both boats carried No. 2 jib topsails at first, but smaller ones were substituted later. Mineola made the change first. As the wind freshened, Yankee gained, and at the mark off Mott's Point she was leading by nearly a minute. Mineola cut down Yankee's lead on the reach across to the Southwest stakeboat and she was only half a minute behind at the end of the first round.

The westerly shift in the wind allowed spinnakers to be carried on this leg and on the beat to the second mark she more than held her own. There was little or no change in the boats' positions in the reach across the Sound, and Yankee won by 43s. elapsed time. Mineola allows her 11s., so that she won by 54s. corrected time.

Mira was again without a competitor in the 40ft. sloop class. She again took a sailover, which assures her of the series prize. When running down before the wind with light sails set the little catboat Fannie, owned by Mr. C. Oliver Iselin's young son, got in the way and Mira's main boom struck the little boat's mast and capsized her. Master Iselin was accompanied by a capable paid hand who looked after the boy until they were picked up. Mira gave all the assistance she could, and her owner greatly regretted what seemed to be an unavoidable accident.

The 33-footers, Mimosa III. and Regina, sailed twice over an 11 1/2-mile course. At the end of the first round Mimosa III. was leading by nearly 14m. Near the end of the race Regina encountered the first of the squall that had been making and her mast snapped off near the deck. She was towed to Oyster Bay, her home port, by the steam yacht Sylph's power tender. Mimosa III. was left to finish alone.

At 11:50 Neola II., well placed, led the twelve contenders in the New York Y. C. one-design 30ft. class over the line. Banzai was second, Ibis third, Dahinda fourth and Nautilus fifth. In the 6-mile run to the first mark the boats strung out considerably. Nautilus was first around the leeward mark, but on the next leg she did not do well, and finished next to last. Dahinda and Banzai had the best of it on the windward work and finished first and second respectively. Dahinda beat Banzai 1m. 37s. Oriole 1m. 48s. and Pintail 3m. 16s.

The raceabouts made almost as good a showing as the New York Y. C. one-design boats, there being eleven starters in the class. All finished, except Mystral, which boat fouled a mark and withdrew. The invincible Tartan again led her rivals across the finish line. She beat Nora, the second boat, 2m. 58s. Her big gains were made on the second round. Invader, Jr., was third and Rana fourth.

There were four starters in the 27ft. sloop class. Thelema gave Rascal a fair race although the latter won. Maryola and Montauk were left way behind. Dorothy had a comfortable win in the Larchmont 21ft. class.

More Trouble lost her first race in Class Q, and had to be contented with third place. Quest won and Saetta was second. Both boats were designed by Mr. Henry J. Gielow.

Orion and Dipper, two of the old Seawanhaka knockabouts, raced in a special class. Dipper had trouble with her rudder, and was finally towed into the harbor. Orion went over the course alone.

Gauntlet won on corrected time in the 18ft. sloop class, although Ace pushed her hard for first place.

The 15ft. Dod, and the Horseshoe Harbor boat Quinsigamond got mixed up in the squall and had their sails torn. They were towed into the anchorage.

Kenoshi had another easy win in the Indian Harbor one-design class. Fritter won in the Milton Point class, and Vava, the only starter in Class V, did not finish. The summary:

Catboats, Class V—Start, 12:10—Course, 11 Miles.			
Vava, G. T. Barton.....	Withdrew.		

Fifth Day, Thursday, July 20.

The largest boats to start in Thursday's race were the New York Y. C. one-design 30-footers. There was no class for the 70-footers, and as Mimosa III. was without a competitor, she did not start.

The wind was light from the N. W. at the commencement of the race, but gained strength as the day progressed, and then petered out toward the finish.

The New York Y. C. boats went twice over the 9 1/2-mile course, a total distance of 19 1/2 miles. These boats were sent away at 11:40. Nautilus went over the line just on the signal in a fine berth. She was followed by Banzai, Cara Mia, Neola II., Oriole, Pintail, Maid of Mendon, Atair, Alera, Ibis, Adelaide II., Minx and Dahinda. Nautilus had her spinnaker drawing in short order and worked out a big lead on her rivals. At the first mark she was a long way ahead. On the reach to the next mark she was passed by Cara Mia, Neola II. and Banzai. It was a beat to the third mark, and Nautilus did not do well, as she was handicapped by a wretched mainsail. Cara Mia led at the end of the first round and was never headed. Neola II. made a strong play for first place, but could not do better than a second. Banzai was third and Nautilus fourth.

At 11:45 Rascal II., showed the way over the line to her nine competitors in the raceabout class. She was followed by Pretty Quick, Rana, Tartan, Nora, Mystral, Cricket, Invader, Jr., Circe and Busy Bee. These boats went twice over the 5 1/2-mile course. Nora was lucky and slipped home a winner with a 4m. margin over Rana. Mystral was fourth and Pretty Quick fifth. It was fluky and Tartan did not have her share of luck as is shown by her position. Rascal had an easy time with Maryola in the 27ft. class, and the race was anything but interesting.

Dorothy took another first prize in the Larchmont 21ft. class, and Thelema defeated Firefly in the 27ft. special class.

In the 22ft. class More Trouble found her pace again and took another first prize. Saetta was second and Quest third. Mr. J. H. Mahlstedt, owner of Okeo, one of the Class Q boats, was knocked overboard on the second round, but was picked up without difficulty.

Kenoshi won out again in the Indian Harbor one-design class and Owatana was second. Kenoshi wins in this class with the greatest consistency and mainly because she is so well handled.

Ace took another first in the 18ft. sloop class with her usual regularity. Hamburg was second.

Fritter had an easy win in the Milton Point one-design class. Dod took a sailover in the 15ft. class. The summary follows:

Sloops—N. Y. Y. C. 30ft. One-Design Class—Start, 11:40—Course, 15 1/2 Miles.			
	Finish.	Elapsed.	
Cara Mia, S. Wainwright.....	3 28 07	3 43 07

Dod, D. E. Dealey.....	4 05 00	4 05 00	

Sixth Day, Friday, July 21.

Friday was perhaps the most unsatisfactory day of a very unsatisfactory week in so far as the weather was concerned. There were forty-five starters, and the winners were Minx, Rascal II., Rascal, Hour, More Trouble, Kenoshi, Ace, Fritter and Dod.

The wind, what little there was of it, was from the S.S.E., and as the boats had little more than stercage way at the hour scheduled for starting, a postponement was made. At 12:10 the wind had strengthened slightly, and the New York Y. C. one-design 30-footers, the largest class to start, were sent away. Nautilus did not start, so that left but twelve boats in the class. Banzai was first away, followed closely by Neola II. They were followed as named by Minx, Cara Mia, Ibis, Oriole, Pintail, Dahinda, Alera, Atair, Adelaide II., and Maid of Mendon. On the reach to the first mark Neola II. held a little S.W. slant and ran out ahead, and when the first mark was reached she had a nice lead. The wind having shifted to S.W., made the second leg a beat. The mark off Week's Point proved hard to reach, and the boats that went way under the Long Island beach did better and were around first. Neola II. lost her advantage on this leg through ill luck. It was a spinnaker run to the finish line, and the boats that went well off to the eastward got favorable slants and reached up to the finish line fast. Minx, a boat that had been out of the running got a big jump on the others and came in a winner. Cara Mia was second. Neola II. pushed Alera hard for third place and finished only 10s. behind her. The Regatta Committee very wisely stopped these boats at the end of the first round, as there was little prospect of their being able to cover the 9 1/2-mile course a second time.

The eleven starters in the raceabout class managed to cover their 5 1/2-mile triangle twice. Nora was first away closely chased by Mystral, Tartan, Busy Bee, Rascal II. and Rana. Rascal II. chased puffs and managed to benefit by the ones she was lucky enough to reach. She finished an easy winner. Cricket was second and Rana third. Tartan again had more than her share of ill luck and did not show up to advantage.

In the 27ft. sloop class Rascal beat Maryola easily. Hour, unusually well handled, managed to beat Vaquero and

Dorothy, her old rivals. The race between these boats was a hot one, and they hung on to one another from start to finish.

Ojigwan got the start in the 22ft. class and worked out well into the lead. This boat has not done well at this meeting, and every one wanted to see her plucky owner capture at least one race. She was not headed until after the first round, and while she was trying to get out of a soft spot four boats passed her. More Trouble managed to keep in what little wind there was, and she again came home a winner. Saetta was second and Quest third.

Kenoshi performing as consistently as usual finished in first place as is her almost invariable custom. Wa Wa, her only competitor, was left far in the rear.

Ace proved too smart for the two competitors in her class and took another first. Hamburg gave her a fair run for first place, but was never dangerous.

The two little catboats, Fritter and Fannie, found it tedious work covering the 10 1/2-mile course. Fannie withdrew and Fritter finished alone.

Dod was fortunate enough to have a competitor in this race. All the week she has been forced to take sailovers, but Pyogha turned up in time to give her a race and incidentally to get beaten. The summary:

Sloops, N. Y. Y. C., 30ft. One-Design Class—Start, 12:10—Course, 9 1/2 Miles.

	Finish.	Elapsed.
Minx, Howard Willets.....	4 08 48	3 58 48
Cara Mia, S. Wainwright.....	4 09 08	3 59 08
Neola II., George M. Pyncheon.....	4 09 39	3 59 39
Alera, A. H. and J. W. Alker.....	4 09 29	3 59 29
Atair, Cord Meyer.....	4 10 11	4 00 11
Pintail, August Belmont.....	4 10 27	4 00 27
Banzai, N. D. Lawton.....	4 10 23	4 00 23

**Corinthian Y. C.**

Marblehead, Mass.—Saturday, July 22.

The fourth championship race of the Corinthian Y. C. was sailed off Marblehead on Saturday, July 22, in a light S.E. breeze. In the 22-footers, Chewink V. got the start and led all around the course. In the 18-footers, Otter was first across the starting line, but was soon passed by Moslem II, which led to the finish. Carina II, won easily in Class P, handicap. In Class M, handicap, Chewink IV, had the best of the start over Cossack, and pulled away on the beat to windward. Cossack gained off the wind and passed Chewink IV, on the last leg and won. The summary:

22-footers.		
	Elapsed.	Corrected.

**Boston Y. C.**

Annual Cruise—Marblehead to Five Islands.

The most successful cruise ever held by the Boston Y. C. was that which was started from Marblehead on Saturday, July 15, and ended at Five Islands, Me., on Saturday, July 22. The best of racing weather was had for the port to port runs, and the contests in all classes were full of ginger. There were from 27 to 33 contestants in the racing runs, and in the special open race at Five Islands on Friday there were 44 starters, including the launch classes, the latter being composed mostly of boats owned along the Kennebec River.

It was upon invitation of Commodore E. P. Boynton that the members of the club be his guests at Five Islands that the Sheepscot Bay resort, where the club has a station—established by Vice-Commodore Boynton—was chosen as the objective point. The cruising yachtsmen had plenty of attention at other places, however, as they were the guests of Mr. J. Fred Harvey, at New-castle, N. H., of the Portland Y. C., at Portland, and of the Kennebec Y. C. at Bath, Me.

For the racing runs, the squadron was divided into the following classes: First class, schooners, yawls and sloops over 45ft. over all; second class, schooners, yawls and sloops 37ft. 6in. and not over 45ft. over all; third class, schooners, yawls and sloops less than 37ft. 6in. over all. Prizes for the port to port runs were awarded by the Regatta Committee.

Saturday, July 15—Marblehead to Gloucester.

On Saturday, July 15, the fleet made rendezvous at Marblehead, off the club station, and at 2:15 the starts were made on the short run to Gloucester. In addition to the racing yachts, there were several steam yachts and launches and sailing yachts which did not race. There was a strong breeze from the N., which held steady, and the yachts made fast time. In the first class, Elaine got the start, but was passed by the big scow Golden Rod, which beat her into port by over 3m. On corrected time, however, Elaine took first prize. In the second class L'Aiglon got the start and led to the finish. In the third class Mildred II. was away first, but was passed by Kit, which was the first yacht of the squadron to cross the finish line. The summary:

First Class.		
	Elapsed.	Corrected.
Elaine, A. W. Chesterton.....	0 56 35	0 50 14

Pet, Walter Burgess.....	Not timed.	

Sunday, July 16—Gloucester to Newcastle.

On Sunday, July 16, the squadron raced from Gloucester to Little Harbor, Newcastle, near Portsmouth, N. H. The wind was a bit light in Gloucester Harbor when the start was made, but was of good strength outside. It was S.W. from Eastern Point to Cape Ann, and from there to the finish it was S.E. The 25-footer Sally VII. joined the fleet in this run, sailing in the first class. She got the start in her class and led the fleet to the finish line. In the second class Gringo, Ulala and Opitsah V. were bunched at the start. By good judgment Opitsah V. got the best of the incoming breeze and established a lead on the class, which was kept to the finish. Mildred crossed the starting line first in the third class, but Kit got the lead before passing Dog Bar break-water, and held it to the finish. There were thirty starters in all. In the evening the yachtsmen were guests of Mr. J. Fred Harvey at supper at Hotel Wentworth, which was followed by a concert. The summary:

First Class.		
	Elapsed.	Corrected.
Shyessa, Alfred Douglas.....	6 22 09	5 13 45

Monday, July 17—Newcastle to Portsmouth.

On Monday, July 17, the squadron run was from Newcastle to Portland. The wind was S. W. and moderate until after Wood Island was passed, the yachts carrying spinnakers and ballooners. Then it shifted to the E. and died out, afterward coming in from the S. In the first class the yachts started in a bunch, with Sally VII. in the weather berth. The starts were postponed 30m. to enable Goldenrod and Redskin, which had grounded in Little Harbor, to get out. Sally VII. held her lead only a short time, when she was passed by Goldenrod, which led the fleet into Portland. In this class, Magnolia won on time allowance. L'Aiglon was first across the starting line in the second class, with the whole class well bunched. Opitsah V. took the lead soon after the start, but was passed by Alkyris and L'Aiglon. Alkyris, breaking down, L'Aiglon held the lead until the wind headed them, when Opitsah V. proved the best wind hunter and led her class across the finish line. Mildred II. got the start in the her class across the finish line. Mildred II. got the start in the finish. Clique took first on corrected time. The summary:

First Class.

Tuesday, July 18—Portland to Bath.

On Tuesday, July 18, the squadron sailed from Portland to Bath, the finish of the racing run being off Pond Island, whence the yachts were towed to Bath by launches of the Kennebec Y. C. There was a fine breeze from the S.E., the yachts reaching all the way. There were thirty-three starters in the racing classes. At the start the wind was so light that some of the yachts had hard work to reach the line. In the first class Sally VII. was across first, and led to Cape Small Point, where Redskin passed her and led across the finish line. In the second class Quill II., Alkyris and Jingo were across the starting line together, the rest of the class being handicapped. Opitsah V. caught the new breeze first and was soon so far ahead that the other boats could not catch her before the finish line was reached. Idella won in this class on time allowance. Thea II. got the start in the third class, but Kit got through Whitehead passage first and led to the finish, thus leading her class on all the port to port runs. First place in this class, however, went to Gringo on time allowance. The summary:

First Class.

Friday, July 21—Special Open Race.

On Friday, July 21, a special open race was sailed off the Five Islands station of the club, cash prizes being donated by Vice-Commodore Boynton. In conjunction with this race there was a race for power boats under the auspices of the Kennebec Y. C., and the total number of starters was forty-four. The wind was light from the S.W. Sally VII. got the start, and held the lead on the beat to the first mark, but Goldenrod passed her on the two reaches, holding her lead on the second round of the course. Sally VII. won on time allowance. In the 22ft. class Nutmeg and Opitsah V. sailed a very close race. Nutmeg was the leader, however, from the start. In the second class Alkyris got the start, with Myrtle and L'Aiglon close behind. L'Aiglon took the lead and kept it to the finish, while Alkyris and Myrtle swapped turns at second place. The lot finally fell to Alkyris. In the third class Gringo took the start, with Kit close behind. Gringo led on the windward leg, but Kit beat her on the two reaches to the starting line. Gringo again took the lead on the windward leg and again Kit beat her out on the two reaches, finishing first, but losing to Gringo on time allowance. Brunhilde, Eleanor and Buffalo were the winners in the power boat classes. The summary:

Table with columns: Name, Elapsed, Corrected. Includes sections for First Class, Class E—22-footers, Second Class, Third Class, Class A—Cabin Launches, and Class B—Open Launches.

On Saturday morning, July 22, the fleet was disbanded at colors.

Beverly Y. C.

Wing's Neck, Buzzard's Bay—Saturday, July 15. THE Beverly Y. C. sailed its 368th regatta off its club house on Saturday, July 15. The event was the second Corinthian race of the season.

During the previous week, Buzzard's Bay had been suffering from a continuous blow from the S.W., and Saturday morning the wind was still in this direction, of great velocity, but the clouds seemed to indicate that a change was coming during the morning. The wind hauled steadily to the W., and then to the N., until 1 o'clock, the hour for starting, it was due N.E., very puffy, and of perhaps about 12 miles velocity.

The 51-footers Humma and Shark were started off Beverly Y. C. Buoy No. 1, because of the difficulty of maneuvering them off the club house. By special agreement they were allowed 2m. to cross the line, but in spite of this fact, both got to the line at the same time. Shark was to the windward, with her sheets well off, heading on her course down the bay. Humma, just before the start, was a short distance behind, with her sheets trimmed a little closer. She was, however, traveling much faster than Shark, and just as the latter reached the line, Humma poked her bowsprit up by the weather counter of the Shark, attempting to force a passage between her and the stakeboat. It was impossible, however, for Shark to get out of the way, and Humma was therefore obliged to run on to the stakeboat, which she did, scaring the judge and the newspaper reporters very considerably. Shark at once hoisted a protest flag and the two ran down the bay together. When she came back, Humma had a lead of about 2m. The judge, however, disqualified her on account of her striking the stakeboat. At the request of Mr. Emmons, her owner, the case has been appealed to the full Regatta Committee.

The smaller boats, the 21-footers, were the first to get away. These boats were sent first to Dry Ledge, then down the bay, to Scraggy Neck Buoy No. 8, then back to Dry Ledge, and from there home. The boats got away well together, but soon split up on their beat across the bay. The wind was very variable in direction and gradually diminished in force, so that the boats that stood up on the flats had the best of it. Mr. Crane's new boat, Amanita III., did excellent work, and after turning the last mark had what seemed to be a safe lead. When about half way home, however, the wind died out entirely, and the order of the boats was practically reversed, Mr. Crane, who was leading, taking next to last place, and Arethusa, which was last, taking first place. This was made possible by the fact that the rear boats seeing that the leaders had run out of the wind entirely, were able to sail around this calm spot and finish just a short way ahead of those who had shown them the way all day.

The 18-footers were sent first to Dry Ledge, then to Abiel's Ledge and then home. This was a very short course, and they finished before the serious changes in the wind took place, therefore their race was the most satisfactory of the day. Jap won by the small margin of 9s., and all the other boats finished within 2m.

The 15-footers were sent over the same course as the 18-footers, but since they started later, they naturally sailed slower and had a less satisfactory race and were very much spread out at the finish. Ranzo won and Mr. Weld in his Compress was second home, but was disqualified for fouling Fiddler. The second place went to Vim. In spite of the fact that Fiddler broke her gaff in the foul with Compress, Miss Dabney was the first of the ladies to finish, and Miss Williams came next in the Fly. The judge was Mr. F. A. Eustis. The times in detail follow:

Table with columns: Name, Elapsed, Corrected. Includes sections for 46-Footers, 21-Footers—Course, 13, 12 1/2 Miles, 18-Footers—Course 21, 5 1/4 Miles, and 15-Footers—Course 21, 5 1/4 Miles.

Narragansett Bay Y. R. A.

Week of Racing—July 17-22.

THE annual meet of the Narragansett Bay Y. R. A. this year was thoroughly successful in every way, and the fine open regattas provided some excellent sport, although in the first two events the light winds precluded any excitement. The cruising fleet of the Sachem's Head Y. C. spent the 19th and 20th in the bay, as the guests of the Rhode Island Y. C., at its Prudence Island Station, and a team race between the two clubs on the 20th, while not really a part of the Association series, formed a prominent feature and gave the best racing of the week.

First Day, July 17—Edgewood Y. C.

The opening regatta with the Edgewood Y. C. was a rather slow affair, owing to the very light wind. For the most part it was practically a drifting match, although about two-thirds of the boats were able to finish within the time limit. There were twenty-seven entries in the ten classes. The summary:

Table with columns: Name, Finish, Elapsed, Corrected. Includes sections for 30ft. Sloops—Start, 3:17—Course, 15 Miles, 25ft. Sloops—Start, 3:19—Course, 15 Miles, 21ft. Sloops—Start, 3:21—Course, 15 Miles, 18ft. Dories—Start, 3:23—Course, 11 Miles, 25ft. Cats—Start, 3:37—Course, 11 Miles, 15ft. Cats—Start, 3:43—Course, 11 Miles, 18ft. Launches—Start, 3:45.

Second Day—July 18.

The second race was the open Association regatta, sailed over the Prudence Island course of the Rhode Island Y. C. This was also a light-weather affair, but made a fairly good race, and all the boats finished. There were only fifteen starters in six classes. The summary:

Table with columns: Name, Finish, Elapsed, Corrected. Includes sections for 30ft. Sloops—Start, 2:47:15—Course, 16 Miles, 25ft. Sloops—Start, 2:49:15—Course, 8 Miles, 21ft. Sloops—Start, 2:51:15—Course, 8 Miles, 30ft. Cats—Start, 2:59:15—Course, 16 Miles, 21ft. Cats—Start, 3:03:15—Course, 8 Miles, 15ft. Yawls—Start, 3:07:15—Course, 8 Miles.

Third Day—July 19.

The third event of the series was the nineteenth annual open regatta of the Rhode Island Y. C. It was marked by about all the varieties of weather that Rhode Island is capable of furnishing, and the racing skippers had a vigorous experience. Two sharp thunder squalls came during the progress of the race, alternating with a season of fair sailing breeze and several spells of almost flat calm. The wind shifted to all points of the compass. The first squall was a black one, and for ten or fifteen minutes the wind blew a gale and the rain descended in torrents, but there were no serious accidents, and only three of the twenty-two boats entered withdrew from the race. Several boats met with minor mishaps, and young Nat Herreshoff was capsized, but righted his boat and finished the course. The summary:

Table with columns: Name, Finish, Elapsed, Corrected. Includes sections for 30ft. Sloops—Start, 2:12—Course, 16 Miles, 25ft. Sloops—Start, 2:14—Course, 16 Miles, 21ft. Sloops—Start, 2:16—Course, 8 Miles, 18ft. Sloops—Start, 2:18—Course, 8 Miles, 15ft. Yawls—Start, 2:34—Course, 8 Miles, 30ft. Cats—Start, 2:25—Course, 16 Miles, 21ft. Cats—Start, 2:28—Course, 8 Miles.

Fourth Day—July 20.

The fourth race of the week was the team event between the Rhode Island and Sachem's Head yacht clubs, and it was the feature of the week, although it had no connection with the Association series. Fourteen boats were entered, nine from the Rhode Island and five from Sachem's Head, one of the Rhode Island boats, the sloop Sachem, breaking down and withdrawing. The result was based on average sailing lengths and average times of the boats that finished, the Sachem's Head fleet, in this way, although smaller in number, but larger in average size, having to give an allowance of 20s.

The race was for a club cup presented by Commodore Rogers, of the Rhode Island Club, while Commodore Peck, of Sachem's Head fleet, offered two cups for the boats making the best elapsed time, regardless of size. Lady Mary finished first by 6m., and Wanderer IV., which sailed as a sloop, beat out the fast Sachem's Head sloop Possum by 13s., all the prizes thus going to Rhode Island. A short 8 mile course was sailed, and as there was a rattling W. breeze, the race was a fine one all through. The summary:

Table with columns: Name, Finish, Elapsed. Includes entries like Lady Mary (R. I.), Whitman & Ingraham, Wanderer IV. (R. I.), Flint Bros., Possum (S. H.), E. C. Seward, Priscilla (R. I.), Wood Bros., Adelaide (S. H.), E. R. Newell, Sigma III (R. I.), L. L. Lorillard, Jr., Elizabeth, W. D. Wood, Mblem (R. I.), G. E. Darling, Little Rhody (R. I.), C. F. Tillinghast, Micaboo (R. I.), W. R. Tillinghast, Kittiwynk (S. H.), C. B. Wyckoff, Midge (S. H.), R. Deming, Grilse (S. H.), F. M. M. Milliams.

Fifth Day—July 21.

The fourth Association regatta was held with the Fall River Y. C. in Mount Hope Bay, on Friday. There was a good S. wind, that did not amount to much, however, until nearly an hour after the start, so that it was another day for the light-weather boats. There were twenty-seven entries in eight classes, and of the winners, six were scratch boats. The summary:

Table with columns: Name, Finish, Elapsed, Corrected. Includes sections for 30ft. Sloops—Start, 1:35—Course, 11 1/2 Miles, 25ft. Sloops—Start, 1:38—Course, 11 1/2 Miles, 21ft. Sloops—Start, 1:41—Course, 11 1/2 Miles, 18ft. Sloops—Start, 1:44—Course, 11 1/2 Miles, 30ft. Cats—Start, 1:47—Course, 11 1/2 Miles, \*Mblem, G. E. Darling, Elizabeth, W. D. Wood, Wanderer IV., Flint Bros., Ina, J. Wilkinson, Mary Ann, C. Danielson, G and M, J. Crosson, Olivette, J. Dessart, Ingomar, J. Whitehead, Sally, F. Drapcan, Launches 21ft. and Over—Course, 10 Miles, Neon, N. G. Herreshoff, Jr., Unique, J. Whitehead, Elizabeth, E. Fournier, Ponemah, Wilkin, Ina, J. Wilkinson, Mary Ann, C. Danielson, G and M, J. Crosson.

Sixth Day—July 22.

The concluding Association regatta, held with the Bristol Y. C. on Saturday, was, from all points of view, the best of the series. There were thirty-seven entries, and the number of starters would have been more than forty had not several of the boats been delayed by the light winds early in the day, and thus were unable to reach Bristol until after the start. The event was favored by the best wind of any in the series, a stiff S.W. breeze coming up just before the start, and for good sport the race was the best of the week, unless the special team race of Thursday be excepted. The fast sloop Lady Mary was badly defeated by the Newport 30-footer Hera, and in the 30ft. class, Sigma III., which boat had a long lead, lost the race by carrying away her bowsprit when about half way over the course. The starts were exceptionally pretty ones, and in nearly all the classes there was good racing. The summary:

Table with columns: Name, Finish, Elapsed, Corrected. Includes sections for 36ft. Sloops—Start, 2:10—Course, 11 Miles, 30ft. Sloops—Start, 2:13—Course, 11 Miles, 25ft. Sloops—Start, 2:16—Course, 11 Miles, 21ft. Sloops—Start, 2:19—Course, 9 1/2 Miles, 18ft. Sloops—Start, 2:22—Course, 9 1/2 Miles, 15ft. One-Design Sloops—Start, 2:25—Course, 9 1/2 Miles, 30ft. Cats—Start, 2:30—Course, 11 Miles, 21ft. Cats—Start, 2:36—Course, 9 1/2 Miles, Dories—Start, 2:45—Course, 4 1/4 Miles, Launches—Start, 2:53—Course, 4 1/4 Miles.

Harlem Y. C.

City Island, Long Island Sound—Saturday, July 22. THE Ladies' Day races of the Harlem Y. C. were held on Saturday, July 22. Four classes filled, and there were sixteen starters. The wind was light from the S., and the boats covered inside courses. The summary:

Table with columns: Name, Elapsed. Includes sections for Sloops, 33ft. Class, Sloops, 22ft. Class, Sloops, 18ft. Class, Sloops—15ft. Class.

Eastern Y. C.

Annual Cruise—Marblehead to Bar Harbor.

The annual cruise of the Eastern Y. C. from Marblehead to Bar Harbor, starting Saturday, July 8, was quite successful, although there were not as many competing yachts as last year, and the yachts did not hold together as long. At times light weather also proved a handicap, but those who went through the cruise to the finish had a most enjoyable time. A number of steam yachts accompanied the fleet, which swelled the numbers of the little squadron.

Saturday, July 8—Marblehead to Gloucester.

Thirteen yachts crossed the starting line in the first day's run, from Marblehead to Gloucester, on Saturday, July 8. There was a moderate S. E. breeze, giving a close reach to Halfway Rock and a broad reach from there to the finish. In Class B of schooners, Chanticleer went over the starting line first and in the weather berth, but Corona caught her before half the course was sailed, and led the fleet into Gloucester Harbor. This class was started last, the usual rule of starting the smaller classes first being followed. In the schooner classes, D and E, Agatha was away first, with Hope Leslie close behind and to weather, followed by Bancroft C. Davis' new schooner Vision. Agatha went out ahead at first, but Hope Leslie caught her on the broad reach and was first in at the finish. In the classes for sloops and yawls, Dorel got the start, followed by Doris, the others being bunched. Doris took the lead before Halfway Rock was reached and led these classes to the finish. In the evening there was an entertainment on board Mr. Charles Hayden's steam yacht Wacondah. The summary:

Schooners—Class B.

	Elapsed.	Corrected.
Corona, Arthur F. Luke.....	1 03 39	
Chanticleer, John F. Harris.....	1 10 19	
Schooners—Classes D and E.		
Hope Leslie, Laurence Minot.....	1 17 55	1 15 45
Agatha, William S. Eaton.....	1 24 13	1 17 50
Vision, Bancroft C. Davis.....	1 34 24	1 20 55

	Elapsed.	Corrected.
Doris, S. Reed Anthony.....	1 41 21	
Wasp, Gordon Dexter.....	1 18 36	
Heron, Walter I. Badger.....	1 31 05	1 20 30
Louise, E. McWilliams.....	1 35 31	
Katharine II., F. W. Rollins.....	1 40 44	
Halcyon, H. W. Peabody.....	1 41 15	
Takitasy, J. F. Appleton.....	1 41 50	1 34 02
Dorel, George L. Batchelder.....	1 41 52	1 26 24

Doris probably wins.

Sunday, July 9—Gloucester to Isles of Shoals.

On Sunday the squadron raced from Gloucester to the Isles of Shoals. The wind was from S. by W. to S.W., and all hands carried spinnakers after passing Cape Ann. In the big schooner class Corona got the start and she had no difficulty in leading Chanticleer to the finish. She was the first boat in, going steadily up through the smaller classes after she had started. In Classes D and E, schooners, Agatha was first across the starting line, followed by Vision, Hope Leslie and Undercliff. Greater length counted in the long off-wind stretch, and Hope Leslie went to the fore, finishing first, with Undercliff less than 3m. behind her. In Classes K and L, Wasp got the start, followed by Doris and Gloriana. In these classes size again counted, Doris being first to finish. She was pushed hard by Gloriana, sailed by Hon. Charles Francis Adams, 2d, and the race between the two was very close. Gloriana stuck to the larger sloop all the way, and finished only 34s. behind her, while two minutes behind Gloriana was the other 46-footer, Wasp. In Classes M and N, Dorel was again first across the starting line, followed by Louise and Heron. Here Heron had a chance to show what she could do, and she crossed the finish line nearly 6m. ahead. The summary:

	Elapsed.	Corrected.
Corona, A. F. Luke.....	2 54 51	
Chanticleer, J. F. Harris.....	3 02 01	
Schooners—Classes D and E.

Louise, E. McWilliams.....	3 51 39	
Dorel, G. L. Batchelder.....	4 00 30	3 17 35

Monday, July 10—Isles of Shoals to Boothbay Harbor.

Eleven yachts started in the racing run from the Isles of Shoals to Boothbay Harbor. The breeze was light from the S.W., and the run was a long one. Corona again took the lead at the start of the big schooners and led all the way. She did not lead the fleet to port, however, as this honor fell to Athene, the 70ft. sloop. In Class D of schooners Hope Leslie had the start of Undercliff, and led to the finish. In Class E, schooners, Agatha took the start, followed by Vision and Simitar. Agatha led across the finish line, but was given a good race by the smaller Vision. In Classes K and L of sloops, Wasp was across the starting line first, followed by Athene, Gloriana and Doris. Athene soon went out ahead in these classes, leading them and the entire fleet to the finish. Gloriana again beat her younger sister, Wasp. In Classes M and N, Dorel again got the start, followed by Heron and Louise. Heron was again in her element and crossed the finish line a winner by a big margin. The summary:

	Elapsed.	Corrected.

Katheryn II., F. W. Rollins.....	Withdrawn.	

Tuesday, July 11—Boothbay Harbor to Mark Island.

On Tuesday, July 11, the squadron raced from Boothbay Harbor to Mark Island, in Penobscot Bay. The wind was S.W., but was so light that only the larger yachts could be timed at the finish of the long course. Corona again had things all her own way and led the fleet by a long margin, on account of holding the breeze longer. Athene was first in the sloop classes, but was so closely pressed by Doris that it is supposed the latter will win on corrected time. The summary:

Schooners—Class B.

	Elapsed.	Corrected.
Corona, A. F. Luke.....	6 35 52	6 35 52
Chanticleer, J. F. Harris.....	7 53 48	7 55 22

Athene, W. O. Gay.....	8 04 13	
Wasp, Gordon Dexter.....	8 15 31	8 09 06

On Wednesday, July 12, the fleet proceeded at will to Dark Harbor, Islesboro, where the day was spent.

Thursday, July 13—Islesboro to Bartlett's Narrows.

On Thursday, July 13, the squadron raced from Islesboro to Bartlett's Narrows, through Eggemoggin Reach, in a strong S.W. breeze. Corona, in the big schooner class, continued her winning performances and won easily from Chanticleer, leading the fleet by many miles. Hope Leslie sailed in Class E of schooners and finished first, but lost to Vision on corrected time. Agatha, which was second to Hope Leslie at the finish, was also second on corrected time. In Classes K, L, M and N, Athene was first in, but her position on corrected time will not be known until later. Of the three 35-footers, Heron was first to finish, but Dorel was rewarded for her good work on starts by finishing within a minute of the white boat and beating her on time allowance. The summary:

Class B—Schooners.

	Elapsed.	Corrected.
Corona, A. F. Luke.....	2 29 49	2 29 49

Louise, E. McWilliams.....	3 43 54	
Athene, W. O. Gay.....	2 42 36	

Friday, July 14—Bartlett's Narrows to Bar Harbor.

On Friday, July 14, the squadron made the last run of the cruise, from Bartlett's Narrows to Bar Harbor, in a moderate S.W. breeze. There were only eight competitors, and Corona, as usual, led them to the finish line, again winning from Chanticleer. In Classes D and E of schooners, Hope Leslie was first to finish in a very close race with Undercliff. Vision was somewhat behind these two, but as she is also somewhat smaller, she was ahead of them on corrected time. In Classes M and N, Heron had things about her own way, and raced to the finish many minutes in the lead. The summary:

Class B—Schooners.

	Elapsed.	Corrected.

Winthrop Y. C.

Winthrop, Mass.—Saturday, July 22.

THE Y. R. A. open race of the Winthrop Y. C., sailed on Saturday, July 22, brought out the biggest fleet of the season, fifty-seven starters in all. There was a moderate breeze from the S.E., and the racing was generally good. In the 22-footers, Rube got the start and led all over the course, although the work was very close at times. In the 18-footers, Mirage II. got the start, but Bat soon came into the lead from the middle of the bunch and kept it to the finish. The largest class was the Cape cats. In this class Marvel was in the best position at the start, but lost time by a foul with Thelga. In spite of this, she went out to the fore again and was first in at the finish. L'Aiglon, after a hurry sail over night from Five Islands, had an easy win in the first Boston Bay class. In the second Boston Bay class, Fantasy won, after a close race with Sentinel. Scout was an easy winner in the Crystal Bay class. Hattie won in the 15ft. class, and Zaza in the dory class. The summary:

Scamper protested Sentinel in Class 2 for not leaving the first mark on the port hand.

Marine and Field Club.

Bath Beach, New York Harbor—Saturday, July 22.

THE second of five races to count on the championship of Gravesend Bay was held on the afternoon of Saturday, July 22, under the auspices of the Marine and Field Club. Eighteen craft started in the different classes. The winners were Vivian II., Cockatoo II., Careless and Delta. Four of the new Class Q creations were at Larchmont, thereby robbing the race of much interest and giving Cockatoo II. an easy victory. J. B. O'Donohue's N. Y. Y. C. 30-footer Tobasco made her initial start, but proved to be in poor racing trim and withdrew after the first round.

The regular association courses were covered, leaving all marks to starboard. Classes P and above went from the start off Ulmer Park, thence to a mark off the Atlantic Y. C. at Sea Gate. From there the journey led to Craven Shoal bell buoy, thence to Fort Hamilton and home. The first leg was to windward in the S.E. breeze blowing. The second proved a reach with ballooners carried to starboard. From Sea Gate to Craven Shoal a good spinnaker run was in order. A reach brought the boats to the Fort Hamilton mark, and a few short windward hitches ended the journey.

Boats under Class P covered practically the same course with the exception that instead of going out to Craven Shoal, a leg from Sea Gate directly to the fort was taken. This proved to be a broad reach on which some carried spinnakers. The longer course, covered twice, aggregated about 10 miles, while the inside journey measured 7.62 miles. The third race to count on

the championship is scheduled to occur under the auspices of the Brooklyn Y. C. on Saturday, Aug. 5. The summaries follow:

Sloops, Class N—Start, 3:05.

Rifle Range and Gallery.

Fixtures.

July 26-Aug. 1.—Creedmoor, L. I.—Second annual of New York Rifle Association. Aug. 7-8.—Springfield, Mass.—New England Schuetzenbund. Aug. 11-18.—Fort Des Moines.—Iowa Rifle Association annual meeting. Aug. 24-28.—Sea Girt, N. J.—National rifle and revolver matches. Aug. 29-Sept. 9.—Sea Girt, N. J.—National Rifle Association and New Jersey State Association. Sept. 1-16.—Annual out-door championship of the United States Revolver Association. J. B. Crabtree, Sec'y, Springfield, Mass.

Ohio Rifle Notes.

THERE was a large attendance at the monthly cup shoot of the Dayton (O.) Sharpshooters on July 20. Among the visitors were: J. Johnson and A. U. Clemmer, W. Alexandria; G. W. Izor, Germantown; P. Rhinehart and C. W. Matthews, Lewisburg; G. R. Loudenbach, Sidney; H. W. Duchtler, Toledo, and Chas. Chase, W. Milton. Good work was done throughout the afternoon. The event of the day, the club cup, 200yds., muzzle rest, 5 shots, possible 120, was won by Chas. W. Sander with 107. John Beaver and G. R. Decker tied for third place, and in the shoot-off the former won, 23 to 22. Adolph Schwind and John Rappold tied on 96, and after two shoot-offs, Schwind won, 24, 23 to Rappold's 24, 19. Gus H. Sander was second in this match with 99. In the muzzle rest, free for all match, at 200yds., 3 shots, possible 72, there were 75 entries. G. K. Decker and Adolph Schwind tied for first in 65; A. U. Clemmer, 65; G. H. Sander, 62. Offhand match, 200yds., 3 shots, possible 75: P. Rhinehart 69, J. Johnson 66, A. U. Clemmer 60. The next regular shoot will be on Aug. 24. It was announced that the next great Hunters' reunion would be held on Sept. 14. There will be, besides the game targets, the usual cup and free for all muzzle rest and onhand matches.

It is reported that Capt. C. B. Winder, inspector of rifle practice, O. N. G., one of the best rifle shots in the world, was seriously injured on July 20 by jumping from a fast Pennsylvania Railroad train at his home in Woodstock, west of Marysville, O. Capt. Winder had been on duty at Camp McKinley, Newark. He received word that a new daughter had arrived at his home. As there was no other train, he took the limited, which makes no stop at Woodstock. He was unable to induce the conductor to either stop or slow down, and jumped while the train was at full speed. He is said to be in a serious condition. Capt. Winder won high honors at practice at Sea Girt, and in the international shoot in England last year.

The new 100yd. range of the Dayton Sharpshooters' will be ready to use at the Hunters reunion on Sept. 14.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of this Association at Four-Mile House, Reading Road, July 16. Conditions, 200yds., offhand, at the 25-ring target. Payne was declared champion for the day with 224 points. Freitag was high on the honor target with 65 points. Mr. Freitag shot in fine form, and went away above his usual average. It was a pleasure to note the frequency with which the flag came up for 25s in his scores, and it is needless to add that the old gent himself was much elated over it. The thermometer registered 96, and things were just sizzling. The scores:

Table with 2 columns: Name and Score. Payne 224, 222, 219, 217, 211. Hasenzahl 215, 212, 211, 208, 199. Roberts 223, 221, 208, 207, 196. Trounstone 175, 171, 156. Freitag 218, 217, 212, 207, 206.

The light attendance to-day was possibly due to the excessive heat.

United States Revolver Association.

JULY 18.—The annual outdoor championship meet of this Association will be shot September 1 to 10, inclusive. We hope to be able to hold contests at Portland, Boston, Springfield, New York, Philadelphia, Wilmington, Baltimore, Washington, Cleveland, Chicago, St. Louis, Pine Bluff, San Francisco, and the contests will be for both national and State honors.

J. B. CRABTREE.

Rifle Notes.

The King's prize was won by Armorer Sergeant Comber, of the Second East Surrey Regiment, with a score of 315, at the meeting of the National Rifle Association, Bisley, Eng., July 22.

Trapshooting.

DRIVERS AND TWISTERS.

At Richmond Valley, S. I., on Aug. 5, the Aquahonga and Castleton gun clubs will engage in a team match.

The programme of the Chicago Trapshooters' Association tournament, to be held on Aug. 17-19, is published elsewhere in our columns this week.

In a ten-man team contest at Media, Pa., July 22, for the Winchester trophy, the Media team won. The scores were: Media 394, S. S. White 401, Camden 376. Each man shot at 50 targets.

After his strenuous work in connection with recent tournaments, Mr. Elmer E. Shaner, Secretary-Manager of the Interstate Association, is enjoying a much needed rest in the comfortable quarters called Rainmakers' Camp.

Mr. Chas. G. Blandford, Ossining, N. Y., announces that he will be pleased to send a copy of the Constitution and By-Laws of the New York State Sportsmen's Association to residents of New York State who apply for it.

The Newton, N. J., Gun Club and the Montclair Gun Club will shoot the fourth team match of the North New Jersey League series, at Montclair, on Saturday of this week. The trophy is a fine silver cup, value \$75. Other contests are on the programme for that day.

The five-man team contest at the West Virginia Gun Club tournament, held at Sistersville, July 18, was won by the Union Gun Club of St. Mary's, with a score of 107 out of a possible 125. Mr. T. S. Bibbee won highest average, with 197 out of 210. J. M. Speary, second, 193. Ed. O. Bower, third, 189.

On the grounds of the Highland Gun Club, the Highland Club defeated the Narberth, Pa., Gun Club in a ten-man team contest, in the Winchester trophy No. 2 series. Each man shot at 50 targets. The scores were: Highlands 339, Narberth 250. The Hill Rod and Gun Club, of Chester, Pa., lost by default.

The Shooting Times of recent date states that "In view of the fact that the Hurlingham Club has decided to discontinue live pigeon shooting, Mr. Corrie Grant, M. P., has given notice to ask the Home Secretary whether he will promote legislation next session in order to extend the Cruelty to Animals Act to wild creatures kept in confinement and released for the immediate purpose of being hunted or shot."

In the second of the Philadelphia Trapshooters' League series for the Dupont trophy, three teams contested on the Clearview grounds, Philadelphia. It was a ten-man team contest, but the Florists' had six absentees, therefore scored only 25 out of the 50 targets allowed to a vacant place on a team. The Clearview team was first with a score of 442 out of a possible 500; Meadow Springs second, 408; Florists, third, 309.

The Missouri and Kansas League of Trapshooters' third tournament has a programme of twelve events on the first day, 10, 15, 20 and 25 targets; entrance \$1, \$1.50, \$2 and \$2.50; \$6, \$7 and \$10 added. Event 9, 25 targets, is the L. C. Smith badge event, 16yds., use of both barrels. On the second day there will be twelve events, of which eight are at 15 and four at 20 targets, entrance \$1.50 and \$2; \$7.50 and \$10 added. Handicaps 15 to 18yds. Shooting will commence at 9 o'clock. Rose system. Ship shells to Drake Hardware Co., Carthage, Mo. The dates are Aug. 10 and 11, and the place is Carthage, Mo. Dr. C. B. Clapp, Sec'y, Moberly, Mo.

The programme of the Interstate Association tournament given for the O. K. Gun Club, of Kansas City, Mo., Aug. 16-18, at Schmelzer Shooting Park, provides twelve like events: each day, eight at 15 and four at 20 targets; entrance \$1.50 and \$2; \$5 and \$10 added. Luncheon will be served on the grounds each day. Targets, 2 cents. Aug. 15, afternoon practice. Rose system, 7, 5, 3, 1. Amateur averages, \$5 and \$3, first and second. Manufacturers' agents' high average, a loving cup each day. Shooting will begin at 9 o'clock. An open special event, 25 pairs, \$2.50 entrance, \$50 added, will be shot on one of the tournament days. "Guns and ammunition, prepaid and marked in owner's name, care of Schmelzer Arms Co., Kansas City, Mo., will be delivered to the shooting grounds free of charge."

The constitution of the New York State Sportsmen's Association, Article IV., Section 2, is as follows: "Any shooter will be eligible to compete for any prize offered by this Association, that is a member of this Association, a bona fide member of a club or association that is also a member of this Association, and he shall have been a member of said club or association and a resident of the State one month prior to the time fixed for the State shoot." The foregoing conflicts with Article XIV., Section 1: "The Dean Richmond cup shall represent the club State championship. Conditions governing same to be as follows: One or more teams of three men each from any club which is a member in good standing of the Association. 2. Each member of a team to be residents of same county in which the club is located. \* \* \* In Article IV. it will be noted that no exceptions are made. In Article XIV., paragraph 2 conflicts with Article IV. Paragraph 2 also recognizes the Dean Richmond trophy as a county shoot instead of a State shoot. We would be very pleased to know any just reasons for the county limitation. In a State shoot, a county limitation is absurd. Bona fide membership should be the only restriction as to club members' eligibility.

BERNARD WATERS.

National Team Shoot.

KANSAS CITY, Mo., July 22.—We append herewith list of the winning scores made in the Dickey Bird national team shoot, July 4: District No. 1, lying east of a line drawn along the eastern boundary of Ohio, Kentucky, Tennessee and Alabama—Kane Sportsmen's Club, Kane, Pa. District No. 2, lying west of a line drawn along the eastern boundary of Ohio, Kentucky, Tennessee and Alabama, and east of the Mississippi River—Middleton Gun Club, Middleton, Wis. District No. 3, lying west of the Mississippi River, and east of the eastern boundary of Montana, Wyoming, Utah, and Arizona—Shakopee Gun Club, Shakopee, Minn. District No. 4, lying west of the eastern boundary of Montana, Wyoming, Utah and Arizona—Santa Ana Gun Club, Santa Ana, Cal. The Shakopee Gun Club leads the procession with a score of 300 straight. The team is composed of Dr. H. P. Fischer, Kopp George, Jos. C. Linhoff. This club accordingly gets the extra

5,000 Dickey Bird targets. Had they shot over a Dickey Bird autotrap, they would have received 15,000 targets. We offer this score for the team record for three men, shooting 100 targets each in regular consecutive events.

