It is a recognized condition that men and animals are more vigorous, hardy and energetic in the zones furthest from the equator, or until polar zones chill them into inactivity; but it has not been generally understood that altitude or elevation may exert the same influences as animals ascend from the sea level or from lower planes. We had left the sultry, humid valley, feeling calm, enervated, indifferent, insipid, lazy, sleepy and in fact, fashionable. As we ascended the mountains day by day, we became alert, hungry, ambitious, still hungrier, actively ravenous and somewhat primitive in our tastes and desires. At the summit we did unnecessary things, even to chopping wood after climbing about all day. I could even watch from a reasonable distance while my grandfather sank a seven-foot crosscut saw into a six-foot log, while Enochs and Dick in their verdancy, or absence of mind or intelligence, several times took hold of the saw.

It seemed strange, these evenings late in the month of August, to go into the log cabin and sit before the wide stone fireplace heaped with blazing logs. After our first night in the open air, upon finding our blankets stiff with frost in the morning, we were pleased to accept the privilege of spreading ourselves, the dogs and Jack, upon the floor of the cabin, the larger room of which accommodated us all comfortably. At sundown, each evening became chilly, and at dark we were satisfied with nothing more moderate than a roaring fire. In dressing the trout that we caught during the day, down in a cañon, our fingers would become benumbed and blue with the cold water from the spring and with handling the fish. Sitting about the fire after supper we exchanged such observations as each of us had garnered, and concentrated into truthful reminiscences. It is true that Enochs sometimes trimmed his stories with a little fretwork border of fantastic ornament, but I had implicit confidence in my grandfather's and Dick's anecdotes, while of course I could depend upon my own without any very painful solicitude.

One evening I remarked that it was wonderful how vigorous and different we felt at that altitude; how hungry, how full of vitality, how almost industrious. My grandfather studied a while, looked at me in rather non-committal way, but said, "It may be the mountain air, or perhaps you are not very well. After you have been in the mountains a few weeks you feel different; you will feel like moving about more, and your appetites will pick up some."

At that point I went out to the wagon and took an inventory of the amount of flour, bacon and other provisions. I refrained from a thrifty impulse that almost persuaded me to carry off a sack of flour and

place it in some secluded place of safety. I decided to be honest as long as Enochs and Dick were, but I felt more confidence in them, and in my own invincible resolution, with an inventory of the provisions in my pocket. I had heard of men upon the further frontiers who became so solicitous for their future welfare that they would get up in their sleep and steal their own supplies, carry them off and hide them, and go about in the morning with consciences utterly untrammelled and blank.

When I got back to the fire, the old gentleman was saying,—"can bolt and split a thousand shakes, or five hundred cedar rails in good timber; he is beginning to show signs of vitality. Several years ago, over yonder near Susanville, a feller moved on to the Patterson place, which had been left deserted when Patterson died. His name was Slocum: he wasn't thought to be of much account, and he settled in the worst kind of a place for a slow man. The Patterson place—Patterson Holler, it was called—was too low down, sultry and malarious. Slocum was slow enough when he went there, but after he had been there a year he was given up for good. His nearest neighbor, who lived about four miles way, got to going over once a week regularly to see if Slocum needed a funeral, but, as near as the man could tell, Slocum was always alive. The road at one time went through Patterson Holler, but it had to be changed so as to go around on the upper side. Nothing much could be hauled through on the old road; the teams would get to going slower and slower until they reached the bottom of the holler, where the horses and mules allus went to sleep and stalled. The teamsters would go to sleep also, and if they carried watches the watches always stopped; they could never tell the time, nor how long they had been on the road when they did wake up. They seldom woke up until some one else overtook them and wanted to get them out of the way. Everything allus stopped opposite Patterson's. Surveyors tried to run a line through the holler, but the compass wouldn't work, the needle wouldn't even quiver till they got upon higher ground; and they had to give it up and depend upon scientific estimate for the real distance and levels.

"Slocum had been warned, but he seemed careless; and after he was there a while, and found everything as sleepy as he was, he seemed to enjoy it in an easy kind of a way. At last he wouldn't move a finger except when he wanted a cracker to eat, and he would hold that in his mouth until it soaked into his system, just to save the trouble of chewing and swallowing it. His neighbors supplied the crackers, as they didn't want Slocum to die altogether on account of expenses, and because they had begun to consider him a public institution. He was of some use, too, for they could point to him as a terrible example and a danger signal. The deestrick was altogether too conservative and optimistic any how. So they kept a box of crackers allus at his bedside, and Slocum's greatest trial was to reach out for one when he could stand it no longer. He would have starved, but when he got just so far along, he just had to have a cracker to keep from kicking.

"The neighbor, a Swede by the name of Jensen, or Yensen, as he claimed, finally got tired of going to the holler, so he moved Slocum up to his ranch, four miles along the road. Slocum objected, but made no resistance. It would have been too much of an effort for him to remonstrate, so Yensen took him along peacefully enough. After Slocum had been at Yensen's place a while he began to get uneasy and moved occasionally.

One morning when Yensen was out he tried to stir the fire and a burning stick rolled out upon the floor. It was too much work for him to put the stick back or throw water upon it from a nearby bucket, and he was too lazy to shout to Yensen. He only managed to get out of the house after most of his whiskers had burned off.

"Yensen, who was after a stray cat, smelled Slocum's whiskers burning, but got back too late to save his house. He exhausted himself so in trying to, though, that he dropped down alongside of Slocum, and the two were lying there apparently dead when a man with a wagon came along. Seeing these two men he hauled them along, after loading them in his wagon, to a deserted sheep camp about six miles up the road. After a little, Yensen was able to make a sort of shack of fence rails, and the two stayed there. Yensen always would work some, and the change of location and excitement improved him. He was doing quite well in cutting at a tree that he 'low'd to make posts of, and Slocum began to take interest enough in things to look around, listen when it thundered and sometimes to growl a little when Yensen tried to sing Swedish psalms. He even took interest in things besides crackers to eat, and began to chew such food as he could get with some little appreciation. They were doing well when a sheep man claimed the ranch, and as a compromise moved them ten miles further up the side of the mountain to another sheep camp.