The following ten clubs made a total of 2,914 out of 3,000 targets, thirty men shooting: Shakopee Gun Club, Shakopee, Minn.; Adair Gun Club, Adair, Ia.; Hastings Gun Club, Hastings, Colo.; Hollis Gun Club, Hollis, Kans.; Brenham Gun Club, Brenham, Tex.; Corsicana Gun Club, Corsicana, Tex.; Dawn Gun Club, Dawn, Mo.; Fort Worth Gun Club, Fort Worth, Tex.; Kane Sportsmen's Club, Kane, Pa.; Santa Ana Gun Club, Santa Ana, Cal.

The average score for these ten clubs was 97 per cent.—We think that all the sportsmen in the country will agree with us that these scores are remarkable, and we do not believe they have ever been equalled, or that they will be excelled for a long time to come. It shows what we started out to prove, i. e., that Dickey Bird targets are good breakers. The event has attracted a great deal of attention, and the contest was participated in by a large number of gun clubs from Maine to San Francisco, and from St. Paul to New Orleans. We are so well pleased with the result that we contemplate making it a regular feature for the Fourth of July club shoots.

W. S. DICKEY CLAY MFG. CO.

K. & K. Tournament.

AUBURN, N. Y., July 20.—We held an invitation Jack Rabbit tournament this afternoon with eight 10-target events and one 20-target handicap event, entrance price of birds at 1 cent, and prize, a \$4.50 dress suit case. In this event G. A. Brown, of Seneca Falls, won in a miss-and-out from nine ties on 20, breaking 11 straight.

We had thirty-two shooters present, and all had a good time. The shooting was difficult, but Mr. R. G. Wheeler, of Jamesville, was in such form that he broke 97 out of 100 in the programme, and G. H. Mann, of Syracuse, broke 94 out of 100.

We expect a large attendance at our annual Labor Day tournament.

Table with 10 columns: Events, Targets, and names of shooters with scores. Includes names like R. G. Wheeler, C. J. Dalley, F. G. Millard, Kennedy, Carpenter, C. L. Frantz, E. A. Wadsworth, C. W. Brown, Geo. A. Brown, M. C. Smith, L. Kingsley, Geo. C. Kirk, H. Conners, H. W. Smith, G. E. Nearing, J. Cottle, Dorman, De Groff, Hookway, Mann, Helmer, Stickle, Lamphere, Traver, Mason, McCarthy, Post, R. Brown, Fedigan, Knox, Knapp.

KNOX & KNAPP, Mgrs.

Powders and the G. A. H.

BROOKLYN, N. Y., July 21.—Editor Forest and Stream: I have been reading the powder advertisements in this week's FOREST AND STREAM, and am somewhat at sea. My perplexity is caused by conflicting claims of powder performances at the Grand American Handicap. I don't see how different powders could have won the same prizes as claimed, unless the prize winning shooters alternated their powders and used first one and then another in their shooting, or else mixed different powders when they loaded their shells. This is something I never knew a shooter to do willingly in shooting a match of any sort, and certainly I should not think it would have been done in a contest of such importance as the Grand American. At the same time I confess to a curiosity to know how we are to harmonize the conflicting statements about the records of the several powders. Are there any official records to throw light on this?

WILLIAM APPLIGATE.

[The matter of the winnings relatively of the Dupont and Ballistite powders at the recent Grand American Handicap, June 27-30, has been called earnestly to our attention, particularly by the letter above. We have examined the Interstate Association official records of powders, guns, etc., pertaining to the point in question, and from them we extract the following statistical information: In the Grand American Handicap there were 73 men in the money, instead of 64, as has been represented. Of the 73 winners, 40 used Dupont powder, or nearly 55 per cent. of the winners, and their total winnings were \$1,710.50, or over 53 per cent. of the purse, \$3,200.20. Of the 73 winners, 13 used Ballistite, or nearly 18 per cent., and they won a total of \$619.95 out of the purse of \$3,200.20, or a fraction over 19 per cent. Dupont powder won the Preliminary Handicap, the Grand American Handicap, the Consolation Handicap, and the five-man State championship, thus winning all the trophies. There is no such thing as a "prize" officially known in the Grand American Handicap at Targets. There are purses, moneys and trophies only. Of the total of 184 winners in the three handicap events, Dupont had about 100 and Ballistite had 26. The official records of the Interstate Association are the only authoritative records on this subject.]

Somerville Gun Club.

SOMERSVILLE, Conn., July 22.—This afternoon at the regular practice shoot of the Somerville Gun Club we had a good attendance of regular and visiting shooters. J. S. Fanning, of New York, made us his first visit, accompanied by Messrs. Kites, Le Noir, Cheesman and Lathrop, of Springfield, Mass.; Messrs. Quinn and Smith, of Enfield, not to mention Henry and Finch, of Thompsonville, who, however, are both regulars and members of our club, were also on hand.

The afternoon was fine, and some 1,600 targets were trapped. Quite a number of sweeps were got up, and several ties were settled by shooting miss-and-out from the 24yd. mark. The following are the scores made, not including the miss-and-out events:

Table with 4 columns: Name, Shot at, Broke, Per Cent. Includes names like Fanning, Finch, Le Noir, McMullen, Cheesman, Cooley, Arnold, A. Pease, Kites.

A. M. ARNOLD, Sec'y.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., July 22.—The Peters badge was won by Mr. Hann. The eight events shoot to-day were each at 25 targets, as follows:

Table with 8 columns: Events, Name, Shot at, Broke, Per Cent. Includes names like Anderson, Hunter, Michaelis, Morris, Parry, Harrod, Finley, Moore, Wands, Tripp, Dixon, Smith, Leib, Hann, Moller, Mrs. Hann.

### West Virginia Gun Club Tournament.

SISTERSVILLE, W. Va., July 19.—What proved to be one of the best little one-day tournaments ever held in this vicinity took place yesterday on the new grounds of the West Virginia Gun Club, this city. The new quarters are located at Paden City Park, about fifteen minutes' ride by trolley.

The weather was ideal for the sport, except a little warm, and all present seemed to enjoy themselves, and were glad that they were present.

Those participating were as follows: T. S. Bibbee, Elba, O.; J. M. Speary and C. W. Decker, Marietta, O.; T. A. Neill, Fairmont, W. Va.; E. F. Jacobs and B. S. White, Morgantown, W. Va.; C. J. Mowry, Cole D. Bolard, Jr., J. H. Ellsworth, J. D. Dinsmoor and E. R. Smith, St. Marys, W. Va.; C. P. Kinney, Dr. H. S. West, R. L. Hibbs, G. W. Bayles, McMechen, W. Va.; Doc Smith, Wheeling, W. Va.; R. R. Carnahan, Mannington, W. Va.; Dr. L. J. Walker, Grafton, W. Va.; Dr. Edwards, Portsmouth, O.; H. H. Stevens, New York; Ed. H. Taylor, Fairmont, W. Va.; Walter Clark, Dr. E. L. Boone, W. M. Snodgrass, S. R. Wells and D. B. Potts, New Martinsville. The locals were represented by Ed. O. Bower, J. G. Wolfe, Judge J. H. Strickling, and Dr. Jas. R. Stathers.

The trade was represented by Messrs. H. H. Stevens and Ed. H. Taylor. Mr. Stevens had the misfortune to break the firing pin of his gun during the early morning, making it necessary for him to shoot the right barrel, which accounts for his low score. Mr. T. S. Bibbee won high average by breaking 197 out of 210. J. M. Speary followed closely for second place with 193, and Ed. O. Bower, third with 189.

The team championship went to the Union Gun Club, of St. Marys, with the very creditable score of 107 out of 125. The locals were short one man for their team, but being eligible for the individual championship, entered the four and "copped" the prize, Dr. Jas. R. Stathers running his 25 straight.

The Dupont Powder Co., through their representative, Mr. Ed. H. Taylor, presented the new organization, the Ohio Valley Sportsmen's League, with a very handsome loving cup, to be contested for from time to time during the year 1905. The Union Gun Club team from St. Marys were the first winners, and the cup will be forwarded to them as soon as received. The writer of this report desires, on behalf of the members of the above organization, to thank Mr. Taylor and his company for the very handsome cup, and to assure them of our hearty appreciation.

Tabulated scores follow:

League team race, 25 targets per man:

Union G. C., St. Marys.	McMechen, W. Va., G. C.
Cole.....20	Kinney.....23
Ellsworth.....20	Hibbs.....20
Dinsmoor.....22	West.....21
Mowry.....23	Bayles.....19
Bolard.....22-107	Doc Smith.....16-99
New Martinsville G. C.	West Va. G. C., Sistersville.
Snodgrass.....12	Stathers.....25
Hobbs.....20	Wolfe.....22
Clark.....21	Bower.....20
Potts.....16	Strickling.....16-83
Boone.....15-84	

About 6,000 targets were trapped. The trap worked perfectly. Gee, what a whopper!

Mr. Bibbee says our new grounds are all right, but that we are too far from water.

We are dictating this report to a lady stenographer, so cannot tell you what Tom Neill called our trap when it was breaking targets.

C. W. Decker, of Marietta, never said a word all day. Just sawed wood.

It was a warm bunch from St. Marys, and they took our cup. The McMechen squad shot a steady clip all the way through. They would have shown up better in the team race, had it not been that they hurried it along so as to catch a train.

Bower claims to be the engineer of the only gun club on earth that own their own trolley line, to say nothing of the blackberries. Ellsworth had a bad half hour in event 5 or he would have been near the top.

Roy Carnahan got a bad start, but wound up like a house afire. J. G. Wolfe had his gun in the factory for repairs, but shot through the entire programme, shooting a different gun in each event. He says he will not do it again.

Harry Stevens, the genial representative, looked a little blue when his firing pin broke, but his face was all smiles when shown the blackberry patch.

Judge J. H. Strickling was much pleased with his first tournament scores, and is ready to challenge his old friend W. M. Snodgrass, of New Martinsville, for a race for big money.

Dr. Jas. R. Stathers arrived at the grounds just in time to enter for the team race, his professional duties keeping him at his office nearly all day. Twenty-five straight for individual championship is not bad. Here's to you, Doc.

W. B. Woodruff was the "candy" when it came to handling the cashier's office. Everything was figured up ready for settlement in five minutes after the last shot was fired. There are a lot of good cashiers over the country, but don't overlook our Bill.

This tournament would not have been anything like a success without Doc Smith, the genial Doc, from Wheeling. He stole a march on us, however, and was using a pair of large yellow glasses a long time before it was discovered. Hereafter the management reserves the right to reject entries where the contestant is to wear yellow glasses.

Lack of time prevented the meeting for the purpose of organizing the League to be known as the Ohio Valley Sportsmen's League, which should be held as soon as possible. From present indications, the following clubs will be represented: Wheeling, McMechen, New Martinsville, Sistersville, St. Marys, Marietta, Parkersburg and Portsmouth. Talk the matter up, boys, and let's get together.

### Charlottesville-University Tournament.

CHARLOTTESVILLE, Va.—The tournament of the Charlottesville and University gun clubs had scores as follows:

July 17, First Day.

### Springfield, Mass., Shooting Club.

The practice shoot of this club, held on their grounds at Red House Crossing, on the afternoon of July 15, drew out sixteen advocates of the scatter gun. The wind, as usual, blew a gale, but some good scores were made. T. H. Keller, Jr., of New York City, was the guest of the club, and shot fairly well, considering he used a borrowed gun, his tried and trusted gun being at home.

In the prize event, for a trout rod, a 15-target event, added target handicap, E. H. Lathrop won the prize, breaking 13 out of his 15, which, with a target allowance of 2, made him the winner. He is only sorry, he says, that he won't have a chance to use the rod this year, the trout law being now on.

The Peters cup contest and the contest for three merchandise prizes, are to be shot for throughout the season, ten shoots in all. Added-target handicap in cup contest, and in the merchandise race the shooters are divided into three classes, A, B, C, 60, 70 and 80 per cent., according to their shooting.

Scores in the three handicap events follow:  
Semi-monthly prize, 15 targets:

Brk.	Hdp.	Tot'l.	Brk.	Hdp.	Tot'l.		
Lathrop.....	13	3	15	Kites.....	11	0	11
Chapin.....	11	3	14	Boughton.....	7	4	11
Le Noir.....	14	0	14				

WESTERN TRAP.

Cincinnati Gun Club.

The temperature on July 22 was especially grateful, and the attendance larger than for some time. Of the twenty-five men in the Schuler prize event, Barker was high in actual breaks with 47. Hesser was second with 45. The only straight 25 made to-day was by Gambell, at practice. Lutie Gambell shot at 25 and accounted for 20, a score which a number of the older shooters do not always equal. In a match at 100 targets per man, Peters and Sycamore defeated Gambell and Barker by a score of 174 to 163.

Schuler prize shoot, handicap, 50 targets: Barker, 4, 50; Tuttle, 12, 50; Linn, 14, 50; F. Altheer, 15, 50; Lytle, 18, 50; Falk, 21, 50; Myers, 22, 50; Sycamore, 5, 49; Krehbiel, 12, 49; E. Altheer, 16, 49; Hesser, 1, 46; Bagby, 4, 46; Crippen, 22, 46; Risley, 23, 46; Keplinger, 8, 45; Williams, 5, 44; Jack, 9, 43; Peters, 0, 42; Pöhler, 1, 42; Maynard, 2, 42; \*Gambell, 0, 39; Herman, 2, 39; Bullerdick, 4, 38; Jones, 8, 38; Andrews, 7, 30. \*Gambell did not compete.

Ohio Notes.

The trustees of the Rohrer's Island Gun Club, of Dayton, have announced that the club will hold a grand family picnic and all-day shoot on Wednesday, Aug. 16, one of the club's old-time love feasts.

The metal shoot of the Springfield, O., Gun Club, on July 14, was won by Foley after shooting off a tie on 24 out of 25 with Poole. The first shoot-off resulted in a tie on 23, but in the second Foley was victorious.

At the regular shoot of the Dayton Gun Club, nine events at 25 targets were shot, entrance 50 cents, four moneys in each event. Carr was high gun with 193 out of 225. Craig broke 145 out of 150 and made three straights. Ike came second with 163 out of 175, making five 24s. A four-man team race at 25 targets per man was shot: Craig 24, McKnight 21, Dickey 17, La Rue 24-86, against Ike 21, Carr 19, Darst 19, Cloggett 12-71.

The Cleveland Gun Club will hold a shoot on July 29 at their grounds, Stop 16A, Mayfield Road. At this shoot a new trophy will be placed in competition for the first time, and will be shot for thereafter on the second Saturday of each month at 2 P. M. It will be known as the Greater Cleveland Amateur Championship trophy of Northern Ohio.

The regular monthly shoot of the Here He Goes Gun Club, Price Hill, Cincinnati, was held on July 16, and was well attended, many ladies being present. Miss F. Altheer, a member of the Cincinnati Gun Club, was among the guests, and she did some fine work, breaking 43 out of 60 and tying with H. Osterfeld for first in the club event. Miss Altheer is a young lady of sixteen who has lately taken up shooting and is making excellent scores.

A good crowd attended the handicap medal shoot of the Rohrer's Island Gun Club, Dayton, O., on July 19 in spite of the heat. Six men tied for the medal on scores of 25 or better. In the fourth shoot-off Oldt broke 5 to Hanauer's 4 and Carr's 3. This is the third win for Oldt and places him tie with C. F. Miller.

Rolla Heikes and Ed. Rike, of Dayton; Dr. Geers, of Cleveland, and Col. Henry Avery, of Jackson, Mich., have been enjoying themselves at the latter's summer home at Pearl Beach, Mich., for the past couple of weeks. The party had caught 19 maskinonge up to July 15 weighing from 13 to 35 1/2 pounds. "Pop" and Rike proved themselves to be almost as good with rod and reel as with the scatter gun, the former catching the second largest fish, 24 pounds, and the latter being third with one of 16 1/2 pounds. Dr. Geers was high-line, his captive weighing 35 1/2 pounds.

The Dayton, O., Gun Club held their regular shoot on July 21, ten men taking part in one or more of the five 25-target events. Craig was high man with 113, breaking 90 out of his first 100, and going straight in the third event. Wertz was second with 98. Keller and La Rue broke 78 and 77 respectively out of 100. Craig and La Rue shot at six pairs of doubles and broke 6 each.

July 22 at the Springfield Gun Club shoot, some good work was done. Poole broke 91 out of his first 100 and finishing high gun with 113 out of 125; Foley was second with 87 out of 100, and Winkler third with 81 out of 125. Downs broke 80 out of 100. Several of the members will take part in the tournament at De Groff on July 20.

The Pleasant Valley Gun Club, of De Groff, Ohio, held a very successful tournament on July 20. The day was hot, but there was a good attendance forty-five men in all facing the traps in the various events, and fifteen shooting in all the programme events. About 6000 targets were thrown during the day. The trade was represented by Messrs. D. D. Gross, H. U. Kirby, C. A. Young and J. R. Taylor. For the Peters cups, emblematic of the 5-man and individual championship of Champaign, Clark, Union, Madison, Shelby, Miami and Logan counties, there were five teams entered, and Springfield was victorious with a score of 218 out of 250. This makes their second win. C. A. Young made high individual score, 48. The individual cup was won for the third time by E. W. Holding with 45.

Garfield Gun Club.

Chicago, Ill., July 22.—The appendid scores were made on our grounds to-day on the occasion of the seventh and last trophy shoot of the second series. In the club trophy shoot Eaton and Hicks tied for Class A on 24; Dr. Reynolds won Class B on 21; George won Class C on 21.

In Dupont cup shoot which followed, Hicks won Class A on 20 straight; Dr. Reynolds and T. L. Smedes tied in Class B on 17; George won Class C on 17.

In Hunter Arms Co. trophy shoot 10 singles and 5 pairs, Hicks, Dr. Meek, C. Einfeldt and Goetter tied in Class A on 18; Dr. Reynolds won Class B on 17; George won Class C on 15.

The club then indulged in a team shoot formed by choosing sides, Dr. Reynolds and Einfeldt captains. The Doctor's team won by 5 targets. The day was an ideal one for trapshooting, being calm and cool.

Table with 2 columns: Events and Targets. Lists scores for various participants like Thomas, Meek, Hicks, Eaton, Davis, Kampp, Reynolds, Einfeldt, George.

No. 1 was Hunter Arms trophy. No. 2 was the 14th trophy event. No. 3 was the Dupont cup.

Table with 2 columns: Team event, Dr. Reynolds and Mr. Einfeldt, captains. Lists scores for Dr. Reynolds, McDonald, Meek, Eaton, T. L. Smedes, Thomas, George, Drinkwater, Ostendorp.

In Other Places.

The trophy presented to the West Duluth, Minn., Rod and Gun Club has been received, and there will be some tall shooting for some as soon as the committee has arranged the handicaps.

A deposit of \$50 a side has been posted for a match at live birds between Mr. Hanerty, of Pottsville, and Mr. Berner, of Mahanoy City, Pa. Each man to shoot at 21 live birds. The date for the match has not been arranged. These men shot to a tie on a previous match.

A new gun club was originated on last Friday at Sebastopol, Cal., it being the intention to hold shoots every Sunday during the remainder of the summer season.

Mr. Powell, the Arkansas champion, will use an automatic shotgun in his matches for the medal.

Edwin Wilson won the trophy shoot at Troy, O., at the last meet of the club.

The Tomah, Wis., Gun Club becomes possessor of the Chronicle trophy, which was held by Winona for a year through default. Winona having failed to take notice of the challenge issued through the proper channel.

The first regular shoot of this season held by the East Side Gun Club, Saginaw, Mich., was held last Sunday.

Many members of the South Tacoma, Wash., Gun Club were in attendance at the Elma shoot, held July 15. Regular and well-attended shoots are held by the Tacoma members each Saturday.

The Boon, Iowa, Gun Club held a tournament July 21 at the Driving Park.

The members of the Whitaker Gun Club, Homestead, Pa., held

a shoot on last Monday at Hays Park. This club has many good shots who are making some excellent records at their practice meets.

The McLean County Gun Club will shoot at 300 targets for a cup presented by a powder company. Shoots were to be held July 12 and 19, Aug. 9 and 23, Sept. 13 and 27, with 50 targets to the man.

Considerable interest is manifested in the Jackson, Mich., Gun Club contests. Mr. Crosier now holds the badge, but there are others with covetous eyes.

At the trophy shoot of the Highland Gun Club, at Duluth, Minn., P. J. Story, W. J. Webb, Arthur Gillenberg, Leroy Coons and W. H. Wells, were high, and Story won the powder cup; Welles the cartridge company's medal; Gillenberg the jewelry medal; Coons the Hardware medal, and Welles the arms company medal. Scores of 47 were made by those of the participants. The club is flourishing.

Members of the Hamilton, Can., Gun Club were guests of Perl Friend, Secretary of the Brant Gun Club, on Monday last. The weather was good. W. P. Thompson scored 49 out of 50. After the shoot they were entertained at the Brant House. The party was composed of W. P. Thompson, T. Upton, "Benit," Wilson, R. C. Ripley, G. Stroud, Perl Friend, "Ben R.," Dr. Hunt, H. Kempf and Mr. Brady.

At Lake Charles, La., the newly elected officers of the gun club are Dr. J. H. Mathieu, President; Hugh N. Green, Secretary; W. H. Simmons, Attorney. The Board discussed the building of a club house to cost not less than \$5,000.

The powder company is liberal these days presenting cups, one of the latest being to the Fairmont Club, of Morgantown, Pa.

Following are the lately elected officers of the Findlay, O., Gun Club: President, Thomas Lang; Vice-President, Frank Hurd; Secretary, Ott Marvin; Field Captain, Al. Barton; Trustees, Dr. J. C. Tricht, J. N. Schafer, Dr. W. H. Drake.

The newly organized Celestial Gun Club, of Pekin, Ill., held its semi-monthly meeting Sunday last. Herman Brown was champion for the day at the shoot held by the Winona, Minn., Gun Club on last Sunday.

The Forest Gun Club, Upper Sandusky, O., will hold their first tournament some time in September. It is the purpose of the club to put up a purse that will be large enough to attract many of the best shots.

The Blue Grass Championship was won at Maysville, Ky. Mr. B. Green, of that city, won with a score of 48 out of 50 targets. W. Henderson, of Lexington, and S. S. Pinny, of Maysville, tied for second. Mr. Henderson won a loving cup for high average, 228 out of 245.

The members of the Bisbee, Ariz., Gun Club are getting in earnest. Some six members ordered new guns to cost \$125 each. The new traps have arrived, together with the targets, and now the club will have the best of everything.

The recently organized Northern Michigan Sportsmen's Association was well represented at the Traverse City, Michigan, tournament.

At Corsicana, Tex., Mr. Wade, the expert, made high professional average, 195 out of 200. Mr. Tautch won the individual championship and the high amateur score, 183.

There will be a big shoot some time during August, held by the East Side Gun Club of Saginaw, Mich.

If you think you cannot shoot targets without almost constant practice, note the following: Old members of the Ackley, Ia., Gun Club, after months of lay-off, met to see what they could do. Well, out of 50 targets E. Behrens broke 49, John Fahing 48, J. J. Deimer 46, Ben Blake 43. Where is there four men in Iowa who live in same town can beat that, though they may keep in constant practice? They will shoot regularly hereafter.

The East Side Gun Club, of Saginaw, Mich., has elected officers, viz.: President, John Popp; Vice-President, Charles Schmidt; Secretary and Treasurer, F. J. Wolf; Captain, Joe Ditz. The committee is composed of C. E. Lown, C. C. Dietrich, Fred Baumgartner, P. H. Mertz, John Leidim and J. P. Derby, Jr.

August 27 is the date of the big shoot, to be held by the East Side Gun Club, of Saginaw, Mich. There will be \$500 worth of merchandise given to the victorious shots. On Oct. 15, there will be an outing on the river intended to accommodate those who do not shoot. This club has 150 members, and the annual dues have been changed to 50 cents, so that no one will cease to be a member. The old and popular gun club has taken a new "lease of life," and all plans are now laid for a brisk summer and fall campaign.

J. C. Scott, Secretary of the Walla Walla, Wash., Rod and Gun Club, has been notified that five barrels of rainbow trout will be placed in Mill Creek. It is hoped that the creek will in due time become what it once was—a fisherman's paradise. The trout came from the Government hatchery in Oregon.

Biele Allen won the county championship at Hutchison, Kan.; C. T. Rankin was high average, and C. B. Wolf, of Macksville, won first prize.

The first tournament held by the Martinsville, Ind., Gun Club was a great success, many of the well-known Indianapolis shooters being present. Bell was high with 180 out of 200; Wildbock, 178; "Smoke," 176, and Wands, 175.

The Tallahassee, Fla., Gun Club held its shoot Tuesday, and there were some fine scores made. Mr. Pearsell won the medal with 48 out of 50. The club has a fine ground equipped with the latest paraphernalia.

The Cypress, Tex., Gun Club held a contest at the traps July 16, and then held a ball in the evening. The social part of a gun club organization should not be overlooked, providing the club desires to hold together.

There were twenty shooters at the tournament given by the Vernon, Texas, Gun Club. James S. Day, of Fort Worth, broke the ground record with 199 out of 210.

The Magnolia, Miss., Gun Club is now busy with preparations for a big shooting tournament for Aug. 17 and 18. The clubs in Mississippi and Louisiana will meet and contest. There will be some handsome prizes hung up by the home club. The programme will be a handsome book of 50 pages.

Charles Plank has returned from Denver, after making a successful trip as far west as Portland Ore., where he attended the shoot. Mr. Plank reports target shooting booming in the west, especially in Montana. The shooters there have a strong league, and they keep shooting all the time. Mr. Plank reports that there is much enthusiasm concerning the Trinidad shoot.

Chas. W. Budd, Fred Gilbert, Russell Klein, and all the big guns of Iowa were helping out Marshalltown, Ia., in the big tournament.

The Manton, Mich., Gun Club boys went to Kingsley and entered in the sweepstake shoot. Higbee and Swanson tied for high average with 77 out of 100.

At the Eufaula, Ala., tournament, E. S. Jones, of that city, won the \$100 gun, with 179 out of 200; G. G. Vaughn, of Selma, was second, 170. High scores were Huff, Hall and Hightower.

The Badger Gun Club, of Janesville, Wis., will hold a two-days' shoot Aug. 6 and 7. The towns of Southern Wisconsin and Northern Illinois are connected with trolley cars, and this should be an excellent shoot.

The Mishawaka Gun Club has decided not to move from its present locality at South Bend, Ind. There was opposition on the part of the residents living near the new ground.

A charter has been asked for by the Tobyhanna Rod and Gun Club, composed of New Yorkers, William S. Schulenger, William C. Kent, William Hunter, Fletcher Pearson and Spencer K. Mulford. Land has been secured, and a club house will be erected near Stroudsburg, Pa.

The championship of Summit, Postage and Start counties was up for settlement at a shoot held last Saturday at Turkey Foot Lake, where the Akron, O., Gun Club held an outing.

Nelson McSherry won the high average at the York, Pa., all-day shoot last Tuesday with 183 out of 200.

Some one of the expert rifle shots was lately visiting at Marquette, Mich., and much interested the sports with his fancy shots. He was at home drawing letters on card board, shooting walnuts and many other fancy shots.

There was a fine gathering of marksmen at the Webb City, Mo., Gun Club meet on last Saturday. There were present Chris. Gottlieb, C. Behney, J. S. Behney, Wernecke Drake and Joe Liggett, of Carthage.

Many of the shooters present at the Portland, Ore., shoot, say many kind things of the members of the home club, and praise and commend the hospitality and goodfellowship generally; but they draw the line on the bad background, which was pine trees and could not have been worse. It is always annoying, especially where there is such a big shoot as at Portland to have to encounter a dark background where targets cannot be seen.

Another gun club for Belleville, Ill. The Fireworks Station Club has officers, viz.: President, M. McDonald; Secretary, E. Latinet; Treasurer, Era Pfeiffer; Manager, Louis Latinet. A match with the Allen Gun Club will be held this month.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Brugmann's Shoot.

RUTHERFORD, N. J., July 22.—There was a rallying of shooters to the grounds of the Boiling Springs Gun Club, once so famous and active in shooting matters about New York, but almost idle during recent years. Forty-one shooters participated in the different events, of which seven were sweepstake events, one was a consolation event, and five at 10 targets each were silver prize events. In the 20-target events, the entrance was \$2. Event 12, consolation sweep, was at 25 targets, entrance \$2.50. There were ten amateur average moneys in the 20-target events. The entrance in the merchandise events was 75 cents and \$1.

There were present members of the Crescent and New York Athletic clubs, and nearly every other active club in the vicinity of New York. The scores follow:

Table with 12 columns: Events, Targets, and names of shooters with their scores. Includes names like G. H. Piercy, Jap, F. V. Carlough, O. C. Grinnell, Jr., Fred Truax, L. A. Scofield, J. A. Howard, Wm Slater, Scott, F. W. Schoverling, Count, B. H. Clickner, E. W. Reynolds, C. E. T. Foster, Edward McMurtry, H. B. Williams, Sim Glover, G. R. Schneider, V. Van Buskirk, R. C. Reeves, Jr., R. F. Holloway, C. L. Bush, E. L. Akers, B. F. Abbott, F. Saldirini, F. H. Van Tassell, A. Cottrell, W. F. Stumpf, Kevitt, A. M. Ferguson, F. W. Perkins, Louis Laue, A. J. Coman, J. H. Hall, G. H. Krus, Edward Winslow, Paul, R. S. Wise.

SIDE LIGHTS OF TRADE.

Parker Bros. want to call the attention of the shooting fraternity to the performance of Mr. John A. Flick, of Ravenna, O., a one-armed shooter, who scored with the Parker gun 97 out of a possible 100 at the G. A. H. The Parker gun also made some other very good records at the shoot, winning the team race with a total of 474 out of 500, and four Parkers out of five shooters in this event. The Consolation Handicap was also won with the Parker gun in the hands of Mr. J. T. Atkinson, tying on 99, and shooting out his opponent, At Waynesboro, Va., on July 4, Mr. C. H. Newcomb, of Philadelphia, strictly an amateur, won high amateur average, and at Richmond, Va., Decoration Day, also won high amateur average. At New London, Ia., the three handicap events held during their last tournament were all won with the Parker gun. Barton, of Chicago, and Gilbert and Garrett all tied on 50 straight, Barton breaking 100 straight to win the event. The second day handicap was won by John Burmeister with 50 straight, and the third day handicap was won by Fred Gilbert with 50 straight. All of the handicap events were won with the old reliable Parker in the hands of amateurs in two cases. In three days' shooting the old reliable Parker made scores of 200 straight, which is a remarkable performance, and proves conclusively the reliability and effectiveness of the famous "old reliable."

Answers to Correspondents.

No notice taken of anonymous communications.

J. S., Twenty-eighth Street, New York.—Could a man make money by hunting wild animals—wolves, panthers and the like—for the bounty some States pay for the killing of these animals? If so, in what State or Territory would it pay best? Ans. No; no one to-day can make a living, to say nothing of laying up money, in the way you suggest. Wild animals on which a bounty is paid are nowhere sufficiently abundant for this. Now and then a man who has some other occupation succeeds during the winter in earning a few dollars by killing wolves. The days of hunting and trapping for a livelihood are about over, and we should not advise you to take up this work in the hope of supporting yourself by it.

PUBLISHERS' DEPARTMENT.

Lewis and Clark Exposition.

THE passenger department of the Northern Pacific R. R. has issued a fifth edition of the "Lewis and Clark Exposition," now being held at Portland, Ore., in celebration of the first Government transcontinental expedition in America. The pamphlet is one of great interest for a multitude of reasons. It is from the pen of Mr. Olin D. Wheeler, well known for his many valuable writings on the Western country, and especially for his work entitled "The Trail of Lewis and Clark." It is illustrated with a multitude of beautiful photographs, gives a great deal of information about the Exposition and about the country passed through in reaching it from the East, and finally describes a number of trips which may be made north or south by the traveler who intends to visit the Exposition. It is only about two months since the Exposition opened, and it will last for two months and a half more. Persons who contemplate visiting Portland will do well to provide themselves with this pamphlet, which we presume will be furnished by any one of the principal offices of the Northern Pacific Railroad in the chief cities of the United States.

All duck shooters recognize the paramount importance of having good decoys, stools which so closely resemble the live birds that they cannot be told from them until the flying fowl are close to the counterfeit. The advertisement of Mason's Decoy Factory, of Detroit, Mich., is very timely, and the catalogue which it issues is an interesting publication. It contains cuts excellently printed on good, coated paper of ducks, shore birds, geese and so on, which no gunner for wildfowl can examine without feeling a certain thrill.

PASTE IT UP OVER YOUR TELEPHONE.

In using the telephone, remember that a stranger is at the other end. The manner in which you speak to him renders him a customer or the reverse. Make a customer of him and you increase your usefulness to the firm. The necessity of politeness, attention and patience in telephone communication is therefore impressed upon the employees.

## EDWARD RUSSELL WILBUR.

EDWARD RUSSELL WILBUR, Secretary and Treasurer of the Forest and Stream Publishing Company, passed away at his summer home in Oyster Bay, Long Island, on Sunday, July 30. His age was seventy-seven.

Mr. Wilbur was born in Chatham, N. Y., and came to this city in 1849. He first found employment as clerk in the shipping house of Russell Sturgis & Co., in whose service he remained several years. Failing health obliged him to give up business, and on the advice of Dr. Willard Parker, the most eminent physician of the time in New York, he was sent south, as it was feared, to die of consumption. There he led an outdoor life, and in the course of a year or two regained his health; and returning to New York, entered business again, but still kept up the regimen of vigorous outdoor exercise, to which, as he was long after wont to say, he owed life and health.

Mr. Wilbur was a member of Company A of the Seventh Regiment, New York National Guard, and when the Civil War came he went as a non-commissioned officer with his regiment on its historic march to Washington. Among the experiences he loved to recall was that of the company's bivouacking in the Senate Chamber of the Capitol, where they were addressed in a characteristically terse and pithy speech by President Lincoln. Mr. Wilbur shared the services of the Seventh at the front, and had part with others of his regiment in the quelling of the draft riots in this city. It is interesting to note that one of the prized friendships of those years was that of Major Robert Anderson, among Mr. Wilbur's mementoes of the time none was more cherished than a letter written to him by Major Anderson from Fort Sumter a day or two before that fateful April day when the fort was fired on.

Soon after the close of the war he formed a partnership with Mr. William H. Hastings under the firm title of Wilbur & Hastings, which soon became a well known house in the stationery trade in this city.

From his youth he had been interested in all outdoor sports. He was one of the founders of the first baseball association in New York at a time when the game was purely a recreation for amateurs; and was one of the incorporators of the Blooming Grove Park Association, whose extensive preserve in Pike county, Pa., was one of the first of such enterprises in America. Among his associates in the Blooming Grove Park was Charles Hallock, and when Mr. Hallock established the FOREST AND STREAM in 1873 he invited Mr. Wilbur to become a stockholder. As time passed his interest in the paper and its welfare grew, until he became one of the principal owners. In 1880 he retired from active partnership in the firm of Wilbur & Hastings, and from that time devoted his attention to the FOREST AND STREAM, in which was found a field most congenial to his tastes. As a sportsman he was fond of the gun and the rod and had enjoyed a wide experience with both. He had fished in many of the famous waters of the continent from California to Florida. In 1882 he was one of the organizers of the National Rod and Reel Association, and often served as judge or referee at the tournaments. In Fred Mather's "My Angling Friends" a chapter is devoted to

Mr. Wilbur, and Mr. Mather recalls that it was a chance remark by Mr. Wilbur at one of the Rod and Reel Association dinners which led eventually to the experiment of stocking the Hudson River with salmon.

Mr. Wilbur was a close observer of nature; he loved to study the trees and flowers and birds. For many years the summers were spent on his country place at Sayville overlooking the Great South Bay of Long Island, and no field conquest ever afforded him more genuine satisfaction than his success in overcoming the shyness of the birds and the squirrels on his place and winning their confidence, as he did in a remarkable degree.

Mr. Wilbur was not of a demonstrative nature; his was a personality which was revealed only to those who

EDWARD R. WILBUR  
From a photograph in 1897.

long enjoyed his companionship. The qualities which made up the man were such as stood the proving of time. His integrity was sterling and uncompromising. His cheery kindness and the readiness and the tenderness of his sympathy made him to all who saw much of him a dear and valued friend. The sense of loss and sorrow that is felt by those associated with him in the office of FOREST AND STREAM—some of us for more than twenty-five years—is not to be expressed by any written words.

DR. HIRAM BYRD, of Jacksonville, Fla., suggests that as a complement to such remedial measures as draining ditches, screening cisterns and oiling standing water for the abatement of the mosquito plague, each household might maintain an artificial breeding place to trap the young for destruction. A pail of water set in a shady place in the yard will, in the absence of other breeding places, be resorted to by the insects for depositing their eggs, and the water being emptied out, the eggs will be destroyed. As the larvæ require about ten days to mature, the pails need to be emptied only once a week.

## SOME PRIMITIVE PLANT FOODS—II.

WHILE the sugar and the syrups were both keenly enjoyed by the Indians for their sweetness, they were also highly valued as furnishing a most nourishing food. Mixed with cornmeal, as stated, or with wild rice or bear's fat, or even with walnuts, they made a wholesome and favorite article of diet.

There is some reason to believe that the Indians of a hundred years ago were better farmers than those of today. At all events, we know that not a few early travelers starting out on their travels across the plains spoke with enthusiasm of the attractions of some of the Indian farms which they passed.

Of the implements used by women none were more important than the hoe and the root digger—a sharpened stick from three to six feet long with which the women unearthed their roots. They had a wide acquaintance with certain facts of practical botany, these young girls and mothers and old women who used to start out in considerable companies to dig roots or to gather berries. They knew what plants were nourishing and palatable and what were not; they knew at just what season of the year each root was at its best, when it must be dug, and how it must be treated after being secured. Their patient industry, extended through almost the whole summer, gathered together what in the aggregate was a vast deal of food—sacks of dried berries and great caches of dried roots.

Take for example the camas, each root of which—shaped somewhat like an onion—is about as large as a good-sized chestnut and each one of which must be dug individually. It took a long time to fill a parfleche—a sack—with these tiny roots, which must then be carried home, spread out in the sun to dry, roughly cleansed of the dark earth in which the root had grown, and then cooked. In those primitive times the labor of digging a great pit in the ground was not slight, for the only tools were a sharpened stick and the hand. In such a pit the camas roots were steamed or baked, and after the cooking process was over, the bulbs were spread out in the sun and dried. Or if not dried they were sometimes pressed together while still moist in cakes to form a sort of bread.

The cultivation of the land in the Southwest—in what are now Arizona and New Mexico—was made possible by extensive irrigating systems, built with remarkable engineering skill, the canals being lined with tamped clay, which was impervious to water and prevented all seepage. These great works to-day excite the astonishment of the traveler and the ethnologist.

After all it was the wild fruits on which the Indian depended, outside of that wonderful plant, the maize, about which cluster so many beautiful traditions and which in many tribes has a sacred character, so that it was called "mother," "our support," "our helper." If the Indians of the north, the west and the southwest had their corn, not less did those of the south raise this plant, on whose grain they also depended. They cultivated also peas, beans, pumpkins and tobacco, but besides gathered roots, berries and nuts. A dish spoken of by the old writers with some enthusiasm was hickory milk, being the pounded hickory nuts and water, which the people ate with their bread. They gathered the water chinquapin and the seeds of a great water lily which to-day gives food to the wild ducks in many places in the South. The seed of another species of lily more like our common yellow pond lily is extensively gathered to-day and eaten by the Klamath Indians, and its collection and preparation have been interestingly described by Mr. F. V. Coville, of the Department of Agriculture.

Another curious use to which the seed of this water lily are put by some Indians is the forming of packages to bind about the head of the infant tied to its board, for the purpose of flattening the head, as was formerly the custom with very many Indians of the west and south,

## THE SPORTSMAN TOURIST

### On the Desert.—II.

AFTER the Professor's wrestle with death for water at Coyote Holes, it was a week before he got about much. You remember he had stripped himself in his aberration and the sun had blistered his tender skin so badly that he could wear no clothing, so he loafed about camp with a piece of old tent canvas draped about him poncho-fashion, a hole cut in the middle for his head, so that the canvas fell about him from his neck. However, by the aid of herb lotions we brewed he peeled off beautifully and was soon all right.

We had several pets about camp, including Pete's Chuckawalla lizard "Billy" and a big gopher snake, both harmless. The lizard we kept for his looks and the snake because he kept the camp clear of rats and chipmunks. Billy was about the ugliest thing in the reptile line that I ever saw next to a Gila monster. He was about eighteen inches long, the color of dirty mud and his shape was fierce—head and feet something like an alligator's and a thick, clubby tail about eight inches long. He belonged to Pete by right of capture. Pete was sinking a prospect hole on one of our locations and was about ten feet down when Billy discovered him. With the curiosity peculiar to that particular class of reptile, the lizard would persist in crawling to the edge of the hole and looking down; every time he did, he rolled bits of gravel and dirt down on Pete's head and neck. Pete shoed him away any number of times, but he would always return. Life is scarce enough on the desert, and no true prospector ever kills anything for the mere sport of killing unless it is harmful or poisonous. At the top there was a little nick broken in the granite, like a trough. To this the lizard always returned, so Pete made a slip-noose in a piece of stout twine and laid it in the nick with the other end of the string dangling in the hole. In a few minutes, more dirt and gravel came rattling down, and without looking up, Pete gave the string a yank and down came the big lizard with the noose taut behind his forelegs. Then Pete was up against his old trouble of never seeing but one thing at a time. His idea was to catch the lizard, but he had not foreseen the excitement of pulling him down into the hole. The lizard dropped "plump" on Pete's back, dropped and hung. Pete yelled and shucked out of his jumpers, then made a wild leap for the niches cut in the rock that he used as steps. He knew the Chuckawalla was perfectly harmless, but it was not pleasant to have an ugly 18-inch lizard galloping over him in a 5x6 hole. The lizard made a rush up Pete's leg, over his back to the rock and out, Pete catching the end of the string as it was disappearing. When he came to camp that night he had Billy in a gunny sack that he used for carrying giant powder.

We tied the lizard to a stake for a few weeks until he became accustomed to us, feeding him on bread, tender shoots and flies. We spread some wild honey on a piece of tin can, and Billy would lie alongside of it like a stick. If ever a fly lit within three inches of him it was curtains for the fly; that long tongue would snap out and Billy would swallow, wink and wait for the next. We never knew him to make but one mistake, and that was when he hit a blue waspish thing that looked like a hornet but wasn't, for there are no hornets on the desert. Whatever it was, it hurt and Billy didn't even swallow nor wink, but scuttled for his den of rocks we had made and didn't come out for two days. After he became "hanted" to the place, we cut him loose and he stayed about. We had a rough rock cabin of two rooms thatched with giata grass, and Billy made his home in the thatch.

The gopher snake, about five feet long, was in the cabin when we came, and it stayed. We named it "Anaconda," which was afterward shortened to "Anna," probably unjustly so, to the snake, but we did not know. Billy and Anna would fight something awful, and had many a scrap on the dirt floor of the cabin. Anna liked condensed milk, Billy didn't and seemed to be mad because Anna did. Billy would run over the pan and upset it, and when Anna tried to gather him in her (or his) embrace, Billy would fetch a whack with that club tail that would send Anna to the mat almost for the count; then, before Anna was up Billy would be in the thatch and hissing down awful things. But there—I had almost forgotten the Professor.

It was his second day in camp, and he had seen neither Billy nor Anna. We were at supper when we heard a hiss, a whack, then a second or two afterward, a rustle in the thatch and "plump" Billy dropped on the center of the table. The Professor, who was sitting on a candle box, went over backward and began to crawl.

"It's all right, Professor; it's only Billy. He often does that, misses his hold and falls," said Pete.

"A member of the family to whom I have not been introduced, eh?" said the Professor, as he pulled himself up alongside the wall. "Well, will you explain to him that I am very hard to get acquainted with, and that one must know me a long while before he can be familiar?" The Professor stuck to it, and would never call Billy by his first name but always "Mr. Chuckawalla."

The Professor saw Anna after supper. Paystreak and Sam were washing dishes, I was out getting wood for breakfast; Pete was puffing at his pipe while sitting

on a folded blanket on a box, his back against the wall and his hands clasped about his crossed knees. By holding the ace, deuce, jack and ten of trumps he had won immunity for the night from household cares. Anna had "its" head in an old tin plate licking at the particles of butter fat—the remains of condensed milk; all was a picture of domestic contentment. The Professor was in the bunk room spreading his blankets, and after he finished, came and stood in the door. Then he saw Anna. Pete was watching him and saw him go white under the red and his eyes grow big and round. He passed his hand over his head and walked like a blind man to the outside door; there he turned and looked again; Anna was still snapping up crumbs. Pete put on his poker face and watched him; their eyes met, and the Professor beckoned with his head for Pete to come out. Pete sauntered to the door and into the night, and the Professor's voice was hoarse as he whispered: "Look in there—by the edge of the table—and tell me if you see a snake." Pete said the temptation was great, but he resisted it and said:

"Why yes, that's Anna, another one you have not met." Then the Professor laughed just as we used to do when we came to the surface after the first fellow in had told us that the water was not cold.

I have no desire to tire you with a relation of all the trouble to which that Professor put us for the six weeks he was our guest, but we pitied his ignorance and bore with him. He had learned one lesson well, however, and that was to not go far without a supply of water; learned it so thoroughly that he would not go a mile from camp without a six-quart zinc canteen of water hanging to him, and he would not go over a mile without one of us was with him. He could not cook, and about the only thing he could do well was to carry wood and water. He did not care to be left alone in camp with Billy and Anna, so we used to lead him to the big face of granite about two miles up the cañon and there leave him to study the Indian picture writing. He made copies of every mark on the granite, including the seams in the rock, but knew no more about it than he did before he saw it. He had a little book filled with other Indian picture writings that had been translated and tried to make a comparison, but it ended in a try, for the pictures did not agree. He eventually accepted old Chemihueva Joe's translation that the single sawbuck marks meant so many pack-horses, or mules, and that the double sawbucks with long sticks meant so many mounted men with spears. As for the pictures, they resembled nothing ever seen on, under or above the earth unless it was the antediluvian monsters, the kind we used to draw on our slates and label: "This is a —."

But we treated the Professor kindly, even when we found him with the shotgun trying to bunch some of our quail. There was a big covey living on the mistletoe in the ironwood and palo verde on the mesa and in the cañon, and the birds became so tame that they would come within a few feet of the cabin and pick up the rolled oats and crumbs that we scattered for them. Of course we were fond of quail, but when we first pitched camp we became interested in their fuzzy little children, and they came and went unharmed. We even had names for some of the older ones, names suggested by some peculiarity in appearance or action. We would sit at the cabin in the evening and watch them running here and there and note the early or late arrival or absence of the "Topknot," "Cocky" or "Prudy" families. And that Professor was trying to get a shot at a bunch of them. But he was a gentleman, apologized when the situation was explained, put away the gun and became interested with us in watching them. But the fact that he "intended" to shoot them hurt a little.

I may, however, refer to his first experience with coyotes. He had some hesitancy about going to sleep in the bunk room; he was in doubt about the actions of Billy and Anna during the night. The thought that an 18-inch lizard might drop on his bunk or that a 5-foot snake might coil up with him in his blankets seemed to disturb him, and a slight rustling in the grass thatch would keep him awake for hours. He had a hammock in his pack, and concluding that he preferred to sleep in the open, stretched the hammock about twenty yards from camp between two mesquites. That day we had bought a mountain sheep from an Indian. The sheep are protected by statute in California, and white men are not allowed to kill them, except in self-defense. We had been in bed but a short time when there came a chorus of coyote howls and yelps a short distance from the camp. Now, one coyote can howl and yelp in one breath and in several different places at the same time. He will yelp here, and before the sound dies away he is howling over there, so that two or three coyotes will sound like a pack of a dozen or more. If you get tired of their noise all you have to do is to rise up and yell and they are gone like gray shadows. But the Professor did not know this and the opening chorus had not reached the first bar until we heard the patter of feet scratching gravel, and the Professor entered the cabin as if he was blown in, and asked excitedly: "What is that?"

"Wolves," said Paystreak, gruffly, in order to hide the laugh in his voice. The Professor did not try to sleep in the open again, and Pete had to go out and fetch in his blankets.

We were beginning to wish for an opportunity to bid the Professor Godspeed and a safe journey home when came the incident of the mountain lion that hastened his departure. As a rule there are no mountain lions on the desert; prey is too scarce for them in that arid region, and they are never seen there unless in crossing from the Colorado River to the mountains on the coast. The bottoms of the Colorado River are wide and covered with jungle, trees and brush. There are a few ranches along the river from which cattle stray away and once in that jungle they are practically lost to the owners. There are hundreds, if not thousands, of wild cattle now roaming up and down the river bottom and occasionally, after the winter and summer rains, some of them will range out on the desert for thirty, forty or fifty miles grazing on the fresh herbage; it fails in a few weeks under the hot sun, and they range back to the river by way of Black Tanks, Horse Tanks or Chuckawalla. These cattle bear no man's brand, and are therefore legitimate prey to a prospector's rifle if he feels in the need of fresh meat or desires to replenish his supply of jerky. Occasionally some of the lions that are along the bottoms, will follow the cattle to the desert and return with them. Among prospectors a young, unbranded steer is known as a Chuckawalla elk.

The August rains were over, and it was about the first week in September. The Professor had been putting in the day at the cliff dreaming over the Indian picture writing and was returning to camp. He was within about a mile of the cabin when he saw a huge, long, yellow body gliding through the bushes on his left. It was a mountain lion following him. I know just how he felt when he saw it, for I have had them follow me, and I know how I felt but I can't describe it. You want to run, but you know that the lion could overtake you in a half a dozen bounds. I cannot account for this peculiarity of the animal unless it is curiosity or a desire for companionship. Passing along a deserted street late at night, did you ever notice that you were being followed by a house cat, slinking along in the shadow, darting across a ray of light, stopping when you stop and going on as you do? I have been followed exactly the same way by a mountain lion for two miles, when my only weapon was a prospector's small pole pick. In the evening shadows of the cañon it is not conducive to hilarity for an unarmed man to see the big, sinewy beast slipping through the bushes first on one side and then on the other, sometimes ahead but generally a little distance behind, but assuredly keeping him company. He does not want to whistle nor sing nor make any show of bravado, he wants to attract as little attention as possible. That was the Professor's state of mind when Paystreak and Sam saw him about half a mile from camp. They were coming down a side cañon from a prospect hole up near the head, and saw the Professor coming down the main cañon; his actions were such that they stopped and watched him. He was stepping quick, high and softly, looking back and acting as though he wanted to run but was afraid to; in fact, as Sam said, "Like he was plumb skeered."

The Professor went on for fifty yards as though he was treading on eggs, then he turned a bend from where he could see, a half a mile ahead, the smoke curling from the cabin chimney as Pete and I sat about getting supper. At that welcome sight the Professor threw his discretion, canteen and other deadweight to the winds and started down the cañon hotfoot. He had told us of his sprinting days at college—tales we had accepted with reservations; but as Paystreak and Sam watched him hiking down the bed of the cañon they decided that he had been telling the truth and that he had not forgotten his stride.

"Do you reckon he has discovered the translation of that picture writing and scared himself?" asked Paystreak. Before Sam could hazard a reply a big mountain lion trotted out of the bushes into the cañon, and with a plain look of surprise and astonishment squatted on his haunches and gazed after the rapidly disappearing Professor. It was a fair mark broadside on at not over 100 yards, and at the crack of Sam's rifle the lion went into the air and forward and falling on the sand, gave a few convulsive kicks and was still. He would not have hurt the Professor; a mountain lion is almost as cowardly as a coyote and will fight only when cornered, ravenously hungry or in defense of cubs. This was explained to the Professor, who replied that he did not have time to ask the lion its intentions. We skinned the brute and salted the pelt for the Professor to take in with him for a rug, and that pelt was the cause of his cutting short his stay by several days.

His burros were turned loose with ours and ranged down on a mesa that was covered with young ironwood and giata grass, the best of forage for jacks. The band would come to the spring for water and if the burros saw us around camp they would return to the range without coming to the cabin. If no one was around they would loaf about the cabin until some one appeared to show that we were still there. We were all out in the hills one-day, and the Professor was the first one in, returning about 5 o'clock. The burros were browsing about camp and the Professor thought he would have some fun, so he draped the green pelt of the lion about him, got down on all fours and with a roar went scuttling toward the burros. Now if there

is anything that will stampede a burro quicker than a mountain lion I never saw nor heard of it, unless it be a grizzly, and it is an even break between them. The burros threw forward their ears, took one look, wheeled and there was a clatter of hooved feet over the gravel down the cañon as each sent out a raucous bray through the hills for help. A moment later Pete came running up. The Professor was still laughing heartily at his joke. Pete looked at the lion's pelt and asked: "What have you been doin'?"

I have been playing a joke on the burros. You should have seen them skeddaddle down the cañon."

"Yes, that's funny; in fact, it is — funny. I could almost split myself laughin' when I think of you and me footin' it ten miles or more across the desert packin' blankets, grub and water to round up them burros; they won't stop this side of Mule Springs. Oh! yes, it's awful funny, ha! ha! I ain't heard of such a good joke sence I went to sleep and rolled in the fire," and throwing his canteen one way and his pick another, Pete went in the cabin and kicked a box till it split.

Pete was right; they followed the trail of the burros for ten miles and more; and before they came up with them the Professor fully realized the point of his joke. He did not know on which foot to limp when he got back to camp. Pete rested one day and then announced that he was going to start for Salton the next day for another supply of grub and hinted strongly to the Professor that it would be his last opportunity for company across the desert for three months. The Professor took the hint and began packing. He apologized for any trouble he might have caused us but was too much of a gentleman to even think of offering any monetary remuneration. He was a good fellow, well-educated and all that, and the trip added to his education, for he learned that all knowledge is not included between book covers. E. E. B.

## Floating Down the Mississippi.

### A Lumber Camp.

As we dropped down stream, broadside, to, the Medicine Man watched the lumber camp closely, "sizing it up," as he said. When we came close to the camp we ran into the eddy at the caving bank and tied. Men, who were rafting logs in the dead water, were rolling them off the flat top, jumping them down the fifteen or twenty feet. The water shot out from under the logs in yellow spray. Then the log was piked around under the long pole binders, and spiked fast with nails nearly a foot in length.

The Medicine Man had greeted every one with a cheery Howdy, and mentioned the weather, the stage of the river and the log business. As he talked we made fast and climbed the bank to see the place.

Nearly a dozen tents of assorted sizes were scattered over a hundred yards square. Up stream was the log dump, with logs coming in, one or two at a time, on wagons fit to carry obelisks, drawn by mules. A couple of white men were in sight, but the dozen others were negroes. One of the white men was a broad-shouldered, broad-faced, square-set individual. As he looked me in the eye, and then took in the details of my dress, and the features of my companion, it was easy to see that he was boss, the more so as the other men were all working.

He had the look of an ideal lumber camp foreman. I had seen his kind in the Adirondacks, and if a certain Jim MacBeth of the Adirondacks had been there it would have been a question as to which was which at first glance. But there was a difference between the Adirondack and the Mississippi River man. Jim MacBeth would put up a mighty fight if need be, but there is none of the peculiar over-bearing, set expression in his face that was in the face of the man who eyed us.

Our reception was open, and not free. We didn't know that the next steamer, expected that afternoon, would bring some hundreds of dollars to the camp to pay off the men, but apparently the boss presumed we knew.

I introduced myself, and the boss said he was Hiram Marshall. The camp was one of five in the vicinity run for Anderson, Tully & Co., veneers. L. C. Snider was the contractor, or jobber, and was the general superintendent, and boss of one of the five camps himself. On the job so far 25,000,000 feet of cottonwood had been cut from the vicinity of Lake Lee. While I was talking to the boss, he turned to a young man and said, "Go down and take a look at that boat—see if it's the kind of a boat we was talking about the other day for a dormitory."

The youth went down with the Medicine Man, and looked at it carefully. When he came back to report, my companion remained behind. A log rolling down the bank caused me to turn from the boss as the youth reported, but I happened to observe a little gesture of the boss, which meant, "Do they sell liquor?" and a sideways shake of the head was the answer. I've wondered since what would have happened to us if our boat had been a whiskey saloon. I think we would have left the camp very soon. Mississippi lumber camps do not like to have whiskey in them.

There was reason for the boss to think we had come because it was pay day at the camp. I had been there only a few minutes when I saw a tall, lean negro loping down the log road along the river bank. He was astonishingly dressed in a suit of black, with creased trousers, a shirt like a house a-fire, clean collar and cuffs and a natty brown derby. He addressed a log roller of his own color, who motioned toward the boss.

The boss said in a low voice: "Here they come! Just like a lot of black buzzards."

The negro came to the boss, smirking and bowing low and touching his finger to his hat. "Be yo' de boss, seh? Yasseh, yasseh, thankee. Would you 'low me teh stay yeh to-night?"

"You're a crap shooter, aint yeh?" the boss said.

"Nosseh, nosseh—I ain' no crap—"

"What's the use o' your lying? You're a gambler—but you can stay—that's my tent there." The negro didn't approach within forty yards of the tent indicated thereafter, but the permission to stay he received with a happy little jump, and a smile wider than his face.

The steamer came toward night. The coming of the steamer was noted with joy by all hands in sight. It whistled for the landing, and the boss, flanked by a couple of white men, went aboard and got the money—about \$700. As soon as he got it to his tent, paying off began. No lumber or other boss in a negro camp cares to have any great quantity of money on him over night. The negroes, one at a time, or in twos or threes, went in after the money they had earned. Three beds were in the tent, and on them lounged the three or four whites, beside the boss, employed there. The boss was flanked by them from any possible attack by a desperado.

The money was piled up on a small square table—rolls of bills, heaps of silver dollars six inches high, and other smaller coins in proportion. The men being paid off, rolled their eyes down on the glistening piles, actually wetting their lips at the sight. Some of the black men glanced around the tent from under protruding brows and accepted their jingling share with their lips rolling up in a pursing curl of a sneer—so little from so much! The money was soon paid out, and the Medicine Man, when I glanced around for him, was missing. At last he appeared at the door, just after dark, and with an expansive smile on his face wanted to know if he could come in.

He carried the leather grip, and he remarked to the foreman: "I 'lowed to show you all that medicine I was a-telling of. Za-mi-a-ya Bitters, consisting of sarsaparilla, rhubarb, quinine, salsify, celery, pennyroyal, witch hazel, ipecac and other ingredients to the number of fourteen, including za-mi-a-ya, the great health and nerve restorer, discovered in the Philippines and recently brought to this country. It is guaranteed to cure rheumatism, blood disorders, stomach troubles, etc., etc.," reciting the list printed on the label. It had seemed to me that the list was a preposterous one, and that it cured too much. But an old white lumberman sitting on one of the beds showed unmistakable interest in what was passing. His lean face and sallow, wrinkled skin showed the symptoms of several of the diseases named, and long before the Medicine Man had completed his "talk" a half dollar was transferred for a bottle of the stuff. The Medicine Man then tried to sell to the others present, but met with no success. He asked the boss for permission to go to the negro quarters, and got it.

"They might's well buy that as lose their money crap-shooting," he remarked sardonically. The Medicine Man left.

Knowing that I was after stories, Marshall proceeded to fill me up with some stock tales which were epidemic in the southern papers—negro incidents magnified and changed and localized from Bayou Tech to Reelfoot Lake. Gradually the supply gave out, and then I began to hear of the work done—seventy-two logs rolled in that day and rafted, and 252 on the dump that morning. The raft would number 3,500 logs.

Through the thin side walls of the tent came sounds of distant shouts. "What's all that noise?" I asked.

"The niggers is parting with theh money, I reckon," the Medicine Man left.

"Where are they?"

"They's in the crap tent, I reckon."

"Got a crap tent?" I asked.

"Yesseh! You all knows what craps is, don't yeh? Well, this is jes' a tent whah they all plays craps, that's all."

"Is it?" I said, "Well, I'd like to see it."

"Would you? Huh! Nothing but a lot of niggers shooting craps."

"I'll go out with you," the boss said, giving me a look that I did not understand till I was nearly to the crap tent. He had a good deal of money on his person, in spite of the amount paid out. And as we walked the hundred yards to the gamblers he kept a full step behind me, and when I looked back at him, his right hand was clenched at the top of his belt, and it was there all the time we were alone together, a precaution well worth his taking when in the Mississippi swamps with a rough-looking stranger "off the river."

With such a companion just behind me, a river man, I spread the tent flaps and looked inside. The tent was jammed full—there were thirty-five or forty in it, and all black. Two flickering lanterns swung over a waist high table, round which was a 3-inch high board fence. Hold of the fence were half a hundred hands, some with long, curving nails. Leaning over the table were a score of curly-haired craniums with lumpy projections on them. In the center of the left side was the long, lean negro whom the boss had accused of being a crap-shooter. His hat was on the back of his head, and he was swaying back and forth with a wide smile on his countenance not dissimilar to the smile of my Medicine Man when he "began business" with the boss of the camp itself.

A glance was all that any one gave us, and only a few so much as glanced in our direction. They all watched the little "bucks" as they jumped half way across the table, jerked whirling from some toil-cracked fist. Quarters, half-dollars and dollars were on all sides, and it needed only a few minutes to observe how much found its way down into the lean man's pocket and how little came up from it.

Four deep they stood around the table, reaching over shoulders, and crying for a chance to put their money down. Occasionally, when a play won, there would be an unconscious burst of song:

"'Tis the old-time religion,"

or, more frequently, a snatch from some roustabout lay.

After a time the boss and I walked back. He had watched me while I watched the crap-shooters, and he was by my side, instead of behind me as we walked back. When inside his tent once more, I remarked to him that I should think he would be afraid of having so much money on him, even for a short time, as he had had that afternoon.

"Afraid!" he snorted, drawing a revolver from his pocket. It was a .45, 4-inch blue-barrel Colts, of latest and most approved pattern. As he tucked it back into his holster, a yellow man came in.

"Say, boss, 'll you all loan me a dollar?"

Marshall laughed.

"Heah's mah gun—hits a new one, bran new!" The negro drew a gun just as good as the one owned by the boss, and on this he got a dollar. Ten minutes later, he came back and got \$9 more—all the boss could let him have, and went back again to the crap tent—and this, in spite of the remonstrances of the boss.

"They'll play all night," the boss remarked, "and when that nigger sharper goes away, he'll carry all the money with him. It's bad, but if we didn't let them play here, every man in our gang would quit on pay day, and go to town. They wouldn't show up again till the money was gone, and then it would be a week more before we could work the cocaine out of them. As it is, they'll go to work Monday, and repeat their circus again next Saturday."

In the morning, the Medicine Man made a tour of the quarters, and came back disgusted. "I sold eight bottles last night—I'd a sold a dozen to-day if that nigger scoundrel of a gambler hadn't cleaned the whole camp out. I tell you, they ought to lynch them gamblers. Why there's a fellow up there lost all his wages and a \$20 gun. How can a man do any business when them gamblers gets all the niggers' money?"

The Medicine Man worked himself up into a fine frenzy of indignation, and then fell a stuttering, when I said: "It's blamed tough, for a fact. You won't be able to sell half as much sugar and water as you might have done."

We pulled out of the lumber camp before noon, and soon were wrestling with the problem of which course to take through the snags or against the far bank. We got caught in a large Arkansas eddy, and were held there by the wind and water for an hour, but these things did not dismay.

"I got \$7 out of that bunch," said the Medicine Man. "How's that for five hours' work rubbing the bank, eh? I'm a grafter, I am!"

A restless, vacillating character, the Medicine Man pulled the oars first one way, then the other, fearing first the water, then the bank, and all the time nervous lest he miss a good landing where medicine was wanted.

"I tell you, a man sells when there's an epidemic—everybody thinks he has the yellow fever when the fever's at N' Orleans, an' small-pox when small-pox is up the river. It's then a man can sell Za-mi-a-ya, yeh sir!" he said.

We now began to have fogs in the mornings—hours of waiting with nothing to do. They were the hardest to bear of any river hours. The mist would lie across the river surface in a 20-foot layer, trailing away southward before a faint breeze. From a bank top, the surface of the fog presented a beautiful sight rolling and flowing like a gray stream. To see a great wave of fog coming, inundating the thin layer of fog, and rolling the trees and banks under, is one of the most interesting and awing sights of the river, the fog looks so solid and so threatening of asphyxiation for one caught in the pathway. To go down from a high bank and clear air into a dimly seen cabin boat in a fog bank is like descending into fearful depths. Once we started to float when the fog was only four or five feet deep; we were on the edge of a wide eddy, where he had moored when we saw the whole surface of the river apparently rising and toppling over upon us from a vast height, a veritable breaker of fog. We found the bank by means of the compass I carried.

And these days were bad ones on the boat, for the Medicine Man had secured a quart of whiskey somehow on the bank—some blind tiger, probably. He wasn't offensive—merely glum and distant and uncommunicative, according to the stage of the alcoholic action. The fog, which was in flour-like particles, and the man were part of the river system.

The fog was so long-lasting one morning that he couldn't stand it. I was writing some notes, when suddenly I felt the boat tilt slightly. Looking up, I saw nothing on any side but the gray water dust, thick and lonesome. The Medicine Man was sober, and he stood in the doorway looking into the fog with morose satisfaction. It was curious to watch the fog eddying at the corners of the boat, and behind the bow posts. Soon, ahead of us, we heard the rustling of water. He seized sweep handles, and looked into the fog, unable to see three rods. The water was undulating under the boat, and then a black snag ploughed past us in the stuff. We seemed to be motionless, and the water still, and the hook-armed snags on the shoal bar we passed through seemed to be shooting past us like projectiles.

"Spoken we'd a hit that!" my companion would remark with satisfaction at the little excitement such things gave us. "This is better than dying there on that mud bar, ain't it?"

The wind came up rapidly not long after this, and we had to drop anchor to keep from being blown on a bar. There we hung for hours, obliged to take in slack on the rope at intervals because the anchor dragged. We slept part of the afternoon, and at night when the wind lay, we carried the anchor out and swung ourselves to the bar by a couple good "staubs" or stakes. The sun setting red promised three days of hard wind, and nights of calm. Nevertheless, next morning we pulled out in gusty weather. We fought the wind for a couple of hours, and then landed—tied to Louisiana bottom land, and that was near Lake Providence—so near and yet so far.

In the morning we started at 6:30 o'clock and ran into a gale. The boat pitched and plunged astonishingly, and because it was an old scow, I was wrought to a considerable nervous tension. But we were in sight of the place, one might say, and this was reason enough to try to fight our way down. Night found us in a little sand bar bay, anchored out of the waves.

The wind died away, the moon came up—"Let's float!" he said, so we cut loose, with a lantern on our roof. Wild geese were honking on the sand bars and ducks quacking in the eddies where the water was shallow. We could see very plainly, apparently, but at intervals there was a haze out of which jumped snags in disquieting fashion, while far away was a steamer coming which might come too close to us for our comfort and safety. Night floating in a clumsy cabin boat is one of the most thrilling of river experiences—but

there are river men who cut their boats loose at night, put a lantern on the roof and go to bed and sleep till sunrise without a qualm—on a falling river; that is, in windy weather, night traveling is the only way of avoiding "bank-doping" for days at a time. Had we not floated on this night, and made an eddy above town from which we worked down by main strength, the sandbar bay would have held us a week in the storm that followed.

We remained at landings only long enough for the man to see if he could do any trade. After selling a "line," he would drop down the river a mile at least, and usually around the next bend to pass the night. So we came to Salem Landing at last, and here we were caught by a cyclone—my second one—and as violent storms always are on the river, it was exceedingly interesting to us while it lasted. RAYMOND S. SPEARS.

## When the Indians Hunted Me.

I PUT in twenty years on the Southwest frontier, most of it in hunting Indians. Once in a while, though, the Indians would change the programme and start to hunt me. This was one of those times.

Prior to 1861 a large business was carried on driving cattle from the ranches about San Antonio and west of it across the plains to California, over what was called the old California trail. It led from the settlements up past where Fort Concho was afterward built; there is a large town there now, San-something or other, I have never seen it, and have forgotten its name.

From the Concho the trail continued on west through Cañon Pass, then crossed the Pecos River at Horse Head Crossing and so on west to California. The war stopped all this, and the first attempt made to resume it was in the spring of 1867.

The first herd to cross here was met west of the Concho by Indians. They got the cattle. The cowboys got into the cellar of an old stage ranch that had been burned long before by Indians. No more cattle were sent out just then, but we were sent up to old Fort Chadbourne to look after the Indians. Chadbourne had been a large frontier post before the war, it was one of the oldest on the frontier. Why it had ever been put where it was I do not know. Oak Creek, on which it had been built, was dry six months in the year and the water in it during the other six months could not be used until the doctor had disinfected it with permanganate of potash; at least that is what he said it was, but he may have been stuffing me. I am no doctor, only a third-class lawyer, and I was continually asking questions of these college graduates only to sometimes be given a lot of valuable information that I would afterward find to be of no value at all—it was of no value to me, anyhow.

There were very good rivers in this country not one thousand miles away, on one of which the post might have been built; I should have put it there; but I was not an engineer. When I had a military road to build—and I have had several of them—I built them without the aid of an engineer, only using picks, axes, and shovels, plows, carts and army mules. The nearest approach to an engineer I had was an enlisted man that I found could use a surveyor's transit. He tried to teach me the use of it, but only partly succeeded. I used him.

If I ran the road against a swamp I did not know any better than to go around it; then keep on. An engineer would have gone straight across it if it took him a year, with all the mules and carts in the country to do it.

This post was in ruins now and we let it stay so, and built Fort Concho where this one should have been built in the first place. I helped to build it, but was not the engineer. Colonel Strang looked after that part of the job. I shoved a plane. I saw the site of one post, some years after this, on which some engineer had spent several thousand dollars before he found out that the spring on which the post would have to depend for water only had water in it when it rained hard. This was Buffalo Springs, Tex. We took post at Fort Chadbourne, then were sent out on the North Concho River to camp. Here we escorted cattle across the plains. The different herds would be driven up here, then when five or six herds that would aggregate about ten thousand head in all had been brought here, they would be started across. These herds were driven about fifteen miles a day if water could be found at the end of that drive. Often it could not; then if it were not too far to it they would keep on. If it were too far for one day's march, they made a dry camp.

The only water here would be found in ponds—water holes. Some would be dry, but we would know that in advance. On the march the herds would be kept close up, one behind the other, only the cook wagon of each herd being between them; but they would be spread out on each side for a quarter of a mile or more.

We generally rode on in advance, and I have been sent to ride around the herds, going down one side and up the other at a walk or trot, when it would take me nearly all day to do it, the herd being on the move all the time.

The object in sending me was to see that everything was all right, or to give the alarm if the Indians should strike the herd. They might strike it miles in rear of the escort.

We took the cattle as far as the Horse Head Crossing on the Pecos River. Here a troop of the Ninth Cavalry (colored) took it farther west, or north, if it were going that way. Some of the herds went up to Fort Sumner, New Mexico. The Navajo Indians were there then, and these cattle were sent to feed them. The rest went to California eventually; it took them two seasons to go there.

A few miles short of the Horse Head Crossing is Cañon Pass, and east of this for thirty miles there was no water. The cattle would be suffering now for it. The cattle could smell the water miles away at the river, and if let go would rush to it, plunge over the high banks, and nine out of every ten would drown. A great many were drowned in spite of what we could do to prevent it.

The herds would be held at the Pass, then a few hundred at a time would be let go. They would rush across to the river, plunge in over the high banks if they did not happen to strike the ford, then fill themselves with water and swim out, the cowboys being stationed above and below to direct them to the ford; they could not get out anywhere else. It would take a whole day to get the

herd across in this way. We had taken one lot of cattle across the plains, and while waiting for the next drove to come up, I one morning asked permission to go hunting on foot.

The officer in command, our first lieutenant, a brevet major, told me to take my horse and to keep a good lookout for Indians while out. I had an opinion of how many Indians I would be likely to meet here—we never had seen any; but the major had a select assortment of opinions of his own, he would not want any of mine; I did not offer any.

I had been out an hour or more, had not seen any antelope, or Indians either. I was not looking for Indians, though, but could see them if they were here before I fell over them. I was a mile and a half from the river, but having gone south all the time, was still about opposite the ford.

The prairie here was a succession of low rolls, each one a half mile or a mile beyond the last one, and I had just crossed out of the rolls when I saw a man that I did not need a glass to tell me was an Indian, ride over the roll in front of me, and halt a moment. He was over a quarter of a mile away, and I continued to ride forward slowly while I studied out my plan of campaign.

I might ride that Indian down before he got home, he had a number of miles to go before he got there, and one of him was not at all dangerous. These Indians did not have the latest style of breech-loader. I had. This one probably had only a bow and arrow; he might have an old muzzle-loading rifle, he might as well not have it, though, if he kept on running, and he would if I took after him. But then I might charge into a hornets' nest behind that roll. The Indian had hardly come all the way from Arizona all by himself; he had come from there I knew, and his friends might be behind there now, having only sent him out to get me to charge him. I would not do it just yet, there would be plenty of time later on, let him mozey down behind me until I get him nearer the ford and far enough away from the roll to overtake him, and far enough on this side of it to have time to go home if too many of his friends came. I ought to know nearly as much about strategy by this time as an Apache does. Without seeming to see my Indian at all I turned around and rode slowly toward the ford, keeping a good lookout over my shoulder, so as not to let him get in close enough to send me any arrows before I turned the Colt lose on him.

I kept on at a walk, the Indian took up a slow trot. "Make that trot a gallop," I said to myself, dragging my pistol holster in front of me, "come within good range of this pistol. I want to see if I can hit you."

At last I thought he must be close enough and was about to draw my pistol and meet him, when I saw half a dozen or more Indians come riding, all in a bunch, over the long roll he had come over. They halted a moment as they came in sight of me and sat there still in a bunch.

Some of our recognized authorities on Indians tell us that the Indians always march in single file, one behind the other, one ahead of the other; it don't make any difference which so long as they get in that file and stay there. And they will stay there; you could not get them to travel any other way if you paid them for it. This is according to Fennimore Cooper. He knew Indians from away back. His Indians always marched that way to avoid knocking down trees, but there were no trees here to knock down, so my Indians had come here in a bunch.

The Indians only stopped long enough on that hill to deploy skirmishers. They were going to run me down. They did not send a trumpeter to tell me so, but I felt it in my bones that they were, and now I suddenly remembered that the major had told me to look for Indians. I had better go in and tell him I had found some before I forgot it.

I never wore spurs for this horse, he did not need any. If I wanted him to run I told him about it and he would run all day. Leaning forward I let the reins slack, then digging my heels into his flanks yelled "Git!" and he got. I did not hold a watch on him while he was making that mile, I thought, though, that he made it in a minute. He must have taken longer than that, but he did not take an hour. The river at the ford was about thirty feet wide, too wide to jump, but it was only a foot deep, and without slacking up we plowed through it, and landed thirty seconds later in camp. I told the major that I had a few Indians out there, but they were too many for one man to bring in.

He yelled, "Saddle up! Be in a hurry now!"

They hurried, but it would take them some minutes to get the saddle on, and give the Indians lots of time to get away. I did not expect to find many out there by the time we had got out. As soon as they had seen the horse and I plow through that river they would go on a scout and not stop long enough to draw any rations, either. We had about forty men here—enough men to eat up all the Indians I had out there if the Indians would only wait. That is what these men got their \$16 a month, board and clothes and do your own washing for, to eat up Indians or tell each other how fast they could do it if we brought along our Indians.

We got out at last to where I had left the Indians, but the Indians had also left. The major halted here, then sent me off on the right and sent a sergeant off on the left to see if we could find any signs of a trail. I found no trail, but did find five arrows that an Indian had spilled while charging on me or when he was sallying on the center after I had got clear off. I got the arrows and sent them by mail to a museum at home with a description of where they had been found, and the name of the tribe they belonged to. The points on them told me that the arrows belonged to Apaches. I did not know which band of Apaches then, but found out later on that they were the Chiriqua Apaches. This was in 1867. Years after, on April 23, 1882, I had the honor to meet them again, but I did all the chasing this time, or helped to do it. We had six troops after them, Gen. George A. Forsythe, our lieutenant-colonel, being in command.

We chased them into Horseshoe Cañon, on the line between New Mexico and Arizona, killed a few of them there, then chased them south across the Sierra Madre Mountains into old Mexico, then on down through Sonora, and while busy getting away from us the Indians ran on top of a big command of the Mexican cavalry and infantry almost before they saw it. They were too busy keeping ahead of us—we were only an hour or two behind them—to see much of anything ahead of them.

The Mexicans killed some and captured the rest and lining up the men shot them, then took the squaws and children home with them. We got there before the shooting began and left before it began also, the Mexican officer in deference to us postponed it. These Mexicans had lost their doctor in the fight; we had two, a regular and a contract surgeon, and they fixed up the wounded Mexicans. I went into their camp with the young contract surgeon to carry his "tool box," as he called it, and help him to hunt for balls and to cut off any legs or arms that needed cutting off. We found none that needed it, much to the doctor's disappointment. He was in the habit of telling me that he would rather cut a man's leg or arm off than eat. If I had a leg or arm to be taken off I would want him to do it; he was a good surgeon, but a poor shot on the wing.

The Mexican major in command was badly wounded and we fixed him up. Seeing that there were several boys among those prisoners, and knowing that the males would be shot, and finding that this major and I belonged to the same society, I put in an appeal to him to save the boys. He said he would not shoot them, but would shoot the men.

"You have my permission to shoot the men, and begin it right now," I told him. "These men have been trying to shoot me for years." But I am forgetting all about the time that they tried to shoot me at the Concho. The major took a survey of the country and then said to me:

"Those Indians must have missed you by about an inch, did they not?"

"No, sir; they missed me by half a mile. I ride a horse that is not run down by an Indian pony every day."

"It's lucky you rode him to-day." Then to the men: "Here after this you men do all your hunting in large parties. I didn't want these Indians chasing you all over the country. Some of you are not riding race horses."

I was not riding one, either, but he was several removes from being a cart horse. I rode him a few weeks afterward across this same country 140 miles in twenty hours when I was going for a doctor to cut a cowboy's arm off. He had sent a charge of buckshot into it when climbing up on top of a wagon, and drawing his shotgun after him. It is the approved way to carry a shotgun, but I have always found it a safer plan to carry it by the stock; then if it does go off the other fellow gets the buckshot and the coroner can tell me that it was an accident.

CABIA BLANCO.

## The Lost Girl.

I AM a rough old miner, and in the fall of 1893, when owing to the hard times, all the mines in Peon county, Mich., had shut down, right after the terrible accident at the Mansfield, where the Michigamie River had come tumbling down into the mines, drowning twenty-eight of my mates like rats in their holes, and from which fate I narrowly escaped, I was feeling blue and sad and wondering what I should do to keep the wolf from the door. I ran across my friend, Miles Graham, son of a Hudson Bay trapper. Miles had followed hunting and trapping all his life. He invited me to join him. "Come with me this winter," he said, "I can make good use of you, and by spring you will be a trapper. I have traps and enough money to fit us out, and have located a fine trapping ground; and when the season is over, we will each have a pot of money." The next day we bought our outfit and started. We had a fine winter's work, and lots of sport, besides a fair roll of money to divide when we took up the traps in April. To amuse ourselves we told each other tales, incidents and adventures in the evenings over our camp-fire. One of these was a story of a lost girl. It is strictly true, the names and locality only being changed, and I tell it as nearly as I can in Graham's own words.

"Some years ago," he said, "the wolves were pretty thick on Blank River, Mich. I thought I would put in the winter poisoning and trapping them for the bounty and their pelts. Early in the fall, I bought from an Indian a birch canoe, loaded it down with traps and supplies for the winter, worked myself up stream three or four days, and came on fine ground with plenty of wolf sign. I built a snug, warm shanty and got down to business. One day I was out setting bait and traps, when I saw a young woman standing on a log. You may guess my surprise when I had thought that no human being except an Indian was nearer than forty miles. I knew at once by her clothes—almost all torn from her body—that she was lost. I stalked her as carefully as I would a deer, and when I was about a rod from her, I said as gently as I could, 'Madam, do not be frightened, I am a friend.' She jerked her arms above her head, screamed and ran. Jack, would you believe it, she ran faster than I could. I saw that she was getting away from me, so I set the dog on her, not to bite, but to get in front and bother her, so I could catch her. Then she fainted. I raised her tenderly in my arms—poor girl, she was no burden, only skin and bones—and carried her to camp, and forced a few drops of whiskey and water down her throat. When she revived, I saw that she had lost her reason. I tied her to my bed, so she could not run away, while I shot some partridges to make soup. I gave the soup to her, feeding her as you would a baby. I gave her only a little at a time for two days before I would let her eat her fill. In the meantime I made her some clothes out of my blankets, and tried all I could to give her strength to bear the trip down river. After a day or two she seemed to have the same affection for me that a dog has for his master, and would follow me like a dog. In about a week I judged her strong enough to stand the journey, but her mind was entirely gone. I started with her in the canoe, and in the afternoon of the second day hailed the first settler, asking him if any girl had been lost during the past month. 'Yes. Cy Johnson lost his Lilla about three weeks ago, and the wolves ate her.'

"No, this is she here in the canoe, and I wish you would go to the settlement and tell her folks to come to the point above where I will camp, as she is out of her mind."

"I had hard work to keep Lilla in the canoe, as she was afraid of the settler and his voice. In the evening her father and friends came, but Lilla did not know them, but crouched and cowered at my feet for protection. Finally her father said they had sent for

er mother, and in the morning he would bring her. Then it was the same thing over again; she was afraid of her mother. I offered to stay a week or two and nurse her, but her father objected on the score of his daughter's reputation, to which I replied: 'Sir, your daughter has been with me some ten days. I am a man, not a brute!' When they tore her from my arms she fainted, the father called me one side and said, 'Mr. Graham, I am not rich, neither am I a pauper, what do I owe you for your services?' 'Sir, you owe me nothing,' and jumped into my canoe and went back to my wolves.

"In the spring, when I came down, Lilla was dead; and, Jack, it has always been a mystery to me that he escaped the wolves, for I never saw them so thick and bold. Let us turn in and it is your turn to get the breakfast."

MOQUAW.

### The Tragedy of El Capitan.

IN the San Francisco Chronicle Mr. J. C. Staats tells his story of the climb of El Capitan in June, when his companion, C. A. Bailey, fell and was dashed to death:

There is something in all great mountain peaks which seems like a direct challenge from nature to the traveler. The sheer height of an unscaled summit rises insolently, as if it laughed at the insignificance of man. I am sure that this idea has occurred to every climber who has set his strength and cunning against the stern face of the granite, and I know it quickened in the breast of one at least the determination to let no crag go un conquered. That one was my friend, Charles A. Bailey, of Oakland, whose intrepidity led to his fatal fall from the almost perpendicular face of El Capitan on June 6 of this year. That mighty wall has been scaled at last—but at what cost!

It was my first visit to the Yosemite, and I had started it with a general determination to let no view escape on account of the difficulty of climbing to the best point of vantage. But the first glimpse of the valley from the gorge of the Merced temporarily put all thoughts of climbing out of my mind. As the stage rumbled along at the base of El Capitan the idea of tempting to scale it seemed simply ridiculous, and I understood at once why nobody had ever, up to that time, seriously entertained it.

We arrived at the hotel on the evening of June 2, and as I listened to the stories of what others had done, my courage revived. Then somebody introduced me

Charles A. Bailey, and the spell of the mountaineer was upon me. Bailey told us of the peaks he had surmounted in Asia and in Europe, and as he spoke with the vivid language of a good raconteur, climbing seemed easy. The next day we spent enjoying the stories of the valley, which are within the reach of the most timid soul, and it was not until the following Monday that he mentioned El Capitan. It was several hours before the sun had gilded the neighboring peaks and spires when we started down the east bank of the river. No more lovely morning ever tingled with the spirit of springtime. Nowhere was there a foreboding hint of the tragedy which was to end the day.

We walked as far as Bridal Veil Falls and sat down to plan our campaign, commenting at the same time on the surpassing loveliness of the scene. We had not yet fully determined to make El Capitan the objective, and arriving at Cathedral Spires, debated whether it could not be well to attempt the gorge between them. Then we turned toward the river and crossed the ridge which leads to New Inspiration Point—how unfortunate nomenclature often is—and there to the right rose El Capitan itself, steep and unconquered. Bailey at once laid bare the plan he had been cherishing in his heart, and without much persuasion I agreed to help make the mad attempt, which, I was yet to learn, was to go where no human foot had gone before.

By 10 o'clock our progress had become very much slower. The path was now frequently overhung with projecting shelves of rock, and the foothold consisted of fragmentary ledges to reach which Bailey would climb upon my shoulders, and then, taking hold of some projecting knob, slowly draw himself up to a place of safety. I would then pass him his staff, with which he could reach down and help me to gain a place beside him.

After allowing my companion to use me as a ladder a few times in the way described, I proposed that we give up the enterprise, and descend, if possible, by the way we had come. But my loss of nerve was momentary. To go back would in itself have been an undertaking full of peril, and when Bailey cried, "Never give up till you're up!" I was seized again with the enthusiasm which loves to conquer difficulties. I suppose it is some such spirit which bids men cut down a giant tree and hold cotillon parties on its stump—the delights of mastering something huge, be it a giant redwood or El Capitan.

"That's right! Brace up, and the summit is ours," said Bailey, when he found me ready to proceed. But no sooner had we recommenced the climb than he himself seemed to realize the desperate nature of the situation. "If one of us should fall," he observed, "it would mean death—to both."

"Why both?" asked I.

"Because neither would be able to climb up or down from this place without the assistance of the other."

"Then God grant that I may not be the one left alone!"

I cried. Nothing could have been more horrible than the thought of being solitary, helpless, clinging between heaven and earth to the face of that sheer precipice, feeling one's strength gradually go and waiting for the inevitable fall. From that moment I knew that it was to be a fight with death, and the very extremity of the danger nerved me to go on. In the end it was, indeed, who was left alone, but by better luck than is likely to come to a man twice, I was not called upon to share the fate which overtook the brave man who had acted as my guide.

But we now faced a well-nigh perpendicular wall of rock, with nothing to break the smooth surface save here and there a small shelf or crevice. We could not see more than a few feet above us, as it was exceedingly dangerous to lean back or try to obtain a clear view of the way. All that promised a foothold was a tiny ledge nearly ten feet directly over our heads.

Bracing myself as before, I let Bailey climb upon my shoulders. Then he reached up with one hand and grasped the edge of the shelf, and a moment later had succeeded in seating himself upon it. It was a magnificent feat of strength, agility and coolness—the last he was destined ever to perform. He seemed quite elated at having bridged a seemingly impossible part of the journey, and called down to me, quite exultingly: "When you reach this place the hard climb will be over."

A moment later he said: "Pass me my staff and I will help you up."

These were his last words. Whether he was seized with fright, vertigo or weakness I do not know, but an instant later I saw him fall back against the face of the rock. The shelving ledge on which he sat let him slip, and he shot like an arrow into the abyss, passing about three feet to the right of where I was standing.

I saw him strike first one ledge and then another, till falling in a bruised head upon a point of rock many feet below, he bounded and took the final plunge out of sight.

I was not frightened. I was not nervous. I did not cry out. I felt as if I were turning into stone. I could not move. My feet and hands seemed heavy, or rather as if glued to the little shelf on which I stood.

Gradually I realized where I was, and what had happened. The meaning of my friend's words, "If one falls it will mean death for both," came back to my mind. There I clung for I know not how long, nothing but the steep granite above, below, and about.

When I could move, the first thing I did was to stick Bailey's staff into a crevice to mark the spot. Then I crawled down to the shelf below and removed my shoes. Barefoot, I succeeded in reaching the place where he had first struck. There lay his hat, a mute token of the tragedy, so silent, so sudden, so awful, which had taken place. By the time I had reached the third red-stained ledge, which he struck in falling, I discovered that it would be impossible for me to get where I could even see his body, and I began to think about my own safety. Discarding everything which could encumber me, I tried to regain the lost ground. For a long time it was impossible to advance an inch, and I was about to give up the struggle, when I noticed a narrow shelf two feet above me, which seemed to extend clear around the main rock. Below me was the gorge. Above me was the sky. My only hope was the shelf. Did it grow narrower or wider?

My fate depended upon that answer. With my arms stretched flat against the rock, and my face close to the wall, I began sidling along to the right. But the shelf became narrow; my heels projected over the dizzy gorge. Still I continued to advance slowly and painfully, till suddenly the sound of falling water burst upon my ears. Little by little my six-inch path widened, and I was enabled to move a degree faster, but an overmastering desire to look behind me was threatening me with imminent danger. Calling all the remnants of my will power into play, I succeeded in momentarily controlling this awful desire, to gratify which would have meant instant death. The sound of gurgling water became plainer. I was nearing a waterfall, and in a moment more the fall itself was in sight.

There was but one thing possible to do. That waterfall must be surmounted. Into the icy water I crawled, and up, right under the falling stream. The rocks were of shale and I reached up, grasping a projecting point of one, by means of which I drew myself up to a higher shelf. But this ledge was in the direct path of the falling water and my limbs were fast becoming chilled. I knew continuous motion was necessary, so by holding to the rocks along the stream I managed to drag myself up some thirty feet higher, where further advance was apparently stopped by a perpendicular wall nine feet high which barred my way. Even in the face of this difficulty, my nerve did not fail me. I worked loose some small stones which I piled to a height of about two feet just under the falls, and found that by standing on this pile I could just reach with the ends of my fingers a small projecting rock. Securing as firm a hold as I could, I swung my feet clear of the stone pile to a point about eighteen inches higher, and by continuing to push myself up feet first, and making use of the small bumps on the rocks, I finally was able to stand upright on a small shelf of rock only a little distance from the one from which my late companion had been hurled to his death. I was, by this time, thoroughly soaked, and shivering with cold. My fingers were blue and pinched, my whole body numb; but I felt with a sensation of infinite thankfulness that, as Bailey had said, "If I could attain that ledge, the worst was over."

I looked at my watch. It was just four o'clock. It seemed an age since I had started on my appalling climb over the perpendicular face of the monster cliff after Bailey had vanished, yet only an hour had been consumed. The distance to the top of El Capitan was yet two hundred feet, but the mountain from the point where I was, is covered with small bushes, vines and rocks, and in an incredibly short time as compared with my previous efforts, I stood upon the summit, 3,300 feet above the level floor of the valley, but beyond the grim clutch of death. The top of El Capitan is nearly level, and after searching for some time for a sign or mark that would aid me in discovering a trail to the valley, I found a blazed tree, and following the direction indicated soon came to an Indian trail which led to Eagle Peak, where I struck the main trail to Yosemite Falls. The distance from the blazed tree to the camp is fourteen miles, but the trail was good, and I made rapid progress. I reached the valley at 7 o'clock, just three hours from the time I had stood on a narrow ledge, clinging like a fly to a sheer wall of granite, and having expected for hours to be dashed, a whirling atom, on the giant rocks below.

When I was able I reported the awful accident, and was ready to lead a party to the scene of the tragedy that same night, but this idea had to be abandoned. At 5:30 o'clock on the morning of June 6 I started back over the ground, in company with nine others, and at 11 o'clock reached the top of the gorge at the point where I had come out the day before. We had brought 700 feet of rope with us, but finding it 20 feet short, we obtained a piece from a pack saddle, and so were enabled to reach the remains of my friend. The heroism of J. A.

Snell, of Calistoga and of H. Spaulding and F. Curry, of Palo Alto, who permitted themselves to be lowered over the great cliff, deserves to be commemorated.

When we again reached camp, my nerves suffered a complete collapse, from which they have not yet recovered. They will not be put to the test again. Others may attempt to scale El Capitan. I have climbed my last crag.

### Whale Fishing in Brazilian Waters.

UNITED STATES CONSUL-GENERAL SEEGER writes from Rio de Janeiro, Brazil: Whales seem to be animated in spring by that indefinable desire to wander, which the Germans call "wanderlust." Regularly every year, at the beginning of spring (which in this part of the world is August and September), numerous shoals of cetaceans leave the southern waters and swim northward toward the coast of Bahia, so rich in the fish and animalculæ they seek. The reefy waters between the Abrolhos Islands and the port of Caravellas are their feeding grounds. While they are feasting on the almost inexhaustible supply of fish the natives lie in wait for them. Fortunately for the whales (which belong to the species of cachalot or sperm whale and are neither very swift nor very courageous) their human enemies are centuries behind the times, lacking modern weapons and equipments.