"This change was a sudden elevation to higher ground, and it nearly killed both the Swede and Slocum, especially Slocum. Their blood got into circulation so suddenly it exhausted their capacity for inaction and almost laid them out. Some stray cows happened along and the Swede managed to round them up and milk them, thereby saving them both. Slocum liked milk, as it was easy to take, and in a few days he got so's he could sit up and let Yensen drive a cow near enough to him so's he could shoot the milk in a stiff stream into his face. Sometimes Yensen shot him in the eye with it, but he centered most of the time, being an expert at milking, and Slocum wasn't particular, or, if he was, couldn't explain it.

"They did very well until the cows started for summer range higher up in the tall timber, then they found it easier to follow the cows than to keep them rounded up; and so they left the neighborhood, little by little, finally getting up into the northwest corner of Lassen county. For some time all track of them was lost, and they were almost forgotten, when a stockman ran across a clearin' about a mile square over near Eagle Lake. He found a double log house of hewn logs, piles of posts, rails and shingles, and a couple of hairy-looking giants squaring timbers for a barn, and working like steam engines. It took people some time to find out for sure that these formidable giants were Slocum and Yensen; but in a year or two they had all kinds of live stock, had been arrested a dozen times for cattle stealing, and the Government agents had warrants out for them for slashing timber over the line.

"In fact, Slocum in particular had developed into one of the leading citizens of the region, and the people of the county wanted him to run for election as tax collector, but he refused on account of having almost all he wanted where he was. He said it was all he could do to find work enough to keep him busy, but that he wasn't so stuck after a job as to try to collect tax money in Lassen county; said it was all he could do to collect tools, ammunition and stock enough from the

Nov. 4, 1905.]

achers to keep himself and his partner supplied, because the ranchers were too lazy to get anything much. Slocum and Yensen were now so full of energy, other people were afraid of them. They had accumulated a lot of property, including cattle, horses, mules and sheep. Other ranchers missed things of the same brand, but they were curious enough to inquire of Slocum, because he had grown too impulsive. It was all on account of the altitude," concluded the old gentleman, "the higher some men get in these mountains the more order it becomes for them to control themselves. Making posts and rails, the use of a crosscut saw about 12 hours."

At this point I began to lose faith in my grandfather. I quietly reached a trout from a pan in the next room, rubbed the nose of Jack, the bear, with it, and then put it hastily away. Jack had been sound asleep on the floor, but he got up immediately and began a r dance, squalling for the fish that he couldn't find. Nothing made Jack so ambitious and noisy as the smell of fish, and as an interruption to conversation at a critical time he was a squalling success. The old gentleman had had considerable experience with wild bears, and he did not put sufficient faith in Jack to continue his story at that time; he preferred to retire, and it was past his bedtime, anyhow. He rarely told such long yarns as this one, and while telling it he had been busy with other things, such as the fire, wood, water and what not, while he gave a good deal of time to watching Jack's doings, allowing that animal considerable freedom, but always a little suspicious of his innocence. I may have misconstrued some of the details of his narrative about Slocum, but after we had been at this place some days all of us believed the most of it. Whenever I set off with an ax or other implement of industry, Enochs would tell Dick to "look out for Slocum, and chain up the blankets and provisions." Although we were out for an easy time, we found ourselves getting up before daybreak, eating five or six times a day, hunting, fishing, chasing Jack about, doing everything except resting. About a mile and a half east and west of us were cañons, the headwaters of the low creeks, and we made frequent trips to them for wood. The streams were so small at their heads, and there was so much brush and chaotic confusion of fallen trees, logs, rocks and boulders in these cañons, there was no chance for fly-fishing. Trout were there in large numbers, but there were few holes or eddies more than eight or ten feet wide, while much of the water was defended from our encroachment by impenetrable tangles of vines or precipitous banks. We took all the fish we wanted with bait, and found our amusement in watching the hundreds of trout in the deeper holes.

Dick was an expert fisherman, but Enochs was the poorest excuse I ever saw attached to fishing tackle. He would work harder and longer in making preparations, break down more brush and driftwood, have more trouble and make more fuss at it than a woman. Finally he would get in a conspicuous position above some pool, where he could hang over the water, and after he had scared every fish out of it, he would sink his bait to the bottom and wait with wonderful patience—that is to say, wonderful for him. A peculiar look of solicitude and anticipation would rest upon his countenance, and after a while he would pull his line carefully to the surface with now and then a water dog or a turtle upon it. If any one was watching he would quietly let his catch sink to the bottom again, while he muttered inexpressible things. After a while he would haul in and release his catch by slyly cutting the line. In hunting he was no more successful. He would get up and out at daybreak, hunt with great enthusiasm and industry, climb the steepest, rockiest and brushiest hillsides without seeing a deer or firing a shot. I believe he killed a squirrel or two in the time we were out, but squirrels might be shot at any hour from our camp, almost any time from our wagon when upon the road.

Upon these trips we let Jack follow, and he usually wagged along with us for a while until he found something about some old log or tree of interest, when he would stray off by himself, usually returning to camp about the time he guessed that we would be cooking something or dressing game or fish. At such times we had to chain him up, as he persisted in taking a hand, or, rather, both hands in the operation. He liked his venison and fish raw, but he accepted it cooked, half-cooked, or, in fact, otherwise. Sometimes we would give him a fish or a piece of meat hissing hot from the fire in an effort to teach him some little deliberation. He never attempted to gorge these hot things, but he would paw them about with great gravity and patience or an animal with his capacity for things he liked. It was often diverting to see the jealousy manifested by Jack and the dogs while food was in course of preparation, for they were nearly always hungry. They were not often cross, but they were so distressingly eager that we often fed them the first thing. I could not see that it took any more to satisfy Jack than it did the dogs; while the bear seemed the more contented and playful when he had been supplied. He sometimes took from the dogs a bone that he preferred, but upon the whole there was an amicable understanding between the three that never culminated in trouble. It might have been different if any one of them was suffering for food.