From the Abrolhos the whales, on their journey to the equator, keep close to the shore until they reach the Bay of Bahia, where, in the vicinity of the island of Itaparica, within sight of the city of Bahia, the conditions are very much like those of the Abrolhos. The fishermen keep a sharp lookout for the passing whales, and at a signal they prepare an organized attack, exactly in the manner their ancestors did 300 years ago. Two clumsy, flat-bottomed whaleboats, manned by six or eight oarsmen accompanied by half a dozen small canoes, with four colored fishermen in each, take strategic positions. The men never think of venturing out in the open sea with their primitive craft, but scheme to surround their victims and drive them toward the shoals inside the bay. After they have succeeded in isolating a whale, the whaleboats are rowed up to it, one on each side, and the "baleadores" (harpooners) drive their heavy, old-fashioned spears into the neck of the animal. The whale tries to escape, but the boats keep up a hot pursuit, and the "baleadores" continue spearing their victim whenever they have a chance. This struggle lasts for many hours until the whale, exhausted through loss of blood, gives up the fight. Then comes the moment for driving the harpoon home, which is delayed until the agony of death has set in for fear the harmless monster might try to defend itself or madly rush out into the open ocean and escape. With their antiquated methods the hunters can kill but few of the whales within their reach. But, strange to say, they hardly ever lose one after they have attacked it, and accidents to the men are of very rare occurrence.

When the troubles of the whale have ended the real troubles of the hunters begin—the transportation of the dead whale (generally from 75 to 100 feet long) to the island. It often takes these fishermen (Brazilian half-breeds or negroes) several days to pull the carcass ashore. Its landing, of course, causes the greatest tumult among the insular population gathered at the shore and eager to help. When the monster is securely on shore, twenty to thirty negroes, armed with heavy cutlasses, throw themselves on the carcass and cut it to pieces. The choice portions, in chunks of 50 to 80 pounds, are taken to the "saladeiros," or salting places, where they are prepared for the market in Bahia, whose negro population furnishes ready customers for the meat in spite of its very nauseating smell. The blubber and other portions, without being properly flensed, are carried to the "whale factory," where the oil is tried out. The rest of the krang, nearly half the carcass, as well as the skeleton and the flesh, after the oil is pressed out, are left to decay. Neither the skin, out of which a high-grade leather might be manufactured, nor the blood, the baleen, the fins, nor the bones are utilized by the ignorant whale hunters of Bahia. The presses used for obtaining the oil are remnants of the colonial period. The oil is neither purified nor clarified, but is sold in its crude state to Bahia dealers.

The catch in the neighborhood of Itaparica is now about thirty or forty whales annually.

### Owls Killed by Electricity.

THE temporary suspension of work at the mine and mill of the Granite-Bimetallic Mining Company, caused by an owl becoming entangled in the wires, recalls the fact that since the transmission line was put in commission, nearly four years ago, twenty-five owls have been electrocuted by coming in contact with the wires, and since November, of last year, twelve fine specimens of the owl family have gone to owl land over this route.

The transmission line is eleven miles in length and furnishes a current of 16,000 volts to the mine and mill, No. 4 copper wire being used. The line traverses a wild and unsettled country, the abiding place of all kinds of wild beasts and birds. Shortly after the line was opened there was a sudden break in the current one night. The line crew began an investigation at once. A few miles from the power station a monster owl was discovered dead just below the pole line. The bird bore every evidence of having been electrocuted. The occurrence was then considered a novelty, and the bird was stuffed by some of the company employees and placed on exhibition. Since then, however, the act has been repeated so often and with such serious loss of time to the company's operations that the freaks of the owls have become a serious nuisance.

As might be supposed, the breaks always occur at night, just at the time they are most difficult to find. In nearly every instance the wires are burned outright, but in a few cases where the owl fails to land with both feet on both wires no serious damage is done to the wires, but the bird is always a victim. George T. MacGuire, the electrician at the power house, has a memento of one of these night tragedies in the shape of a rabbit's foot, which was found in the talons of an electrocuted owl.—From a Phillipsburg Correspondent Anaconda Standard.

# NATURAL HISTORY

## The Strategy of a Wild Mother.

BY HERMIT.

APRIL 1 there was every indication of an early spring. The snow had disappeared and the trailing arbutus was bursting into bloom. The shad bush buds were ready to open and here and there in the shrublands clumps of the fly honeysuckle had put forth leaves. The days were filled with bird music, while the nights fairly thrilled with the swelling chorus of the frogs.

For several years this had been the day when Dame Nature had said to me, "Take up thy bed and walk." I hastened on this April morning to obey the command by moving from my log cabin to my outdoor bedroom. This bedroom was an airy affair. It consisted of canvas roof to keep off the rain and snow, with walls of wire poultry netting to keep out dogs, skunks and human beings.

When I awoke the next morning there was an inch of light snow on the ground. "The poor man's dressing." While crossing the dooryard to the cabin, my footsteps were suddenly arrested by the sight of baby footprints in the light snow. The footprints crossed and recrossed the open space, disappearing under the shrubs and trees that surrounded the cabin. I knew that the hermitage had no baby attachment, and that it was too far away in the woods to expect that a human baby had wandered barefoot so far from home. The story books for little folks would readily have explained the mystery by claiming the footprints were made by the good fairies, that had so thoughtfully provided "the poor man's dressing." As I had passed the years of childhood and fairyland, there was only one solution left; the footprints were made by the plantigrade foot of a raccoon.

After breakfast I followed the trail and found the raccoon's den under a huge boulder, about 250 yards from the cabin. Before my advent rattlesnakes had occupied the den. A good Samaritan, in the interest of berry pickers, had exterminated the snakes and raccoons had immediately taken possession.

My visitors proved to be a mother raccoon with twins on her hands. I made it a practice to put out food every night, and she came regularly, soon after dark, just as the stars began to show. For this reason I named her "Starlight." Moonlight nights she made a pretty picture in the dooryard. I often wished that others might enjoy this bit of wild life, but Starlight shunned the dooryard when visitors were present. At such times we could hear her but she would not leave the protection of the shrubbery.

I contrived a way to bring Starlight close to my sleeping quarters. I scattered nuts along a plank seat that led to the wire wall of one end of the building. In a remarkably short time she became tame enough to allow me to set inside while she ate nuts outside, within reach of my hand.

When the baby raccoons were as large as a small cat, Starlight led them into the dooryard. There was a nightly circus after that, for the little imps were as mischievous as monkeys. One of the twins would drop from a limb on to the mother's back, and while she mauled him till he whimpered, the other would sit up and look on seeming to enjoy his mate's discomfort. Perhaps in ten minutes he would try the trick and have to take his medicine. The twins were always on the lookout for their mother's tail, and Starlight was obliged to sit on this member to protect it from attack.

One night the twins, while playing, found that the wire walls of my sleeping place would twang when touched. It gave them a great fright at first, but the scamps experimented until they lost all fear, then they kept up such a din, by running over the wires, that it was impossible to sleep. I drove them away several times before Starlight took them in hand. She seemed to understand that I was annoyed by the noise, and she punished the twins severely whenever they approached the wires. It did not take them long to learn their lesson, but now and then one of the scamps would sly up and hit the wire a slap, when the mother was not looking.

It is needless for me to state that I thoroughly enjoyed the visits of the raccoon family. There was one disquieting feature. I looked forward with anxiety to the hunting season. Two raccoon clubs visited this locality, for it was a famous feeding ground for raccoons. Sturdy white oak trees afforded an abundant supply of sweet acorns in the fall, while frogs and fowls were accessible in the spring and summer.

During my life in the woods I had stumbled on to a feature of raccoon life wholly unknown to me heretofore. It was the fact that male raccoons were the victims in the hunting season. One fall ten raccoons were killed in the immediate vicinity of my cabin, and eight of the number were males. The difference in death rate is explained in one way only. The male raccoon, when pursued by the hounds, takes to a tree, while the female hustles her family to the den and thus escapes.

Would Starlight escape? I had my doubts. She was the only raccoon left near my cabin. Extermination seemed likely, as the members of the raccoon clubs did not seem to realize that the death of the last raccoon meant no sport another year.

When the acorns were ripe Starlight led the twins to a new feast, a feast that would put fat on their haunches, and make it possible for them to sleep through a long, cold winter. Starlight had deserted me and my dooryard. I supposed she thought it best to give her children a raccoon education.

Meantime I dreaded the advent of the hunters. One Saturday night, near 10 o'clock, my fears were realized.

From my hammock I saw a glimmer of light in the treetops. Down through the woods, in Indian file, came eight hunters, each with a lantern. The long column of lights did not approach in a straight line, but moved from side to side as it followed the winding path to the cabin. The boys invited me to the hunt, but for a good reason I declined. Just then the hounds gave tongue near the den. They outwitted Starlight by getting between her and home. There was nothing left but to tree. If the raccoons treed they were lost. When the hunters heard the hounds they left on the run and were soon out of sight.

While I was thinking how to aid the little mother, I heard animals bounding through the undergrowth. It was Starlight followed by the frightened twins. There was a big hemlock tree just fifteen feet from the south wall of my sleeping place. Starlight made for this tree and sent the twins up while she remained on the ground. The cubs stopped when about ten feet away, but the mother urged them on and they climbed to the very top. Starlight uttered a few low notes, which I took to be words of warning, then bounded away.

The hounds were trying to unravel the numerous trails made by the family early in the evening. I could hear them distinctly, for they were dangerously near the cabin. Sometimes their mellow notes were sent up encouragingly, and again disappointment was voiced in no uncertain tones. By and by I heard the glad cry: "Trail found, trail found!" I well understood Starlight's ruse. She had placed herself in the path of the hounds and was leading them away from the babies.

Would she seek safety in the den? No, that was dangerously near the hemlock tree. She must lead the hounds a long distance away, and perhaps be forced to sacrifice her life to save her babies. I awaited the result with sad misgiving.

Two hours later eight disgusted men and two tired dogs made the dooryard. The men sit on the plank seat within fifteen feet of the hemlock tree. The dogs are further away, resting on the pine needles in front of the cabin. Eight lanterns light up the dooryard, but the little raccoons are safe and silent in the treetop, not thirty feet from the hunters, while they relate how the raccoon had tricked them. She had taken to a swamp and the hounds had lost the trail in pools of water.

Ten minutes after the hunters were out of sight, Starlight returned. She purred softly and the twins scrambled down, glad no doubt to have a chance to stretch their legs. Starlight led them away purring all the time, doubtless telling the little ones how she had fooled two dogs and eight men.

When Starlight sent her babies up that hemlock tree, she knew that I would protect them if anything happened to her. Her confidence was well placed. I would have sacrificed my hermitage to save the little beggars.

## Martins, Swallows and Sparrows.

Theresa, N. Y., July 24.—On Saturday last, at Redwood, I was much interested in watching the occupants of an elaborate bird house placed on a post standing in the middle of the street in front of the Dolinger House. I should judge that the bird house was forty inches square, of four gables with tin roof. There are four rows (of five each) entrances on each side of the house, and three entrances in each gable, making ninety-two entrances in all. There are posts about five inches from each corner extending from the lower floor to the roof, with four verandas running entirely around the building, which is painted white and trimmed with green.

What surprised me most was that the post (which is about twenty feet high) is placed directly in the middle of the main street of the village, as if it were a corporation institution. I never saw so many martins in one place. I saw only a few barn swallows about the house. They were probably out on the telegraph wires and flying about getting in condition for their long journey south. There were plenty of English sparrows in and about the house, and I noticed that they were carrying nesting material and getting ready for another brood. There will be plenty of room, as the martins and swallows will soon vacate their northern summer homes for their southern ones. I wonder do they breed there? I never saw more than two pair of martins breeding here.

J. L. DAVISON.

## A Fateful Grouse Drum.

Editor Forest and Stream:

This is a story told by my father, Rev. George W. Eaton, D.D., LL.D., a distinguished pulpit orator of the Baptist denomination and for twelve years previous to his death in 1872 president of Madison University. I have often heard him relate the circumstances. The experience shows conclusively the effect of imagination upon a sensitive mind and that of the mind upon the physical system. Father was born in a log house near Huntingdon, Pa., in 1804, but in 1805 with his family moved to Ohio, where he was brought up in a log cabin contiguous to a heavy forest. The boy in his teens, some fourteen years I should judge, imagined he had heart disease from the severe palpitation that oppressed him whenever he approached the wood lots. He began to grow into a "decline," as they call it, and from a rugged boy sound in every way he became weak and was gradually wasting away. The doctors, if they had any of any account in that sparsely settled region, could do nothing; and George was booked as "consumptive" with but a few more months to live. And he undoubtedly would have become a victim had he not one day been out in the woods with his elder brother David. His heart commenced its usual thump, and he became so

weak he could hardly stand. "Hark!" said brother Dave. "Hear that partridge drum? Wait until he starts again and we can crawl up and see him. He is on some log in the thicket there. I know there is a drumming log there somewhere."

With heart beating with another kind of beat, father with David sneaked up, and peering carefully through the bushes they discovered the bird with tail spread and feathers erect strutting on a log. Then came the thump, thump, th-u-m-p, thum-m-m of the vibrating wings and the muffled thunder. It was to the boy, revelation and a glorious deliverance; the seat of the "consumption" was exposed; and with that welcome music all disease was scattered in the dim woods, and it did not take long to get back the health and vim of sturdy farmer's boy. My father really believed that but for this timely discovery in a few more months he would have died from exhaustion and filled an untimely grave from assisted imagination purely.

JACOB STAFF.

## Dog and Rattlesnake Bite.

Keller, Wash., July 15.—Editor Forest and Stream: About ten days ago some boys who are spending their vacation at my cabin, went up on to the mountain, and while resting at a spring, my dog, while hunting above them a short distance, got bit by a rattler. The boy started home with him, and they carried him part of the way, and he hobbled along on three legs and got home in about an hour after being bitten. His leg and foot were badly swollen when they reached the house. I bathed the wound and the leg with turpentine and kept bathing it for some time.

By night the leg was swollen to more than twice its natural size, and the swelling extended into the body. That night he was very sick, and I thought for some time he would die before morning. But by morning he was some better, and the swelling had gone from his body so that you could tell it. He would not eat anything till night, then he drank a little warm milk and ate a little bread.

I kept bathing the wound with turpentine, and the next morning he was greatly improved and ate quite a lot, and could put his foot to the ground. He has improved right along till now he can walk very well, though his hair has all come from his leg up as far as it was bitten and there is still a running wound in the foot several inches from the toes. I did not have any ammonia, or think he would have got along much better.

Birds are very plentiful, and the boys are very anxious to have the game season open.

LEW WILMOT.

## Horns Seven Feet Across.

A KANSAS paper says: "A peculiar pair of horns was found by Harley Henderson, of Hoxie, Kan., and Frank Lee, of Hill City, Kan., one and a half miles southeast of Hoxie thirty-five feet below the surface of the ground. The specimen is petrified and in a perfect state of preservation, notwithstanding the ages it is supposed to have remained beneath the ground. Many conjectures have been made as to what sort of bovine this magnificent pair of horns must one time have adorned. Following the curves of the horns from tip to tip the distance is eight feet nine inches, but straight across it is seven feet. The circumference of the horns next to the skull is twenty inches. The distance between the horns across the skull is fifteen inches."

In Post Tertian times there were in America bisons which carried horns of gigantic size, one species, described by Harlan from the Big Bone Lick of Kentucky having horns which measured eight or nine feet across. May not this have been one of these ancient bisons?

## How an Owl Did Not Catch Chickens.

Editor Forest and Stream:

In a late issue you told how owls catch chickens by crowding them off the roost and catching them as they flew to the ground. I want to tell how a great-horned owl (*Bubo virginianus*) did not get his chicken. About twenty years ago a Mr. Webb, of Somerset, brought to me at Lockport an owl that had been captured in a peculiar manner. A hen and her brood had been kept in a coop for some time and then were allowed their freedom. The coop had been raised up in front and held in position by a stick put under the edge of the coop. The owl attempted to go under the coop for its meal; in doing so it knocked out the prop and down went the coop. The hen and all the chickens but two managed to get out when the owl went in. The next morning the owl and the two chickens alive were found occupying the farther ends of the coop. Apparently the owl had forgotten all about its meal of spring chicken.

J. L. DAVISON.

## Another Great Auk Sold.

The last number of Nature reports the sale to a museum on the Continent of another mounted specimen of the great auk. The sale was made through Rowland Ward, and the price paid was reported to have been £400, or \$2,000. There are said to be about seventy-five skins of this species in existence and a like number of eggs. Most of the specimens are in public museums. While only a few of the skins of the great auk are owned in the United States we have large collections of the bones of this species. Funk Island, near Newfoundland, was a great home of this bird, and Mr. T. A. Lucas, visiting the island nearly twenty years ago, collected a vast deal of interesting and useful material about the species.

# GAME BAG AND GUN

## Queer Experiences of a Fox Hunter.

### II.—An Unexpected Meeting.

"I WAS using a muzzle-loader at the time of this incident," said my uncle. "In fact, I don't think I had then ever seen one of the 'break-down' style of guns, nor was I particularly anxious to do so, for I shared the general prejudice of the old hunters against the 'new-angled things,' as we rather contemptuously styled them or some years after their appearance. They might be all right for city sportsmen to use on quail and woodcock, we argued, but when it came to long-range work, such as was necessary in duck or fox hunting, we reckoned that they would be worth no more than pop-guns. Even after we saw how thickly they would spatter a target with shot at truly surprising distances, many of us still remained skeptical, believing they lacked the penetrative force of the old-style gun. It was only after practical trials of those belonging to sportsmen from town who visited my place, that I came to recognize their greater convenience and efficiency, and finally to purchase one of the arms I had so long derided. However, even when I did not lose my regard for my old-time piece, but still clung to it, and I trust it will ever remain one of my most valued possessions, for the good work it has done and the pleasant memories a sight of it always inspires.

"Well, as I said at first, I was hunting that day with the old gun. You've seen it—English twist barrels, plain walnut stock, strong, smooth-working locks, well balanced and weighing about 8½ pounds; no fine finish or ligree, but built for actual work, which it is still capable of doing, in spite of the exposure and many hard knocks it was subjected to during the years of its use in the field. For foxes I always loaded it with a stiff charge of BB's—I don't know how many ounces, for I never measured either powder or shot in those days, only with my eye as I turned them out in my hand—and in addition to the regular shot charge generally dropped a round pistol bullet, about 150 to the pound, on top of each load. These the old gun threw surprisingly straight, considering the amount of play they had in the barrel, and with great force. Of course there was considerable ruck about it, but I found that I frequently stopped my game at long distances by means of them, and the fact that I scored a kill in the particular case of which I am speaking was due solely to this extra item of my load.

"It was late November, but no snow had fallen. I had the fox going soon after light, hoping to be able to pick him up on the heavy frost of the night, but though the dogs whooped him along merrily for two or three hours, somehow he managed to steer clear of me. The sun was now well up, pretty much spoiling the running, and as the fun was fast dropping out of the chase I was thinking of getting the dogs off the trail and starting for home, when all of a sudden I found they were coming toward me. I was stationed in the uppermost of one of a succession of fields making back into a hard-wood growth toward a range of hills, on my left being a low mountain. I had expected the fox would pass between this detached peak and the hills, but finding that he kept to the opposite side of the mountain and would in all probability cross the fields some distance below my position, I started full speed to intercept him. A cart road led back through the fields past the base of the mountain, and taking this I ran my prettiest, vaulting lightly over a set of bars between the first and second fields. But at the next fence a high gate closed the way. The fastening bothered me, and the wall on either side being piled high with brush, I started to scale it. On the opposite side of the next field, which was only about a hundred yards in width, there was another set of bars behind which I intended to take my stand. I had just got astride the top rail of the gate, my left leg in front and my right leg half raised to follow, when my eye caught a swift dash of red under these very bars for which I was making. I was rigid in an instant, and the spot of red stopping just as suddenly, resolved itself into a magnificent fox. There he stood, or rather half crouched, under the bars, motionless, and alert to catch the first sign of danger. Apparently he had heard or scented me—probably the latter, for the little wind there was moving from me to him—and was trying to locate the danger before making a move that might betray him. For my part, though in a most unnatural position, I dared not move a muscle for fear of giving him the alarm. I supposed, of course, he must soon get his eye on me, but, strangely enough, he seemed to be looking under me all the time. The ground descended sharply from the gate to the bars, and perched on the top of the high gate I was at a much greater elevation than he was accustomed to see those who hunted him. The sun, too, was at my back, and a fox's eyes are no better than a man's in a strong sun.

"The tableau probably was not of long duration, but every second seemed a minute to me. The strain was indeed terrible, and finding I must soon lose my grip altogether, I resolved to put an end to it. It was a long shot, but it would do no harm to try it, especially as the dogs, which for several minutes had been yapping in a puzzled sort of way back about a mile, had now got straightened out, and would soon be on the scene. I had my gun, uncocked, in my right hand, which rested on the top rail beside me. My first move was to work my hand back to the grip and softly raise each hammer in turn. Next, very cautiously, I lowered my right foot until it rested on the rail beside the left. Then, poising myself as I threw the gun to my shoulder, I pulled both triggers in quick succession. I was nearly knocked backward from the gate by the recoil; when I recovered my balance the fox was nowhere in sight. I jumped to the ground and ran down to the bars. There he lay, just back of the wall, kicking his last. One of the pistol bul-

lets had hit just inside the left fore shoulder, and passed clear through him. Later, I measured the distance between bars and gate, it was ninety-six yards. But of course this was much beyond the legitimate range of the gun, for while I found where several of the BB's had struck him, it was the lucky bullet that did the work."

TEMPLAR.

CORNISH, Me.

## The California Bluejay.

Editor Forest and Stream:

I inclose copy of a circular that has been extensively put in circulation in northern California this year by a Sacramento sporting goods firm. It offers a series of rewards for strings of bluejay scalps taken before Sept. 1, 1905. The reason for instituting the bird-killing competition is thus stated:

"We believe that bluejays, skunks, raccoons and other varmint that prey upon the eggs and young of our game birds are more destructive to them than all other factors combined, and they do not use guns and ammunition in the annihilation, either. That's what makes us mad. Now you do, and the more game there is, the more will you use, and the more we will be benefited. Bluejays, in our opinion, are the greatest natural enemy that quail have, therefore, we would like to see them exterminated first. The other skunks will receive our attention in due time. We wish to educate our people as to the habits of these ill-mannered pests, so that it will become a sort of habit to kill them on sight for years after this contest has been forgotten."

This certainly shows that the sporting goods house is very enterprising; yet I believe that the call for a decimation of bluejays is warranted. The bluejay is an arrant pest. Many miners and prospectors have told me of finding quails' nests which had been visited by bluejays and who had destroyed every egg in the nest. Ranchmen complain, too, that the bluejay will visit barns and chicken houses and tap the eggs of poultry in nests under cover. He is bolder than any other varmint, including chicken-hawk, raccoon or skunk, and not so easy to be caught as the quadrupeds, and will keep out of the way of a gun better than a hawk.

I don't know what progress this unique campaign is making against the blue feathered biped, but after seeing so many bluejays and so very few quail as I have in several months of journeying through Plumas, Nevada, Butte and Yuba counties, I think something ought to be done to give the quail a chance.

I don't believe in encouraging youth to ruthless slaughter, but in this matter of exterminating bluejays, I believe it is justifiable. I would go further, and ask the Audubon Society to recommend women to wear bluejay feathers in their millinery—they would thus assist in an attempt to extirpate an ornithological cannibal which the bluejay surely is. He does not stop at quails' eggs, but the egg of any and every bird is natural food to him, except the eggs of his own kind of feather. All manner of song birds suffer from his unnatural penchant for eggs. He is a gourmand and makes havoc with a nest, whether it contains two or twenty eggs, so long as they are fresh.

Anyway, the bluejay ought to be killed off on general principles. Nearly every hunter knows he is a nuisance. He will spy a man with a gun a long ways off and give warning to deer. He and the squirrels will, by their screeching and chattering, warn everything around about for half a mile that there is a hunter around. But in doing that service for the denizens of the forest, the squirrel and bluejay are both hypocrites—they want the field of game to themselves.

Of recent years, at any rate, grouse and quail and dove have almost entirely disappeared from the foothills of the Sierra Nevada Mountains, where they rim the Sacramento Valley on the east, but the game birds have nearly all disappeared, while the bluejay is about the only large bird that continues in evidence in numbers, excepting hawks. Even the woodpecker is conspicuous by his almost total absence.

WM. FITZMUGGINS.

## Camp Fires of the Wilderness.

MR. E. W. BURT'S happily entitled book, "Camp Fires of the Wilderness," has enjoyed a wide popularity, especially in New England. It has been for some time out of print, but the many calls for it have led to the issuing by the Forest and Stream Publishing Company of a new edition, which is a great improvement on the earlier one.

The volume treats of a multitude of matters of the highest interest to the camper, who unless he is made comfortable by the exercise of a little expert knowledge and thoughtfulness, may find himself when in camp the most miserable of mortals. A man who has had experience knows what to take and how to travel. He makes himself as comfortable as at home, while the free and independent life, the exercise that he is constantly taking, the fresh air in which he works, eats and sleeps, combine to render his physical condition so perfect that every hour of every day is likely to be a joy.

"Camp Fires in the Wilderness" is written for the benefit of those persons who wish to go into camp, yet are without experience of camp life. It comprises the results of Mr. Burt's experience of travel, chiefly by canoe and on foot, through various sections of the country, and it may be read with profit by everyone who enjoys camping. The author tells what to take into camp in the way of bedding, tents, camp equipage, cooking utensils, food, medicine and fishing tackle. He gives advice about camp locations, camp life, cooking and travel, and gives fresh and pleasing accounts of a number of trips that he has made. There are given in the book partial lists of the fish and the wild animals of the Maine

woods, and the last chapter tells the reader how to build a log cabin. The volume is very fully illustrated by half-tone cuts, some of which possess especial interest.

Mr. Burt's book was very warmly received by the press of the country, and it may be predicted that the present edition, which has been wholly rewritten, enlarged and improved, with some additional pictures, will have a greater popularity than the old one. The volume deserves a place in every sportsman's library. Illustrated, cloth, 221 pages, price \$1.25.

## A Rifle for Big Game.

NEW YORK, July 31.—Editor Forest and Stream: I was glad to see the striking page advertisement of the Mannlicher rifle, which appeared in last week's FOREST AND STREAM, for it has reminded me that if I shall succeed in getting off for a hunt this autumn, I mean to try that arm.

I shall do this because of what has been told me about it, not only by several competent men who have used it in the Rocky Mountains and who have highly praised to me the strength with which it shoots and the slight fall of the bullet at distances considerably over 100 yards, but also because of what has been told me by two rather eminent African travelers—one an eminent naturalist engaged in the collection of specimens for a great museum, the other an explorer in one of the greatest game countries left in Africa, that about Mt. Kilimanjaro.

These men carried a very varied armament, that of the explorer ranging from elephant guns to rifles of very small bore. While the hunting of different game required the use of rifles of different sizes, the explorer told me that in the fighting which he was forced to do with some of the native peoples, he and his men used the Mannlicher, and that it proved a most effective weapon. He also spoke of it as the great hunting arm for long-range shooting.

My purpose is to use the rifle in the northern Rocky Mountains on mountain sheep, animals at which one sometimes is obliged to shoot at very considerable distances, especially where the sheep are as wild as they are in some places where I have hunted north of the boundary line.

BIG GAME.

## Primitive Man and the Beasts.

IF, as seems probable, the animal fear of men was acquired, and is not natural to their minds, it is not very clear how the very early tribes of men, when the larger carnivorous animals were far more numerous than now, escaped destruction and survived long enough to impress on the animal world the sense of fear by which man now dominates it. Regarded merely as a conflict between one class of animals and another, the result should not have been doubtful. Man ought to have disappeared from the face of the earth, or, in any case, to have retreated to remote strongholds in regions not frequented by the beasts. That he did not do so, but turned the tables on the better equipped offensive creature, is fair presumptive evidence that original man never was on a level with the animals in intelligence, but was equipped with the predominant brain-power which has put him ahead in the race ever since. Primitive man, literally speaking, "lived by his wits," for he could have owed his survival to little else. He was not, for example, nearly so well equipped as the monkeys for physical defense or fight, though their survival is not altogether easy to explain on purely physical grounds. Their power of using their arms and hands as a means of swinging rapidly from branch to branch gives them an advantage over all the tree-climbing cats. Their habit of throwing missiles is also very disconcerting to other animals, though this art is only practiced by certain monkeys.

But their rapid and intelligent combination for defense, menace, and lookout duty has contributed quite as much to their survival as their speed and activity. In tropical America even the monkeys are hard put to it to escape the attacks of such active and formidable foes as the harpy eagle and the ocelot. But it cannot be proved that even the most debased or physically weakest of mankind has ever been the "natural prey" of that "natural enemy" which, according to Sir Samuel Baker, is the nightmare of nearly every species of non-carnivorous animal. The causes which make exceptions to this rule are temporary and narrowly local. Even the Greenlander and the Esquimaux are the masters of the polar bear, and probably always have been, though little better armed than primitive man, and the pigmies of the Central African forests are mighty hunters. It may even be that the neighborhood of fierce animals aided the early development of man; for the least developed races are largely found in such places as Tierra del Fuego, where, in the absence of savage beasts, savage man had no inducement to arm and equip himself.

But man has had an even more potent ally than his own ingenuity which from remote antiquity has invested him in the mind of the animal world with something of the supernatural. He is ever accompanied by the one element which the animal mind cannot create, cannot understand, stands in constant awe of, and dreads by night, when its courage is greatest and that of man least steady. Fire, that pillar of cloud and flame which precedes not the aggregate human host, but the smallest fragment of the invading army, the constant and dreaded harbinger of human presence, springing up, as the beasts must think, automatically from the earth wherever man rests his body, guarding him in sleeping and waking, always associated with his abode, has for ages terrified the beasts.—London Spectator.

## A Reminiscence.

My friend Hill and I had held many an earnest and prolonged discussion over the question of a suitable place at which to spend our approaching summer vacation. To give a proper flavor to these lines, let me preface them with the remark that we were both members of that large and respectable fraternity, known as fishing cranks.

It was not a fashionable resort or "watering place" that we were in search of. On the contrary we preferred something wild and primitive, where we could find a bit of the "strenuous life" and be mother nature's red-faced children once again. We had, for several weeks, been laying in a stock of flies, leaders, lines, reels, and many other interesting and necessary etceteras which go to make up the fisherman's outfit, and which, as a rule, give us more pleasure, in their selection and purchase, than we ever get out of them again.

In this way we had worked ourselves up into a high state of enthusiasm and were, so to speak, hot on the trail of the best trout fishing to be found within a radius of 500 miles of Chicago.

One day, over a down-town lunch, Hill broke out after this fashion: "See here now, Colonel, let us go about this matter in a sensible and business-like way." Whenever Hill struck that gait, I knew something unusual might be expected, and so I was all attention.

"Now," he continued, "every time we have been disappointed, it has been because we listened to these fellows that go fishing for a week, and catch their fish after they get home—mostly suckers—and then advise their friends to go to streams that have been fished to death—if they ever did afford a day of first-class fishing. Now isn't it about time that we began to make some use of our knowledge of geography and the general lay of the land—the number and character of the streams; the nature of the country, as to farming, lumbering, mining, railroads and other matters having a bearing upon the problem, and in this way figure out for ourselves, just where good trout fishing and plenty of it can be safely depended upon."

Leaving no opening for me, he went on: "Now I have an idea, that somewhere on the Northern Peninsula, where the rivers of Lake Superior, and those of Lake Michigan and Wisconsin take their rise, and flow off in different and opposite directions, we can find just the place we are looking for."

Mrs. Hill makes as fragrant a cup of coffee as ever was brewed; and knowing this so well, I suggested that we adjourn to meet at his house on the following evening, for an after-dinner continuation of the discussion, with special reference to his valuable suggestions. Of course my motion was adopted. The hour having arrived, and dinner over, I was in a measure compelled to brag on the elegant action of Hill's favorite rod—and also to listen patiently to that whopper that he always tells about how he took thirty-four trout (none of them less than a foot long) out of one hole, with that same rod and a now faded and bedraggled Parmacheneebelle.

The maps were at length brought out and we began a careful examination of that stretch of country, known as the "Great Divide." We were not long in discovering a net work of streams, that seemed to have gotten mixed up with each other, and after wandering around in an aimless sort of way, had in some mysterious manner untangled and separated.

The town of Watersmeet seemed to be located in about the center of the tangle of streams. We learned upon further investigation and inquiry that lumbering in that section was a thing of the past, and that we should therefore escape the annoyance of the frequent flooding of the streams, which we had so often met with on the Southern Peninsula.

It was not a farming country, and therefore only sparsely populated, and of course, the streams were not fished out. If any other consideration was necessary to convince us that we had found what we were looking for, it was discovered in the fact that the Northwestern Railroad Company had for years assisted in, and encouraged, in every way, the stocking of those streams, and also, in the protection and preservation of the trout. And so it was settled, Mrs. Hill and her two lovely daughters all voting in the affirmative that we should go to Watersmeet.

The day of our departure arrived, and our baggage was checked and our tickets punched, for what we felt sure was the fisherman's Eldorado of the Northern Peninsula.

The Northwestern runs a special and palatial train for the accommodation of the fraternity, leaving Chicago at 5:05 P. M., and arriving at Watersmeet at 7:06 A. M., without change or other discomfort, and just in time for breakfast, with Mr. and Mrs. Darling, of the R. R. eating house. We shall have a word to say about this man Darling a little later on. I shall never forget the first few hours of that evening ride. Any one who has ever resigned himself to the comforts of a Pullman sleeper, for a flight through whirling fields of grain, orchards, meadows, groves, gardens, and restful homes, all aglow with the rose-tinted flames of the setting sun, with his case of favorite rods by his side, while only a few hours beyond—and they to be hours of rest and slumber—the royalest sport on earth awaits his arrival; any one who has experienced all this, knows all about it.

The morning came none too soon, and while the dew was still glittering on the jack pine, the cedar, the tamarack and the spruce, we whirled down the tortuous valley of Duck Creek, into Watersmeet, and were soon introduced to Mr. Darling and—to breakfast.

I think I'll just pause here and have it out with this

man Darling. He was rightly named. In other words, the people who named him Darling builded better than they knew. After breakfast, and a few passing remarks, as a sort of limbering up process, I told him we had come to stay for several weeks, and expected to go into camp on the outskirts of the village, if we could find a suitable location. Now who ever knew a hotel proprietor to drop his morning newspaper, and interest himself in hunting up a camp for strangers whom he had known but an hour? That is just what he did for us, and within a few minutes we were standing on a beautiful grassy knoll that seemed to have been made to order for us. After we were nicely settled, I called on Mr. Darling and stated that we would like to get a little ice from day to day, and that we expected to pay well for the accommodation. He asked me if I knew where the ice-house was. I told him I did, for it was one of the most conspicuous buildings in the village. "Well," said he, "it's all yours."

About the next time I met him he took my breath away after this fashion: A gentleman by the name of Fuller, from Chicago, brought in as fine a basket of trout, running from twelve to fifteen inches in length, as I had ever seen. Mr. Darling had been with him and informed me that they were caught in the pools, about three miles below on the Ontonogon River. "Any time you would like to try your luck, I'll take the Pede and run you down in the morning, and if I can't stay with you, I'll run down in the evening and get you."

I hardly knew whether to take him seriously or not, so I turned to Mr. Fred Johnson, an acquaintance of a few days, and asked, "Does he mean it, Mr. Johnson?" He simply replied, "When you have known him as long as I have you will not doubt it."

The Pede was a railroad velocipede, and many a ride we enjoyed, after days of sport and toil, and they are all days of toil—before we regretfully turned our faces toward home.

Mr. Darling had spent many days with us, devoting himself wholly to our pleasure and success, when I said to Hill: "It cannot be that Darling is going with us this way just for the fun of it." So I walked down to the hotel and said to him, "I think I'd better settle up before we get in too deep."

"Settle up for what?" "Well," I said, "you have been with us several days now, and of course we expect to pay you." But it was no go, he simply walked off and left me. I have omitted to mention a very characteristic incident which occurred a few days after our arrival.

"By the way," said Mr. D., "if you folks ever want any fresh meat, you'll generally find some part of a carcass of a sheep hanging in the cold storage room, and if you don't know enough to help yourselves, you ought to go hungry."

Then turning to Mr. Johnson, he said, "Fred, take Mr. Akers in and show him where to find it." The result was that I went back to camp with a mess of chops on which no fiber of wool ever grew.

I must here refer to another matter, which added so much to the pleasure of that memorable summer. The Northwestern Railroad people treated us as though we were the special guests of the company. We could take any morning train and be landed at any stream, lake or other point of interest, by simply notifying the engineer where we wished to get off. At night all we needed to do was to wave our baskets before any approaching train, and the brakes were instantly whistled down, the train slowed up, and a strong arm assisted us aboard. We never found a conductor who would accept a penny for such a princely favor.

The summer was not specially favorable to trout fishing, on account of the extreme drouth and consequent shallow and clear water; and yet we seldom ever failed to make a fair catch when we went early and staid with them. The lakes about Watersmeet are even more plentiful than the streams—clear, cold and alive with bass.

I never knew until I began to visit them, what sport two men and a boat can have with the proper casting tackle, where bass are plentiful, fat and saucy, and just spoiling for a scrap with a spoon. Mr. Darling had loaned me a Meek reel, and introduced me to one of his guests by the name of Mull. I soon found myself wondering how I had managed to get on so long without knowing Mull. He had often visited that locality and knew the ins and outs—the cross-cuts—where the boats were sunk and the paddles concealed, as well as any guide in the country. He was an expert in handling a boat, which, by the way, is a valuable and well-nigh indispensable acquisition for the bass fisherman. When you see two men come in with a fine catch of bass, give the man who handled the boat more than half the credit. Mull could cast with wonderful precision. His line never tangled, his spoon went out like an arrow and generally dropped just where a bass was waiting for it. Given an old sunken log—with the boat brought to it properly—and you could safely wager that Mull's spoon would drop within six inches of it, near the shore, and then dart like a ray of light lengthwise along the log and—there was something doing. When he struck the hook home, he usually remarked, "That's the system," and seldom ever failed to land his fish. I have known him to land thirty small-mouth bass in thirty consecutive casts.

Our first trip was to Lake Marian, about three or four miles northeast of town. We took an early train down to Crosier's Mill and walked across the country to the lake. On this cross road we passed through grand timber that might have been the meeting place of King James and Rob Roy.

Mull raised an old boat, and we were soon crossing one of the loveliest lakes one will see in a lifetime. In

going over and returning, we saw by actual count fourteen deer. This was a day long to be remembered. The bass were of the large Oswego variety, and what a fight they could put up! I had a strong Chubb rod, in which I had unlimited confidence.

Mull generally took the paddle, and headed for a tree top, and knowing that I was a novice, he cautioned me not to cast until he gave me the signal. "Now Drop your spoon just this side of that limb. Reel in quickly"—I was fast on the largest bass that I ever tackled. Then the fun began. "Look out! Keep him out of that brush. Keep your line taut! Give him line—give him line! Look out, he's coming at you." But I was too slow—under the boat he went, and before I realized it, my rod was broken into slivers; but my hook had gone home to stay, and seizing the line, I continued the struggle, and at the end of a hard-fought battle, my bass was safely landed.

I gazed upon him with a tinge of pathos, and with a feeling of admiration for his pluck and fighting qualities.

But I have neither time nor place in which to relate the many thrilling incidents of this day's sport.

On our return to the railroad with a very heavy sack of bass, we found Mr. Darling—the darling—waiting for us with the Pede.

Mull and I hired a horse and a sulky and simply did the country. We visited lakes seldom ever fished, made our own rafts, and held many a cotillion with their unsophisticated inhabitants. We were fishing one day in west Six Mile. Mull had hooked an unusually heavy bass and was having a time to keep him out of a pine treetop lying a few rods from us, and to prevent which he was urging me to pull out in the lake further. Finally the big fish sulked under the boat, and Mull arose from his seat, and squatting on his haunches close to the side of the boat, was trying to dislodge his bass, when in some way he lost his balance and went over, capsizing the boat and turning me out into twenty feet of water.

I can only give a very brief account of this well-nigh serious affair. Our heavy iron anchor went to the bottom and neither of us thought anything about it. But as soon as Mull began to swim and push, the boat sank, so that I could barely touch it and keep my head above water. At length I touched the rope with my foot, and then knew what the trouble was. With difficulty I raised the anchor and got it in the boat. We then swam and pushed it to where Mull saw our paddle, and having recovered this, we succeeded, after having been in the water fully an hour in getting the boat to shore. I was well-nigh exhausted. We emptied our boat, wrung the water out of our clothing, and went back to the scene of our accident to see if our tackle could be located. Drifting as quietly as possible, Mull, with his face close to the water, soon announced that he could see my rod. Over he went like an otter, and soon rose with the rod and Mr. Darling's Meek. In this way we recovered everything, except Mull's fine rod and reel. His bass had carried or dragged that away and we failed to get trace of it, and had to go home without it.

On the following morning he and a friend returned, with a drag of hooks, and on the first draw caught his line and so recovered everything but the bass. Mull was much chagrined that he did not get him, as he intended to have him mounted as a souvenir of the crowning catastrophe of that eventful day.

J. W. AKERS.

## Why One Goes a-Fishing.

To CATCH fish? Perhaps, but that's not half the story. Even the man who fishes for his living cannot be satisfied with such an answer. He goes out upon the waters that he may get the wherewithal for the maintaining of his little home. And you and I, anglers not for pelf's sake, but for the love of the sport, surely we will not hear complacently that we go a-fishing to catch fish. True, an empty creel at eventide gives us a keen sense of disappointment and a full one a rich feeling of satisfaction, and yet to sum up our day's angling in terms of the content of the creel—why, it is simply absurd.

Think of the ozone we have inhaled, of the enchanting views we have beheld, of the birds' songs we have heard, of the fairy-like reflections we have seen in the water, of the much needed exercise we have taken, and of the manifold indefinable glorious experiences of which only the angler knows, experiences but remotely connected with the actual catching of fish. To catch fish! Bah! He is but a sorry philosopher who would so say. If that were all, you and I had no such love as we have for the tapering rod, jeweled reel, silken line and graceful fly.

To-day as I lie on the soft moss under the branches of a giant pine on the shore of the lake, and with a peculiar delight anticipate to-morrow's fishing—ah, it is not just the catching of fish that explains that delight. And the psychology of my present experience every angler understands, and he alone.

By the by, do we, lovers of the angle, not find a large measure of our happiness in our sport through anticipation, and also through memory, living over again the glad hours when we sought the sequestered lair of the lordly salmon, or wary trout, or doughty bass? (This thought comes to me as I am dreaming of the morrow and recalling the past, while I lie here in the shade and my eyes rest upon the rippling water yonder shimmering in the twilight.)

To catch fish! Oh, how small a part is thus answered! What freedom from professional and business care in angling! If those overworked, nervously unstrung men in our cities, who walk the streets nights because they

cannot sleep, finding it impossible to throw off their care and rid themselves of worry, could and would go a-fishing! Too bad many of them know not the art! I have heard physicians say that the rod and line have been to them of greatest value, enabling them to rid themselves of many of the anxieties of their noble calling and become refreshed in body and in mind. To the lawyer, too, and the clergyman and the instructor, angling brings a blessed freedom from care, and brings recuperation, zest, new life.

No wonder that those who fish, as you and I, hotly spurn the idea that the story is told when it is said that one goes a-fishing for fish. No, indeed! We are not such fools as to spend hours, days, even weeks just in catching a few or many of the finny denizens of the water merely for their possession, or even the sport of catching them. In angling a thousand benefits are obtainable! Angling may enrich a man in mind and in heart, put bronze on his cheek, light in his eye, red corpuscles in his veins, strengthen his muscles—invigorate him in body, mind and spirit for his life's work, whether it be in the pulpit, at the sick bed, in the court room, in the counting house, or in the shop. Nothing surpasses it as an all-round benefactor. And to be commiserated is the man who knows not how to angle.

Maybe such a one may read these lines; if so, I urge him to arise, and with some earnest Izaak Walton make his way, rod in hand, to catch fish—oh, not that only, but to begin a pursuit that will prove an ever-increasing source of pleasure and comfort to him to the end of his days.

CORNELIUS W. MORROW.

## The Sea Trout Redivivus

Editor Forest and Stream:

After all that has appeared in your columns for the last thirty years on the vexed question of the identity of the so-called sea trout, I thought the subject had been pretty well threshed out. After the admission from Mr. Hallock and Mr. Chambers, to say nothing of Prof. D. Starr Jordan, the leading ichthyologist in America, that "the marine and fluvial trout are one and the same fish—varietally and structurally—differing only in coloring and other conditions resulting from their habitat," (see issue of March 11 last) I, for one, considered the question settled; as did, I think, all who have taken enough interest in the matter to follow the discussion in your columns. But what will Dr. Morris, E. A. Samuels, W. B. Merston, Walter M. Brackett and all the other anglers, observers and writers who have caught and studied the fish from the waters of Labrador and Newfoundland to those of Bay Chaleur and on both shores of Nova Scotia from Cape Sable to Cape North, say of this new Richmond who entered the field in your last issue?

The revelations contained in Mr. Hickson's letter to Mr. Hallock must have amused the veteran naturalist, and he must have smiled sardonically at the latest exemplification of Pope's immortal line: "Fools rush in where angels fear to tread"; but to give the jejune effort to the angling world through your columns was "the most unkindest cut of all."

Mr. Hickson says he has proved, "that sea-trout go to sea, first by the fact that we have caught trout 8 and 9 pounds far from the rivers in which these trout spawn; we have caught them at the mouth of Bathurst harbor."

\* \* \* With all these things considered, where do the large sea trout which appear in the early spring with the smelts come from? Had Mr. Hickson known a little more—what every angler on Bay Chaleur is familiar with—he would know that the estuaries of the Cascapedia and the Bonaventure (in which rivers the largest trout known in Quebec and New Brunswick spawn) and the estuary of the Nepisiguit face each other, with only a few miles of open water between them. The very large trout taken occasionally on the New Brunswick side of the bay early in spring, are, in the opinion of those who have made the subject a life-study, stragglers from the Québec rivers, in which they are indigenous. What proof is there in all this that these trout "go to sea"? Does anyone except Mr. Hickson consider the almost landlocked Bay Chaleur, with innumerable streams from both sides flowing into it, and all containing sea trout, to be "the sea"?

Mr. Hallock, who is familiar with Labrador and its rivers, all abounding in sea trout, must have laughed when he read the following in Mr. Hickson's instructive letter: "My opinion is that these trout have recently been released from the large Newfoundland and Labrador rivers, where they were imprisoned by ice, and as soon as released they have gone out into the Gulf of St. Lawrence, struck the spring-run of smelts and herrings and followed them into the Bay Chaleur." \* \* \* These are, therefore (?), the trout which we find feeding on the smelts and herring spawn in May and early June." As Captain Cuttle would say, "here's an opinion as is an opinion," and it can surely claim the merit of originality. This new Richmond in the field must be as ignorant of geography as he is of natural history. Is there no captive smelt, herring spawn or other food along the coasts of Labrador, Newfoundland, Cape Breton, Anticosti and the Magdalene Islands (in all the rivers of which sea-trout abound), that the trout from these coasts and rivers should seek it in distant Bay Chaleur? There is not a single fact in this wonderful letter that has not been stated in your columns a dozen times, and nothing but Mr. Hallock's well known sense of humor could have led him to publish it.

But enough of this ignorance which Mr. Hickson mistakes for knowledge. Let me come down to matters that even his limited intelligence can understand. In a long life of observation and study of this subject I have never been able to find a sea trout in New Brunswick or Quebec waters of 8 pounds weight; the largest I ever saw weighed was from the Bonaventure, but it did not turn the scale at 7½ pounds. I have seen many and caught a few in Cascapedia that weighed 6½ and 7 pounds. Still, as Mr. Hickson says: "These facts being proved [no proof is given in his letter] that we have the big sea trout, 8 and 9 pounds in weight, caught in the open bay and in the salmon nets four miles on each side of the entrance of the river." I will not be so discourteous as to contradict him, strong as are my convictions; but, as I am anxious to have the "proof" he speaks of, and as the open season for salmon fishing does not

close until Aug. 15, I will give \$10 each, and pay express charges, for all the sea trout weighing 9 pounds that are delivered to G. A. Pearson, M.D., of Sussex, with an affidavit from the sender that they were caught on the New Brunswick side of Bay Chaleur.

THE OLD ANGLER.

## Black Bass of the Bay of Quinte.

THE Bay of Quinte stretches along the south shore of Ontario from the city of Kingston to the Murray Ship Canal, near Trenton, altogether about ninety miles. The Murray Ship Canal is about six miles long and the line of boats from Montreal to Toronto go through this canal and by doing so avoid about one-half of the lake.

There is a channel which is defined by buoys through the entire length of this bay, and outside of the channel the lake is full of bars or shoals of from nine to twelve feet deep which constitute the fishing grounds of the bay.

The head of this bay is about north of Rochester, and it can be reached in two ways. One is by Clayton, and taking a boat there to Trenton or going over to Gananoque, nine miles distant, on the Canada shore, and taking the cars on the Canada railroad to Trenton Junction, where you can take the cars about three or four miles to Trenton or you can go to Rochester and go from there to Charlotte, about nine miles, and take the boat across the lake to Coburg, and then take the train east, about twenty miles to Trenton.

The bass fishing in the Bay of Quinte is very indifferent until about Aug. 25 or Sept. 1, and then the large bass go upon the shoals, and the average catch after that is about 3 pounds up to say about the middle of October, many of the bass weighing from 4 pounds to 4¾ pounds. In my fishing I have taken all my bass with a trout rod weighing about seven ounces, and using about 300ft. of line with a single snell and small hook, and using a minnow for bait.

In fishing for bass I have had my boatman drift or drag, which means rowing very slowly so as to keep the hook from catching on the bottom and letting out about 75ft. of line, and when I feel the bass at the hook I let out about 60 or 75ft. more of line until the bass has had time to swallow the bait, and then give a very slight jerk to set the hook in the fish, which at the same time usually leaps out of the water two or three feet, and with skillful management I have almost always landed my fish.

In my judgment, this is the finest accessible fishing ground to-day in the United States for black bass, all of which are small-mouthed bass.

Unfortunately there are no persons at Trenton, which is at the head of the lake and where you will find much of the best fishing, or at Northport, about twenty or twenty-five miles east of Trenton, where the fishing is equally good, who have any knowledge of the shoals or bars, and it is therefore necessary to get a boatman from Clayton, and quite a number of them are thoroughly acquainted with these grounds. This, of course, entails a considerable expense, as these boatmen expect to be paid \$3 a day from the time they leave home until they return, and also to have their expenses paid, which is usually about \$1 a day at the hotels. In addition to this we have to pay our own expenses—about \$1.50 a day at the hotels—and provide our boat, which costs about \$1 a day, so that the daily expenses of this trip amount to about \$8 or \$9 a day.

## Conditions at Temagami.

BUFFALO, N. Y., July 31.—Editor Forest and Stream: Coming out from Temagami last week I met a man going in with a bundle of golf sticks. I was startled at first, then the humorous side struck me and I thought what fine grounds he could find in that country of timber and rocks for playing the game. But, in a sense, it is only a forerunner of the summer boarder and the opening up of one of the finest spots in America. Already there is a hotel at Temagami station, one at Temagami Island, and a boarding house on Bear Island, and more to be built this winter. While most who have gone there this year are enthusiastic fishermen, another year will find loungers around the hotels and guests dressing for dinner. With this the charm of the place will be lessened and the magnificent stillness be disturbed, but the beauty of the lakes, islands and woods will be a perpetual pleasure, for the place has been set aside as a reserve. Right now it is a breaking up of the old ways and the new railroad in there will do the rest.

On Bear Island lives Mr. McLean, who has lived in its vicinity for thirty-eight years, and who has been hunting and trapping in the Hudson Bay territory for over fifty years. He is a willing talker, and it is a treat to listen to his experiences and the hardships he has passed through. There were no wolves or Virginia deer in that district when he first trapped there. Now there are both. His opinion is that the wolves have been baited in by the moose carcasses left by hunters, who take the heads and leave the rest in the woods, but it seems more probable that they have followed the red deer there. Many moose and deer are seen there by camping parties, and I saw a fresh moose skin from a moose recently killed by the Indians. They are allowed to kill them at all times. But it seems that the laws have been of little bother in the past.

A lady told me that she was camping there last summer, and she expressed a desire to one of the forest rangers, who are also game wardens, for a grouse. The next day a bag was left in front of her tent with the remark that there was a bag of Spanish onions for her. There were several brace of grouse in the bag. Some of the fishermen this year are catching over the limit in numbers and keeping bass under the ten-inch limit. The printed regulations are posted around, and there is no excuse for this. But no one seems to bother about it. I suppose it is because fish are plentiful and easily caught.

The largest bass I saw in two weeks weighed a little better than 2¼ pounds, and the largest lake trout weighed 26 pounds and 14 ounces when brought in. It is amusing to hear these trout called outaniche, landlocked salmon, salmon trout, etc., by the different fishermen. It seems that the great majority are not informed and do not trouble themselves very much as to what they are catch-

ing, and what is more, do not bother themselves to find out. The trout are lake trout, *Chistivomer namaycush*. One man who has made different fishing trips up north asked me the name of "those duck-billed fish." He alluded to the common pike, *Esox lucius*. By the way, Cabia Blanco writes in FOREST AND STREAM that he saw a mas-kinongé 27 inches long which he estimated to weigh 40 pounds. Is there not some mistake here? You are not allowed to keep one in Ontario under 30 inches.

The guide question around Temagami is a serious one. There are not nearly enough of them. They are very hard to get. I did all of my fishing without one, as I was unable to get one.

I do not think the bass there so full of fight as in some other waters, but the sport is good. The water is practically free from weeds; in fact, there is nothing but an occasional pond lily in some of the deep bays, and this makes fishing very pleasant. It is very easy, though, to get caught in the rocks trolling and to get caught trolling for trout with 200 or 300 feet of line out is quite a bother. It means lots of reeling and backing up. There seems to be quite a difference of opinion as to the pleasure of catching the trout there. One gave me the most excitement of any fish I caught, and yet some do not care for the sport. It seems to me that some give up easily while others fight very well.

DIXMONT.

## The Life History of the Angler.

BY THEODORE GILL.

From the Smithsonian Miscellaneous Collections.

ONE of the most interesting and remarkable fishes of the north Atlantic is that whose cognomen in books is angler, but which has received a number of true vernacular names in the countries bordering the waters in which it lives; it is scientifically known as *Lophius piscatorius*. It is the best known representative of a large group (order or sub-order) of fishes named pediculates.

For a long time only a couple of species of this family were known, but successive deep-sea explorations have brought to light quite a number, and the last reviser of the group—C. Tate Regan—in 1903 recognized as many as thirteen distributed among three genera—*Lophius*, *Lophionus* and *Chirolophius*.

The name angler, which is almost universally used for the fishes of this genus in books, is really a book-name, and not one in general use among shoremen and fishermen. It was, indeed, especially coined for the *Lophius piscatorius* by the English litterateur and naturalist, Thomas Pennant, in 1776; in his British Zoology, as he says, he "changed the old name of fishing frog for the more simple one of angler," simply because he did not like the former, which was one of the popular names. But there was no lack of real vernacular names. In England, besides fishing-frog, there are frogfish, toadfish, pocketfish, monkfish, nassfish, sea-devil, devilfish, wide-gut, wide-gap and kettle-maw, and these are supplemented by other local names in Wales, Scotland and Ireland. In America another set of names replaces the English ones. The most common along the Massachusetts coast is goosefish; in Rhode Island bellowsfish is in use; in Connecticut, molligut may be heard, and in North Carolina allmouth. One who has looked into the vast cavity behind the jaws will concede the aptness of the last name.

Although angler is not a true vernacular name for the *Lophius*, is is an analogue of names in popular use in other countries, as Pecheur or Poisson-pecheur at Bordeaux, Pescatrice at Rome and some other places in Italy, and Petricia at Malta. The modern Greeks have adopted the Italian name with a modified form (Peskandritza or Peskantrizza) into their own language; a true Greek word, Batrachopsaro (frogfish) is also in vogue at some places (Patras). Among the ancients it was known as the sea frog, the Greeks calling it Batrachos o alieus; the Romans, Batrachus marinus.

The angler's horizontal as well as vertical range is great, and covers a large portion of the north Atlantic on both sides, where the temperature may range between 32 and 60 degrees Fahrenheit—perhaps even higher. On the eastern side it is common in the Mediterranean and along the western coasts of Europe, becoming less common along the Scandinavian shores to the northward; it wanders upward, however, to the North Cape and the Faroe Islands.\* Along the American coast it is most common in the comparatively shallow waters of New England, and in deeper water about Nova Scotia and Newfoundland to the north, and as far to the south as the Caribbean Sea. "There is some reason to think that south of Cape Cod it retreats to deep water in summer."

While thus quite common along many coasts in rather shallow water, it appears to be at home in deep water. In the cold water under the tropical surrounding Barbados, at a depth of 209 fathoms; at another place, from "a depth of 365 fathoms" (according to Goode and Bean), specimens were dredged.†

It is emphatically a bottom fish, as its depressed form and up-looking eyes sufficiently indicate. It is also addicted to solitude, living apart from its fellows. In some selected nook, perhaps "hidden among seaweeds or stones"; perhaps "buried in the mud, with only the mouth and the gill-openings free," it "lies in ambush for its prey." At depths where algal vegetation no more thrives, it doubtless lies exposed or half-buried in the bottom, for the light is dim and extraneous concealment not much required. According to Day (evidently guided by Couch), in England "during the summer and autumn it resides near the shore where, by means of its pectoral fins, it forms for itself a cavity in the sand," or, should the ground be rough, it lies as if dead, while "its floating filaments, kept in motion by the tide, decoy other fish, and the angler's tendril is no sooner touched than the game is caught." Saville Kent, who had excellent opportunities of observing a large individual in the Manchester Aquarium (1874), was struck by its adaptation to its natural environments, and has given a graphic description of it.

\*Commencing with generalities, one of the most striking-

\*If the identification be correct, it even reappears around South Africa.

†The deep-sea Caribbean fishes are not in the National Museum, and the writer is unable to confirm the identification. They probably belong to a different species.

ing features that first attracted notice in this specimen was the remarkable likeness of the animal's head to a mass of rugged rock—the irregular outline formed by the prominent ridges of its upper surface, and the excessive projection of the massive lower jaw, especially favoring this simile. Following up the idea still farther, the illusion was found to be carried out to an extent altogether marvelous to contemplate. This prominent lower jaw in itself formed a natural rocky ledge springing from the parent mass. Along its lower margin are dependent, in the most highly developed state, those singular lobulate processes which extend in a straight line backward to the creature's tail. The size and shape of these processes vary considerably, though generally following a more or less leaf-like contour, and one between every two or three being much longer than its neighbor. As far as I am aware, no attempt has yet been made to explain the purpose or function of these appendages; but to one accustomed to hunting for marine treasures at low tide on a rocky coast line, their resemblance to the small flat calcareous sponges, ascidians, zoophytes, and other low invertebrate organisms which fringe the lower margin of every conspicuous ledge, is strikingly suggestive. The next point we arrive at is the wonderful apparatus upon its head, with which the animal has been supposed to lure on its prey to destruction. It consists of two erectile filaments, the foremost of which is produced at its extremity into a membranous digitiform expansion. According to the books, this expanded membrane owes its especial attractive qualities as a bait to fish in its vicinity to the glittering metallic colors which play upon its surface. As far as I can ascertain, however, by both personal observation and that of others, no such distinctive coloring really exists, the membrane sharing the sombre hues of the general surface of the body. Following out our rock simile, these organs yield another point remarkably favorable thereto; the foremost filament, with its digitiform membrane, is the facsimile of a young frond of oar-weed in both shape and color; and in the tendril behind it we have a repetition of the same with the blade of the frond, as it were, worn away by the current of the ocean. Our rock, however, is not yet clothed with all the growths that contribute to perfect its mimicry of nature; for where we least expect it—that is, in the animal's eye—we find the most extraordinary mimicry of all. These organs are very large and prominent, the iris being conical in shape, of a yellow ground color, with longitudinal stripes of a darker shade, while the pupil, commencing abruptly at the summit, is of so jetty a hue that the aspect of the whole is that of a hollow truncated cone, resembling, with its longitudinal stripes, the deserted shell of an acorn barnacle, and with an amount of exactness that is apparent to the most ordinary observer. We have here in this fish, then, the most perfect possible embodiment of a rocky boulder, with its associated animal and vegetable growths. Lying prone at the bottom of the ocean among ordinary rocks and debris, it might well pass muster as an inanimate object, and the other fish on which it preys would approach it with impunity, and never discover their mistake until too late to escape from its merciless jaws. Ensconce the animal snugly, however, in the crevice of some precipitous submarine cliff, and the illusion is more perfectly complete. No strategy need now be exerted by the voracious fish to attract his prey; he has only to lie close and quiet, letting his tendrils sway to and fro in the passing current like the weeds around him, and the shoals will approach, browsing the vegetation, or pursuing their crustaceous diet right into his very mouth. And that such surroundings as the foregoing are most congenial to the angler's tastes is abundantly evinced by the habit of the specimen in the Manchester Aquarium. He is ever slinking off to the rock work, and establishing himself so closely in some snug corner that it requires notwithstanding his large size, a considerable amount of diligent search to detect him.

Conceding the perfect aptness of Kent's remarks, the story is yet only half told. There can be little question that the foremost spine of the angler, with its leaf-like or worm-like appendages, does really attract fishes, in so far as they are moved by curiosity at least to approach so near that the angler can leap upon them and engulf them in its capacious mouth. Two thousand years ago and more the adaptation for concealment as well as for capture, by attracting other fishes, was recognized by naturalists and philosophers. Cicero of old, in his work on natural theology, looking at one side only of the question, called attention to the ability of the angler (or sea frog as he called it) to conceal itself and yet attract other fishes for its consumption.† Could those other fishes be heard, they would tell a story against providential interference!

Not long after the observations made by Kent in England, even better ones were made by the German naturalist, Schmidlein, on individuals kept in captivity in aquaria at the zoological station of Naples. His account is here translated from the original German:

"Lophius embodies, so to speak, a living angling apparatus. Unfortunately there is not much to record concerning its habits in captivity that might be considered as a contribution to the already known characters, for it is so peculiarly adapted for its dark mud-bottom, that it can never endure the confinement in our bright, well-lighted prisons with the clean sand for more than a few days. It lies for the most part on the bottom in perfect apathy without burying itself in the sand, and stares with its big dull, glazed eyes straight before it, while the jaws of the enormous mouth open a little and close at every breath, and the lobed barbels on the chin swing back and forth. At times it raises the 'hooks' on the head and lets the terminal lappets play, or it yawns and changes the color of its dull mud dress into a lighter or darker shade. It never takes any food either voluntarily or by force. If it is made to feed it will spit out the morsel again. Before death the skin of the tail generally peels off, and the tail putrefies from the point upwards. The sea-devil attains considerable size, and the aquarium several times possessed specimens more than a meter in length; the latter, however, could not survive even as long as the smaller fishes."

†Ranae autem marinae dicuntur obruere sese arena solere, et moveri propè aquam, ad quas, quasi ad escam, pisces cum accesserint, accipi a ramis, atque consumi. De Natura Deorum, 1, 49.

As one of the popular names, allmouth, indicates, the fish is well fitted to ingest food, and its instinct is coordinate with its capacity. It is, in fact, a most voracious carnivorous animal, and, so far at least as flesh is concerned, omnivorous. It is indiscriminate, too, for in Massachusetts some "annoy the fishermen by swallowing the wooden buoys attached to the lobster pots," and a man "caught one by using his boat-anchor for a hook." A bottom fish, it naturally feeds largely on fishes living on or near the bottom, such as flatfishes, gurnards, sculpins, sea-ravens, dogfishes and small rays, as well as crabs, lobsters, squids and starfishes. Impartiality in accepting what offers itself was manifest in one from which Buckland took "two marysoles, one common sole, one piked dogfish, one foot six inches long, three moderate-sized crabs, fourteen five-fingers, and one whiting." Observations were made on three Massachusetts individuals taken in 1897 and 1899 and recorded by Edwin Linton (1901). One "had in its stomach a large quantity of mud which was rich in mollusca, annelids and small crustaceans." Another, "a small specimen, had in its stomach a winter flounder almost as large as itself." A third had "fragments of fish." The first observation is of unusual interest as an evidence of what the fish may do when unsuccessful in securing larger prey.

Its search for food is by no means restricted to the

An angler of large size was also discovered in shallow water by a couple of boys who were in a boat, where they happened to be without oars. But with the intention, perhaps, of annoying the fish, they loosened a board that lay along the bottom of the boat and thrust it within the creature's expanded jaws, which immediately closed upon it. A struggle then commenced, but so firmly did the fish retain its grasp that it suffered itself to be dragged out of the water and secured."

Another feature of the fish is the slowness of its digestive powers. Couch has also aptly illustrated this characteristic, where the angler's skill was utilized by other fishers. "On one occasion there were found in the stomach of an angler nearly three-quarters of a hundred herrings; and so little had they suffered change that they were sold by the fisherman in the market without any suspicion in the buyer of the manner in which they had been obtained. In another instance there were taken from the stomach twenty-one flounders and a dory, all of them of sufficient size and sufficiently uninjured to make a good appearance in the market where they were sold." Still more apt evidence of the slowness of digestion has been given by James T. Linsley (1844). A large angler (three feet eight inches long), caught near Bridgeport, Conn., "continued alive out of water about twenty-four hours," and when cut open, Linsley "took from its

ANGLER (*Chirolophus naresii*).

bottom, however, for though a slow and clumsy swimmer, by stealthy approach it succeeds in surprising not only active fishes, but even birds and mammals swimming on the surface. According to R. Q. Couch (1847), in Cornwall, it also "frequently rises to the surface of the water in the summer and autumn, and lies basking in the sun."

Its success in capturing large birds swimming on the surface, is commemorated in a name most in vogue along some parts of the coast (goosefish); several "have been known to swallow live geese." A fisherman told G. Brown Goode that "he once saw a struggle in the water, and found that a goosefish had swallowed the head and neck of a large loon, which had pulled it to the surface and was trying to escape. There is authentic record of seven wild ducks having been taken from the stomach of one of them. Slyly approaching from below, they seize birds as they float upon the surface."

A number of analogous instances of capture of birds might be given. Birds quite as large as a goose have been taken, such as the loon and gull (*Larus argentatus*). Reliable Cape Cod fishermen, Captains Nathaniel E. Atwood and Nathaniel Blanchard, assured Dr. D. H. Storer that "when opened, entire sea-fowl such as large gulls, are frequently found in their stomachs, which they supposed them to catch in the night, when they are floating upon the surface of the water." Storer was also "informed by Captain Leonard West, of Chilmark, that he had known a goosefish to be taken having in its stomach six coots in a fresh condition. These he considered to have been swallowed when they had been diving to the bottom in search of food."

By far the most valuable studies of the food of the angler were made by T. Wemyss Fulton and published in 1903. No less than "541 anglers of various sizes, caught mostly in the Moray Firth, Aberdeen Bay, and the deep waters of the Shetlands were examined." Fulton's studies were for the purpose of ascertaining "the amount of destruction caused by this species among the food fishes." It appears that, "so far as the anglers investigated" were concerned, "the principal food consisted of whittings, sand eels, haddocks and common dabs, and in smaller amount of herrings, solenettes and others." The "proportions differ on the different grounds, and at different seasons." A noteworthy circumstance is that "the great majority of the fishes found in the stomachs were small, even when the angler was large." The rarity of large fishes was supposed by Fulton to point "to their greater caution than when younger." Besides fishes "the only other organisms found in the stomachs were a shore crab in one and a swimming crab in another, and cephalopods in thirteen."

Another noteworthy characteristic of the angler is the tenacity with which it holds on to what it has seized. A couple of anecdotes told by Jonathan Couch (1862) will illustrate. "Mr. Thompson, of Belfast, records an instance where a gentleman discovered an angler near the shore, and presented the butt end of his whip to it, when it seized and held by it until it was thus drawn on shore.

stomach subsequently, a large half pailfull of fishes, of various species, such as tomcods, cunners, bass-fry, etc.; of the latter, some were as perfect as when swallowed, notwithstanding the lapse of time mentioned."

## Fishing for Trout at the Cold Water

THE stream that I have fished for trout for the last twenty-five years has been fished by my father for more than fifty years. When he began to fish the stream its banks were covered with a dense growth of pine and hemlock and its waters kept cool through the greater part of the summer. He tells of catching trout on the riffles with bait in harvest time. But the saw-mills and the tanneries have stripped its mountain sides of everything but the hard-wood, and during my time the trout have been compelled to seek the mouths of the mountain brooks and the cold springs as summer advanced and the sun got high and warm. If the summer be a cool and rainy one, the trout may stay on the riffles until the middle of June, but the ordinary season will drive them to the cold water before the last of May, where they will lie in schools of several hundred with the smallest trout nearest the spring or the mouth of the brook and the big fellows away on the outer edge in the deepest water.

Trout at the Cold Water have certain peculiarities. They will rise to a fly early in the morning, just at noon, and again late in the evening. I have always suspected that the shadow of the rod on the water had something to do with this. Then if there has been a small flood in the stream, roiling the water, the trout will rise greedily as soon as the water clears again. Nessmuk tells in "Woodcraft" of going with a successful angler to a spring hole in a lake and seeing him drive trout out into deep water and then stir up the mud and catch them as they returned to the springs. Under most circumstances, not more than three or four trout can be caught at one time; the water must then be rested and then fished again. A native angler whom I knew lived near the mouth of a mountain run where a large number of trout collected each summer. In the proper season this man would go to the run ten or twelve times a day, catching two or three trout at each trip. Sometimes after trout have been fished over at such a place for several days, they refused to pay attention to fly or bait of any sort, probably doing their feeding at night, if feeding at all. They also grow accustomed at such times to the angler and stir only when he makes some sudden or violent movement. An acquaintance of mine once caught a very large trout lying in a cold pool by baiting with a crawfish and slapping it on the water with a splash. The trout had not stirred until the bait struck the water and then it rushed rapidly around the pool several times and without stopping its speed darted forward, took the bait and was hooked. This coincides with my own experience at several different times. I was once watching

a school of trout lying around a spring below a mill dam, when I decided to see what I could do with bait since none of them paid any attention to my flies. On the bank I found some large grasshoppers, and standing in open view of these trout and throwing the grasshopper on the water with considerable force, I found that every few minutes the impulse to get that grasshopper would be too strong for some trout, and that after rushing around once or twice, it would come up and grab it and be hooked. It was not a very sportsmanlike way to catch trout, but it helped to fill my basket with some fine trout. On another occasion I had gone to some cold water late in the evening and found three or four very large trout lying there. I had waded in close to an enormous trout that was lying in about two feet of water and I stood there watching it and flicking my flies down on the water above it when so suddenly and unexpectedly that it startled me it came up with its mouth wide open and grabbed a white-miller that was on my cast. Well, I held the trout for about a minute, when with a lunge that no ordinary tackle could have held it tore loose.

My favorite fishing place after the trout had gone to the cold waters was at the head of an old mill dam, where there was a large volume of cold water coming from a number of springs just in the edge of the stream. Here the trout used to gather in a great school, and if one was fortunate enough to meet with favorable conditions he could have some fast and furious fun. I had gone to this place one evening, and after catching a few small trout, found that some large trout had moved in, one of which I finally hooked after it had made a furious lunge that took it nearly out of the water. I soon saw that I could hold this trout but could not land it. The stream at this point is of such depth and width that I needed only to follow the trout along the bank until it either broke loose or gave up, and so I walked slowly down the stream for an eighth of a mile or more, keeping my line on top of the water and watching the struggles of the fish. Finally, when I had begun to force the fight, a little woodsman with a bright red flannel shirt on came down to the stream to take a bath, and when he saw what I was doing he was very anxious to assist. What appeared rather curious to me was that when I pulled a little the trout's tail came out of the water, and his broad tail waving slowly in the air so excited the woodsman that he plunged in and had nearly grabbed my line before I could stop him. I knew that the fish was poorly hooked, and so I asked him to get a slab to place edge-ways outside of two large stones on the edge of the stream after I had pulled the trout between them. He did this and we landed our fish, a trout weighing three and a half pounds and hooked in the back fin in a slit torn an inch long, from which the fly dropped when the trout touched the shore. My own satisfaction over the capture of the trout was not a bit greater than that of the woodsman.

I started with a friend one evening for this place, expecting to fish late. I had several places that I wished to fish before reaching the spot where we were to put in the greater part of the evening, and I instructed my friend to proceed directly to the good fishing and wait for me there. It was later than I had intended it to be when I reached him—almost dark, in fact—and I could hear him splashing around at a great rate before I got to him. When he heard me on the bank he called to me that he had just learned how to catch them, and when I inquired about the new method, he said that when one struck he just threw it on to the bank without playing it at all. I have had many regrets in my life, but none keener than the one when I learned that he had hooked probably fifty large trout during the evening and had landed but three. Oh, if I had but gone with him instead of pottering along the stream at the other places where I expected a few trout to be lying!

Another time I had gone with this same man to this place very early on a foggy morning in July. He had been staying in the mountains for a week or more and as the streams were very low had not been able to catch any trout to eat. I had joined him the evening before at the cabin where he was staying and had promised him that we should catch some trout the next day, and had selected this cold water as the most likely place to find them. When we reached the spot I reconnoitered from the bank above and discovered that a large school of fine trout was lying in just the right depth of water. When going on the bank that overlooked the pool I had stirred up some large grasshoppers, and it occurred to me that since we needed meat more than sport, I would plan to get meat and let him do the fishing. I instructed him to remove his flies and put on a small hook on which I impaled a grasshopper. Then from the bank above I would show him where to wade, tell him when the trout had taken the bait, and direct him when to pull. The trout were all large, and as he was fishing with a light fly-rod he had plenty of sport landing them. To me it was also some sport to watch the trout take the bait. I maneuvered it so that he usually threw nearest the biggest trout. Sometimes they would take the bait on top of the water and again they would pay no attention to it until it had gone kicking down nearly to the bottom, when a big fellow would dart forward, snap it and turn and drop among his companions again. I was so close and the water was so clear that I could see the bait disappear in the trout's mouth and at the proper time I would say pull and the fun would begin. At 10 o'clock we stopped fishing with some thirteen or fourteen large trout which we cleaned and took back to the cabin for our dinner and the dinner of the large family with whom we were stopping. Just as the trout were frying nicely a tremendous thunder shower came up, and it rained down around the stove pipe so hard that the fire was put out and the trout almost set to swimming again. But the old lady had been through that many times before, and when the shower had passed the fire was started again and the children and fishermen sat around the stove hungrily watching the trout fry to a turn, and from then on we had no trouble to keep the horde of hungry children and ourselves very well supplied with fish.

For more than a dozen years I camped annually about the first of July in a fine grove of old maples that

stood on the bank of my creek. From my camp I could reach easily in a fifteen-minute walk the mouths of two little mountain brooks or a section of the stream where some springs kept cool the edge of a long strip of water. The latter place was overhung by some fine old trees, and it was great sport to wade down the middle of the stream and cast under these trees into water so shallow that the trout had to roll on the fly to take it. This fishing I did in the morning, reserving the cold water at the brooks for my evening fishing. One of these brooks emptied into a pool so deep and dark that we could not see what it contained. I had gone here one evening after supper and had continued to fish until long after dark, catching a ten or twelve-inch trout every few minutes. Finally I found that a large trout was coming up into the shallow water near my feet to feed. I could hear him splash but it was too dark to see him and he paid no attention to my flies. I went to shore and by the aid of a match selected a very large queen that I had in my fly book. At the first cast he struck and I surprised my companion by dragging up on to the beach a very large trout without playing him at all. When I showed him the size of the fly on our return to camp he understood what gave me such confidence. There was a native angler near our camp who was an expert fly-fisherman and who knew the Cold Water even better than I knew it. One morning just at dawn as I was lying in bed with my hands under my head watching the trees on the opposite shore of the creek, a fly-rod curved in the shape of a drawn bow came within my line of vision. Springing quickly to my feet and running down to the stream I was just in time to see this angler net a two-pound trout that had been lying at a cold spring just in front of my tent. This man worked every day but holidays until 6 o'clock in the evening, and I suspect that to be able to take his rod after supper and catch a half-dozen trout that had gathered at the cold water made life more worth living to him.

I am not sure that any trout should be caught at the cold water; it is quite probable that they ought to be let alone when they have gathered at such places. But this kind of fishing has a peculiar fascination for me. It is best late in the evening, a time of the day when I most like to fish; the trout must nearly always be caught with fly, if caught at all; and when the trout are rising at these places the sport is unequalled. However, if the Legislature should see fit to close the trout season before the fish have gone to the cold water, I shall be well content to stop it and to dream over the deeds I have done at the cold springs and the mountain brooks of the stream I love so well. CHAS. LOSE.

### New Brunswick Salmon Rivers.

*Editor Forest and Stream:*

In your issue of July 22 your generally well-informed correspondent, E. T. D. Chambers, had a bewildering array of figures to cozen his readers into the belief that salmon culture has increased the catch of this fish in New Brunswick rivers. He takes exception to my fairness in comparing the catch of 1874 (the year the hatcheries were started) with that of 1903, after twenty-nine years' operation, because, he says, the former catch was exceptional. My object was simply to show what the fish did without any artificial assistance, when they were allowed to reach their spawning places and propagate in the natural manner.

Let the intelligent reader take the figures furnished by Mr. Chambers from the official reports and see if they work out any better, with all his ingenious groups, periods and averages which only confuse the general reader, but do not alter the practical result. He quotes from Mr. Wilmot, the late superintendent of fishculture, to show that it was not until the year 1877 that the hatcheries commenced to work satisfactorily, and he gives the catch of the next year as 1,763,772 pounds. Since that year up to 1903 the presumption is that the hatcheries have all worked satisfactorily, since the enormous number of 129,286,200 young fish have been turned out, with the result, as Mr. Chambers' figures show, that the catch in 1903 was 1,300,540 pounds—just 463,232 pounds less than it was in 1878, the year after the hatcheries had begun to work satisfactorily.

I have the greatest admiration for Mr. Chambers' genius for manipulating figures, and will be much pleased to have him exercise it in working out the following little sum: If the planting of 129,286,200 young salmon in twenty-nine years decreased the catch by 463,232 pounds, how many young salmon and how many years' operations will be required to bring the catch up to 3,214,182 pounds, which it was in 1874, the year salmon culture was started?

THE OLD ANGLER.

SUSSEX, N. P., July 24.

### A Large Muscalunge.

THERESA, N. Y., July 24.—On July 4 guide Dave Tyler, of this place, was rowing a Mr. Doyle and lady of Ogdensburg on Indian River and Red Lake, when near the Red Lake House Mr. Doyle hooked a large muscalunge on light tackle. After playing the fish for one hour and twenty minutes guide Tyler succeeded in getting his gaff-hook into the fish, but the lady occupant of the boat objected to his boating at, as it was so large. "Dave" told me that it was five feet long and would weigh over 50 pounds. Tyler then decided to land it on the sandy beach nearby. After hooking the fish the boat was worked out into deep water between which and the beach were many weeds. While going through these the fish escaped. An excursion party of young people at the Red Lake House watched the fight with the big fish.

It has long been known that there were a few large muscalunge still in Red Lake, as parties have reported hooking on to them only to have them escape by breaking the hook or line.

In November, 1898, you published the photograph I sent you of one weighing 42½ pounds. Since then only one larger (46 pounds) has been taken, but a dead muscalunge measuring 4ft. 3in. was found at the foot of the lake a few years ago. I have the lower jaw and other bones of the head of this fish, one side of the lower jaw had been broken and was twice its normal size. I know that I should say "maskinongé," but it would hardly be recognized here.

J. L. DAVISON.

### A Siwash Whale Story.

*Editor Forest and Stream:*

The Norwegian steamer Tricolor brought in a report to San Francisco the other day of a whaling voyage that was made by the Siwash Indians of the Pacific Coast, in Neah Bay, off Cape Flattery, lately.

According to the account of it given to the Call by this steamer's captain, the whale had been seen off the cape for several days, and at last about sixty Siwashes organized a party to capture him, going out in canoes, each canoe having one or more harpoons, with beef bladders tied to their shanks. Every time a canoe would get within striking distance of the whale, a harpoon would be thrown into him, until at last there was hardly room for any more harpoons. This is the newspaper's version of the story. Some of us who have seen harpoons thrown into whales know about how long the whale will lie on top of the water after he has got the first harpoon, and wait for more of them to be thrown into him. He either goes below or else goes for the boat out of which the harpoon has been thrown. This whale was probably an old humpback, or a sulphur bottom. Neither of these would be noticed by a regular whaler's crew; they are of little or no account. Had he been a sperm or a right whale, there would have been a scattering of canoes and Indians when he had got that first harpoon.

After harpooning him they used a few bombs on him. What kind of bombs the captain did not state. The bomb part of the story is rather fishy. They were not bomb lances that are now used on most northern whalers; the gun that fires them could not be mounted on a canoe, and a Siwash Indian would have about as much use for a bomb as he would for a pair of wings. Before they had quite killed the whale, they tried to herd him toward the shore, but failed; then after killing him they tried to tow him ashore, but failed in that also; and a tug came out and towed him ashore for them. Then they beached him and began to cut in, but did not try to cut; they would eat him, blubber and all; and when the steamer left the bay, they were still busy eating him, and giving parts of him away to all comers. CABIA BLANCO.

### Barnegat Bay Fishing.

BARNEGAT CITY, N. J., July 27.—*Editor Forest and Stream:* It may be of interest to your readers to know that bluefish are here in abundance, and are large and fine. The bay is white with sails, and fishermen are having great sport. Weakfish, bonita and channel bass are also in evidence. A shark, weighing 250 to 300 pounds, was captured off the Sunset Hotel pier yesterday, and created some excitement and sport. We are expecting each day to have the time-schedule of the steam launch Adelia to run between this place and Barnegat Pier. The cottages are well rented here this year, and, so far, have been free from mosquitoes. JAMES H. ROMAINE.

### American Fisheries Society.

THE report of the meeting of the American Fisheries Society of last week has been delayed in transit, preventing its publication to-day. It will be given in our next issue.

### Bookmakers' Profits on Races.

Nor five men in fifty who bet on a horse race win. If this were not so, the bookmakers could not live, for their expenses are heavy. Until near the end of May it cost a member of the Metropolitan Turf Association about \$100 a day to make book. It was necessary, therefore, for the eighty members of this body who "booked" regularly to take out of the pockets of the public \$8,000 each day, in order to quit even. The 100 outside layers with their daily expenses of \$55 each had to win another \$5,500, while the thirty back-liners whose expenses were \$30, were forced to mulct the followers of the turf to the extent of \$900 more; and the forty field layers with their \$40 outlay had to collect from their golden geese \$1,600. Thus the 250 gamblers who habitually do business at the tracks had to win \$16,000 daily in order not to lose money, and it was rarely that they failed to do so. The meaning of these figures is that the 10,000 persons who on an average attended the race track, were forced to lose \$1.60 each in addition to the payment of a \$2 admission fee, car fare, programme, etc.

It is impossible to obtain exact figures as to the daily losses on the New York race courses, but that they are large can be readily understood from the foregoing. An ex-bookmaker tried to make an estimate for the writer, but finally gave up in despair, saying: "All that is positive is this, that a layer, a member of the Metropolitan Turf Association, who has not a net profit at the end of the season of \$20,000 considers the season to have been a bad one." This meant a loss by the public to the Metropolitan Turf Association alone of \$3,120,000, the \$1,600,000 net profit and the \$1,520,000 of expenses, based upon the old order of doing business. This is a daily winning of \$205 a man, which is undoubtedly low. The ex-bookmaker admitted this, and said that during his career as a layer he had cleared as high as \$200,000 in a season. The bookmakers that lose, he said, are those who, not satisfied with making a winning book, try to increase their "rolls" by betting on their judgment in other books.

When rich men lose from \$10,000 to \$20,000 on a race, as certain Wall Street plungers have been known to do, it is easy to realize that the estimated winnings of the members of the Metropolitan Turf Association are placed, if anything, below the real mark.—Elisha Marfield Kelly, in Public Opinion.

UPON a nobleman's estate in the Highlands, a splendid eagle was caught in one of the traps which Mr. Jerome condemns. Examination of its wound showed that when the keepers found it the bird must have been a prisoner for days. Yet it was strong and vigorous; around it were the bones of birds and animals, and within its reach, a leveret and a partridge. Who had brought this food to the captive all these days? Its mate had. It was hovering overhead, bringing up further supplies, while the keepers were examining the prisoner.—St. James' Gazette.

# YACHTING

## Yachting Fixtures for 1905.

MEMBERS of Race Committees and Secretaries will confer a favor by sending notice of errors or omissions in the following list, and also changes which may be made in the future:

### AUGUST.

3. Boston, M. Y. R. A., Hull, open.
4. Boston, M. Y. R. A., Hull, open.
4. Shinnecock, association.
5. Shelter Island, annual.
5. Boston, M. Y. R. A., Hull, open.
5. Knickerbocker, one-design power boats.
5. Knickerbocker, cruise.
5. New Rochelle, cruise.
5. Squantum, club.
5. Rhode Island, cruising race.
5. White Lake, open.
5. Seaside Park, power boat.
5. Royal Canadian, club.
5. Chicago, club.
5. Edgewood, club.
5. Shinnecock, association.
5. Wollaston-Squantum, inter-club.
5. Beverly, club.
5. Corinthian, club.
5. Huntington, annual.
5. Brooklyn, third championship.
6. Morrisania, ladies' race.
6. Larchmont, club.
6. Lakewood, Cleveland, club.
7. Boston, M. Y. R. A., Marblehead, open.
7. Old Mill, open.
7. Sachem's Head, club.
8. Eastern, M. Y. R. A., open.
8. Seaside, power boat races.
8. Sachem's Head, club.
9. Corinthian, M. Y. R. A., open.
9. Sea Side, club.
9. Seaside Park, club.
10. Corinthian, M. Y. R. A., open.
10. Seaside Park, ladies' race.
10. New York, cruise, rendezvous cups, Glen Cove.
11. New York, cruise, Glen Cove to Morris Cove.
12. New York, cruise, Morris Cove to New London.
11. Corinthian, M. Y. R. A., open.
12. Beverly, club.
12. Sea Side, open.
12. West Hampton, C. C., association.
12. Atlantic, Havens cup.
12. Corinthian, M. Y. R. A., open.
12. New Rochelle, long-distance race.
12. Knickerbocker, one-design power boats.
12. Seaside Park, Sewell cup.
12. Canada's cup races, Charlott.
12. White Lake, power boat races.
12. Chicago, club.
12. San Francisco, cruise.
12. Corinthian of San Francisco, cruise.
12. Sunnyside, Toronto, commodore's cup.

24. San Francisco, cruise.

### THE SEAWANHAKA CUP.

It is not strange that the races for the Seawanhaka Cup should have attracted less interest this year than ever before, even though the American boat was victorious, for the matches had been so one-sided ever since the cup left America that yachtsmen felt that the trophy was to repose in Canada forever.

The honor of winning the cup goes to a very active Massachusetts organization, the Manchester Y. C. It is essentially a small boat club, and among its members are some of the cleverest boat-sailors in the country.

The Manchester Y. C. was first represented in the Seawanhaka Cup trial races in 1902 when the Bridgeport Y. C. challenged. At the trial races that year their two entries made a poor showing, but the matches taught many lessons, and a year later the Royal St. Lawrence Y. C. accepted a challenge from the Manchester Y. C.

Kolutoo was selected as a challenger in 1903. She was the product of that very able Boston designer, Mr. E. A. Boardman. This was Mr. Boardman's first attempt at a boat of just this type, and Kolutoo made a very creditable showing. Mr. Boardman returned from Canada satisfied that he could design a boat sufficiently fast to defeat any Canadian product, and from that time until this year, when the Manchester Y. C. challenge was again accepted by the Canadians, he has made a study of the type produced under the conditions governing the trophy.

This year two boats were built by the Manchester Y. C. members, and they were tried out on Lake St. Louis, where the matches for the cup are sailed. Manchester, the boat selected, was a very smart, all-around craft and was at her best in a heavy breeze and a sea. As it happened this year, all three of the matches that were finished were sailed in boisterous weather, and the Canadian defender Alexandra was clearly outclassed.

Unless we are greatly mistaken, the Royal St. Lawrence Y. C. is not sorry that the Cup has passed out of their hands, for it has been a source of great effort and expense to defend it. Through all the years the club has defended it they have done so in such sportsmanlike manner that they are now known the world over as among the fairest and squarest of small boat sailors. The races this year went off more pleasantly than previous ones, if such a thing were possible, and it must be a source of great satisfaction to the Canadians that in losing to the Manchesters they have lost to sportsmen of their own caliber.

The National Yacht and Skiff Club of Toronto has already opened negotiations with the Manchester Y. C., and it is quite possible that a challenge will follow.

JEEBI PURCHASED BY R. K. CROSS.—The crack 21-footer Jeebi, designed and built by Mr. Thomas Clapham, of Roslyn, L. I., has been sold by Mr. Arthur D. R. Brown to Mr. Richard K. Cross, of Baltimore. The boat is now at Wianno, Mass., where her new owner spends his summers.

## Seawanhaka Cup.

BY WILLIAM Q. PHILLIPS.

THE match of the present season is the eleventh that has been sailed since the trophy was offered for competition in 1895. In the following year it passed to the Royal St. Lawrence Y. C., and up to the present year has been successfully defended against all comers. This second challenge from the Manchester Y. C. is an earnest and well-considered effort to take advantage of the experience gained two years ago, and to produce a boat specially suited for the general conditions on Lake St. Louis. In one way the problem is simple enough. Given 500 sq. ft. of sail, and a crew weighing 665 pounds, what is the best that can be done on a waterline limited to some 27ft.—all the length, or rather more than can be used to advantage. The answers to this question during the last few years have varied considerably, both as regards the appearance and performance of the boats. The general tendency on the part of challengers has been to produce light weather boats, low-sided and lacking in stability. In several cases failure has been clearly due to a lack of stability, making it impossible to hold the boat to her work in a fresh breeze. What is wanted is a craft that is rather tender up to 15 degrees of heel, so that she will readily get down to her best form. After that the stiffer the better, if the boat is to win when it blows, and experience has shown that the decisive work is always done either in a good working breeze or something stronger.

In preparing for the match the Manchester men have wisely avoided building a larger number of boats than could be tuned up, with the result that the chosen representative is in splendid form, and a credit in every way to her designer and skipper, Mr. E. A. Boardman. Although built for other parties, she was purchased by Dr. J. L. Bremer, who acted as judge two years ago, but is sailing on the boat this year. In the course of an after-dinner speech, the genial doctor admitted that in planning the boat there had been no hesitation in following the general model of the Lake St. Louis boats that have defended the cup for so many years. But Manchester is no weak copy of something else, neither is she a freak or the long shot of a desperate experimenter. In every way she is a sane and wholesome model with fair lines, well finished and carefully rigged.

The only boat built for the defense this year is Alexandra, designed by Mr. Shearwood, and owned by a syndicate. On paper she is said to be the fastest boat ever turned out of the Dorval shop; but her appearance is not altogether pleasing. The bow is remarkably full at the waterline and snubbed in on deck; but as an expert remarked after a careful examination, "Her diagonals are all right." In other respects she is of the usual type developed by Mr. Shearwood, with two bilge boards and two rudders. So far as the trials went, she was a fair match for Thorella and Noorna, but the Royal St. Lawrence people were in hard luck over their trials this year, light winds prevailing. Not enough races were held, and the results were inconclusive, so that the selection of Alexandra was based on faith as well as performance.

The official measurements of the boats were as follows:

	Manchester.	Alexandra.
Length—		
Over all .....	39ft. 11in.	37ft. 9½in.
Fore overhang ....	8ft. 6½in.	7ft. 2in.
After overhang ....	6ft. 8in.	3ft. 9in.
Load waterline ....	24ft. 8½in.	26ft. 10½in.
Bilge boards .....	135 lbs. each	151 lbs. each
Sail Area—		
Mainsail .....	384 sq. ft.	397 sq. ft.
Headsail triangle ..	99 sq. ft.	99 sq. ft.
Spinnaker .....	203 sq. ft.	200 sq. ft.

Manchester's crew—E. A. Boardman 199 pounds, R. D. Boardman 171, R. Boardman 142, Dr. J. L. Bremer 148; total, 660 pounds.

Alexandra's crew—C. Routh, 164 pounds, W. C. Finley 169, Thornton Davidson 136, Huntley Gordon, 168; total, 637 pounds.

### Thursday, July 20.

Skipper Routh won the toss and elected to sail the first race to windward and return. The wind was moderate to fresh from the W., blowing fairly down the lake with a tendency to work around to the N. The starting line off Point Claire was used, the course being logged by Sir George Drummond's steam yacht Wild Rose, and there was no difficulty in getting the requisite two miles in good water. The starting gun was fired at 2:20, after the usual preliminary signals, but at the time both boats were to windward on the wrong side of the line. They ran back rather leisurely, Alexandra crossing 30s. late and Manchester 15s. afterward. The start was not brilliant, and had little merit, except that of avoiding complications.

The boats broke tacks, each skipper sailing his own race; but it was soon apparent that Manchester was steadily pointing higher than Alexandra, while her footing left little to be desired. Less than 25m. were sufficient to cover the two miles to the weather mark, and long before the boats converged for rounding, it was clear that Manchester was gaining steadily—the first instance for several years of a challenger showing decisive superiority in the first race. At the mark she led by 1m. 28s., but this was reduced by 6s. on the run back. On the next round Manchester gained steadily, and at the weather mark on the final round her lead was 3m. 44s. Alexandra was fairly beaten but managed

to pull up a little on the final run, reducing the difference to an even 3m. It was a clever, fair race, almost devoid of incident, and it is difficult to add anything to the following official times:

Start, 2:20:	Weather Mark.	First Round.
Manchester	2 44 28	2 57 42
Alexandra	2 45 56	2 59 04
Weather Mark.	Second Round.	Finish.
Manchester	3 21 09	3 33 10
Alexandra	3 23 14	3 35 30
Weather Mark.	Finish.	
Manchester	3 55 04	4 08 05
Alexandra	3 58 48	4 11 05

Friday, July 21.