Do what we might, and try as we could, we could neither suppress our inclinations to be almost constantly moving about, or to be eating something. Unrest and hunger seemed to be in the air we breathed, sure enough, and the same spirit and energy and appetite filled all the animals. Our horses, as docile and well trained as any could well be, were now a source of anxiety. If there was a loose stake or rail they would get out of the pasture or out of the stable, while they filled themselves with timothy hay until their hides were stretched and the hair was scattered about upon them almost at rare intervals.

I would not like to be quoted as saying that our horses got so full of hay that they had no more hairs to the square inch of hide than a Chinaman has of whiskers, but I say with entire assurance and without undue qualification, that the hair upon them was not, at such times, as thick as the trees of the surrounding forests. When one of them was patted he reverberated

like a big drum, and if you punched one of them vigorously his elastic reaction would knock you down before you could take your fist away. A well hung punching bag would be no comparison, while all this time the horses were taking in more hay. When we first arrived at the summit, we could lead those horses about anywhere between the trees, but after we had been there a week we had to lead them long distances around to get them to water, or we had to take the road. Why, when we wanted to pass one of them we saved time by crawling under; it would be a close squeeze between his midway elevation and the ground, but none of us wanted to be all day about getting around a horse or even a haystack. The animals got away from us several times, but it took them so long to squeeze between trees in their distended condition, we soon overtook them and worked them back to camp. I tried to ride one of them bareback, but owing to his spherical development and my inability to adapt my legs to it, I decided to walk. I have seen cowboys that might have done it, for some of them are arched like a rainbow. Besides, they commence riding horses before their legs get into shape, and they keep them going that way.

RANSACKER.

### The Turtle's Direction Sense.

KNOXVILLE, Tenn., Oct. 26.—I read with great interest an article in a late issue, on "How Fishes Find Their Way in the Water." I lived several years on the east coast of Florida at a place just being settled by a colony from New Britain, Conn. I arrived there the latter part of November, 1875. With the exception of one or two small farm houses, the settlers were living in tents and palmetto shanties, and were engaged in setting out wild orange stumps as fast as they could clear the land. I went to Florida to spend the winter hunting and fishing and to get away from the cold northeast winter of my home in New Hampshire. I was given a hearty welcome and soon had a comfortable camp to live in. The east coast at that time was some forty miles from the line of Florida travel; it was seldom visited by northern sportsmen, and I soon found that it was a veritable sportsman's paradise. Bear, deer and wild turkey were abundant.

My first bear was as fat as a seal. I had been there but a few days, and this was the first fresh meat the people had had. Everybody got bear meat and bear grease a-plenty. It is the best in the world for cooking, as you cannot burn it. My reputation was firmly established as a hunter; they all, even the women, knew the report of my gun. I fire-hunted a great deal. One old fellow said whenever they heard the report of my gun, "You can bet your life D's bringing in meat." I remember once killing two deer, one with each barrel, so quickly that those who heard the report thought I had accidentally pulled both triggers.

During the summer months, from May to August, the loggerhead, or big sea turtle, lay their eggs on the beach. They come possibly hundreds of miles, and if undisturbed will land within a few yards of the same place year after year. They crawl up the beach in the night and make their nest in the sand just above high water mark. I have watched them from behind a sandhill, but a few feet away. They dig the hole with their hind flippers, and after covering it over, first filling it with eggs, they will go a few feet and make another place, I always thought as a blind, for one looks just like the other. They lay each month usually during the high tides of that month, beginning in May and ending in August, from 90 to 185 eggs, that can be put to more uses than hens' eggs.

During the summer of 1876 I found and brought into camp 2,755 eggs. The yolk in coffee is as good as rich cream, and for butter cakes, and egg-nogg they have no equal. I put some in the sand near our camp, and in twenty-seven days the top eggs hatched; the rest in three days more. The little turtles would dig out, raise their little heads and sniff the air a moment, then start for the river, 100 yards away. It was always a mystery to me how a turtle could find the same place on the shore. When a short distance out at sea it all looks alike—just sandy ridges, with scrub palmetto and coarse grass. There are no landmarks for miles and miles.

### Philippine Crocodile and Scout.

CAMP CONNELL, SAMAR, P. I., Sept. 23.—*Editor Forest and Stream:* The following excerpt from a letter written to me by Contract Surgeon J. A. Escobar, U. S. Army, stationed at Oras, Samar, P. I., under date of Sept. 18, may be of interest to members of the FOREST AND STREAM family:

"As you are a hunter and interested in natural history the following account may be of interest to you. Some ten days ago, in the evening, when two scouts at Cagpili were bathing in the Oras River, one of them was taken by a crocodile. A week ago yesterday I went hunting for these reptiles on the same river, and was fortunate in killing and securing one whose length was, upon measurement, one inch less than eighteen feet and whose girth was about seven or eight feet. The saurian was brought to Oras, where its stomach was opened and the following contents withdrawn therefrom: The remains of two monkeys, two pieces of tin can and the bones of both arms and both legs of what had been a human being. Whether these bones were those of the scout who disappeared while bathing, or of some other individual I am, of course unable to state positively, but anatomically I have no doubt of their having been human bones."

A .45-90 Winchester repeater, with the regular black powder cartridge (300-grain bullet) was used by the doctor, who fired twice, the first shot taking effect behind the foreleg, the second between the eyes of the man-eater.

The reptile killed by Dr. Escobar is readily identified as a true crocodile, not only from the shape of the head, but also from the position of the canine tooth of the lower jaw.

Captain O. P. Robinson, of the Philippine Scouts, is the happy owner of an albino monkey. The animal was caught in eastern Samar some months ago, and is becoming quite domesticated.

A. M. MACNAB,

First Lieut. Philippine Scouts.

### A Blackbird's Victim.

ST. LOUIS, Mo., Oct. 25.—*Editor Forest and Stream:* Last Sunday I visited the big bird cage in Forest Park and witnessed a tragedy among the inhabitants.

My attention was attracted by a fine specimen of a crow blackbird, which appeared to be testing the flyaway capacity of the great cage. As the bird returned from a rapid flight to the east end of the cage and passed very close to where I stood I noted the blackbird was chasing a sparrow. Suddenly both birds wheeled and darted to the ground, almost at my feet, with a thud that scattered the sand and dust on the bottom of the cage.

The fight that ensued was fierce for several moments, when the weight and strength of the larger bird began to tell, and finally taking the sparrow by the neck and holding it on the ground the blackbird actually stood upon its victim until it ceased to struggle. Then carefully releasing its hold on the neck the black murderer proceeded to pound the head of its victim with its sharp bill until there was not a kick or a struggle left in the unfortunate sparrow.

With hundreds of people about and many of them as intensely interested as myself we watched the murderer finish up the job. It was when, with one foot still clutching the body of the dead bird, the blackbird deliberately began to pick its victim's eyes out, that many ladies and little girls retired from the scene. How I wished for a camera with which to record the evidence against this black murderous cannibal.

When all was over I hunted up the keeper, who tells me that almost daily the blackbird kills a sparrow. At this season most of the smaller birds have been removed from the cage, otherwise, I presume, the killing would not be confined to any particular kind of the smaller birds in captivity. I doubt if the result would have been as above described if the attack of the blackbird had been made in the open, at least I have never read nor heard of such a thing.

NOVNEK.

### Ruffed Grouse Vagaries.

NEW YORK, Oct. 25.—*Editor Forest and Stream:* I have read with much interest various accounts of the vagaries of ruffed grouse. These have been of the usual plunging-through-windows or against-wires variety. An Eagle Lake (Ticonderoga) farmer and hunter related the following incident last summer: "I was sitting on my porch one afternoon when I was frightened by some heavy object striking hard against the side of the front door. I turned around and found a large partridge lying as if stunned under a chair. Before I had time to get out of my seat another object seemed to come out of the clouds and struck almost where the bird did. It was a large hawk. Before I could get my wits about me the partridge started off again as well as ever, and the hawk followed. Both were going in a straight line, and I am sure that the hawk could catch his prey. Whether the bird flew to the house for protection or hoped that I would shoot the pursuer I don't know. These hawks are death to any bunch of partridges that they get after. I have known a covey of a dozen or more to be wiped out one by one by them."

I wonder if the bird in question was a duck hawk. It was in a mountain valley near a pretty large lake and abounding in creeks and streams. I have never before heard of a hawk trying to fly down a grouse on a long distance course. Perhaps some of your readers have.

PETER FLINT.

[Within the limits of New York city we have on two occasions seen an English sparrow dash into a room in flight from a sparrow hawk.]

### More Bird Reservations.

WASHINGTON, D. C., Oct. 24.—*Editor Forest and Stream:* Since the writing of my article in the FOREST AND STREAM of Oct. 21 on bird reservations, the President has issued three additional orders establishing bird reservations as follows: "Siskiwit Island Reservation, embracing a group of unsurveyed islands at the mouth of Siskiwit Bay on the south side of Isle Royal, in Lake Superior, Mich.; the Huron Islands Reservation, including all unsurveyed islands of the Huron Islands group along the south shore of Lake Superior in Tp. 53 N., R. 29 W., Mich., and the Passage Key Reservation at the mouth of Tampa Bay, on the west coast of Florida."

From 6,000 to 10,000 herring gulls breed annually in the Siskiwit Islands and many other forms besides, and in the Huron Islands about 1,500 gulls with terns and other species breed. Passage Key is the greatest breeding ground for terns and other water birds characteristic of that locality found along the Florida coasts. Effort was being made to get possession of Passage Key for the purpose of exploiting it as a resort at the time the Executive order was issued, and the signing of the order was extremely opportune since the bird population would have been annihilated in six months more.

All three Executive orders are dated Oct. 10, 1905. The National Association of Audubon Societies will place wardens in charge of these reserves at once.

FRANK BOND.

### Fulvous Tree Duck in Washington.

NEWSPAPER reports on natural history matters are proverbially untrustworthy, yet often are worth investigating. An item appearing in a recent issue of the Seattle Post-Intelligencer is of this character. The fulvous (*Dendrocygna fulva*) tree duck is a tropical and sub-tropical species found in Mexico, parts of California and Nevada, Louisiana and Texas. Its occurrence so far north as Washington would be very surprising. The item says:

The first specimen of the fulvous tree duck ever killed north of British, French and Dutch Guiana was shot a few days ago by Phil. Locke, of Aberdeen, near Grays Harbor. The bird has been stuffed and is now in the possession of the hunter who killed it, and is prized as a rare trophy by him.

The creature is much like the American wood duck, recognized as one of the most beautiful of birds. In color it is light brown on the breast and a beautiful mottled brown on the back. In shape it is much the same as the American wood duck, but is considerably more leggy.

# GAME BAG AND GUN

## In the Fall of the Year.

W'en de possum an' 'taters am er sizzin',  
 An' de ash cake am er bakin' in de coals,  
 W'en de squirrels am er barkin' in de hickories,  
 An' he cottontails am snugglin' der holes,  
 W'en ole Bob White sets yer blood all in a tingle,  
 As he loudly whistles fer his lady love,  
 W'en de north wind starts to loosen up de shingles,  
 An' is sighin' in de treetops up erbove,  
 W'en de frost turns all de leaves ter red and yellor,  
 An' de 'simmons an' de seals barks am good,  
 W'en de pumpkin on de vine am rich an' meller,  
 An' de screech owls am er screechin' in de wood—  
 Den it's time ter start ter cleanin' up Ole Betsy,  
 An' ter keep de dogs from gittin' over fat;  
 Kaze de raccoons am er gittin' mighty "pesky,"  
 An' dey's usin' on de hills an' in de flat.