The wind still hung in the W., moderate to fresh, with fine, clear weather. The triangular course, with all marks to port, gave some windward work on the first leg, then a reach, and a run home, not very free, however. The start at 2:25 was prompt and close, and there had been some pretty jockeying before the gun. The boats really got to the line too soon, luffing at the last moment to cheek headway and crossing in rather lifeless fashion. As on the previous day, Manchester showed herself superior going to windward and pulled out a lead at the weather mark of 40s. The reaching was watched with interest, some of the admirers of Alexandra claiming that she was very fast with a free sheet. But on the first round Manchester gained steadily, leading at the end by 2m. 12s. From this to the finish there were small variations; but on the whole she proved a consistent performer, beating Alexandra all around the course. The times were as follows:

Lcg.	Leg.	First Round.
Manchester	2 41 20	2 55 00
Alexandra	2 42 00	2 57 12
Leg.	Leg.	Second Round.
Manchester	3 13 08	3 26 32
Alexandra	3 15 09	3 29 30
Leg.	Leg.	Finish.
Manchester	3 43 40	3 58 56
Alexandra	3 46 51	3 58 28

Saturday, July 22.

This was a fine hot day, with light variable winds that did not serve for the completion of a race. A start was made at 2:50, the course being 1½ miles to windward from Point Claire across the lake. For nearly two hours it was a mere drifting match, Alexandra getting the better of the wandering streaks of wind, and the weather mark at 4:34:10, Manchester following at 4:40:25. A breeze now came up from the E., making a reaching course, Manchester closing in on her competitor until the difference in time was reduced to about 3m., after which they sailed very evenly. The short course demanded four rounds, only three of which were completed when the time limit expired at 6:20.

Sunday, July 24.

There was a fresh breeze from the S. all day, varied by thunderstorms, one of which broke over the club house at Dorval about noon, delaying the start for the course. It cleared with a hint of more to follow, and the tender St. Louis, with the yachts, steamed to Beaconsfield Bay and laid a mark for the start. The wind held fresh from the S., white caps were plentiful, and the attendant fleet was limited to the larger steam craft. The Wild Rose logged two miles to windward across the lake in good water, finishing in another thunderstorm, which postponed the start. Finally the weather cleared and the boats were sent away at 3:55, making a close start under reefed mainsails and small jibs. They tacked in company for a while, and then Manchester slowly drew away from the defender, pulling out a lead of 1m. 49s. at the weather mark. She gained another 10s. on the run back. But the next beat to windward decided the race in her favor, Alexandra losing heavily. On the final round the defender was in trouble with halliards and had to lower her mainsail, but it had no bearing on the result, except in the matter of time. The wind moderated, so that the final run was made in spectacular fashion under full sail, Manchester winning by 9m. 37s. The times were:

Start, 3:55:	Weather Mark.	First Round.
Manchester	4 18 54	4 32 02
Alexandra	4 20 43	4 34 01
Weather Mark.	Second Round.	Finish.
Manchester	5 00 31	5 12 43
Alexandra	5 00 31	5 12 43
Weather Mark.	Finish.	
Manchester	5 30 50	5 46 00
Alexandra	5 41 44	5 55 37

The races were so clean and decisive in every way that comment is pointless and superfluous. To an unprejudiced observer the handling of the boats left nothing to be desired, and the superiority of the winning boat was beyond question. Possibly Alexandra is not quite up to the usual Lake St. Louis standard, but she is a fast boat and would have beaten almost any previous challenger, except perhaps White Bear, in a moderate breeze. Manchester, however, is a distinct advance on all former challengers, and it is greatly to the credit of her designer and skipper, Mr. E. A. Boardman, that he succeeded at the first attempt, where so many others have failed.

After the first two races had been decided, there was a persistent but vague rumor that the Manchester Club would seek to change the conditions for future matches, so as to encourage a type of boat better suited to open waters, and in effect bar challengers from the inland lakes. For such a step it would of course be necessary to have the consent of the Seawanhaka Corinthian Y. C., but aside from this it is difficult to see what changes could be made except in the direction of a restricted class of raceabouts, of which there are already enough. There is nothing to prevent the use of keel boats with fixed ballast, except that it is impossible to get anything like the same all-round speed with 500 sq. ft. of sail. This is the essence of the matter, and some very remarkable legislation would be required to drive out the present type which is safe, handy and manageable, but above all very fast.

The races were managed, as usual, by three judges—Mr. Geo. W. Mansfield (Manchester), Mr. W. Q. Phillips (Royal St. Lawrence) and Mr. W. P. Stephens, the unanimous choice for third judge.

Temeraire Picked for Canada Cup Challenger.

TEMERAIRE has been chosen as the Royal Canadian Y. C.'s challenger for the Canada Cup. The choice was made after a comparatively short series of trial races. The judges were Dr. A. A. Macdonald, Rear Commodore of the Royal Canadian Y. C., Mr. W. A. C. Hamilton, of Montreal, and Mr. George Evans, of Toronto.

While the trial races were comparatively brief, no one thinks of questioning their result, and perhaps it was just as well to get them over as soon as possible, in order to give Temeraire plenty of time for tuning up for the final races at Charlotte.

Temeraire was designed by Mr. William Fife, Jr. for Mr. Frederic Nicholls, of Toronto, and built by Capt. James Andrews, of Oakville. Both Mr. Fife and Capt. Andrews will be on hand during the races to give their personal supervision to the challenger. Mr. Fife was specially requested by Mr. Nicholls to do so and at once agreed, sailing for America on Saturday, July 20.

The Royal Canadian Y. C. offered \$1,500 in prize money for these races, and this will be divided as follows: Temeraire, \$750; Zoraya, \$500; Naniwa, \$250.

The trial races began on Saturday, July 22. They were held off Toronto Island, in the open water of Lake Ontario, where former Canada's Cup races have been sailed and under practically the same conditions as will prevail at the final races at Charlotte, N. Y.

First Race—Saturday, July 22.

In the first race the wind was blowing 10 miles an hour from E.N.E., the sky was clear, and the sea fairly smooth. The course was a 9-mile triangle, 3 miles to a side.

Naniwa, of Hamilton, sailed by her owner, Mr. J. H. Fearnside, got the best of the start, leading Zoraya by 5s. and Temeraire by 10s. The boats went over the line close together in the first half-minute after gun fire. Temeraire was sailed by her regular skipper, Mr. E. K. M. Wedd, and Mr. George H. Gooderham handled Zoraya.

It was a broad reach for the first leg with booms to starboard. Anticipating a luffing match, the boats did not break out balloon canvas immediately. Naniwa tried hard to keep to windward of Zoraya, but the latter could point higher, and in the first five minutes blanketed the Hamilton boat, passing to windward, and broke out a balloon jib in pursuit of Temeraire. The latter had been steering a straight course for the buoy. In a mile and a half Zoraya was abreast of Temeraire, but she held away to windward, being about 200yds. on her port side. Temeraire was also somewhat to windward of her course, but she discovered the buoy first and bore away, and Zoraya's 200yds. of weather gauge put her that much to the bad. The times at rounding the buoy were:

	First Mark.	Elapsed.
Temeraire	11 36 45	0 36 15
Zoraya	11 37 50	0 37 25
Naniwa	11 39 00	0 38 40

It was a beat to the next buoy, and Zoraya held her own fairly well, although she was scarcely close enough to do any fighting. Naniwa was both outpointed and outfooted, and the time at the buoy was:

	Second Mark.	Elapsed.
Temeraire	12 13 10	0 36 25
Zoraya	12 15 05	0 37 15
Naniwa	12 21 55	0 42 55

The next leg was another broad reach, with the sails this time on the port side. Zoraya closed up some, but she was still too far away for a fight. As a matter of fact, she sailed this leg of the course in 10s. better time than did Temeraire. The yachts were indeed very closely matched, the difference between the three being only 15s. altogether. The finish was fairly close, Temeraire's actual lead being 1m. 45s. Naniwa was away back a mile or so astern. Summary:

	Finish.	Third Leg.	Total
Temeraire	12 39 05	0 25 55	1 39 05
Zoraya	12 40 50	0 25 45	1 40 50
Naniwa	12 47 55	0 26 00	1 47 55

The Second Race.

Shortly afterward, the judges sent the boats off for a second race, from the same starting point, but over a smaller triangle, 1½ miles to a side. The wind had increased to 12 miles an hour and was blowing from the N.E. This did not alter the direction of sailing very much, giving a close reach for the first leg, then a beat, and then a broad reach, which developed into a spinnaker run. Hamilton was not represented by a remarkably fast boat, but she had an excellent skipper, and Mr. Fearnside took his slower craft over the line just 9s. behind the victorious Wedd. The time at the start was: Temeraire, 1:31:16; Naniwa, 1:31:25; Zoraya, 1:31:32. It was a beautiful start and a splendid race, for the wind had freshened and the sea was making. The rough going was to Zoraya's liking, and she profited by her short overhangs. Naniwa, too, picked up in the breeze, although this was largely due to the fact that skippers Wedd and Gooderham were fighting it out for the weather position. Zoraya led by nearly half a minute, turning the first buoy, the time being:

	First Mark.	Elapsed.
Zoraya	1 48 20	0 16 48
Naniwa	1 48 45	0 17 20
Temeraire	1 48 50	0 17 34

But it was in the windward work in the rising wind and sea that Temeraire showed her mettle. Zoraya led at the buoy, but it was only by 7s., and Temeraire's elapsed time for the windward work was the best by 23s. Naniwa fell off badly, being nearly 4m. astern turning the windward mark. The time was:

	Second Mark.	Elapsed.
Zoraya	2 11 40	0 23 20
Temeraire	2 11 47	0 22 57
Naniwa	2 15 20	0 26 35

It was a broad reach home, and in a battle for weather position, the boats edged up far enough to carry spinnakers. Inch by inch Temeraire forged up on Zoraya's weather quarter, blanketed her, and passed her half a mile from the finish line. Zoraya tried to regain her position by blanketing, but failed. The Hamilton boat, left to herself, sailed a straighter course, and again showed that she had some speed in her with a started sheet, covering the leg of the course in the same time as Zoraya. Of course, she was so far astern that there was no question of her blanketing. Summary:

	Finish.	Third Leg.	Total
Temeraire	2 28 55	0 17 08	0 57 39
Zoraya	2 29 20	0 17 40	0 57 48
Naniwa	2 33 00	0 17 40	1 00 35

The Third Race—Monday, July 24.

After a rest on Sunday, the boats went at it again Monday morning. It was blowing fresh then. There was a S.W. wind, 18 miles strong, and the sea piling high on the lee shore. There was a change in skippers. Mr. E. A. Burnside, of Hamilton, took Naniwa, Mr. E. K. M. Wedd again sailed Temeraire, and Mr. J. H. Fearnside, the Naniwa skipper, took Mr. Gooderham's place in Zoraya. It was blowing so fresh that the boats had single reefs in, and No. 2 jibs on.

This race was a 4-mile beat to windward and return. The start was at 11:30, and Mr. Fearnside gave Zoraya an excellent chance to show all that was in her, flashing her across the starting line at 11:30:13. Naniwa went over at 11:30:20, and Temeraire was just 3s. behind her. She was, however, to windward. The first tack was a short one, and as soon as they came about, it was seen that Naniwa was sagging to leeward of Zoraya, and clearly could not hold her. Temeraire, to windward of the pair, left them to fight it out, and sailed a magnificent race to windward, beating her rival Zoraya by 5½m. and the Hamilton boat by 15m. to the weather mark. It was a complete victory for the Fife boat, and on the run, while all of them made excellent time, she even increased her lead. And this in spite of the fact that she made no haste in setting her spinnaker. Naniwa and Zoraya carried balloon jibs and spinnakers down the line, and on the run the Hamilton boat picked up 10s., but she had been so hopelessly outclassed in the windward work that she made a poor finish. Summary:

	Start.	Turn.	Finish.	Elapsed.
Temeraire	11 30 23	12 21 40	12 51 15	1 20 52
Zoraya	11 30 13	12 27 00	12 57 45	1 27 32
Naniwa	11 30 20	12 36 40	1 07 15	1 36 55

The Fourth Race—Wednesday, July 26.

It was thus shown clearly that while Temeraire had a formidable rival in Zoraya in running and reaching, she is sufficiently fast in these points to make her the choice for the cup in blowy weather, while in windward work the harder it blew the faster she seemed to go. Her excellent performance in a seaway was a matter of some surprise, as Zoraya had given indications that with her short overhang she would prove a fast boat in lumpy water. The Hamilton boat, while in the racing on the runs and reaches, was not a serious factor going to windward, and her owner and crew, realizing that she stood no chance of being selected for the cup, took her home on July 25.

The judges decided that it was still necessary to test the capabilities of the boats in light breezes. Zoraya had been looked upon as a heavy weather boat. That she was not was very plainly shown in the racing on Monday, July 24. But her high narrow sail plan gave indications of speed in light airs, and in order to test this the judges decided to have further trials in moderate breezes. As usual, the moderate breezes didn't arrive immediately when ordered, and consequently further racing was postponed until the afternoon of Wednesday, July 26.

They sent the racers over what is known as the short triangle, 1½ miles to a side. The wind was S.W. by S., 10 miles an hour in strength, and the lake very smooth.

The judges signalled buoys to port, which made the triangle a beat and a run and a reach.

The start was at 2:15, and Temeraire led over the line by a margin of 13s., the time being Temeraire, 2:15:30; Zoraya, 2:15:43. As before, Mr. E. K. M. Wedd was at Temeraire's tiller, and Mr. George H. Gooderham was back again in Zoraya. They went off on the starboard tack and held this for 10m., with very little change in position, Temeraire eating slightly to windward and footing quite as fast as her opponent. Temeraire was the first to come about, and Zoraya followed her like clock-work. The port tack lasted 9m., and then they swung back again to the starboard one, the two boats working as though steered with one tiller.

Temeraire rounded the S.W. buoy with a lead of 38s. The times were:

	First Mark.	Elapsed.
Temeraire	2 45 22	0 29 52
Zoraya	2 46 00	0 30 17

Twenty seconds after the turn Temeraire's spinnaker was gleaming whitely on the starboard side. Zoraya's balloon jib was set immediately she turned the mark, but her spinnaker was a little slower, and was not set until 2:46:30.

The boats were so close that a weather quarter battle was inevitable. Temeraire edged to windward until her spinnaker barely drew, but Zoraya went just as high. As expected in the light air, her lofty canvas proved effective, and she gradually drew up. The run to the S. E. buoy was only a short one, and Temeraire held her lead until within a quarter of a mile. At that point her spinnaker fell limp, Zoraya interfering with its draft; but to the surprise of the spectators, Wedd did not make any further fight for the weather berth. As it was, he was far to windward of the buoy, and, suddenly taking the spinnaker in, he gybed over. Zoraya was quick to follow, but her quickness scarcely helped her, for the gybe, which brought the wind on the port quarter, left her well in Temeraire's lee. The result was that the white boat turned the S.E. buoy with a lead of 15s., although the black one had made an actual gain on the run. The time at the second buoy was:

	Second Mark.	Elapsed.
Temeraire	3 01 00	0 15 38
Zoraya	3 01 15	0 15 15

Strictly speaking, it was a reach home, with the wind just abaft the port beam, and the yachts skimmed homeward rapidly with balloon jibs set. They were quite close enough for another weather quarter fight, and to prevent the pursuing Zoraya from blanketing her, Temeraire continually edged to windward.

They got so far off the course that they had again a spinnaker run. Zoraya suddenly squared away at 3:12:15, shooting out her spinnaker to port and away forward, in the hope of springing through Temeraire's lee, but it could not be done. Within a minute Temeraire's spinnaker was also drawing, and she was bearing away straight for the home line. Then Skipper Gooderham smothered his spinnaker in, got his main sheet aboard and tried hard again for the weather berth. But Wedd was just as quick. He had the lead, and having the faster boat, he kept the lead.

Once more Zoraya broke out her spinnaker and tried to sail through Temeraire's wake, but she was again foiled, and the boats made a fine finish under balloon jibs, Temeraire crossing the line just 15s. ahead. Their elapsed time on this last leg of the course was identical. Summary:

	Finish.	Third Leg.	Total
Temeraire	3 18 28	0 17 28	1 02 58
Zoraya	3 18 43	0 17 28	1 03 00

The Fifth Race.

This last race was undoubtedly the best of the series, from a duelling standpoint. The judges realized, of course, that their work lay more particularly in the testing of the merits of the two boats rather than trying out the respective abilities of the two skippers. Consequently for the next test they arranged that the boats should sail just close enough to one another to be sure of the same weather conditions, but far enough apart to prevent any interference. They were to carry the same canvas.

The wind had shifted to the N.W., but still blew about 10 miles an hour. Thus the same old triangle, sailed with buoys to port, gave a reach and a beat and a run.

Temeraire got away at 3:43:47. Zoraya followed at 3:45:16. There was thus a difference of 1m. 29s. between them at the start, quite sufficient to keep them well clear of one another. Zoraya did well on the reach, covering the distance in 19s. less, actual time. The times at the buoy were:

	First Mark.	Elapsed.
Temeraire	4 01 10	0 17 33
Zoraya	4 02 30	0 17 14

On the reach to the next buoy Zoraya was again the faster by 10s. Maybe she was actually faster and maybe this was due to the difficulty every skipper experiences in getting the very best out of a leading boat, especially on a straight course. At any rate, Temeraire turned the buoy for the beat home with her original lead of 1m. 29s. cut down to 1m. 10s. The times at the buoy were:

	Second Mark.	Elapsed.
Temeraire	4 11 30	0 10 20
Zoraya	4 12 40	0 10 10

But in the windward work home Temeraire again showed her excellence. The boats made no attempt at sailing tack for tack, but Temeraire footed faster and pointed higher, and increased her lead materially, covering the 1½ miles to windward in nearly 1½m. less than her opponent. The times at the finish were:

	Finish.	Third Leg.	Total
Temeraire	4 32 18	0 20 48	0 48 31
Zoraya	4 34 53	0 22 15	0 49 39

Temeraire's margin at the finish was 2m. 37s., showing a gain of 1m. 8s. over the whole course.

The Sixth Race.

The judges decided to have "just one more," and this was in the nature of a "pursuit race." It was a short run to the S.E. buoy and back, giving a spinnaker run of 1½ miles and a beat home. A still larger interval separated the yachts in this race, by the judges' orders, and there was absolutely no question of interference.

Zoraya broke out her spinnaker on the port side and made a beautiful start at 4:48:28. Temeraire followed her over the line at 4:51:58. The boats made somewhat of a leeward course for the buoy, or else the wind backed a trifle to the westward, for they had to take in their spinnakers when some distance from it.

At 5:01 Zoraya doused her spinnaker, and at 5:02:10 she turned the mark and made a short starboard tack. Temeraire was 3m. 2s. behind at the buoy, having gained on the run 23s. The times at the leeward mark were:

	First Mark.	Elapsed.
Zoraya	5 02 10	0 13 42
Temeraire	5 05 12	0 13 14

When Temeraire came around she started off immediately on the port tack for home, Zoraya having swung round to the same a minute before she turned the mark. This port-tack was a long one. Zoraya went on the starboard tack at 5:13:50, and Temeraire did so at 5:21:00. On this tack they laid the buoy, the times at the finish being:

	Finish.	Third Leg.	Total
Zoraya	5 21 23	0 19 38	0 32 35
Temeraire	5 23 43	0 18 31	0 31 45

Temeraire won on elapsed time by 1m. 10s., being 28s. faster on the run and 42s. faster on the beat.

This satisfied the judges that Temeraire was the better boat. With their finding, few would be disposed to disagree, for the Fife designed challenger had certainly made an excellent showing,

both in the informal trial races and in the formal ones. Out of fifteen starts, in which she was pitted against four boats altogether, she won thirteen first places, and one of her two losses was due to an error in the course, which gave her at least half a mile more sailing than the others got.

Zoraya's performance, especially running and reaching in moderate winds, was such as to indicate that with different handling and a more thorough tuning up, she might have given Temeraire a very serious argument and the judges a whole lot of food for thought. It is not insinuated that Zoraya could have been handled better under the circumstances, but Temeraire has had the advantage of being in the hands of one man, and that one man a thoroughly skilled amateur, every since her launching. She has also been sailed by identically the same crew, the members being Messrs. E. K. M. Wedd, skipper; J. Wilton Morse, H. F. Darrell, Casey Baldwin, H. Barber, W. H. Parsons and Von Yonson, the latter being the professional aboard.

Zoraya, on the other hand, has been sailed in her races, official and otherwise, by her owner, Mr. James C. Worts, and by H. C. McLeod, George H. Gooderham and James McMurray. It is unfortunate perhaps that the official trial races did not give an opportunity of deciding the merits of the boats in a drift, as, while this is an unsatisfactory sort of sailing, it may prevail in the Canada's cup race, and while Zoraya has been beaten in a drift before, she has also shown considerable speed under such conditions. It should be remembered, too, that her sails are not in nearly as good condition as Temeraire's, the latter's day practice spins having worked her canvas into excellent condition.

Temeraire will use her English suit, by Thomas Ratsey, in the races at Charlotte. These begin Aug. 12.

C. H. J. SNIDER.

## Boston Letter.

**NEW CLASSES PROPOSED.**—Within the past few weeks there has been a movement on foot to establish a class of 30-footers or 31-footers, to be rated under the new uniform rule. This movement is finding more or less favor among the yacht owners in the restricted classes, who are looking forward to improvements in next season's racing. The name of the yachtsman, said to be an owner in the restricted classes, who has hitherto looked upon the uniform rating rule with disfavor, has not been publicly announced, but there is every reason to believe that Mr. Sumner H. Foster has been seriously considering a class of about 30ft. waterline. It is understood that a set of scantlings is proposed and also a minimum limit on displacement. There are many who agree that scantling restrictions are needful additions to the uniform rule, but it is doubtful if a limit on displacement will be likely to produce a lasting class. It does not seem that any minimum limit is necessary to accompany the new rule, as the system of measurement favors yachts of substantial displacement, and this being the case, it would probably be better to allow designers all the leeway possible in producing varieties of types. Direct limitations on measurements and scantlings have proven a good thing among the Massachusetts Bay classes, in correcting evils that existed, but it is quite possible that the remedy, when taken as a steady diet, might prove an evil in itself. It does seem that in forming a new class it would be better to build entirely to a rule that is in operation elsewhere than in Massachusetts waters, so that those who lend their aid by building yachts may have a chance to dispose of them at as good a price as possible in other waters. A class of about 30ft. waterline, that would show indications of lasting, would undoubtedly be a great thing for Massachusetts Bay yachting.

There has also been more or less talk of a number of yachtsmen building for class Q. If this movement progresses to any extent it is quite probable that those who have heretofore been interested in the 18ft. knockabout class will build for the new class. From what has been shown so far this season it looks as though the 18ft. knockabout class in Massachusetts Bay has but a short time longer to exist. The number of boats that have been built this season has been very small, and owners of the older boats who might have built new ones have not found ready markets. This is undoubtedly due to the adoption of the new uniform rule by clubs along Long Island Sound, in which the Massachusetts 18-footers have heretofore been disposed. The Massachusetts 18ft. class is an awfully good one—one of the best in the country—but no matter how good it is, yachtsmen are not going to build for it and keep in the game unless they see a way to get rid of one boat before building another. Yachtsmen have feelings in their pocketbooks, just the same as other people, even if the builders are not disposed to think so. Class Q should appeal to the small boat men, as they get considerable of a boat on the rating, and one that is far more comfortable to cruise in than the present 18-footers. How much of a fever will be developed over the Q class is yet to be seen, as nothing more has been done at present other than general talk.

**TWO NEW ONES BY SMALL BROTHERS.**—Messrs. Small Brothers have completed the lines of a 70ft. waterline cruising steam yacht for Mr. Harry M. Ruby, of Macon, Mo. This yacht is intended to be much of a houseboat, and is to be given moderate power. She will have a compound engine of about 50 horsepower. She is quite bulky but the lines have been so cleverly drawn that a sheer view shows quite a sleek looking craft. She is 75ft. over all, 70ft. waterline, 15ft. breadth and 3ft. 5in. draft. She is much of the type of Monaloo, or Velthra, and has good accommodations under a low cabin trunk. In the forward part of the boat there are accommodations for five men, the crew's quarters running under the pilot house, which is sunk below the deck level. The pilot house is for use as a little library by the owner, and off it is the owner's bedroom, extending the full beam of the boat. Passing aft there are closets on the port side and a bathroom on the starboard side. Aft these is another bedroom extending the full beam of the ship. Then comes the engine and boiler space, while in the after part of the boat is the main saloon, with galley adjoining. There is a bridge abaft the break of the deck house, and the boat may be steered from either place.

Another design just completed by the same designers is an 18-footer for Mr. W. Rogers, of Rochester. This boat is 35ft. over all, 18ft. waterline, 7ft. 6in. breadth and 5ft. 6in. draft. She will carry 500 sq. ft. of sail and is intended to measure into the 20ft. class under the old system of measurement—waterline plus the square root of the sail area, divided by two.

**FROM MARBLEHEAD.**—Messrs. Stearns & McKay, at the Marblehead Yacht Yards are building a 28ft. hunting cabin launch for Mr. F. H. Billard, of Meriden, Conn. It is expected that she will be ready for delivery about the middle of August. She will be fitted with twin screws and will be fully equipped for cruising. The twin-

screw 30ft. open launch that was built for Mr. Herbert Humphrey has been in commission for some time at Marblehead and has attracted much favorable comment. Messrs. Stearns & McKay report the sale of the 25-footer Christina to Mr. George Payson, of Chicago; the 25-footer Chewink II. to Mr. David Bamber, of Boston, and a 21ft. knockabout to Mr. Alexander Galt, of St. Louis.

**NEW YARD PROGRESSING.**—Work has been progressing on the new yard for Messrs. Burgess & Packard at Marblehead. The shop has been completed and the marine railway is about ready. Delay was caused on this account of striking a ledge. A 28ft. power boat is building for Mr. Crane.

JOHN B. KILLEEN.

## Rhode Island Notes.

**NEW 35FT. CRUISER.**—At the shop of the Chase Yacht & Engine Company in Providence there has just been completed for a Providence yachtsman a 35ft. cruising launch from designs by Mr. William H. Hand, of New Bedford, Mass. The design shows the modern type with the sides carried up above the sheer line to the full height of the cabin, this treatment extending to the extreme bow and thus eliminating the usual cabin trunk and giving practically a flush deck boat forward. The cabin affords ample cruising accommodations, with 5½ft. head room, exclusive of the skylights, and there is a large water-tight cockpit. The frame and keel are oak and the planking is of hard pine, while the topsides above the normal sheer line are planked with mahogany and all the finish is of the same wood. The new boat is 35ft. over all, 33ft. 6in. waterline, 8ft. 8in. breadth and 2ft. 6in. draft, with a displacement of 9,680 pounds. The engine is a two-cylinder, four-cycle Chase motor of 15 horsepower, capable of an estimated speed of about 10 miles an hour.

**RHODE ISLAND Y. C. CRUISE.**—The itinerary of the annual cruise of the Rhode Island Y. C., as announced by Commodore Rogers, will make the rendezvous of the fleet at Newport, Saturday, Aug. 12. Sunday morning the run will be to New London. Monday to Thimble Islands, where the club will be the guests of the Sachem's Head Y. C. Tuesday morning there will be races for trophies offered by the Sachem's Head Y. C., and in the afternoon entertainment will be offered in the form of a big barbecue, while in the evening there will be a reception and dance at the Sachem's Head club house. The fleet will return to New London Wednesday and that evening there will be the annual mess dinner at the Fort Griswold House, followed by a dance. Thursday, run to Block Island, where the fleet will remain until Saturday morning, then proceeding to Newport, where the fleet will be entertained at a theater party by Commodore Rogers that evening. Sunday morning, proceed to Prudence Island, where a clambake will celebrate the conclusion of the cruise.

**EDGEWOOD Y. C. CRUISE.**—The Edgewood Y. C. and Washington Park Y. C. will hold a joint cruise this year, starting Monday, Aug. 7, and continuing one week. The cruise will be confined to the waters of Narragansett Bay, and the yachts will race from port to port as usual in such events. Commodore George R. Babbitt, of the Edgewood Y. C., has announced the following itinerary: Monday, Aug. 7, run to East Greenwich; Tuesday, run to Kickemuit; Wednesday, run to Chuck's Cove; Thursday, run to Newport; Friday, run to Wickford; Saturday, run to Bristol, dinner at the DeWolf Inn, afterward proceeding to Potter's Cove, where the fleet will disband Sunday.

F. H. YOUNG.

## The Canada Cup Boats.

THREE boats were built this year for the defense of the Canada Cup now held by the Rochester Y. C. The cup was won last year by Irondequoit, which boat challenged from the Rochester Y. C. As Irondequoit was designed by Mr. William Gardner it is only natural that the syndicate that owned her should look to the same designer when they decided to build another boat.

The races this year are for boats of 30ft. waterline, and the Gardner creation is 53ft. over all, 10ft. 7in. breadth and 7ft. draft. She is known as Rochester and she has a sail area of 1,550 sq. ft. Her forward overhang is 12ft. and 11ft. aft. She was built by Mr. William Miller, of Charlotte, N. Y., at which place the Rochester Y. C. is located. Rochester is owned by a syndicate headed by Mr. Thomas F. Pritchard.

Iroquois is the second boat. She was built by the George Lawley & Son Corp., of South Boston, from designs made by Mr. C. F. Herreshoff. Mr. Frank T. Christie heads the syndicate that owns Iroquois. She is 52ft. over all, 30ft. waterline, 10ft. 6in. breadth and 7ft. draft. Other measurements of the boat follow: Forward overhang, 10ft.; after overhang, 12ft.; extreme beam, 10ft. 6in.; beam on waterline, 10ft.; ballast, 5 tons; sail area, 1,550 sq. ft.; mainsail hoist, 29ft. 6in.; boom, 37ft. 6in.; bowsprit, outboard, 7ft. 4in.; gaff, 24ft. 6in.; spinnaker boom, 23ft. 6in.; jib halliard block above deck, 43ft.

Keel Lox II. is the third boat and she was designed and built by Messrs. C. J. & W. P. Pembroke, two brothers who are both amateurs. Keel Lox II. is 55ft. over all, 30ft. waterline, 10ft. breadth and 7ft. draft.

Last week the Rochester Y. C. held an exhaustive series of races in order to determine which of the trio was the best all-around boat. Keel Lox II. was outclassed and the choice lay between Iroquois and Rochester. These two boats seemed to be very closely matched, and the Regatta Committee were confronted with a serious problem.

In order to further satisfy themselves in regard to the merits of the two boats they ordered another series of races to be sailed on Saturday, July 29. After Saturday's races the committee formally selected Iroquois to defend the cup, and they also picked Mr. Lorenzo G. Mabbett, Fleet Captain of the Rochester Y. C., to act as skipper in the races.

Mr. Mabbett is rated as a very able boatman, and in the trial races he shifted from Iroquois to Rochester and he would invariably bring the boat he was handling home a winner. This would seem that the boats were remarkably evenly matched and that it was more a matter of handling than of speed.

In the trial races Iroquois won five and Rochester seven of the matches, but the judges were of the opinion that Iroquois was the better all-around boat and they selected her as being the most consistent performer in light and heavy weather.

## Sybilla Disqualified.

Editor Forest and Stream:

At a meeting of the Regatta Committee of the Island Heights Y. C., the yacht Sybilla was disqualified for rounding wrong buoy and the race awarded to the yacht Yankee.

Will you kindly correct your notice in your issue of July 29 for the ocean race. Your time and notice is correct with this exception.

R. M. VANDERHERCHEN,  
Member of Regatta Committee.

PHILADELPHIA, July 31.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

**ADDITION TO PLYMOUTH Y. C. FLEET.**—The new boats added to the Plymouth Y. C. fleet this year are as follows: Capt. John R. Dawes has a new hunting cabin launch, built by Shiverick, of Kingston, 28ft. over all, with 7 horsepower Jager engine. Herbert Nash has a new 20ft. open launch with 3½ horsepower Knox engine. Horace B. Maglathlin has a new hunting cabin launch, 32ft. over all, with 16 horsepower Murray & Tregurtha engine. Arthur R. Latham has a new 18ft. Emmons power dory. C. L. Willoughby has sold his launch and bought a raceabout, 36ft. over all, 25ft. waterline, 4ft. draft, centerboard, and has a power tender.

J. L. Bachelder has installed a 7 horsepower two-cylinder Knox engine in his launch Ensign, replacing a single cylinder engine of older make.

There will be a regatta here Aug. 31, given by the club as a member of Mass. Y. R. A. This regatta will be one of the matches of the south shore circuit, and will be followed by a similar race at Duxbury.

\*\*\*

**TAUNTON Y. C. MATTERS.**—The Taunton Y. C. had its first run to Tiverton, R. I., this season, and all enjoyed the sail more than ever. There were five power boats and four racing dories at the line on Saturday, July 22, at 2:30 P. M., when the run started. As soon as open water was reached upon Mt. Hope Bay the dories were started for a race to Tiverton in a dead beat to windward. Messrs. B. Andro and Max Bowne sent the fleet off. The start was a very pretty one, as all the boats crossed the line within thirty seconds of each other, and so was the race a very interesting one, as the boats shifted positions quite often. Pauline, owned by Rollin Babbitt, finally carried off the trophy of the day, winning by over 4m. over the rest of the fleet. Arriving in Tiverton the fleet was royally entertained by Rear Commodore Daniel Brownell at his new residence, the Star Cottage, formerly "The Lookout," one of the handsomest residences upon the water front. All the boats stayed over night and returned late on Sunday to their moorings at the Taunton Y. C. at Dighton, and everybody wishes soon to be ready for another run.

\*\*\*

**MR. PERCY CHUBB'S STEAM YACHT DIANA.**—Commodore F. G. Bourne's steam yacht Delaware, which boat was damaged by fire last winter, has been entirely refitted and is now the property of Mr. Percy Chubb, who has changed her name to Diana. After the fire Commodore Bourne turned the vessel over to the insurance underwriters, who commissioned Messrs. Tams, Lemoine & Crane to place her in first class condition. The work was carried out by the Harlan & Hollingsworth Co., of Wilmington, Del., under the supervision of the architects.

\*\*\*

**ILDERIM SOLD FOR JUNK.**—The old Burgess 46-footer Ilderim, formerly the property of Mr. Cornelius Vanderbilt, is being broken up at the Newport shipyard. Her last owner was Mr. J. Edward Addicks. While at her moorings last year she was attached, and a short time ago she was sold at Mr. A. W. S. Marshall's sale to Mr. Nils C. Peterson. Ilderim was built by Lawley in 1891 from designs by the late Edward Burgess. She was 45ft. 8in. waterline, 60ft. 5in. over all, 12ft. 6in. breadth and 10ft. 5in. draft.

\*\*\*

**K. Y. C.'S LONG DISTANCE POWER BOAT RACE.**—Five boats finished in the Knickerbocker Y. C.'s long distance power boat race from College Point, L. I., to Marblehead, Mass.

Talisman, owned by Mr. William Saville, of Boston, won. She was designed and built by the Murray & Tregurtha Co., of South Boston, Mass., and is fitted with an engine made by the designers and builders. Talisman is 32ft. 8in. over all, 29ft. 9in. waterline, 8ft. 7½in. breadth and 2ft. 10in. draft.

The winner of the second prize was Glissando, owned by Mr. Frank L. Andrews, of Fall River, Mass. She was designed and built by Messrs. Read Brothers, of Fall River, and is equipped with a 15 horsepower Standard engine. Glissando is 39ft. over all, 35ft. 9in. waterline, 9ft. breadth and 3ft. 6in. draft.

The other three boats to finish were: Blink, Aquila and Woodpile. The latter boat finished about 10:30 Monday morning, and receives a souvenir prize for covering the course.

Blink was designed by Messrs. Swasey, Raymond & Page and built by Mr. T. L. White. Her engine is a

30 horsepower Buffalo. She is 40ft. over all, 36ft. waterline, 8ft. breadth and 2ft. 6in. draft. Messrs. C. W. & C. T. Esterbrook are the owners.

Aquila was designed by Mr. Wm. H. Hand, Jr., and built by the Chase Yacht & Engine Co., of Providence. Her motive power consists of a 30 horsepower Chase engine. Aquila is 39ft. 11½in. over all, 36ft. 8in. waterline, 8ft. 5in. breadth and 1ft. 10½in. draft. She is owned by Mr. Allen H. Chase, of Providence, R. I.

Woodpile is owned by Mr. Alfred L. Lincoln, of Hingham, Mass. She was designed by Messrs. Small Brothers and built by Mr. George B. Loring. Her engine is a 12 horsepower Barber. Woodpile is 31ft. 6in. over all, 29ft. 8in. waterline, 8ft. breadth and 2ft. draft.

**VIRGIN LOST.**—The old Inland Lake Y. A. class A racing machine Caroline, which was purchased south last year and renamed Virgin, was wrecked and lost on the Mexican Gulf coast Thursday, July 20. She was returning to Mississippi Sound from the regatta of the Mobile Y. C. on Mobile Bay to participate in the remaining races of the racing circuit of the Southern Gulf Coast Y. A. and was in tow of the 40ft. cabin sloop Invader. They were struck by a severe blow when coming through Grant's Pass, between the bay and the Sound, and Virgin opened up and sank and had to be abandoned. This craft held a unique and prominent place in the yachting annals of both the West and the South. She had an individuality all her own, and the nick-name "Bootjack" conveyed a good idea of her appearance—a segment of a circle appearing to have been cut from her broad bow and stern leaving two horn-like projections on either end of the boat. She was practically two hulls joined by a deck, the median line on deck being about 3 or 4ft. shorter than the over all length at the sides of the hull. Caroline was built upon catamaran principles, as was Dominion, her designers and builders being Messrs. Jones & LaBorde, of Oshkosh, Wis. She was 37ft. long 7½ft. beam and 6in. draft. She was one of the crack Inland Lake Y. Assn. racers of 1901, sharing honors with Anita and Adyrin. Her record in the South was good, she having won a number of races, her best going being in light weather. Her form was against her in lumpy water.

**YELLOW FEVER UPSETS SOUTHERN RACING.**—A most successful season of yacht racing has been interrupted along the Gulf coast between New Orleans and Mobile, where six clubs are banded together, forming the Southern Gulf Coast Y. Assn., by the quarantine regulations, the regattas of the Bay-Waveland Y. C. at Bay St. Louis, Miss., and of the Southern Y. C. at New Orleans, remain to be sailed. The yellow fever is confined to the Italian quarter at New Orleans. It is expected that it will soon be stamped out.

**THE LAUNCH FIRENZE.**—The Gas Engine & Power Co. and Charles L. Seabury Co., Consol., have completed a twin-screw cruising launch for Mr. James E. Martin, New York Y. C. The boat will be known as Firenze and is 60ft. over all, 10ft. 8in. breadth and 3ft. draft. She is fitted with two Speedway four-cylinder motors of 25 horsepower each, which are expected to give her a speed of 13 miles an hour.

**THE LAUNCH CAPTAIN LAUNCHED.**—Last week there was launched from the yard of the Gas Engine & Power Co. and Chas. L. Seabury Co., Consol., the launch Captain, built for Mr. Thomas H. Turner, of New Rochelle. Captain is 63ft. over all, 10ft. 8in. breadth and 3ft. draft. She is a twin-screw boat and is fitted with two four-cylinder 6 by 6in. Speedway engines.

**SALES AND CHARTERS.**—The steam yacht Embla has been chartered by Mr. J. T. Williams to Commodore George Lauder, Jr., Indian Harbor Y. C., through the agency of Mr. Frank Bowne Jones. The same agency has chartered Mr. R. J. Koons' auxiliary schooner yacht Crusader I. to Mr. Thomas A. McIntyre, and also chartered the sloop Effort, owned by Mr. F. M. Smith, to Mr. Geo. W. Darr. The following sales have been made by the same agency: The power boat Delicia to Mr. William C. Stewart, Jr.; the knockabout Mirage, owned by Mr. J. Percy Bertram, to Mr. J. D. Chapman, and the sloop Ramona, owned by Mr. R. W. Blanding, to Mr. William Anear.

**CLUB BOOKS RECEIVED:** We are indebted to Mr. L. D. Sampson, Secretary of the Southern Y. C.; Mr. Addison F. Bancroft, Secretary of the Corinthian Y. C. of Philadelphia, and Mr. E. H. M. Roehr, Secretary of the Atlantic Y. C., for copies of their club books.

**Eastern Y. C.**

Marblehead, Mass.—July 27, 28 and 29.

THE series of open power boat races, given by the Eastern Y. C., and sailed off Marblehead on Thursday, Friday and Saturday, July 27, 28 and 29, were the most successful that have yet been held in Massachusetts waters. It was expected that there would be more entries among the 40ft. high-speed automobile boats, but despite this the racing was good and the conditions were of the best. There were twenty starters on the first day, eighteen on the second day and sixteen on the third day. Dixie, the 40ft. auto boat, owned by Mr. E. R. Thomas, was the center of attraction, and she made very fast time on all three days, winning the Gay cup easily. The success of the series is due to hard work on the part of the Eastern Y. C. power boat committee, and is an evidence that the sport may be made very popular, if given the proper attention.

Thursday, July 27.

With a light breeze and a smooth sea, conditions were of the best for the first race. In the first class Essex was the first boat to get away, but the 60-footer Hupa went by her as though she were anchored. Hupa led all around the course. Dixie was late for the start by 1h. 27m., but her owner decided to send her over the course for the Gay cup, the records for which will appear at the end of this article. In the second class, Blink took the lead at the start, and kept it all around the course. In the third class Lillian B. was first away, with Tai Kun hauling her. Tai Kun was soon in the lead and stayed there. The three classes sailed a course of 12½ miles, and those competing for the Gay cup, continued after finishing their regular course and sailed the 25 miles. The summary:

Launches—First Class—Over 50ft. Rating.	
Hupa, C. H. Clark.....	0 42 58
Spaghetti, E. R. Hollander.....	1 25 45
Essex, E. G. Young.....	Disabled.

Friday, July 28.

Ideal conditions prevailed for the second race of the series, sailed on Friday, July 28. There being no other large auto boats, Dixie was started in the first class. Tama got the start in this class, but Dixie soon passed her and kept gaining all around the course. Hupa, in this class, was disabled. In the special E. Y. C. 32ft. class Spaghetti and Counterfeiter were entered. Spaghetti was away first, with Counterfeiter close behind, and they made a close race of it for a time, but Counterfeiter was just from the shop and steered badly, necessitating her withdrawal. In the second class launches Blink sailed alone. In the third class launches Omeomi got the start, but Tai Kun soon passed her and led to the finish. The summary:

Launches—First Class—Over 50ft. Rating.	
Dixie, E. R. Thomas.....	0 34 44
Tama, F. L. Dunn.....	0 46 40
Hupa, O. H. Clark.....	Disabled.
Special E. Y. C. 32-Footers.

Comanche, Jr., W. P. Wharton.....	1 42 34
Unnamed, P. Markey.....	2 06 19
Irene, F. L. Jewell.....	Withdraw.

Saturday, July 29.

The last race of the series was sailed on Saturday, July 29, under the same ideal conditions that prevailed on the two previous days. In the first class Dixie was again the star performer, so far as actual speed was concerned, but the result on corrected time gave first place in this race to Tama. From the allowance of 16m. 18s. it may be seen that Tama also wins from Dixie in Friday's race. In the third class Little Egypt had the start, but Tai Kun, which was seventh, soon went out ahead and remained there to the finish, winning on both elapsed and corrected times. The summary:

Launches—First Class—Over 50ft. Rating.		Rating.	
Tama, F. L. Dunn.....	63.51	0 51 11	0 33 52
Dixie, E. R. Thomas.....	95.00	0 34 23	0 34 23
Spaghetti, E. R. Hollander.....	61.20	0 56 58	0 38 48
Hupa, C. H. Clark.....	86.40	Disabled.	
Launches—Third Class—Hunting and Open Boats, 21 to 50ft. Rating.		Rating.	
Tai Kun, W. H. Stewart.....	41.4	1 08 56	1 01 58
Little Egypt, C. F. Lyman.....	43.0	1 09 38	1 05 29

**The Gay Cup.**

The Gay cup, offered by Rear Commodore W. O. Gay, was offered for the boat which, having started in each race, made the smallest total elapsed time for all three, completing four laps of 6¼ miles each, or 25 miles in each race. In the first race Spaghetti got a leg for this cup, but it was because Dixie started 1h. and 27s. late. It was apparent, however, once Dixie had got started, that nothing but an accident could stop her from winning. In the second race Dixie more than made up for the time she lost in starting the day before, being 12m. 22s. to the good on total elapsed time at the finish of the race. Dixie made her best total elapsed time in this race. She sailed the 25 miles in 1h. 8m. 58s. This was at the rate of 21.74 nautical miles an hour, or 25.03 statute miles an hour. In this race she also broke the record for the fastest round of the course, 6¼ miles. She sailed the third round in 16m. 58s., at the rate of 22.1 nautical miles an hour, or 25.45 statute miles an hour. The third race was but a repetition of the first two, and Dixie had only to start to win, barring accidents. The following is the complete summary of the three races for the Gay Cup:

Gay Cup.			
	July 27.	July 28.	July 29.
*Dixie.....	2 40 08	1 08 58	1 10 02
Spaghetti.....	2 20 02	1 42 26	1 51 51
Tai Kun.....	2 17 09	2 19 29	Withdraw.
Wee Win.....	2 41 00	Withdraw.	

*Dixie 1h. 27m. late in starting July 27.					
	July 29.	First.	Second.	Third.	Fourth.
Dixie.....	0 17 42	0 16 42	0 17 34	0 18 05

**Riverton Y. C.**

Riverton, Delaware River—Saturday, July 22.

THE Riverton Y. C. sailed its third annual regatta on Saturday, July 22. Four classes filled, and there were thirteen starters. It rained hard all the afternoon, but there was a good sailing breeze from the S.E.

Carolyn II. led the catboats over the line at 3:05. Fiona was second and Sea Gull third. Fiona soon went into first place, and was never headed. Sea Gull passed Carolyn II. on the second round, and secured second prize.

The one-design boats started at 3:10, with No. 2 in the lead and No. 3 next. No. 2 led her four competitors all over the course, and finished over 4m. ahead of No. 3, the second boat. No. 6 was third.

Tadpole not only beat her two competitors in the jib and main-sail class, but finished 3m. ahead of the winning boat in the one-design class.