MEMPHIS, Tenn., Oct. 10.—*Editor Forest and Stream:* Inclosed please find a little poem. I have dedicated it to my very dear friend Frank Blomberg, who is a sportsman in the broadest sense of the word. He and John T. Hudson and myself a few nights ago went coon hunting. Our guide, Joe, was one of those old-time, before-the-war negroes that are too swiftly and very surely passing away. He is a dog-trainer, and has handled some very fine dogs in his days. He still trains a few setters and pointers, but is getting old, "an' de rheumatiz" (as he puts it) has about gotten the best of him. Joe has never lost his love for coon hunting; he always keeps a small pack of good coon dogs, and every fall he is sure to come to see me and makes me promise to go out some night next week and take a coon hunt, and I always promise and never disappoint him. Some of my happiest hours have been spent in the fields and forests with Joe and his dogs, and it is with sincere regret that I see him growing old. Joe is a good shot and loves the sport, and is always thoughtful and considerate. When in the field, the dogs point a covey or a single bird, he will never flush until "de white folks" come up; and when one shoots and fails to bag his bird, he is always ready with an excuse, such as "Yo' feathered him," or "Dat bird was shore a long ways off and flying some." As a rule, when Joe misses he says, "Dese ole eyes er mine is a-go'in' back on me," or "De shells dey make now'days ain't what dey uster be." I have never seen his equal at rabbit shooting, and he prides himself on never missing one, "ceptin' once in erwhile."

On the night of Oct. 6 my friends and I drove out to Joe's farm. We reached there at 8 o'clock, and found everything in readiness. Joe had a mule for each of us to ride, and in less than twenty minutes we were on our way to the old river bottom, where possum and coons are very numerous. In due time we reached the bottom, and in less time than it takes to tell it, the dogs had "struck trail," and pretty soon a coon was "up a tree," and in less than a half hour was ours. There was a time when it would have taken much longer to catch and kill a coon. That was before headlights were used to shine them. Then we would have had to cut down the tree, and that entailed a lot of labor and the useless destruction of many trees. Since timber has been so scarce and valuable, the farmers who own timberlands strenuously object to coon hunting—and I do not blame them.

On this hunt we used headlights, and while some may say (and rightly, too) that it is unsportsmanlike, it most certainly affords one lots of fun and plenty of exercise. When the dogs trailed a coon and treed him, one of the party would take the gun and shoot it out. A coon is a tough customer, and will give the dogs a tussle if he is not too badly hurt. It was nearly 1 o'clock when we decided to start back home. We had killed four coons and had caught two possums—not so bad, considering the rough going on account of the dense undergrowth and the early season. The moon was high in the heavens when we got back to Joe's shack. Everybody was happy and tired, but we were soon revived, and sat down before a blazing log fire and told tales and experiences of former coon hunts. Joe loves to talk about the good old times, when he used to pilot his "young massa" through the forests in pursuit of turkeys, squirrels and other game, and it was after listening to his reminiscences of the good old bygone days that I wrote the lines.

R. C. STREHL.

## Carrying Game Through New Jersey.

LONG BRANCH, N. J., Oct. 24.—*Editor Forest and Stream:* Replying to your esteemed favor of Oct. 4, I beg to say that the New Jersey Commission decided over a year ago that while it was a technical violation of the law to take any game out of the State in another one, the act was designed to protect New Jersey game only, and that the Commission would not enforce the law against any persons bringing game from without the confines of this State and transport it across the State into another. Our wardens have been instructed not to make arrest of parties bringing game lawfully killed in New York, Pennsylvania or any other State across the ferries from Jersey City to New York. It very frequently happens that parties attempt to take advantage of our action in this matter, and claim they have been hunting in another State, and it frequently happens that parties who have lawfully killed game in another State, are held up until they can show where the game was killed. It would therefore be advisable for the parties desiring to take game out of New Jersey, that was killed in another State, to have some manner of proving quickly and conclusively that the game was not killed in New Jersey, but lawfully in another State.

BENJ. P. MORRIS, Pres.

## Shooting in the South.

### The Realms of Sport.

Concluded from page 332.

WHEN the first flight of wildfowl appears along the Virginia and Carolina coasts it is hurrah for Currituck and the rough, strenuous life of the wildfowler. Many sportsmen are devoted to upland shooting and see little joy in lying out in batteries or huddled in a blind, exposed to cold and wet. Only the hardy few can enjoy the sport and brace up to the fierce biting gales that frequently degenerate into cold, driving rain that laughs to scorn one's dogskin jacket and chills him to the very marrow.