The two starters in the Mosquito class were late in getting to the starting line, and the judges were not able to send them away until 3:50. Both boats got away almost on the signal, and they had a close race all over the course. No. 15 crossed the finish line 20s. ahead of No. 14. The summary:

Catboat Class—Start, 3:05.		
	Finish.	Corrected.
Fiona, John Perkins.....	4 34 20	1 28 35
Sea Gull, L. C. Cook.....	4 38 52	1 33 52
Carolyn II., C. C. Rianhard.....	4 41 33	1 36 24
One-Design Class—Start, 3:10.		
No. 2, H. B. Hills.....	4 44 14	1 34 11
No. 3, H. McL. Biddle.....	4 48 30	1 38 40
No. 6, John H. Reese.....	4 54 00	1 44 00
No. 4, C. C. Rianhard.....	4 54 30	1 44 30
No. 7, E. W. Crittenden.....	4 55 00	1 45 00

**Chatham Y. C.**

Chatham, Mass.—Saturday, July 29.

THE first race of the Chatham Y. C. was sailed Saturday, July 29 in the light S.E. breeze. In the first class XXXX got the start, but was passed by Sea Fox at the first mark. At the start of the second round of the course, XXXX was again leading, but Sea Fox passed her and finished first. XXXX wins first on corrected time, the full table of which was not announced. Swan won easily in Class B. The summary:

Class A.	
XXXX, D. E. Gould.....	Elapsed. 1 23 46
Sea Fox, B. L. Jones.....	1 23 13
Flossie, G. W. Bloomer.....	1 25 28
Trilby, N. L. Skene.....	1 25 48
Mascot, W. A. Bloomer.....	1 27 42
Cosmos, A. S. Early.....	1 28 50
Class B.

Leo, N. E. Kendrick.....	0 48 15

**GAS ENGINES AND LAUNCHES.**

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

**Mineola-Virginia Match Race—Amateur Crews.**

Oyster Bay, Long Island Sound—Wednesday, July 26.  
MANNED by amateur crews, the 70-footers Mineola and Virginia met in a match race off Oyster Bay on Wednesday, July 26. Mineola won by 3m. 54s.

The race was the outcome of a challenge issued by Commodore William K. Vanderbilt, and it was accepted by Mr. W. Ross Proctor, owner of Mineola. The arrangements were made by the representatives of the owners of the two boats, and the date for the race was set for July 26. Crews for the boats were recruited, and almost every Sunday before the race they were given practice spins.

It has been some time since any big boats have raced with amateur crews, and consequently the match attracted more than ordinary interest.

The conditions governing the race allowed twenty-five amateurs for each boat, besides four professionals, namely the steward and cook and the lazarette and masthead men. The race was once over a 20% mile triangle. The match was for a \$100 cup, to be given by the losing club.

The start was made at the buoy off Lloyd's Point, thence N.W. by W. 1/4 W., 6 1/2 miles, to Captain's Island, thence E. by N. 5 1/2 miles and E.N.E. 2 1/2 miles to Greens Ledge, thence S.S.W. 5 1/2 miles.

The Race Committee was composed of Messrs. H. H. Landon, H. C. Smith, of the Seawanhaka Corinthian Y. C., and Charles F. Kirby, of the Indian Harbor Y. C., and were on board the steam yacht Tarantula.

Mineola was towed across the Sound by her tender Mermaid, which boat had on board the former's professional crew, together with Mrs. Proctor and some guests. Virginia's professional crew were on board Tarantula.

The warning signal was given promptly at 2 o'clock, and at that time the wind was W.N.W. At 2:05 the preparatory was heard. Both boats had No. 2 jibyard topsails aloft, and Virginia carried her baby jibtopsail. On Mineola a No. 2 jibtopsail was tried and it did good work in the light air.

Captain Addison G. Hanan, Mineola's skipper, got in the weather berth a couple of minutes before the start, and remained there until the starting signal, when his boat slipped over the line close under Tarantula's stern. She crossed on the port tack, and her skipper brought her up as close as she would lay after crossing. Virginia also crossed on the port tack 55s. after the signal.

Virginia was at once put on the starboard tack, and then she went back to the port tack again. Mineola drew out ahead fast and her big jibtopsail seemed to be a big help to her. The wind went to W. by S., and the boats could almost lay their course for the first mark. As they got out in the Sound the wind strengthened a little, and the men who had been sitting to leeward to heel them down were ordered up to the weather side. Two tacks were necessary to round the first mark, and spinnaker poles were run out to port on both boats, and the big sails were sent up to the masthead.

Mineola's topsail sheet got jammed on a capstan, and this caused her crew more trouble. When the mark was reached it was found necessary to carry spinnakers to starboard. Virginia's crew shifted her spinnaker pole to starboard smartly, and soon had the spinnaker drawing.

While Mineola was gybing back and forth, trying to get her jibtopsail sheet and other gear clear, Virginia was running up on her fast, and it looked as though she might catch her. When Mineola's crew finally got things straightened, she was well in toward the rocks, and she had little water under her.

Mineola no sooner got out of trouble, when the man on the starboard main sheet bitts of Virginia let his end of the sheet get away from him, and it ran through one block before it was secured.

Virginia's baby jibtopsail split in two places on the first leg, and a larger sail was substituted for it.

It was necessary to gybe both boats and reset spinnakers to port off Cow's buoy. This time the work was done cleanly on both boats. Spinnakers were carried well down to the second mark, and the following times were taken when the boats rounded: Mineola, 4:04:16; Virginia, 4:06:19. Virginia had gained 38s. on the second leg.

The wind had shifted to S.W., and on the starboard tack the boats lee-bowed the tide, which was running flood. Virginia's jibtopsail sheet parted soon after rounding, and the bowsprit men had difficulty getting the sail in, as the jibtopsail halliard jammed with the spinnaker halliard. A man finally went up the jib stay and unhooked the jibtopsail halliard, and the sail was gotten in on deck. As the baby jibtopsail was torn, another sail could not be set, and Virginia was handicapped accordingly.

Virginia held one long tack across the Sound to the Long Island shore, and one hitch took her across the finish line. Mineola made four tacks in order to reach the finish line.

Mineola's amateur crew went aboard the tender Mermaid immediately after the race, and she ran alongside Virginia. The losing crew gave three cheers, which were promptly returned by the victors. The summary:

Start, 2:10—Course, 20% Miles.			
	Finish.	Elapsed.	
Mineola, W. R. Proctor.....	4 45 02	2 35 02	
Virginia, W. K. Vanderbilt.....	4 48 56	2 38 56

**Swampscott Dory Club.**

Swampscott, Mass.—Saturday, July 29.

A RACE of the Swampscott Dory Club for the Grosvenor cup was sailed on Saturday, July 29, in a light S.E. breeze. Four of the clubs of the Massachusetts Sailing Dory Association were represented. The race was close from start to finish, Catspaw of the Swampscott Club, winning by 21s. The summary:

**Indian Harbor Y. C.**

Greenwich, Long Island Sound—Saturday, July 29.

THE annual regatta of the Indian Harbor Y. C. was sailed on Saturday, July 29. There were thirty-seven starters, and the winners were as follows: Mimosa III., Memory, Phryne, Tartan, Rascal, Vaquero, Heron, Ace, and Kenoshi.

This match was one of the most satisfactory of the season, and the skippers and crews that participated were treated to some very lively sailing. It rained more or less steadily, and the strong E. wind kicked up a lump of a sea. The 33ft. sloops and yawls, and the New York one-design 30-footers covered a 15-mile course. The start was from the red spar buoy off the S.W. end of Great Captain's Island, thence the Cows gas buoy, off Shippan Point, E. by N. 5 1/2 miles; thence to the black spar buoy off Oak Neck Point, S.W. by S. 5 1/2 miles; thence to and across the starting line, N.W. by N., 4 1/2 miles. All the other classes went to the red spar buoy off Woolsey's Rock, E. by N. 1/4 N., 3 1/4 miles; thence to a markboat anchored in the Sound S.S.W. 3 1/2 miles; thence to and across the starting line, N.W. by N. 3 1/2 miles; total distance, 10 nautical miles.

The 33ft. sloops and yawls were sent off on the same signal at 12:20. Mimosa III. led her two competitors Nike and Tito over the line. She was quite at home in the wind and sea, and soon opened up a big gap. Mimosa III. was never headed, and finished 11m. 48s. ahead of Nike, the second boat. Nike and Tito had a fair race for second place, but the former won out. Nike's owner protested Mimosa III. for having fouled Nike when starting.

Memory and Cherokee were the only starters in the yawl class, and the former won by nearly 15m.

Only a small field of the New York Y. C. one-design boats started. Phryne got the start, and before the weather mark was rounded she had a lead to assure her of winning. Nautilus got in a pocket at the start, and was too far behind to overtake Phryne when she got clear. Phryne beat Nautilus 1m. 52s. Ibis was third, 2m. 10s. behind Phryne. Alera was a good fourth, and Atair finished fifth. Maid of Mendon fouled Neola II. shortly after the start, and the backstay of the Pyncheon boat was carried away. Both Neola II. and Maid of Mendon withdrew at once.

Eleven raceabouts turned out, and this class made the best showing of the day. Tartan showed the way to her ten competitors, and won by 1m. 43s. Nora was second and Rana third. Invader, Jr. was the only boat in the class that did not finish.

One boat only finished in the other five classes, the other starters withdrawing from one cause or another.

In the 27ft. sloop class, Rascal wins, as Robin Hood was disabled and Maryola did not finish.

Dorothy withdrew in the Larchmont 21ft. class, and Vaquero finished alone.

As Paumonak and Okee did not finish in the 22ft. class, Heron gets her first prize of the season. Paumonak was run down by the yawl Fleetwing, which boat was participating in the New Rochelle Y. C. cruising race for yawls. Paumonak was damaged, but no one was hurt.

Ace wins again in the 18ft. class, and Kenoshi took a sailover in the Indian Harbor one-design class.

The Race Committee was composed of Messrs. H. Wilmer Hanan, Charles E. Simms, Thomas J. McCahill, Jr., Charles F. Kirby, Charles P. Geddes and Frank Bowne Jones.

**Winthrop Y. C.**

Winthrop, Mass.—Saturday, July 29.

A HANDICAP race of the Winthrop Y. C. was sailed on Saturday, July 29, in a light S.E. breeze. A special class of Cottage Park Y. C. boats was sent over the Winthrop Y. C. course. In the 25ft. class Kit had all the best of it on both elapsed and corrected times. Opeechee won handily in the 21ft. class, as did Hattie in the 15ft. class. Yankee won a close race in the Cottage Park Y. C. class. The summary:

**Bensonhurst Y. C.**

Bensonhurst, New York Harbor—Thursday, July 27.

ALFRED MACKAY'S Ogeemah, representing the New York Y. C., won the first race of this year for the Bensonhurst perpetual challenge cup for Class Q boats enrolled in clubs on Gravesend Bay, which occurred on the afternoon of Thursday, July 27. She succeeded in defeating More Trouble, the Bensonhurst Y. C. defender, on corrected time, by 2m. 50s. for the leeward and windward course of 10 miles. The trophy goes to the club whose boat wins two races, and is held subject to challenge.

Each of the associated clubs on Gravesend Bay sent its speediest boat in Class Q. Besides the two mentioned, the Atlantic Y. C. was represented by Saetta; the Marine and Field Club by Quest, and the challenging Brooklyn Y. C. by Ojigwan.

According to governing conditions, the first race had to be either to windward or leeward and return. The Race Committee, which was on board the sloop Maydic, decided to send the racers from Sea Gate up through the Narrows, to and around Robbin's Reef bell buoy and return, leaving all marks to port. This course has been employed during the past few years for power boats, but not for those propelled by sail. It was with misgivings regarding the possible interference of tugs that some of the contenders started. Fortunately for all, the route remained unobstructed, and the journey proved a good test for the different boats.

The wind from start to finish was from S.S.E. This gave a fine spinnaker run on the outward journey and a hard beat home in the face of a flood tide. Saetta was first to turn the buoy at Robbin's Reef. Ojigwan was second, Ogeemah third, Quest fourth, and More Trouble, which boat had lost her spinnaker when half way to the mark, fifth. Once on the wind, all of the boats stood over to the South Brooklyn shore, and then worked down the Bay by short tacks. More Trouble soon gained the lead, which she maintained until the end. Ogeemah pointed very high, and to this quality her victory on corrected time is undoubtedly due. On actual elapsed time, More Trouble beat Saetta by 2m. 23s., and Quest by 5m. 47s. Ogeemah was the only boat getting allowance, the others being rated at the top of the 22ft. class. The summary follows:

Sloops—Class Q—Start, 3:05.			
	Finish.	Elapsed.	
More Trouble, W. H. Childs.....	5 13 13	2 08 13	
Saetta, Geo. H. Church.....	5 15 36	2 10 36	
Quest, F. J. Havens.....	5 19 00	2 14 00	
Ogeemah, Alfred Mackay.....	5 19 40	2 14 40	
Ojigwan, Geo. E. Reiners.....	5 21 03	2 16 03	

Corrected time of Ogeemah, 2:05.23.

Saturday, July 29.

The Bensonhurst Y. C. held a race on Saturday for the William H. Childs perpetual challenge trophy for Classes M and under. The winner proved to be More Trouble, representing the organization giving the event. She beat Quest, which boat was sailing in the colors of the Marine and Field Club, by 1m. 39s. The 30-footer Tobasco was first boat to finish, but was beaten on corrected time by 5m. 4s.

Under conditions governing the trophy, each club entering a contest is entitled to send two representatives, all sailing in one division on regular time allowance. In the race of the 29th, the defending Bensonhurst Y. C. was represented by Tobasco and More Trouble. The Atlantic Y. C. as challenger sent Cockatoo II. and Lizana. The Marine and Field Club entered the Class Q craft Quest, and the Class RR. boat Beta. Ogeemah sailed for the New York Y. C., while Ojigwan represented the Brooklyn Y. C.

The course selected was from the start, off Ulmer Park, to can buoy No. 13, off Fort Wadsworth; from there to and around Roamer Shoal Light and home, leaving marks to port. The wind was from the S.E. This made the first leg a broad reach, the second to windward, and the third a reach home. The windward work was all performed against a strong head tide. More Trouble was first to turn the can buoy. Tobasco was first around Roamer Shoal Light, with More Trouble second and Quest, which boat had been putting up an excellent fight, third. Lizana, Cockatoo II., Ojigwan and Ogeemah came next in the order named.

All hands sailed fast on the reach home, More Trouble finishing near enough to Tobasco to win out on corrected time. The Childs trophy remains with the Bensonhurst Y. C., subject to challenge. According to governing conditions, only one more event can be held this year. The winning boat of each race gets a miniature reproduction of the larger trophy. The summary follows:

New Rochelle Y. C.—Handicap Race for Yawls

New Rochelle, Long Island Sound—Saturday, July 29. Six yawls belonging to members of the New Rochelle Y. C. sailed a fine race on Saturday, July 29, from New Rochelle to the Towes Buoy, off Stamford, thence to buoy in Hempstead Harbor and home, a distance of 27 miles. A strong breeze from the E. kicked up a lively sea, and a succession of heavy rain and wind squalls made the race interesting from start to finish. There had been considerable rivalry among the owners of the several yawls in New Rochelle harbor, and former Commodore Donovan, E. C. Locke, William G. Dunham, and Frank Tucker presented a handsome silver cup to be given to the winner. The starters were George Matthew's Escape, E. R. Newell's Adelaide, J. P. Donovan's Thora, C. M. Fletcher's Fleetwing, W. G. Dunham's Cavalier, and M. S. Kattenhorn's Surprise. These boats vary considerably in size, and to equalize things it was agreed that Adelaide should have an allowance of 7m., Cavalier 10m., Surprise 25m.; the other three to sail on even terms. Escape was first across the line, followed closely by Adelaide. The boats made a long tack across the Sound, and when they came about, Escape was leading Fleetwing by about a quarter of a mile. This lead was gradually increased until the weather mark was reached, the boats rounding as follows: Escape, 2:08:00; Adelaide, 2:18:00; Thora, 2:28:00; Cavalier and Surprise dropped out. Fleetwing collided with the old one-rater Palm off Greenwich Point, doing considerable damage to the latter. She was obliged to anchor for a time, which spoiled her chances for second place, which she otherwise would have had. The boats carried spinnakers and balloon jibs to the second mark, off Week's Point, and Thora and Adelaide, both gained slightly on Escape on this point of sailing, but not enough to offset her great superiority in windward work. Her crew were all old hands in the boat, and consisted of George Matthews, owner; John D. Sparkman and John H. Schofield, and her skipper. Handicap. Finish. Elapsed. Corrected. Escape ..... Allows 4 17 00 5 07 00 5 07 00 Adelaide ..... 0 07 00 4 28 25 5 18 25 5 11 25 Thora ..... Seratch 4 34 50 5 24 50 5 24 50 Fleetwing ..... New York State Rifle Association.

THE second annual meeting of the New York State Rifle Association, held at Creedmoor, N. Y., commencing on July 26, and ending on August 1, had 29 matches on the programme. The company team match open to teams of four, from any headquarters or company of the U. S. Army, Navy or Marine Corps, National Guard or Naval Militia of any State, Territory, District of Columbia, or any foreign government, or any four members of the Association from a registered club or society. Distances, 200, 500 and 600yds.; seven shots per man at each distance. Positions, standing at 200, prone at 500 and 600yds. Rifle, any military. Entrance, \$10. First, 40 per cent. of entrance; second, 20 per cent.; third, 10 per cent. This event was won by the Headquarters team of the 71st Regiment. Score, 370. Company D., same regiment, was second with 360. Company A, of the Marines, was third with 359. The leading teams and individual scores at 200yds. were as follows: Co. B., U. S. Marines. Co. B., 7th Regt. Lieut. McDougal ..... 32 Corporal Kerran ..... 28 Sergt. Benson ..... 29 Private Thies ..... 29 Corporal Scott ..... 29 Sergt. Fowler ..... 30 Private De Loach ..... 29-119 Lieut. Stewart ..... 29 116 Co. E., 7th Regt. Sergt. Knust ..... 29 Corporal Milleman ..... 26 Private Lonsdale ..... 30 Private Wenige ..... 30-115 Other teams made the following scores: Company A, U. S. Marines, 128; D, 71st, 127; E, 7th, 126; B, 23d, 126; B, 1st, U. S. Marines, 122; F, 71st, 108. At 500yds.: Co. B., U. S. Marines. Headquarters 71st. Regt. Lieut. McDougal ..... 32 Lieut. Casey ..... 32 Sergt. Benson ..... 32 Sergt. Doyle ..... 32 Corporal Scott ..... 32 Capt. Corwin ..... 35 Private De Loach ..... 34-130 Lieut. Ranney ..... 31-130 Co. B., 7th Regt. Corporal Kerran ..... 33 Sergt. Fowler ..... 33 Private Thies ..... 33 Lieut. Stewart ..... 33-129 Other teams at 500yds.: A, U. S. Marines, 114; B, 1st, U. S. Marines, 113; D, 71st, 112; Headquarters 71st, 109; B, 23d, 103; F, 71st, 91. At 600yds.: Headquarters 71st Regt. Co. D., 71st Regt. Lieut. Casey ..... 33 Private Moore ..... 30 Sergt. Doyle ..... 32 Sergt. Potter ..... 28 Capt. Corwin ..... 32 Lieut. Sheppard ..... 33 Lieut. Ranney ..... 34-131 Corporal Flack ..... 30-121 Co. A., U. S. Marines. Sergt. Clark ..... 24 Corporal Burkhardt ..... 34 Sergt. Baptist ..... 30 Corporal Schriver ..... 29-117 The remaining teams at this range were: Company B, 1st, U. S. Marines, 116; E, 7th, 112; B, 2d, U. S. Marines, 108; B, 23d, 102; F, 71st, 99. The totals of the teams were as follows: Headquarters 71st, 370; D, 71st 300; A, U. S. Marines, 359; B, 2d, U. S. Marines, 357; E, 7th, 353; B, 7th, 353; B, 1st, U. S. Marines, 351; B, 23d, 331; F, 71st, 293. No. 2 was the Carbine team match open to teams of four. Distances, position, fee same as in previous match: Headquarters, Squadron A. 200 500 600 Yds. Yds. Yds. Lieut. Sayre ..... 31 32 27 Quartermaster-Sergeant Herrick ..... 29 30 31 Company Sergeant Fahys ..... 27 18 27 Private L. B. Smith ..... 27 34 25 Totals ..... 114 114 110 Grand total ..... 338

The Third Troop, Squadron A, finished second with 325; the Second Troop, third, with 319, and the Second Troop, N. J., fourth, with 259. On July 27, the second day, the McAlpin trophy, open to teams of eight from the U. S. Army, U. S. Navy, N. G. or uniformed militia or Naval Militia of the several States and Territories and District of Columbia, and from any foreign government. Distances, 200, 600 and 1000yds., 10 shots at each distance. Positions, standing at 200, prone at 600 and 1000yds. Rifle, any military. Entrance, \$20 per team. To first, trophy presented by General E. A. McAlpin, for annual competition, and 40 per cent. of entrance fees. Second, 20 per cent. of entrance. At 200yds., there was a gentle 8 o'clock wind and a good light. A fish-tail wind from 5 to 7 o'clock were conditions at the 600yd. distance, shooting then begun at 1 o'clock. Summary: New York. 200 600 1000 Yds. Yds. Yds. Total. First Lieutenant K K V Casey ..... 42 34 43 119 Sergeant G H Doyle ..... 43 43 45 131 Captain B B McAlpin ..... 41 41 35 117 Sergeant W B Short ..... 41 46 31 118 Ord. On July 29, the event of the day was the 71st Regt. trophy, skirmish and rapid-fire match, open to teams of six. The usual military conditions governed eligibility. The shooting conditions were same as the rapid fire and skirmish of the National trophy competition. Rifle, any military. Entrance \$10 per team. Prize, valued at \$200, presented by the Board of officers of the 71st Regiment, N. G., N. Y. The competition in this event was unfinished, owing to darkness, and was carried over to Monday. The competition was closest between the 71st and the Marine Corps, the latter having captured the trophy last year. At the conclusion of the 500yds. rapid-fire, the 71st was 5 points in the lead with a score of 518; the Marines were second with 513 points. At 200yds., they were tied on 263 out of a possible 300. Eighteen teams were entered. On Monday the match was concluded. It began at 3:30 and part was shot in the rain. Scores: 71st Regiment, 1328; Marine Corps (first team), 1259; U. S. Navy (first team), 1162; 12th Regiment (second team), 1136; U. S. The Old Guard match was one of the two programme events of July 31. It was open to teams of six from any rifle club or association in the United States. Distance, 200yds., standing, 10 shots per man. Rifle, any military. Prize, a trophy, value \$200, presented by the Old Guard. Scores: 71st Regiment, 262; Marine Corps (first team), 254; Manhattan Rifle and Revolver Association, 251; Marine Corps (second team), 248; 12th Regiment (second team), 246; 12th Regiment (first team), 246; Italian Libituni, 242; 69th Regiment, 241; 71st Regiment (second team), 240; Italian National, 237; 12th Regiment (third team), 227; 71st Regiment (third team), 225.

The Funston match was the second on the programme of the day. It was open to all. Distances, 700 and 800yds., prone position, 7 shots at each distance. Rifle, any military. Three entries allowed, two best scores to count. Entrance, \$2 to members of N. Y. S. R. A.; to all others, \$3. The prizes were 30, 20, 10, 7 and 3 per cent. of entrance fees, and the five winners were as follows: Lieut. Casey, 71st Regt., 131; Capt. Wells, 71st Regt., 127; Pvt. Short, 7th Regt., 126; Capt. Corwin, 71st Regt., 125; Sergt. Doyle, 71st Regt., 122.

English Army Rifle.

So at last the War Office has made up its little mind, and, after a period of indecision, has finally decided that the new rifle is not good enough for our troops. Already thousands of the new rifles have been manufactured and distributed to the Army, and, as the order has been given that no more are to be made, we suppose these weapons will be returned to store and finally sold off in the usual way. It was the Army Council who obstinately refused to accept the verdict of the majority of the experts who had tried the rifle and pronounced it inferior to the Lee-Enfield, Mannlicher, and Mauser. The Council persisted, and organized a series of trials in a vain hope of upsetting such opinion. The first trial was carried out under the direction of Lieut.-General Sir William Butler, and the report was unfavorable. Then the School of Musketry were asked to test the weapon, but their report was also unfavorable. Finally the School of Musketry were asked to give it a second trial, and this time, strange to say, the rifle was found to be an excellent weapon. In the subsequent use and practice at the ranges the following defects, which had all been pointed out by experts, were rediscovered and reported to headquarters: (1) Jamming of the magazine; (2) too much play in the mechanism; (3) foresight disappears during rapid firing in a haze caused by a vapor; (4) foresight too thick, and obliterates the target; (5) bad balance; (6) metal too soft, resulting in the barrel being permeated with corrosive gas.—Shooting Times.

The indications at present are that the great rifle competition, which will take place at Sea Girt, N. J., this month, will have generous support in the way of entries. Teams from thirty-five States and a team from Hawaii are expected to participate.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Aug. 2-4.—Albert Lea, Minn.—The Interstate Association's tournament under the auspices of the Albert Lea Gun Club. N. E. Paterson, Sec'y. Aug. 5.—Richmond Valley, S. I.—Team match between the Aquahonga and Castleton gun clubs. Aug. 8-9.—Morgantown, W. Va.—First day, Monongahela Valley League of West Virginia fifth tournament, under auspices of the Recreation Rod and Gun Club. Second day, club day. Elmer F. Jacobs, Sec'y. Aug. 8.—Bergen Beach, L. I., Gun Club monthly shoot. H. W. Dryer, Sec'y. Aug. 8-10.—Grand Rapids, Mich.—Consolidated Sportsmen's Association fourth annual tournament.  Oct. 18-19.—Ossining, N. Y., Gun Club shoot, \$50 added. C. G. Blandford, Capt.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Cincinnati, O., Gun Club has arranged to hold a shoot on Labor Day.

The Wilson, N. C., Gun Club have arranged to hold a shoot on Aug. 8 and 9.

The next shoot of the Hudson Gun Club, Jersey City, N. J., is fixed to be held on Aug. 6.

The Ossining, N. Y., Gun Club announces a two-day shoot, \$50 added, to be held on Oct. 18-19.

The New London, O., Gun Club has fixed upon Aug. 31 for their second annual tournament. Mr. A. Ledgett is the Secretary.

The date of the Palisade Gun Club shoot at Edgewater, N. J., has been changed from Aug. 31 to Aug. 24.

The Breeder and Sportsman announces that Medford, Ore., sportsmen contemplate the holding of a big tournament, after the Pacific Coast Handicap in September, with \$500 or \$1000 added.

In the fourth team contest of the North Jersey League, at Montclair, N. J., on Saturday of last week, the Newton Gun Club team defeated the Montclair Gun Club team by a score of 115 to 105.

The three-cornered team contest between the Columbia Gun Club, of South Amboy, the Castleton Gun Club, of Port Richmond, and the Aquichongia Gun Club, of Tottenville, is fixed to take place at Richmond Valley, S. I., on Saturday of this week.

A "special cable dispatch to the Sun" recounts that at St. Sebastian, July 26, "in opening a pigeon shooting match to-day King Alfonso fired fifty shots and missed his bird only twice." In this country a man who missed his bird only twice would have missed it quite often enough. After you, Alfons!

Mr. C. J. Westervelt, Secretary, writes us that "The Pleasure Gun Club, of Englewood, N. J., will hold an all-day shoot on Monday, Sept. 4, Labor Day. The programme for this shoot will be out very soon, and will be made very interesting. A special invitation is extended to all shooters in and around New York."

In the Philadelphia Trapshooters' League series, the Clearview Gun Club ten-man team defeated the Meadow Springs Gun Club team by the score of 398 to 394. The Florists were represented by Fred Coleman, who, with nine-scores of 25 each, allowed to the vacancies, and a score of 42 out of 50, made a team score of 207, on July 29.

The Secretary, R. W. Gorham, writes us that "The Mount Kisco, N. Y., Gun Club will give a tournament on Aug. 24. The programme consists of twelve events, 15, 20 and 25 targets. Event 8 is a merchandise contest. A special prize will be given for professional and amateur high averages." For further information, apply to the Secretary.

At the Aquidneck Gun Club tournament, held at Newport, R. I., on Friday and Saturday of last week, the Watertown five-man team defeated the Aquidneck team by a score of 214 to 206 out of a possible 250. Heer was high average on the first day with 142 out of 150; Griffith second with 138. On the second day, Griffith was high with 169 out of 175; Heer second with 167. For the two days Heer was high with 309 out of 325.

Of the 149 contestants in the Northwest tournament, only one, Mr. W. F. Sheard, of Tacoma, scored 90 per cent. or better. He surpassed it by .006 per cent. Low percentage was 41. Those averages are sufficient cause for a wistful feeling on the part of many shooters elsewhere, to seize hurriedly their guns and ammunition and journey to the Northwest, and with a philanthropic spirit teach some one how to shoot at the regular rates of tuition.

The Christiana-Atglen Gun Club announces an all-day shoot, to be held at Atglen, Pa., Aug. 26. The Trapshooters' League of Lancaster County will be in the competition, and this will be its third meeting. There are twelve programme events, and the League five-man team race, the latter at 25 targets per man. The other events are at 10, 15 and 20 targets, 50 cents, 75 cents, \$1 and \$1.25 entrance. Shells shipped prepaid, care of Lloyd R. Lewis, Atglen, will be delivered on the grounds free of charge.

The Duluth, Minn., Central Gun Club have issued the programme of their eleventh annual tournament, to be held Aug. 8-9. On the first day, thirteen events are provided, eight at 15, \$1.50, four at 20 targets, \$2 entrance, and the thirteenth, a four-man team race at 25 targets, for the Laffin & Rand trophy. The programme of the second day is similar to that of the first, the team race excepted. There are thirty average moneys, totaling \$350. Sliding handicap. Shooting will begin at 9 o'clock. Class shooting. Shells shipped to J. W. Nelson, 5 East Superior street, will be delivered free on grounds. The Secretary-Treasurer is Chas. W. Wilson.

The programme of the Consolidated Sportsmen's Association fourth annual tournament at targets, Grand Rapids, Mich., Aug. 8-10, provides twelve events each day, a total of thirty-six for the three days. Of these, twenty-four are at 15 targets, entrance \$1.50, and \$9 added, and eleven are at 20 targets, \$2 entrance, \$12 added, and one event, the last, at 25 targets, \$2.50 entrance, \$25 added. For the three days' averages, \$25, \$15, \$10. Each day, \$15, \$10 and \$5. Everybody will stand at 16yds. Ship guns and ammunition prepaid to Chas. M. Greenway, Secretary, Grand Rapids. Race system, 8, 5, 3, 2. Shooting begins at 9 o'clock. Aug. 7, practice day.

The Monongahela Valley Sportsman's League of West Virginia have issued the programme of their fifth regular monthly tournament, to be held Aug. 8 and 9, by the Recreation Rod and Gun Club, Morgantown, W. Va. The programme of the first day consists of five events at 15 targets, 40 cents entrance; five events at 20 targets, 50 cents entrance, and event 6, the League five-man team race for the Peters cup, 25 targets, 50 cents entrance. Event 7, 20 targets, carries with it the Infallible cup, emblematic of the individual championship. Total of added moneys in the eleven events, \$22.50. Ten cents from each entrance will constitute a purse for high averages, 60 and 40 per cent. On the second day, merchandise prizes, value \$110, will be shot for. Shooting will begin at 9 o'clock. Rose system. Ship shells prepaid to John M. Cobun. Lunch served on grounds. Chicken and waffle supper on first day. Secretary-Treasurer Elmer F. Jacobs will have charge of office. Cashier of tournament, A. Ford Dickey.

Programmes of the Interstate Association's trapshooting tournament, given for the Colorado Springs, Colo., Gun Club, Aug. 29-31, is ready for distribution. On the first and second days twelve events are respectively provided, eight at 15, four at 20 targets, each \$2 entrance, \$20 added. Day's averages, \$12.50, \$10, \$7.50, \$5 and \$5—first, second, third, fourth and fifth respectively. On the third, there are four 15 and two 20 target events, and the Denver Post trophy, the latter at 100 targets, entrance \$10, handicaps 14 to 22yds., high guns. Only amateurs who are residents of Colorado, Kansas, Nebraska, Wyoming, Idaho, Utah, Missouri, New Mexico, Arizona, Montana, Oklahoma, Texas, South Dakota and Iowa are eligible. Shooters who receive only guns or ammunition free are not considered professionals for this event. There are fifteen amateur general averages ranging from \$25 to \$10, and ten professional general averages, from \$30 to \$10. Aug. 28, practice day. Mr. A. J. Lawton is the Secretary of the Colorado Springs Club. Guns and ammunition, prepaid, may be sent to J. W. Garrett, and they will be delivered on the grounds free.

BERNARD WATERS.

Mount Kisco Gun Club.

MOUNT KISCO, N. Y., July 31.—The appended scores were made on our grounds by the members of the Mount Kisco Gun Club on July 13, 20 and 27. Events 4 are for the P. W. Bouron silver cup, which a member must win three times before it becomes personal property. Handicaps apply to that event. Scores:

Fay wins point on cup.

West Shore Gun Club.

KINGSTON, N. Y., July 29.—I inclose the first and second shoots of our club for the Dupont trophy, under added bird handicap. There are to be ten shoots, the man winning the most times to take the trophy.

In the second shoot, Mr. W. S. Smith made a run of 50 birds straight, using a 16-gauge gun and 2½ drams of powder.

July 22.—First shoot for Dupont trophy, handicap added targets:

Brk. Hdp. Tot'l.	Brk. Hdp. Tot'l.				
Smith.....21	1	22	Floyd.....16	4	20
Schaffer.....20	2	22	Freer.....12	7	19

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., July 29.—The Newton, N. J., Gun Club paid a visit to the Montclair Club to-day, and the fourth of the series of team races between the clubs of the North Jersey League was run off, resulting in favor of the Newton Club with a score of 115 to 105.

No. 4 in the appended scores gives the figures in detail, the first five men forming the Newton Club and the second five the Montclair club. The other events were for silver prizes, some of the winners being Cahrs, Von Lengerke, Allan, Bush, Dr. Gardiner and Brugman.

Quite a large delegation of the Mountainside Club, of Orange, were present, while the trade was represented by Sim Glover and G. Schneider. Glover was in very good form, breaking 103 out of 105 shot at, while Cahrs, of the Newton Club, broke 111 out of 115.

EDWARD WINSLOW, Sec'y.

Recreation Rod and Gun Club.

MORGANTOWN, W. Va., July 28.—The Recreation Rod and Gun Club held its seventeenth weekly shoot at Recreation Park this afternoon, with twelve guns out, fairly good weather conditions, and some pretty fair scores were chalked up.

The officers' goblet, handicap, was won for the week by Price with a score of 19 out of 22 shot at.

The club championship gold medal was won for the week by Dr. Sivey with an average of 89.8 per cent. for the entire regular programme.

After the regular programme was shot off, some of the members shot several extra events, notably a 100-target race between Messrs. Taylor and Jacobs, in which the members' high score for our grounds at this number of targets was tied, Mr. W. N. Dawson holding the previous record, made on Oct. 28, 1904.

The club now has all arrangements completed for its tournament Aug. 8 and 9, and from replies so far received, we expect to have at least two full squads of experts and from sixty to seventy-five amateurs in attendance.

We have two traps installed, with plenty of bluerocks, and are fixed to handle one hundred shooters with dispatch, should they attend. The scores:

Officers' goblet, handicap:

Shot at. Broke.	Shot at. Broke.		
Cobun.....18	17	Sivey.....20	17
Taylor.....20	16	Christy.....19	15
Barthlow.....22	17	White.....22	18
Jacobs.....19	14	Price.....22	19
Beebe.....20	16	Dawson.....18	16
Harris.....20	16	Stillman.....20	7

Events:

Events:	1	2	3	4	Events:	1	2	3	4
Cobun.....	3	22	19	..	Sivey.....	22	23	..	..
Taylor.....	1	22	19	19	Christy.....	19	..	..	..

Beebe.....	1	21	..	..	Dawson.....	17	..	..	..
Harris.....	4	18	..	..	Stillman.....	20	..	..	..

No. 1 was a miss-and-out. No. 2, was at 25 targets. Nos. 3 and 4 were extra events.

Fourth event, club team race, 20 targets per man, five men: Price, captain.....19 Cobun, captain.....15 Sivey.....17 Harris.....10 Barthlow.....14 Beebe.....18 Taylor.....16 Dawson.....17 White.....16-82 Jacobs.....17-77

Extra event, 100 targets: Taylor.....85 Jacobs.....92 ELMER F. JACOBS, Sec'y-Treas.

Boston Gun Club.

BOSTON, Mass., July 26.—The last serial prize shoot for 1905 was held at Wellington to-day, with Wm. Heer and Jack Fanning, trade representatives, as attractions, which in itself was enough to bring out a good-sized attendance.

Heer, with 95 per cent., was high for the afternoon, with Fanning second, though the old reliable Dickey finished to the tune of 92 per cent.

In the serial match, finished to-day, Dr. Gleason captured first with 122. Kirkwood second, 119; Blinn, 118; Frank, 117.

Gleason won the long run of breaks, 52, eclipsing all others, though Dickey all but overtook this with a run of 46 to-day.

Scores:

Events:	1	2	3	4	5	6	7	8	9

# U. S. Government Ammunition Test.

Accuracy test of Krag-Jorgensen .30-Caliber Cartridges held at Springfield Armory by order of the Ordnance Department, United States Army.

**TESTED**—Ammunition of all the American Manufacturers.

**CONDITIONS**—10 and 20 shot targets, muzzle rest.  
10 and 20 shot targets, fixed rest.

**DISTANCE**—1000 yards.

**RESULT and OFFICIAL REPORT: U. S. Cartridges excelled all others**

MANUFACTURED BY

**UNITED STATES CARTRIDGE CO.,**

**LOWELL, MASS., U. S. A.**

**Agencies: 497-503 Pearl St., 35-43 Park St., New York.**

**114-116 Market St., San Francisco.**

## WESTERN TRAP.

### Cincinnati Gun Club.

THE attendance on July 29 was enough to keep the traps busy until dark. The weather was a little warm. A strong, cool breeze interfered somewhat with the flight of the targets. Twenty-four scores were recorded in the Schuler prize contest, five of the shooters making 50. In actual breaks, Sycamore was at the head with 46. A special shoot will be held on Labor Day, and a good programme will be provided. A number of practice events and three team matches were shot during the afternoon.

Schuler prize shoot, 50 targets:

	Hdcp.	T't'l.		Hdcp.	T't'l.
Gambell	6	50	Risling	24	46
Maynard	6	50	Colonel	44	46
Bullerduck	12	50	Captain	12	45
E. Altheer	13	50	Hesser	1	44
Andrews	23	50	Lytle	13	44
Keplinger	2	49	Meyers	17	44

Totals	41	40-81	Totals	42	46-88

### Garfield Gun Club.

The appended scores were made on our grounds to-day on the occasion of the first shoot of the third series.

In the club trophy shoot Hicks won in Class A on 24; George in Class B on 21; Ostendorp in Class C on 19.

In Hunter Arms trophy shoot, 10 singles and 5 pairs, Eaton, Kamp and Goetter tied for Class A on 18; George won in Class B on 15; Ditt won in Class C on 15.

In the Dupont cup shoot on 20 single targets, Kamp won in Class A on 19; George in Class B on 18; Ostendorp in Class C on 14.

The day was a fine one for target shooting, cool and calm and attendance was fairly good, considering that it rained heavily until almost 2 o'clock.

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7
Targets:	20	20	10	10	10	10	10	Targets:	20	20	10	10	10	10	10

DR. J. W. MEEK, Sec'y.

### Ohio Notes.

At the Greenville Gun Club Eidson won in Class A with 41 out of 50. Class B medal was won by Lambert with 38 out of 50.

The Welfare Gun Club, Dayton, O., will shoot every Saturday (except Aug. 5 and 12) until the quail season opens.

Supt. Ed. Clark, of the Dayton Gun Club, reports the prospects for quail this fall good. The birds liberated by the Dayton Pointer Club all seem to have done well.

The Cleveland Gun Club programme for the annual Labor Day tournament will be ready about Aug. 10.

The Superior Fishing Club gave a shoot on July 25, which was attended by over 100 members and guests. The club owns a piece of land on the banks of the Little Miami River, at Camp Dennison, 16 miles from Cincinnati, on the Pennsylvania Railroad.

They have a fine two-story club house with wide verandas facing the river. In another building is the kitchen and still another building, with screened sides, provides sleeping quarters for those who cannot find room in the club house. On the grounds is a base ball diamond, and near the house is the trap pit with expert traps. The club served a fine dinner and supper to its guests, and music was furnished by Messrs. C. Wartman, A. Steemers, C. Adolphi and G. Christopher. The club has twenty-five members and the following officers: Geo. Schenck, President; Frank Kotte, Recording Secretary; Chas. Haefner, Financial Secretary; Wm. Uhl, Treasurer. The most interesting event of the day was a series of three team matches at 25 targets per man for \$25 a team, losing team to pay for shells and targets. The teams were Gambell and Pfeiffer vs. D. Pohlar and W. Uhl, the latter team receiving handicaps of 3, 5 and 2 in the three matches. The first match was won by Gambell 23, Pfeiffer 20; 43 to 38. In the second match Uhl did good work, breaking his first 14 straight and scoring 22, Pohlar 19-41, with handicap, 46 to their opponents' 43. Gambell made high score of the series in this match, missing only his 11th target. In the third match Gambell missed his 1st and 15th targets, scoring 23, Pfeiffer 19-42 to Pohlar's 20; Uhl, 16-36, with handicap, 38. Several other matches were shot, but the scores made were low. The shooting

was brought to a close just as supper was announced, the supply of targets giving out at the same time. During the day Gambell broke 108 out of 126; D. Pohlar, 125 out of 156; Pfeiffer, 68 out of 90; Uhl, 81 out of 110; Knorr, 68 out of 90; Miller, 37 out of 66; H. Pohlar, 27 out of 50. The grounds are hard ones to shoot on, as the background is formed by large trees which grow thickly on the river bank, and quick work is necessary to catch the targets before they are almost lost to sight against the trees.

The regular medal shoot of the Rohrer's Island Gun Club, of Dayton, was held on July 25. Six men qualified with scores of 25 or better, out of the thirteen who shot. In the sixth shoot-off Oswald broke 5 straight and Hodapp broke 4. Hodapp certainly gave Oswald a hot race. In the shoot-offs he shot at 39 targets and missed 5. Oswald shot at 38 and missed 3. Harry Oswald and Wm. C. Oldt chose five men each for a team contest at 25 targets per man. The first match was a very close contest, being won by Oswald's team, 127 to 126. The win was credited to J. Schaert, who beat Sapp, the last man to shoot on Oldt's team, by 1 target, 18 to 17. The score, when five men on each side had shot was tied on 109. The second match was won by the Oswald team, 122 to 115. Miller, of the Oldt team, was high man for both matches with 47. Hanauer, Oswald team, second, with 46.

The Dayton Gun Club held their regular shoot on July 28. Thirteen members were present. As the time for the club tournament, Sept. 4 and 5, approaches the attendance will improve.

The Fayette Gun Club, of Lexington, Ky., had thirty-one shooters in attendance at their regular weekly shoot on July 27, most of whom shot through the 100-target programme provided by the managers. Among the visitors was the genial trade representative, C. O. Le Compte. The first event was for a silver cup given by the club, open to members only. It was won by F. Van Deren. Event No. 3 was the sixth in the series of twelve semi-monthly contests at 25 targets each for a Parker gun. As the scores stand now this is anybody's race. High score for the day was made by F. Van Deren with 83 out of 100; F. C. Bell, second, with 81.

The Columbus Gun Club's plans for their Labor Day shoot have been completed, and a day of good sport is promised.

### In Other Places.

The Grand Valley, Ont., Gun Club held its maiden effort in the target-tournament line last week. The attendance was not large, yet those present had a good time and good scores were witnessed. Arthur, Clifton, Drayton and Toronto sent delegates. McGill, of Toronto, made high score, 158 out of 175; Mallory, Drayton, second, 157, and Dunk, of Toronto, third, 156.

The Topeka, Kan., Gun Club is of late waking up. A merchandise shoot is on tap. This is the town where such men as Frank Irwin, Gwynne, Price, Cap. Bogardus and Fred Erb shot in big tournaments thirty years ago. It was here that the last line of the wild pigeons were shot at the trap. They were secured by Judy from the roost in the Indian Territory. Those good old shooting days will never come again, when 150 men would each put up \$12.50 and shoot the ties to a finish.

When there are shooting matches at Youngstown, Ohio, leading the gang you will always find C. D. Hursey as manager, while C. F. Needels is the efficient secretary.

The gun club known as the Buffalo Bill, North Platte, Neb., has new officers, viz. A. Muldoon, President; George Kinkowinich, Vice-President; C. C. Hopper, Treasurer; W. W. Walkins and Ralph Starkey, Field Captains.

Fred Cronis made the journey from Bucyrus, Ohio, to Monett on a bicycle for the purpose of taking part in the shoot held there. He made the good score of 41 out of 50, notwithstanding his tiresome ride.

The explosion or bursting of a gun at Allentown, Pa., put a stop to a shoot. This leads us to call attention of all shooters that most every accident of this kind can be prevented by simply looking through the gun and note if any obstruction was left by the previous shot.

From far away Weiser, Idaho, comes the report, that it being ladies' day there were many spectators. The official shoot for the gun club trophies will take place at the next meeting.

L. A. Platt, President of the Eau Claire, Wis., Gun Club, reports that what is left of the club will hold a shoot Wednesday. Some ten years ago this club was flourishing, held some large tournaments and had a squad that few, if any, clubs in the Northwest possessed its equal.

Fourteen hundred pigeons were lately sold by the Kidd Ranch near Stockton, Colo., for the purpose of being used at the gun club tournament.

The Omaha, Neb., shooters have an eye to business, and should notify Mr. Roosevelt. At their first shoot, held at Cut-Off Lake, the first prize was a baby carriage. Stewart won the shoot-off.

It has been many months since the Alpena, Mich., Gun Club held a shoot, but the secretary writes that a shoot will be held on Friday to try and get the boys again interested in target shooting.

The new Atlantic Gun Club, lately organized at Houghton, Mich., will hold shoots regularly every second Saturday afternoon. We note that the Cheboygan, Mich., Gun Club has been organized with the following members: W. E. Shoemaker, Capt. Welch, Frank Tracy, W. H. Conboy, Jas. J. Murphy, Fred Steiner, I. S. Cooper, Art. Frambach, Dr. Graham, Henry Cuerny, John R. Craig, W. L. Martain, Joseph Earl, Henry Young, W. S. O'Brien, C. L. Margnette.

The Horton, Kan., Gun Club's name has not, to the writer's knowledge, been seen in print for the past dozen years. Todd Wallingford won a first prize and P. P. Peterson second, with Jules Marquette third.

The Sycamore, Ill., Gun Club has taken a new lease on life, notwithstanding the absence of Colonel Shafter, and will hold regular shoots hereafter.