The coming of frigid mid-winter last season sent a host of humanity scurrying Floridwards, others to whom game was a predominant factor dropped off near good shooting grounds, regardless of the vagaries of the weather. Among that class was the writer of this article, who selected Georgetown, S. C., from among a bevy of attractions. The local pulled out of Charleston about sunset en route for Georgetown via Lanes. We pass Monks Corner, famous in Revolutionary annals, and presently enter upon wild stretches of woodland interspersed with unkempt areas of cultivation. The maze of swamps that line the railway gradually merged their individuality in a haze of shrouded mystery; the early glow of twilight illuminated the woods and waters with a ghostly pallor, and the inanimate forms of nature assumed strange portentous shapes as night advanced, until the twinkling lights of Georgetown proclaimed the journey's end. I was soon comfortably installed in the Tourist Hotel. Its name is somewhat misleading, as no tourist element intrudes to faze the sportsman; the well-worn habiliments of the hunting field pass muster in dining room or corridor. The town is somewhat antiquated and slow, but Georgetown presents a neat and attractive appearance. The lumber industry is drawing heavily on the magnificent forests of pine that shelter an innumerable host of animal and bird life. A couple of settlers, residing about seven miles out of Georgetown, are said to keep their larder well supplied with deer hams. That paragon of feathered game, the wild turkey, roams through a vast domain controlled by the Atlantic Coast Lumber Company; flocks are occasionally seen skulking near lonely forest paths and clearings, often vanishing as mysteriously as they came. Baiting is often resorted to, but calling is not in vogue. They are generally chanced upon by hunters after deer or quail. The numerous swamps that infest the coast present an almost impenetrable barrier to the pursuit of this noble bird. Woodcock, quail, ducks, snipe and doves are found in fair numbers from eight to twelve miles from town. A team is easily procured, but good guides and dogs are at a premium. I was fortunate in securing the services of a young man who owned a valuable setter. Another canine that frequently accompanied us was unsteady and made false points. The mornings were frequently nippish, necessitating the use of a heavy sweater, while ice crunched beneath the horses' feet as we struck out for some happy hunting ground over a road that had a decided leaning to ruts and quagmires, but was redeemed by glorious vistas of towering pines and awesome swamps tinged by the early flush of dawn. Negroes of all shades are a feature of the landscape that remains with us from start to finish. Wild looking clearings loom up ahead at irregular intervals, where the smoke ascends from frowsy cabins, whose owners from lack of ambition—laziness—have lost their grip and allowed weeds, creepers and thickets (the skirmishers thrown out by the stately forest that rims the back-ground) to encroach on the patch.

We have drifted far beyond the ken of the town sport, when Belle and her dubious ally are turned loose to scour the roadside coverts. Presently we pull up and watch them puzzling over a warm scent; but nothing rewards the setter's eager quest; the birds have flown. Many a good bevy is passed by the heedless sportsman who saves his dogs for some grand coup farther on that often fails to materialize. The reader can draw his own conclusions from what follows. We arrived at the farm in high feather, our hopes soaring like a towering quail. This farm raises abundant crops of tobacco and quail; it also furnishes good lodging and fare for a modest compensation. Everything looked propitious as we started across the fields in the rear of the house to investigate one of the best quail grounds within striking distance of Georgetown, reserved exclusively for the guests of the Tourist Hotel.

Dogs and sportsmen alike plunged gaily into the melange of tussocks, weeds and saplings that led up from swampy woods. Imagine our feelings at seeing the dogs draw blank in coverts that previously had resounded with the tumultuous roar of rising beves. We rooted out a few stragglers but the main body had either retired into the swamp or were lying up, goodness knows where. The sport soon degenerated into unmitigated drudgery, so calling the disgruntled dogs to heel we departed in a most unamiable mood for Georgetown. Bravely our forlorn hope charged through tangled thickets and careened among the pines bracing up tired muscles by an occasional dip in swamp water. Only one woodcock rewarded our efforts. This lone bird was the first and last of his species. We did not chance on another specimen in all our wandering. The guide's idea was that they burrow in the swamps.

These vast areas of submerged woodlands are a haven of refuge to the persecuted game. They are a fierce proposition, presenting an array of forest impedimenta supplemented by slimy pools, the home of the deadly moccasin. All manner of wild life thrives within the sombre fastnesses, but the miasma that emanates from the watery receptacles is inimical to the life of man. Quail

are often flushed close to the edge of a swamp. A hit by a choke under such conditions generally annihilates the feathered target. Right barrel open, left full choke, is the arm for brush shooting. If a .12, and not too light, it will give a good account of itself among turkeys and ducks. Deer are numerous in the wilder sections of the woods, a shotgun loaded with buckshot or ball is often resorted to. It may pass muster in thick cover, but the sportsman that wields it in the open advertises his lack of skill with that noblest of weapons, the rifle.

Cold weather to the north sends down thousands of ducks, mostly mallards, to settle on the coast and inland marshes. The constant fusillade that greets them morning and evening from market gunners and local sportsmen puts them on their mettle, and frequently shuts the visitor out from scoring. Duck shooting is rough work and calls for a flawless physique. To remain crouched in the sedge for hours, the sport of the elements, varied by hazardous leaps across brimming ditches, heart-rending misses that leave him a prey to silent fury, constitute a few of the minor annoyances that are quickly forgotten when fortune smiles again. About ten miles out of Georgetown is an ideal spot for ducks. What happy times I recall camping in the old boat house replete with comforts that only sportsmen appreciate. It is true, that the roof leaked in sundry places (the guide ought to know, as he was rooted out of his sleep one stormy night), while bitter cold oft romped in through the crevices of the old structure and dominated the situation from midnight to dawn, but failed to rouse the tired sleepers. The gray light of early morning faintly illumines the cabin as we emerge from our blankets, and quickly don our hunting toggery, tumble into the waiting boat, accompanied by the shivering dog, who is hustled aside when he collides with guns and trampling feet. We soon strike the opposite bank of the river. Climbing up to higher ground discloses a wide extent of marsh aglare with ice, mute evidence of the arctic winter that has clamped the North in its icy grip. The prospect is enough to quench the ardor of the most inveterate. Realizing the futility of our efforts, we nevertheless skirmish about in the sedge silently anathematizing our congealed surroundings. The emptiness of marsh, sky and game pockets reacting on empty stomachs soon punctures our bluff and sends us scudding back to our old quarters. Once within the charmed precincts of our amphibious residence we shed cold and disappointment along with our rough habiliments and revel in the grateful warmth none the worse for our experience.