At Faribault, Minn., it was the decision of the gun club that a shoot would be held only once each week. Does it occur to the new clubs that shooting too often and too much is the cause of the decay of many clubs? It is easy to make shooting too expensive.

Target shooting is improving at Edgar, Nebr. At the last shoot there Dr. P. G. Grimm won first prize, J. W. Hilcr second and Dr. G. R. Woods third.

The secretary writes from Alpena that the Cheboygan and the

Onaway Gun Club are getting ready to challenge the Alpenas. Nothing gets up the interest in the shooting line equal to a team race.

There is talk of holding a big target tournament at Pine Bluff, Ark., Aug. 22-24. Shooters of that State should watch for full information. These Pine Bluff shooters are hummers in the tournament business.

There were teams from eight gun clubs lately in competition at Iola, Kan. They were from Coffeyville, Columbus, Erie, Ft. Scott, Florence, Iola and Nevada and Carthage, Mo.

The Eveleth, Minn., Gun Club has challenged the Virginia club for a team match, and as soon as the conditions are arranged the readers of this journal will be informed of same.

Members of the Fargo, N. D., Gun Club are warming up for the Grand Forks tournament. At the last practice Long made 53 out of 60.

At the last Friday shoot of the Martinsville, Ind., Gun Club Charles Johnson won both prizes. At 100 targets he scored 90.

The Michigan shooters should return thanks to the energetic members of the Saginaw, Mich., Gun Club. Prizes amounting to \$700 were put up for competition at the July 30 shoot.

The Easton, Ohio, Gun Club will on Thursday contest for their new trophy.

The Fairfax, S. D., Gun Club will erect a club house for use of its members.

The Ashdown Gun Club, Winnipeg, lately held one of those unique shoots and outings, shooting from a barge while being towed down the river. Attractive prizes were up, and the sport was much enjoyed.

The grounds for the use of the Ishpeming, Mich., Rod and Gun Club have been located at Brasswire Hill near the street cars. Weekly contests will be held, and shooters of Marquette and Nagaunee will be invited to participate. A tournament is to be held soon.

The Hicksville, Ohio, Gun Club has invited the Defiance Club to shoot for some valuable prizes that will be offered for competition.

Since the temporary organization of the gun club at Carroll, Iowa, there has been a regular scramble to get on the club's roll, some sixty men having already paid the fee. The officers were elected Saturday evening, H. F. Shirmer, President; Julius Ruge, Vice-President; W. T. Ross, Secretary, L. T. Anderson, Treasurer.

An important meeting of the Akron, O., Gun Club was held Thursday night as the stockholders elected officers. G. E. Wagoner was chosen to fill the vacancy caused by the death of J. A. Bradley. Others elected were R. T. Dobson, Vice-President; W. W. Wohlfrend, Secretary; J. K. Williams, Captain. The Akron boys now have monthly shoots, and besides are getting ready for shoots to be held on Labor Day and Thanksgiving.

President A. E. McKenzie, of the Denver, Colo., Gun Club, was seen last week in Salt Lake, where he was boasting the big shoots to be given at Trinidad and at Colorado Springs. McKenzie, Burgess and Sharp each got into an argument and settled it at the traps by each getting 23 breaks out of 25.

Members of the new gun club at Manistiquie, Mich., Henry Neville, Ed. Ashford, John Schuster, Theo. Willebrand, A. McLead, M. Schneider, Oliver Champime, Gus Weigman, J. W. Nagle, Ed. Niles, Sherman McNeill, E. E. Combs, H. F. Dowler, S. L. Dodge, F. N. Meriam, J. E. Fernea, Chas. Howard, P. Eckstrom, N. W. Fox, C. W. Adkins, O. S. Johnson, W. A. Mix, D. J. Ward, Dan La Framboise, J. H. Cole, L. Rosenthal, R. C. McKessen, F. S. Thorp, Claud Smith, Wm. Durno, Alex. Durno, Jake Stellwager, W. L. Carpenter, J. H. Wheeler, T. M. Wood, Wm. Rowe, Ed. Blau, Wm. L. Wood and A. R. Munn.

Marshalltown, Ia., Gun Club has started in to practice for the contest with the Grinnell club. L. C. Abbott was high; C. P. Cook, second; Dr. H. H. Nichols, third; E. G. Wallace, fourth; E. H. Keeler, George Snow and B. H. Hoyer, tied on fifth.

There was a "Tramp" at Monmouth, Ill., last week, and he stirred up some interest in the gun club, and there will be weekly shoots held.

Harry Scriber won the shoot for trophy at Fond Du Lac, Wis., held last week.

A trap has been purchased, and a new gun club is being formed in Beaver Brook, Pa.

The Grinnell, Ia., Gun Club has issued a challenge to shoot a match with the Marshalltown club. A trophy is the object sought.

The New Illinois Athletic Gun Club held their first shoot at Watson's Park on last Thursday, there being twenty-two present. Some good prizes are posted, and shoots will be held each Thursday.

The Dalton, O., Gun Club started Saturday for Turkey Foot Lake, where it will camp for ten days. Those in the party were F. E. Gibson, George Harig, Glenn Kasier, A. H. Arick, H. Santmyer and G. C. Freet.

Virginia, Minn., Gun Club held the first shoot for this year and elected officers, viz. E. D. Parmelle, President; W. J. Schulze, Secretary; Dr. W. H. Spratley, Captain. Dr. Baldwin and D. O. Anderson were new members added.

Little Falls, Minn., Gun Club has secured new grounds and put same in good condition. The first shoot, which is to be a weekly event, was held last Wednesday.

The Forest Gun Club, Upper Sandusky, O., will hold the first tournament in September. A committee now has charge of the affair, and there will be an attractive programme issued.

"Pardon me," said the clubman with the bald spot on the back of his head, "but why do you always insist on playing for stakes when we sit down in a quiet game of cards?" "That's my business—not yours," retorted the clubman with the watery eye. "I know it is. Why don't you quit it and go at something else?"—Chicago Tribune.

"My proudest boast," said the lecturer, who expected his statement to be greeted with cheers, "is that I was one of the men behind the guns." "How many miles behind?" piped a voice in the gallery.—Philadelphia Press.

"Say, father, what is a 'nobody'?" "A nobody, my son, is a prominent woman's husband."—Washington Life.

Derryfield Gun Club.

MANCHESTER, N. H., July 22.—To-day was certainly a happy day for Mayor Reed, president of the Derryfield Gun Club, as the programme which he and the executive committee of his club had arranged attracted some thirty-five shooters, with all of whom Mr. Reed has a personal acquaintance, and among which are some of the best amateur shooters of this section.

Mr. Harrington, of Manchester, had accepted the challenge of our good friend D. W. Hallam, of Dover, N. H., and as the scores of these gentlemen in previous matches had averaged high, a good contest was looked for, with no one reckless enough to hazard a guess on who would win.

It proved, however, that neither was in championship form, Mr. Harrington being so confined by pressure of business that he was unable to get the necessary amount of practice, while Mr. Hallam, the challenger, who, by the way, was shooting a new gun which pounded his cheek so badly as to put him out of the running, was, very much to the regret of his friends, unable to finish the programme.

Elmer E. Reed, of the Derryfield Club, carried away the honors for the day by not only winning the Peters trophy and State championship on the excellent score of 94 out of his 100, but winning the high gun money, a \$5 gold piece, for high average of the day on 142 breaks out of 150 targets, and finishing up with a percentage of 94.6.

On behalf of Saunders & Co., of Boston, Elmer E. Reed was presented a fancy cigar cutter, and Mr. Perley a pocket compass by B. F. Smith, the all-around sport and good fellow of the Watertown Club.

Climax, of Lowell; Hibbard, of Boston, and Wheeler, of Brunswick, Me., while not eligible to the cup match, shot a professional race all through the day. The special prizes for second and third high averages for the day were captured by Messrs. Climax and Hibbard respectively.

Charles J. Darrah officiated as scorer; Bert Davis, of the Manchester Hardware Co., as secretary-treasurer, and Mayor Reed as squad hustler, and succeeded in running off the programme and exhibition in good time. The Derryfield Gun Club has obligated themselves to their friends, and rest assured they will be pleased to reciprocate when opportunity presents itself.

Table with columns: Events, Targets, Names (Eugene E. Reed, Smith, Bowen, Goss, W. L. Allen, Woodruff, Harrington, Bouton, Sawtelle, Merrill, Bartlett, Wheeler, Miller, Tozier, C. A. Allen, Elmer E. Reed, Climax, Rule, Edwards, Dean, Prigley, Berham, Lawson, Hallam, Chadwick, Morris, Stevens, Hibbard, Prosser), Shot, Broke, Av.

Contest for Peters trophy and championship of State of New Hampshire, open to any resident, 100 targets, 16yds.

Table with columns: Names (Elmer E. Reed, Eugene E. Reed, T. C. H. Bouton, W. C. Goss, John Perley, Carl Harrington, Chadwick, C. A. Allen, Chas. Sawtelle, Andrew Lawson, E. C. Brigham, I. T. Prosser, Stevens, D. W. Hallam, Jas. Morris), Shot, Broke, Av.

Norwich Gun Club.

NORWICH, Conn.—A special tournament was held on Tuesday afternoon, July 25, by the Norwich, Conn., Shooting Club in honor of Mr. W. H. Heer, who again made one of his record scores, missing only 2 targets in 150. He was accompanied by Mr. Brindley. There were twenty-one shooters present, many being from out of town. Mr. Prest and Mr. Taft tied for amateur high average with 82 1/2 per cent.

Table with columns: Names (W. H. Heer, Prest, Taft, Noble, Richards, Edgarton, Wells, Vosselman, Strong, Warren, Muir), Shot at, Broke, Cent., Names (Morris, Ames, Jones, Sayle, Holmes, Ulmer, Post, Chapman, Hislop, Mitchell), Shot at, Broke, Cent.

Independent Gun Club.

EASTON, Pa., July 22.—The Independent Gun Club held the second of the series of five shoots for the L. & R. trophy. The day being cloudy and windy accounts for some of the low scores.

Table with columns: Names (W. H. Maurer, J. Maurer, Weiss, Elliott), Shot at, Broke, Cent., Names (Weiss, Hellyer, Sandt, Elliott, Ivey, Richard), Shot at, Broke, Cent.

Aquidneck Gun Club.

NEWPORT, R. I.—The tournament of the Aquidneck Gun Club July 28 and 29, had thirty-six participants on the first day and thirty-five on the second day. W. Heer was high gun on the first day with 142 out of 150. Griffith was high on the second day with 169 out of 175, or 96.5 per cent. The five-man team shoot was won by Watertown, with a score of 214.

First Day, July 28.

Table with columns: Events, Targets, Names (Griffith, Heer, Fanning, McArdle, Elliott, Wheeler, Wm. Hughes, Powell, Keeler, Smith, Bartlett, Bonney, Mason, Dring, Aldrich, Eggers, Noyes, C. M. Hughes, Reed, Parker, Hallan, Hebbard, Lewis, F. Cavicchi, E. Cavicchi, Mamard, Letendre, Getchell, Madau, Cummings, Audet, Worthing, Coggeshall, Weaver, Chase, Thomas), Shot, Broke, Av.

Events 4, 5, 6, and 7, 8, 9, 50-target merchandise handicaps. Griffith and McArdle not in averages, did not accept handicaps.

Second Day, July 29.

Table with columns: Events, Targets, Names (Griffith, Heer, McArdle, Elliott, Fanning, Wheeler, Hebbard, W. M. Hughes, Smith, Reed, Powell, Bowler, Carver, Dring, C. M. Hughes, Blinn, Bornes, Bonney, Bartlett, Nadou, Hallan, Letendre, Wilbur, Parker, Kirkwood, Churchhill, Gleason, Noyes, Dickey, Keeler, Aldrich, Temby, Graham, Taylor, Harris), Shot, Broke, Av.

Table with columns: Names (Smith, Hebbard, Gleason, Burns, Carver), Shot at, Broke, Av., Names (McArdle, Hughes, Bowler, Dring, Powell), Shot at, Broke, Av.

Hudson Gun Club.

THESE scores were made at the last shoot of the Hudson Gun Club, of Jersey City. The day was fine, and was only marred by the uncertainty as to whether the club could hold a shoot.

During the time intervening between July 16 and 23 some miscreant forced his way into the club house and tried to destroy everything useful. Besides breaking parts of the electric pull, stove, sink, dishes and glassware, the person or persons broke every pane of glass but one in the house. If the intention was to spoil the shoot, it was not successful, for things were straightened out and a good many targets were thrown.

Table with columns: Events, Targets, Names (Gille, Cottrell, Schorty, Stroble, Heritage, Kurgee, Duster, Haddow, Malcomb, Banta, Dr. Brothers, Cocklin, Burns, Hughes, Halley), Shot, Broke, Av.

Consolidated Gun Club Association.

SOUTH MANCHESTER, Conn., July 26.—The Consolidated Gun Club tournaments of Connecticut have proved a great success. The sixth shoot was held at New Haven on July 18. Rockville leads in the club event, and following are the individual scores for the Peters Cartridge Co.'s cup, which they have kindly offered to the man making the highest total score in the team race.

Table with columns: Names (A. J. Reynolds, Kelley, Mack, McMullen, I. Prest, E. Hart, H. Metcalf, J. Draker), Shot at, Broke, Names (H. Edgerton, J. Mitchell, D. McElligott, I. P. Taft, Savage, White, E. Finch, A. Langdon), Shot at, Broke.

Springfield, Mass., Shooting Club.

TWENTY-SIX who brought their guns, and a large crowd who didn't attend the practice shoot of this club, held in honor of Messrs. Bartlett, Wheeler and Jack Fanning, trade representatives, at Red House Crossing on the afternoon of July 25. It was an ideal day for shooting, and some very fine scores were made.

The way Fanning smashed 95 out of 100 opened our eyes a little, as it was a record for the grounds. Jack is the same old fellow, and we are always glad to have him with us. The principal feature of the shoot was the fancy rifle shooting of Capt. Bartlett. He surely is a wonder. That he also knows how to handle the shotgun, the scores will show. We must not forget to mention that W. H. Snow is coming fast with his average of 90 for the afternoon, and Le Noir, a close second with 88, while our friend from down the river was shooting in poor form for him. Never mind, George, we know you can and have done better many times. We were obliged to omit our Peters cup and merchandise contests for lack of time. Scores follow:

Table with columns: Events, Targets, Names (Le Noir, Wheeler, Jones, Kites, W. H. Snow, Fanning, Bartlett, Coats, L. Mysterly, A. Mysterly, Bagg, Parsons, Keyes, Cheesman, Dr. Newton, Boughton, Jordan, Alderman, Pomeroy, Gesmer, Austin, A. Snow, Cady, Hills, Talmadge, Hawes), Shot, Broke, Av.

Bonesteel Gun Club.

BONESTEEL, S. D., July 25.—The Bonesteel Gun Club ran off a little afternoon shoot on the 17th inst. The programme consisted of seven events of 15 birds each, \$1.50 entrance and a contest for the Peters Cartridge Co.'s emblem, representing the championship of Gregory county. The attendance was not large, but there were representatives from all the nearby towns, and all events were hotly contested.

Those in attendance were Porter; Thompson, of the Fairfax Gun Club; Phillips, of the Herrick Gun Club; Leach and Spatz, of the Bonesteel Gun Club. The shooting was not up to the standard, which can only be accounted for by lack of practice. Porter won the championship with Spatz a close second. The money in the sweeps was pretty evenly divided.

It was arranged to have a shoot every two weeks alternately at Bonesteel, Herrick and Fairfax, this shoot being the first one of the series under this understanding. The championship medal is to be put up in open competition at each of these shoots, regardless of whether or not the holder of same is present. This trophy was formerly a challenge trophy, and was held by Leach for one year without challenge, and it was for the purpose of bringing into more active circulation that he waived his rights in the matter and changed it to the present rules.

The next shoot will be at Herrick, on Aug. 8, and it is hoped that there will be a large attendance.

Table with columns: Events, Targets, Names (Leach, Porter, Thompson, Spatz, Phillips), Shot, Broke, Av.

Westfield Rod and Gun Club.

WESTFIELD, N. J., July 28.—Appended find scores of handicap event for cup presented by E. I. Dupont Co. We would undoubtedly have had a larger attendance but for the fact that a great many of the club members are away on their vacations. The handicap committee has so arranged it that members not present to-day can make up their scores at future shoots, of which there will be seven more, with 25 birds at each, but each member must shoot at the 200 birds.

The cup is a perfect beauty and the boys all fully appreciate the generosity of the Dupont company. You need not expect any scores such as a Gilbert would make, as this is, as yet, a young club, composed mostly of young fellows who have just begun shooting, but they are all very enthusiastic over it, and, like lots more, think that it is one of the best, if not the best, of recreations.

Table with columns: Names (H. Douglas, H. Wilson, M. C. Miller, H. Douglas, Dr. Seymour), Shot, Broke, Av., Names (R. Thompson, T. Mosher, M. Wratten, W. F. Hopper), Shot, Broke, Av.

Table with columns: Events, Targets, Names (H. Douglas, H. Wilson, W. Hopper, H. Wratten), Shot, Broke, Av., Names (R. Thompson, H. C. Miller, H. Douglas, Mosher), Shot, Broke, Av.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., July 26.—The closing contest for the Borst cup, narrowed down to Skutt, of Morton, and Stoddard, of Shortsville, each 6 points to his credit. The scores:

Table with columns: Names (\*Skutt, Stoddard, \*Borst, Gardner), Brk. Hdp. Tot'l., Names (Coughlin, Stewart, Clark), Brk. Hdp. Tot'l., Names (\*Stoddard, Gardner), Brk. Hdp. Tot'l., Names (Skutt, Stoddard, \*Skutt, \*Stoddard), Brk. Hdp. Tot'l.

PUBLISHERS' DEPARTMENT.

Of all the impedimenta of the camper, the mess kit is perhaps the most troublesome, for it consists of a multitude of pieces, each of which takes up room and is likely to be lost. Writers on camping constantly insist that utensils like cups and camp-kettles should nest. Wilson's Complete Cooking and Serving Outfit seems to have solved the problem of compactness and safety, and persons interested in cooking outfits, may profitably send to F. Cortez Wilson & Co., 245 Lake street, Chicago, Ill., for a circular of their goods.

No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### SEALS AND THEIR EXTERMINATION.

THERE is perhaps no group of the larger wild animals of the world which is so abundant in individuals as are the seals, marine mammals which are found alike in the Arctic and the Tropic zones and which are distributed all over the world. From an economic point of view they are of high importance to man, the seal fisheries of Newfoundland alone running in value up to almost half a million of dollars. Of recent years they have also been of high political importance, the subject of despatches, protocols and conferences, and about them many legal arguments have been used by representatives of two of the great powers of the world.

Much interesting information has been furnished us about the seals in a paper by Mr. C. H. Townsend, Director of the Aquarium, published in the annual Report of the New York Zoological Society.

The Newfoundland seal fishery seems to have reached its height about forty years ago, at which time no less than 400 sailing vessels, employing 13,000 men, were engaged in it. In 1844 the number of seals taken was 700,000; but the Newfoundland seal herd could not stand the drain to which it was subjected, decreased in number and the catch now varies from year to year; the number killed in 1899 having been more than 268,000, and in 1900 more than 352,000. The species found here is chiefly the Greenland seal, though a few hooded seals are taken each year. The seal are killed on their breeding ground on the ice, and more than ninety per cent of the annual catch are young animals taken before they are three weeks old. The force employed in this fishery to-day is about twenty-five steam vessels, giving employment to 3,000 or 4,000 men. The gradual decrease in the number of the seals has made it necessary to put a close season on them, so that the time for taking them at present lasts little more than a month, beginning March 16. These seals are killed for their hides and oil, but do not produce a fur that is of any value.

Largest of the seal family is the huge sea elephant, or elephant seal, so named from his greatly elongated and flexible snout—a real proboscis. In the early days of the seal fishing industry seal elephants abounded in the Antarctic lands, where they were killed for their oil, the skins being almost valueless. A northern species of sea-elephant was formerly abundant along the western coast of North America to the south in early days, and even as late as 1870. For years it was killed there by the whalers, and at last was practically exterminated, so that when in 1884 Mr. Townsend examined Lower California for this species he was able to find only eighteen of the animals. Nevertheless in 1904 a few stragglers were taken.

The familiar walrus of Arctic regions, which formerly was sometimes found on the Atlantic coast as far south as the St. Lawrence River, and another species common in the Bering Sea, have now been exterminated from all parts of either coast which are at all accessible.

The West Indian seal, once abundant in the Caribbean Sea and the Gulf of Mexico and on some of the Florida keys and the Bahama Islands, is almost extinct, and, in fact, was practically exterminated over a century ago. One of these seals lived in the New York Aquarium for more than five years.

In two great inland bodies of water, the Caspian Sea and Lake Baikal, are found seals which probably made their way into the great inland waters which they inhabit long, long ago, and have remained there ever since. The value of the catch of seals in the Caspian Sea has been in a single season \$350,000, in skins and oil. The Lake Baikal seal is remarkable chiefly as inhabiting fresh water. Commercially, it is unimportant.

Far best known of all the seals are those belonging to the group called the eared seals, which furnish the

fur sealskin. These are found in the Arctic and the Antarctic, in the temperate zone, and under the equator. The South African fur seal, breeding off the west coast of South Africa, was almost exterminated, but of recent years has been protected by the Government of Cape Colony.

There is a fur seal rookery at the mouth of the La Plata River, which the Government of Uruguay has carefully protected for many years. The island on which they haul is only a small one, less than a mile in length, but it furnishes an average of more than 10,000 skins a year. It is reported, however, that pelagic sealing is threatening this little herd, as it has already destroyed so many of the northern seals. The Galapagos Islands, lying on the equator 800 miles west of Ecuador, and Guadalupe Island, off the west coast of Lower California, were once seal rookeries of importance, but have been destroyed by man's greed. The rookeries of the Okhotsk Sea, Robbin Island and the Kuril Islands, have been pretty nearly wiped out of existence.

The best known and largest herds of fur seals are those of the Pribilof and Commander Islands in the Bering Sea. Here, more than 100 years ago, the Russian explorers discovered the fur seals in vast numbers. For many years they were destroyed indiscriminately, but at last the Russian Government took the herds under its protection and so regulated the killing that they became very productive. After the cession of Alaska to the United States, the taxes paid to the United States Government on sealskins alone yielded within twenty years about \$7,000,000—the price paid for the entire territory.

Pelagic sealing began about twenty years ago, and has continued up to the present time, destroying in that period the value to Russia and to the United States of the seal islands which they possess.

There still remain a few seals on these islands, but their number has decreased astonishingly from that of a few years ago. Until pelagic sealing shall have been wholly abolished, these rookeries of the North Pacific can never re-establish themselves. The people engaged in it are a few Americans, a few Japanese and a few crews from British Columbia.

From this brief review some notion may be had of the way in which the seals have been destroyed over all the oceans of the world. It would seem as if the time had come for the nations of the world to unite for the protection of these wild creatures, which otherwise must be utterly exterminated. Unless such a step shall be taken, an industry of great value must cease.

### FOREST SERVICE REGULATIONS.

THE new forest service regulations and instructions for the use of forest reserves went into effect July 1. They were drawn up by Mr. Gifford Pinchot, the United States Forester, under whose control, by the action of Congress last winter, the Forest Reserves have now happily passed.

People whose memories are not very long may well enough remember what a howl of indignation went up from much of the western country when the first forest reserves were established, and how, for several years thereafter, the establishment of each new reserve caused a renewal of the public indignation in the territory affected by the proclamation. Happily this is now ancient history, and the public has very largely come to take the common sense view of these reserves which not so many years ago was held by a hopeless minority of more advanced people. If there still remain any who do not believe in the forest reserves in the purpose for which they are created, or the Department's intention in administering them, a few extracts from Mr. Pinchot's regulations ought to show them that they are in error and to make clear to them the good purpose which animates those authorities which now have the reserves under their control.

The first paragraph of these Regulations says: "Forest reserves are for the purpose of preserving a perpetual supply of timber for home industry, preventing destruction of the forest cover which regulates the flow of streams, and protecting local residents from unfair competition in the use of forest and range. They are patrolled and protected at Government expense for the benefit of the community and the home builder."

That statement seems unmistakable and not less so is

another extract: "The administration of forest reserves is not for the benefit of the Government but of the people. The revenue derived from them goes, not into the general fund of the United States but toward maintaining upon the reserve a force of men organized to serve the public interests. This force has three chief duties: To protect the reserves against fire, to assist the people in their use, and to see that they are properly used."

The view of the duties of officers of the Forest Service, expressed by Mr. Pinchot, the head of the service, is quite different from the idea so frequently held and expressed by persons in the West who come in contact with these officials. These duties are thus defined: "Forest officers therefore are servants of the people. They must obey instructions and enforce the regulations for the protection of the reserves without fear or favor, and must not allow personal or temporary interests to weigh against the permanent good of the reserves; but it is no less their duty to encourage and assist legitimate enterprises. They must answer all inquiries concerning reserve methods fully and cheerfully, and be at least as prompt and courteous in the conduct of reserve business as they would in private business.

They must make every effort to prevent the misunderstanding and violation of reserve regulations by giving information fully and freely. The object should be to prevent mistakes rather than to have to punish those who make them. Information should be given tactfully, by advice and not by offensive warning."

It might be wished that every newspaper office in the West were provided with a copy of these Regulations. A study of them would go a long way toward making the public comprehend the objects hoped to be attained by the Forest Service and the methods of its administration.

### GAME PROTECTOR POND.

MAJ. J. WARREN POND, the New York Chief Game Protector, has tendered his resignation to Forest, Fish and Game Commissioner Whipple, to take effect on Oct. 1. His retirement will close a term of seventeen years of continuous service—a term which is notable in these days of political change, and a service which has been of inestimable value to the people of the State. When Major Pond entered the department in 1888 the organization was raw and crude; its development and improvement have been in large measure wrought by him. He was fitted for the place by qualifications which the public soon came to recognize and respect and feel confidence in. With earnestness of purpose were united a shrewdness and a discretion in dealing with the perplexing problems which are forever coming up in the protective work, and these qualities were complemented by a personal integrity which inspired in those who were familiar with his work full confidence in the man and in his methods. For years the sportsmen of New York have felt that in Chief Protector Pond they had an efficient and discreet friend and ally, not only in the repression of law-breaking, but in the wise molding of the laws to meet the needs of the hour. Not the least notable of Major Pond's services has been that of counseling legislative committees in the consideration of the annual amendments of the law. His advice has been sought and heeded, to the great good of the fish and game interests, and to the decided satisfaction of those who are intelligently and unselfishly concerned in the work of protection. That at times the Chief Protector has been assailed with rancor because of his lack of pliability in favor of some pet bill, or some measure designed to give some special privilege, is in itself a testimony to his worth as an official whose aim was to conserve and promote the public interests as against those of individual or class.

Last winter Major Pond's name was associated with the Adirondack timber scandals, and charges of misdoing were rife, but a full investigation of the affair resulted in an exoneration of the Chief Protector, and Governor Higgins declared last week not only that Major Pond had not in any way benefited personally through the illegal cutting of timber in the Adirondacks, but that he had only done his duty in the matter.

We speak for the intelligent friends of game and fish protection in New York when we express our regret to see Major Pond leave the office he has filled so long and so well. We regard his going as a distinct public loss,

## THE SPORTSMAN TOURIST

### Stories of Some Sea Dogs.

#### I.—How My Mongrel Dog Saved the Ship.

WITH as trim a little ship under my feet as ever went to sea, we left New York bound to Buenos Ayres, with a crew list numbering twenty-one as good men as ever crossed a royal yard, or stood a watch, and a mongrel dog. The cargo was a very valuable one, and we hoped that the cleverest dog fancier in the country could not have been at our anchorage in the Rio La Plata, and in half as many days more be loaded with a cargo of hides and start on our homeward journey.

This mongrel dog I had picked up one wintry night on the wharf and brought on board half starved, and shivering with the cold, and although here last enumerated in the number of living things on board, in a few weeks he was destined to be the first to head the list when the ship's crew was mentioned. He was a cross, part collie; the cleverest dog fancier in the country could not have told the other breed. But all the same, mongrel that he was, he was a lovable and most intelligent fellow, and from his actions we reasoned that he was not making his first voyage on a ship; in fact, from the start he appeared to be quite at home, knew that he belonged aft, and while friendly to a certain degree with the crew, yet never permitted any familiarities on their part. He would go forward with one of the mates or myself, but never would go forward of the galley door unless sent. He was a great favorite with the cook, who frequently left him to watch the tid-bits intended for the cabin table, while the cook went aft to get water from the scuttle butt, or to confer with the steward. Sometimes he would be given a book or some old newspapers and told to "go forward and give it to the men," and he would trot off and deliver the books or papers to a favorite man, receive caresses and run aft apparently pleased to think that his chore was done. Occasionally at night he would go up on the topgallant forecastle and spend some time with the man on the lookout, provided he liked the man; but he was never known to enter the forecastle or go forward at meal time.

It was not long before the men came to be very fond of Bob. They made him a very nice collar which he wore with pride; and one day Bob came trotting aft with a water-proof coat that one of the men made him. It was raining hard at the time and I never shall forget how proud the dog seemed to be of his present. He ran up to me wagging his bushy tail and looked at me inquiringly as much as to say, "Can I wear this," and to assure him that it had my approval I went forward with him and asked the man who had made it, and when the man presented himself I thanked him and patted him on the back, and then Bob jumped up and putting his fore paws on the man's shoulder stood still while his head was patted. That settled it, and from that hour the maker of his rain coat was Bob's especial favorite, and when the man was at the wheel the dog would often be found at his feet fast asleep. Bob always wore his coat when it rained, and some willing hands always stood ready to fasten it on for him.

Scarcely a day passed over our heads but Bob would do something in his quiet way, that would set us talking about his wonderful display of intelligence and lovable nature. He had no opportunity to show any temper, for no one would provoke him to show it. That he was a model dog no one disputed. Never a ship passed at night within the range of Bob's scent, but that he apprised us of the fact, and although we often did not see the ship owing to the darkness, we knew that we were passing one, and even when we did see the vessel Bob had always given warning of our proximity to it before the lookouts had seen it. Sometimes he would smell a whale at night, but we soon learned to know by his bark whether it was a vessel or a whale that he had discovered. For this keen scent he was held in high esteem by all on board, and the lookouts felt that if Bob was around he was certain to give them due notice to keep a brighter lookout.

The star event on Bob's record came one dark night when we were about twenty days out from New York. There was no moon, and there was a remarkable dense mass of clouds. We were jogging along with the royals furled, the wind on the quarter. The sea was quiet and the weather did not betoken any immediate storm, yet it was a night which called for doubling up the lookouts, for we were in the track of vessels crossing over from Europe to the West Indies and the northern ports of Brazil. I was down below in the cabin looking over the chart, and had just been reading the barometer, when Bob rushed forward and mounting the topgallant forecastle snuffed the air several times and then set up a fierce barking, his keen eyes being directed right ahead. The lookout men could not induce him to stop, and as the seconds passed he increased the volume of barks, and jumped around the forecastle as if mad. The watch below were awakened, and by the time I got forward half the watch were on deck to see what was the matter with Bob. By this time we all felt sure that the dog had seen or scented something, but none of us could see anything ahead that should provoke such anxiety on the part of the animal. It was not many minutes, however, before we all saw a long, low black object on the surface of the water dead ahead, and calling all hands to the braces, I shouted "Hard down your helm, for God's sake!" and by the time the ship came up to the wind we just barely escaped run-

ning bow on into a large half-sunken vessel which lay directly in our path. But for the timely warning of that faithful creature we should have run into her plump amidships, with a certainty that it would have stove in our bows, sent the masts and spars tumbling about our heads, probably killing all of us; many of us would have been below at that time. I have had many a close escape from collisions in fogs, but never one so close as that one.

As soon as we had given the derelict a wide berth, the ship was put on her course, the yards clecked in, and we began to congratulate ourselves on our miraculous escape, and were giving Bob his full share of the credit, but he was very uneasy and would run to the taffrail and bark occasionally, but when he realized that we were leaving the craft for good he set up a terrific volley of barks, whinings and canine pleadings, looking at me in a most human way. At last I said to the mate, "I wonder if there can be any persons alive on that craft?" The mate thought not, but the action of Bob so appealed to my feelings that at last I ordered the topgallant sails clewed up, put the helm down and resolved to stay by the wreck till morning, and then send a boat on board and settle the question forever. We stood close to the wreck but could neither see any living thing nor hear any sounds, save the splash of the water against her side.

When daylight came we were alongside and laying the maintopsail to the mast, we lowered a boat and the mate went off to board her. It was not long before he made signal for us to come within hail, and from him we learned that there were fourteen human beings on board, and four dead bodies in the cabin. He told us to send another boat at once. Bob was the most interested spectator on our ship, running to and fro in great stress of mind, at times whining and showing an anxiety almost human. It did not take long to get those poor creatures on board of our ship; one of them, the captain's wife, strange to say, had more life in her than any other one of the rescued. The mate buried as best he could the four that had perished from starvation the day previous, and we again made sail for our destination. Bob's attention was attracted to the captain's wife, and as we carried her down into the cabin he followed, and during the time she was in her room he was her constant companion. For several days we had our hands full in nursing back to life the poor unfortunates, but we saved them all, and when they were so far advanced in strength as to be able to be about the decks it was really touching to see Bob's sharing his attention first with one and then another, receiving the pats so lovingly given, and licking their hands and at times laying his head on their laps to receive their caressings. But when he had made his round of visits he would return to the captain's wife and sit by her side for hours at a time.

Fine weather and favoring winds brought us to our destination with no further incidents. The ship from which we had taken the people had been bound from Liverpool to Rio de Janeiro laden with an assorted cargo, but had a large quantity of lumber on board, which kept her afloat. She had encountered a series of gales, had been dismasted, then had sprung a leak, and before they could secure enough provisions to last them for any length of time the most of it had been destroyed by salt water. For some days they had been on short rations, when another gale came upon them, and for over a week, before we fell in with them, they had had but very little to eat, three men had been killed when the masts went over the side of the ship. The three that had been killed were buried in the ocean by their shipmates and the four that the mate had found dead when he went on board had died during the preceding twenty-four hours, but those left were too weak to bury them; another twelve or twenty hours at the most would have ended the earthly career of all of them. They certainly would have perished but for the persistent pleadings of my mongrel dog, Bob. To say that the dog was idolized or worshipped by every soul on board gives but faint expression of the facts; still, the dog took the tributes showered upon him with becoming grace, and was as vigilant as ever in his nightly lookouts; in fact, some of the men said he spent more time on the topgallant forecastle than he had before we fell in with the wreck.

When we arrived at Buenos Ayres we soon had our passengers in the hands of the British Consul, who provided for them liberally. It was a scene I never shall forget—the parting of that rescued crew and Bob. They hugged and kissed him and blessed him, and the captain's wife begged that I would give her Bob; but I believe that much as the men liked her, if I had concluded to let Bob go there would have been a mutiny. The story of the dog soon reached the shore and the ships in the harbor, and hundreds of people came off to see him. Before we sailed my passengers clubbed together and bought a collar for Bob, a most elaborate affair. On a small plate of solid gold was inscribed: "To Faithful Bob, Who Saved Our Lives." On a silver band riveted on the leather collar was engraved the names of each of the party, the name of the ship, the date of the rescue, and the name of our ship and its master. I did not dare take Bob on shore lest he might be stolen or because the crowds to see him would prevent me from doing any business.

Bob and I were shipmates for over three years, and at last he was stricken with some malady beyond my limited veterinary skill to combat, and died at sea. You would think me childish were I to tell you of my grief at his death; a grief that was equal to any I ever experienced.

Well, the carpenter made him a coffin, one that would remain intact for a long time; it was laden with plenty of iron so that it would sink well down in the depths of the ocean, and just before sundown, with colors half-mast, we laid the maintopsail to the mast and when the ship stood still, all hands with uncovered heads stood in the starboard waist, and faithful, loving, intelligent Bob was committed to the deep—gone forever, but to me an ever precious memory of devotion, a dumb animal that had been the direct medium of saving thirty-five lives in one day, a constant comfort, a delightful companion in sunshine or storm, a true friend who never lied to me.

Bob was not the only dog of the sea that has rendered vital service to me, and not the only one that by his vigilance and intelligence has warned me of impending danger in time to avert it, and when I hear a man abuse a dog, I must confess that I am tempted to say that a sign should be placed on his door post, "Beware of the man."

#### Summer Roof Trees.\*—II.

THE plans and perspective sketches of the three rustic cottages which we illustrate in this issue were the prize winning designs submitted in a competition given by the Brochure Series for a shooting box. All the plans and exteriors differ greatly in character, and they offer a wide choice to the prospective builder of a woodland home.

Design No. 1 shows an attractive building with long overhanging roof having very much the feeling of a Swiss chalet. The author intended that the structure should be built on the shore of a lake or stream, as the sketch shows, and a rough stone retaining wall is built in the front where the ground slopes toward the beach to form the porch or terrace, which extends around three sides. The great projection of the roof protects the terrace from the sun and rain. The construction of the roof is of such a nature that no posts or columns are necessary, and a porch roof is secured without the usual obstructions. This requires a strong construction, especially if the building is to be erected where there are heavy snowfalls, for the strains resulting from the great weight imposed upon it would be tremendous.

The plan shows an excellent arrangement. The main feature is the living room, or, as it is labeled on the plan, gun room. It is here that, when indoors, all hands lounge and eat, and as the room has no ceiling, being left open to the roof, a very attractive and home-like spot can be made. The narrow end wall overlooking the lake is pierced by large windows, and both inside and out a wide seat extends the entire width under these openings. In pleasant weather the occupants would sit on the outside seat to watch the sun set behind the hills across the lake, while in bad weather the indoor lounge would enable those in the house to see what was going on outside.

At the opposite end of the room is the huge fire-place, which immediately suggests comfort, warmth and camaraderie when the nights are chilly.

Generously wide doors directly opposite one another open on the porch. Having doors on each side is an excellent scheme, not only because it affords good ventilation when the weather is warm, but one has always a lee side to enter or leave the building by.

Shelves and gun racks extend along the walls on either side between the doors leading to the porch and those which give access to the bedrooms. The bedrooms are not large, but as they are used as sleeping apartments only they are of ample size. They are separated by the kitchen, and the occupants of each are reasonably sure not to be disturbed or annoyed until morning, when breakfast preparations would serve as an alarm clock.

The big living room fire-place does double duty, for the kitchen flue leads into it. A door from the kitchen opens on the rear of the house, and a simple porch would be an addition, as it would protect the doorway and serve as a wash room and a shed where firewood could be kept dry.

The building is constructed of logs and the whole is of a most substantial kind. The big stone chimney adds much to the dignity of the building. Chimneys can hardly be made too big, and nothing adds so much to the attractions of a home in the woods, for there fuel is abundant, and it is only natural that we associate with such an abode a huge cordwood fire crackling on a generous hearth.

This house could be built of ordinary frame construction in most localities at less cost and less pains, and if proper care is exercised and the work is done thoroughly, as satisfactory a building will result.

The plan of design No. 2 is not as good as the one just described, but the exterior is rather more attractive, and the sketch shows considerable refinement of design. The construction is most simple yet most attractive withal.

This plan, like the last, has for its predominating feature the big living room, and in this case it has to serve as a kitchen as well. In a simple camp which is to be occupied by men alone perhaps, this is no objection, but whenever possible it is more cleanly and healthful to have the food prepared and cooked in a separate room.

The three bedrooms in this plan are hardly more than little alcoves with bunks built in on the sides. One man each is about all these little alcoves would accommodate. It is usually better to have bedrooms of more liberal size and let two or more occupy them.

NO. I.

NO. II.

NO. III.

of events before a southern rain storm. Prosaically, I wrote, "Swept out, wiped dishes, hail coming down and rain sprinkling down. Now she comes—the distant banks fade slowly from sight, two more ducks fleet up stream, but I do not see anything after them—wonder why they go so fast.

"2:25 o'clock. Cooler by several degrees. The little shower has turned the switch willows on the sand bars a dark, beautiful green—were purple only yesterday. The Medicine Man does not believe in working on Sunday—says it never helped him, and he won't do it, not even float, if only to keep some line between him and the river people who know neither Saturdays nor Sundays, nor Woden-days.

"Cottonwoods show against the dark-purple forests here now as the poplars show against the green balsam of Adirondack swamps in relatively the same season of the year up north—a light haze against the dark background."

I attempted to describe the coming of the water around the bend, its heaving up on the point of the low sandbar, where the switch willows grew, and the long undulating reflections of the tall trees—a characteristic and beautiful river scene. We were in an eddy, about forty feet wide, and a hundred feet long—a deep, swirling pool. Judging from where the sun set the night before, we were well sheltered from a wind out of the west by a point of high, tough, caving bank, which had resisted the wear of the river longer than the bank above or below. The compass showed later that this apparent shelter from the west wind was deceptive, for the boat, end on to the bank, was broadside and fully exposed to the west gale for two-thirds the cabin's length. An anchor line was out astern, fortunately, and the bow lines ran to logs to starboard forty feet and to port some farther.

Having noted these things, for lack of anything better, and having drawn the point roughly, I noted: "2:47, another storm has developed and is coming—lightning, thunder and a cloud. It is like a skirmish line ahead of artillery, and the main army behind. Rain commences slowly, and the wind comes in strong blasts. 'It looks like a cyclone,' Jim shouts, 'get ready to go ashore!' Then it hits us like a—"

The last entry was in a scrawl and most hastily done. It was nearly three hours later when I was able to write again, and in the meantime the cyclone swept over us.

A cyclone is a wandering band of contending currents of air, swaggering across the country, kicking up a mighty dust, and a-throwing all things handy and movable up and down and in all directions. The first gusts of the storm which struck us seemed to be rolls of air bunched up and thrust ahead by the Ishmaelite rowdy currents. I could see the storm coming nearly two miles across the water and low sandbar, which was surrounded by water. The trees on the distant bank bent and sprung back as they were lost to sight in a dull, grayish mist. The water jerked, apparently, and whitened. The sandbar had been wet down by the rain, but when the water came whitening along both sides of the bar, there was a great puff of tawny cloud sprang up which grew larger and larger, boiling hundreds of feet up into the gray cloud which was coming, and hiding everything behind except the first few yards of fading, bending willows and water beginning to stand up in peaks. Perhaps four minutes elapsed from the time I first saw the trees bending on the distant bank to when the water began to whiten at the near end of the sandbar, a fourth of a mile distant. It was at this time that the Medicine Man caught sight of the phenomenon of which I was so interested and innocent a witness. A glance told his practiced eye what was coming, and his yell of "Get ready to go ashore!" was so full of experiences gone before, and another coming on, that I slammed my note book closed and with four motions wrapped it up with my other ledger, already full of notes, and started for the bow. Whatever else might happen, I would save the 250,000 words in notes I had already written. The oil cloth would keep them from getting wet in any rain.

I was half way through the cabin, and at the partition between the galley and sitting room, when there was a slap against the side of the boat like a plank hitting it flat side to. The boat leaned far over to port, almost upsetting, and then seemed to drop back again. Behind me, I heard a thing like fire burning in a great pile of loosely-heaped laths and other wood. I looked back and saw the starboard side of the galley roof rising in the air, while the red window curtain was flapping straight up toward the ceiling. The roof, of quarter-inch pine, tar-papered, flapped up and down a dozen times and then rolled over till a third of the galley ceiling was open air. Then the roof slammed back again, and I did a thing for which I cannot just account. I jumped and grabbed the roof near the starboard side wall, and held on. Once, as I was lifted by the roof till my heels were clear of the floor, I thought I'd better let go, but the Medicine Man had come aft and he seized the roof, and our combined weight brought it down. The pound and whirl at the head of the storm passed by, and a steady gale set in, and with the gale came long waves which threw

the boat against the bank, sucked it back and threw it again harder yet. Still my notes under my arm, I ran to the bow and saw another curious thing.

The boat was broadside to the waves coming down current from due west. The water pounded against the starboard side, flew up and came down in sheets in the stern in a fashion that would soon have swamped it. There were moments when it seemed as if the boat would turn over.

The starboard line was fast to a three-foot cypress log. It was a two-inch rope, and I tied it—one turn around the log and then two tight half-hitches around the line with at least two feet of the end for play. Because the boat seemed about to be "tore up," I looked at that fastening first. What was my horror to see the knot wriggle and then slip out, while the long rope came trailing across the little beach looking like a snake through the fog of rain which hid any object thirty yards distant. While I stood watching, the bank drew away, and I realized that the boat had moved.

I made a dandy jump. It seemed as though the rain would pound me down into the water, but it didn't. I reached land, with a yell that may have sounded like a railway train rounding a curve coming from my lips. The Medicine Man followed, and then we looked around. As we did so, the port line, dragging in the drift on the beach, caught in a drift willow fork and hung the boat quartering to the waves instead of broadside as it had been. With one mind, we divined what had happened, and the Medicine Man knew what to do. The boat came in as the port line tightened, and he ran aboard, and hauled in the anchor line. That brought us end on to the waves, and this position, and this one only, saved the boat from swamping right there. My skiff, tied at the bow, was washed under and it was three hours before we managed to drag it ashore out of the pounding waves.

The first few minutes over—that is to say, the worst of the storm and the time during which there was danger of the boat being thrown over—we got our stuff ready to rush ashore in case the waves should swamp us. My trunk and other duffe was in comparatively good order for hasty exit, and I had a big canvas to sling over the stuff and weigh down with logs of drift wood, and thus keep it dry. When my boat was drawn up, and found to be uninjured by the pounding it had received, I had no worry, for I could go on down the river in it safely as ever. The Medicine Man was equally philosophical.

"I thought she was going, didn't you?" he said. "If she had, I'd quit the river and hit the back country—I'm double dogged if I like this old river anyhow. I s'pose we'll have to pump now."

There was the water in the hold, and this we pumped out, taking turns at the churn-dasher-like occupation by the half hour. The temperature dropped almost to freezing, and the wind settled to a gale which came from the points between west and northeast. The waves rolled in from ten to fifteen a minute and sloshed against the bluff bank with wearying, unrhythmic noise. Examination disclosed the discomfiting fact that the cabin had been sprung a couple of inches, and that the waves against the side of the boat had found a half-inch crack, or less, above the gunwale, through which the water spurted into our bed unnoticed till capillary attraction had caused the wetting of a third of the bedding. At this discovery, we sat down by the stove until the very dolefulness of our faces made us laugh, and when we had cooked supper, the banjo and the French harp solaced the long hours in which we sat up, ready to jump ashore, or to the lines, should anything need our attention during the gale which lasted with fury till after midnight. When the wind died away enough, the blankets and quilts were sufficiently dry, and we went to bed.

Monday morning came, and the day was a calming finely. After breakfast, the sun shone delightfully and temptingly.

"I'll remember this ole landing nex' time," the Medicine Man said. "F I'd a noticed 'twas the landin' where I got blowed into the willows before and was 'most drowned, I'd neveh stopped yeah, no indeedy!"