What rejoicing there was when propitious gales from off the coast sent hosts of mallards scurrying inland, to settle over the vast expanse of feeding grounds. Fortunately, a good duck dog was part of the outfit; his services were invaluable in retrieving game that dropped in places where man or boat dare not venture. Our larder was kept well supplied with feathered game, venison, rabbits and squirrels constituting a missing link in our camp menu. Their absence scarce created a ripple, as ducks, snipe and doves were always with us. At one time we had more ducks than we could conveniently use, so a friendly rice planter got the benefit. Later on he rendered valuable assistance in bracing up our dwindling commissary. The joint efforts of the guide and Jim, a colored gemman of sporting proclivities, frequently culminated in gastronomic triumphs that were partaken of with silent thanksgiving. The memory of these hunters' feasts is waited about like grateful incense, as I follow the devious trail of my wanderings. How often when coming off the marsh at eventide, chilled with cold, hungry, wet and mud bedaubed, we stumble through the doorway of the cabin and collapse in the welcome embrace of the rockers, tired but happy. After being duly thawed out we discard our wet gear, stowing them and our guns in a dry corner. An occasional yelp from some down-trodden canine helps enliven things while the aromas of baked mallards and coffee proclaim the near advent of supper. Presently we fall to with appetites sharpened by fatigue and exposure; game, hot biscuits, rice and a variety of comestibles brace up the inner man wonderfully, while pleasant comradery puts the blues to rout. Our next move is to gather about the stove where we keep up a desultory fire of conversation punctuated as night wears on apace with yawns and sleepy nods that herald the coming of the drowsy god.

ARTIST.

## Adirondack Deer.

*Editor Forest and Stream:*

Accounts differ as to whether deer are plentiful or not. Probably the deer are about as numerous as usual, taking the Adirondack region as a whole, but they are far more plentiful on the private preserves than on the grounds over which the public roams at will. Of course the effect of the private preserves has been to congest the public on the lands which are accessible, and the deer are learning their parks of refuge. It is a pity that the State doesn't own the private preserves, for then it could make preserves in which hunting could be entirely prohibited. As it is, the tame deer of the preserves are subject to slaughter like cattle, if the preservers care for that sort of thing.

Deer in the region south of Jock's North and South Lakes and south of Morehouseville are only half, or less as plentiful as last year. More than 100 deer were killed in that territory last winter by crusters, some of whom supplied the town of Wilmurt, hotels and all, with venison until March, when the game warden, the now notorious Charles Klock, put in his appearance and arrested one man, Irve Wright, who went to Herkimer jail for 100 days. The rest of the gang escaped.

In the territory, embracing 100 square miles, only one deer is known to have escaped the crusters. He was a buck which was driven by dogs to the vicinity of Flansburg settlement, where the residents watched him and

red him. The doe, heavy with fawn, which accompanied the buck, was pulled down by dogs and killed in a race that took the buck to safety. Some good deer have been killed this season in Herkimer county. A number have been shot from buggies by traveling hunters, notably a white one a few miles north of the Falls. The few days that I passed in the woods were dry, and approaching deer was a matter to test one's skill. Hunters generally report dry weather as a cause baffling their efforts. I doubt very much if the number of deer taken from the mountains this year will equal the low record of previous years.

The game wardens are showing considerable activity on the sides. Hounding is being done around the Tupper Lake country, and in other Adirondack localities. But the gradual tightening of the lines by the present game, and forest administration has resulted in a marked increase in hound values. In northern Herkimer county, before the law forbidding hounding was passed, hounds were worth and brought from \$50 to \$100. Last fall they nearly reached the former valuation. This fall an excellent deer hound brought only \$20. The purchaser presumably needed him for service in South Wilmurt, around the forks of the West Canada, where it has not been too dangerous to dog deer. Partridges were never more plentiful in the edge of the woods, if I may judge of those seen in the old chop-logs up the West Canada. RAYMOND S. SPEARS.

TILLER FALLS, N. Y.

## Big Game Shooting.\*

ALTHOUGH big game is constantly getting scarcer and rarer, books on big game hunting continue to be written, and yet if the truth were known a good big game story is hard to write. There are obviously two ways of writing such accounts. One has to do with the simple "sport" side, as it is often called, that is to say, with the cover of the game, the approach and the kill; while the other deals with the animals themselves, the country they live in, their ways of life—their natural history in detail—and make the killing of an animal merely the climax of the story. There are very many sportsmen, who, while successful in the amount of game that they have killed, are quite unable to tell their story from the natural history viewpoint, and must necessarily confine themselves to the excitement of the chase and the capture of the trophy. It is hardly necessary to say that an account which deals with the life history of the animal, as well as with the acts of the hunter, appeals to a larger sympathy and a wider public than one which is a mere narrative of capture, and the writer who deals with the sport the broader lines tells a more interesting story than one who knows but little about the habits of the animal pursued.

Two volumes entitled "Big Game Shooting" have recently been published in the Country Life Library of Sport and issued by two London firms as well as by Charles Scribner's Sons, of New York. They are edited by Horace G. Hutchinson, contain together over 600 pages, and are illustrated with a multitude of beautiful gravings. These are composite volumes, and the chapters contributed to them are written by a number of big game hunters, all well known in England and some of them in this country. Among the latter are Sir Henry Seton-Karr, Clive Phillipps-Wolley, Warburton Pike and S. Reed, while Mr. H. A. Bryden, who writes of the big game of Africa, is also well known here. The volumes are divided into Parts, the first of which—less than thirty pages—is devoted to Sporting Rifles, by the Hon. T. F. Reemantle. In an interesting chapter he brings together considerable useful information. It is interesting to note that the Lyman sight is recommended to British sportsmen, and interesting also is the comparison of the "battery of rifles" recommended to-day with that advised a dozen years ago for east Africa in the Badminton Library volume on "Big Game Shooting for East Africa." That list ran from a single four-bore rifle, down to a .295 bore rifle, and included two double barrels. Now, Mr. Reemantle says that, by taking a proper assortment of cartridges, a double rifle of .45 to .50-bore for big game of all kinds, and a magazine rifle of .256 to .350-bore for deer and smaller quadrupeds, will answer all purposes. Of course the difference comes about largely through the adoption of smokeless powder and of new forms of bullet.

The main portion of Volume I. consists of two Parts, European Big Game, and American Big Game. Of the European section the red deer naturally takes up by far the greater portion. There are chapters on Scottish Red Deer and Deer Stalking, by Sir Allen Mackenzie and the editor, one on Park Red Deer and the Warnham Court herd, one on the Scandinavian Red Deer and one on the Continental Red Deer, both by Sir Henry Seton-Karr. Chapters on Reindeer Stalking in Norway, and on Norwegian Elk Hunting, by Mr. Abel Chapman, are followed by one on the Chamois, by Randolph L. Hodgson. The Warnham Court red deer have been carefully bred for size and for fine heads, and the illustrations of heads from that herd show how successful this movement has been. A stag is described, which, at ten years old, had less than thirty-two points, and there was one which had forty-seven points, the cast horn weighing seventeen pounds one ounce. While there are larger parks and larger herds of red deer in parks, this particular herd stands very high in estimation of experts on the red deer. Not a few stags have been taken from it to improve the deteriorating wild deer of the deer forests of Scotland. In his chapter on Continental Red Deer Mr. Seton-Karr has a good deal to say about deer's horns, and among others discusses those of the wapiti. He declares that in the wapiti group there is an absence of cupping on the crown of the antler, but later, in speaking of the West American wapiti—by which he means those of Vancouver Island—says that there is a tendency to cupping and to palmation. Again, on page 172, he says occasionally wapiti horns are palmate, and this is said of bulls in Wyoming, or, at all events, on the main divide. As a matter of fact, old hunters know that cupping and

palmation in the horns of the wapiti was not very unusual.

Part III. of Volume I., is devoted to American big game. The moose, elk, caribou, mule deer, blacktail deer and whitetail deer, the mountain sheep, Dall's sheep, bears and the muskox are all more or less fully described, but to our very great astonishment not a word is said about the buffalo, the pronghorn antelope or the white goat. Obviously these animals were known to the editor, for there is a picture of buffalo and one or two of antelope, but the white goat is not referred to at all except that it is mentioned as "goat" in a chapter on Game Laws, which Mr. Phillipps-Wolley contributes to close the volume.

The chapter on moose, by Mr. Phillipps-Wolley, and the one on the Moose of Alaska, by Capt. C. E. Radclyffe, have both to do with the moose of the northwest coast. Each contains some information as to weight and horns. Captain Radclyffe killed a seventy-seven-inch moose head and Mr. Phillipps-Wolley gives the list of Mr. Reed's heads running from sixty-five to seventy-six inches, the climax being capped by the horns of a bull moose found dead in Kenai River a few years ago said to have measured slightly over eighty-one inches.

In Volume II., Part I. is devoted to African big game. Mr. Bryden's introductory chapter points out that there are still large areas of country in the African continent where the white man's face is almost unknown. To show how much we still have to learn about Africa, he instances the recent discovery of the okapi and of a number of new antelopes, zebras and other animals. It is true that in many cases where a multitudinous life once crowded the veldt those ancient pastures are now vacant, but in many parts of Africa there is still abundant game. Preservation also has done something for Cape Colony, and certain species of game are increasing. First rate big game hunting is still to be had, though of course the sport will cost more in labor, in time and in money than formerly. Game licenses range from \$50 to \$250, and much of the hunting has to be done on foot and under severe heat, so that success in hunting in South Africa means work. On the other hand, it means also education. It teaches a man to be observant, quick, strong, self-reliant. No doubt it was because the Boers were practiced hunters that they were also such good soldiers.

Mr. Bryden's battery of rifles includes five arms, among them a double eight-bore paradox and a twelve-bore double-barrel shotgun. These are the special weapons of the leader of the expedition, who also has to supply a certain number of his people—his native hunters and the like—with rifles for their use.

One turns with interest to the article on lions—for we all, big or little, learned or ignorant, love to hear about the king of beasts—and Mr. Bryden's account of the lion is a very excellent one. He does not tell much about killing them, but gives a great deal of information about their habits, and especially about their ways of hunting. He speaks also of the ease with which a lion is killed compared with the thick-skinned elephant, rhinoceros, buffalo, or even the larger antelopes. Of the leopard he says: "It is a fact not known to all naturalists and hunters that the leopard is in the habit of depositing carcasses of slain prey in the forks of branches of some old tree no great way from its cave or hiding place. Such a place is well known to Cape Colonists as 'the leopard's larder.' The food often becomes high and stinking, but the leopard, like the lion, is not a specially clean feeder and will devour decaying carcasses as readily as will a hyena or a vulture. I well remember being shown one of the larders by a Kaffir spoorer who hunted with me; its odors will remain always in my memory. There were the remains of a baboon and the carcass of a klipspringer fawn. In mountain countries, such as I speak of, the leopard will, I think, in preference kill a klipspringer before any other quarry. In this he shows his good taste, for the venison of this most dainty little antelope is among the best in all Africa. Next to the klipspringer he chooses the baboon, an animal which abounds only too plentifully in almost every range of Cape Colony. The baboons look upon the leopards as their most deadly foe, and hate him accordingly. They are most alert, wide-awake beasts, and in daytime have sentries always posted; still, notwithstanding all their cleverness, the leopard usually gets the better of them and secures his dinner when he needs it. It is said, and I believe with truth, that occasionally two or three 'old men' baboons, when desperate or cornered, will go for the leopard, and nathless his strength, his teeth and his fearful claws, rend him to bits. An adult baboon can instantly kill a big and strong dog by tearing out his throat with his enormously powerful teeth, and I see no reason whatever why two or three of these fierce apes should not vanquish a leopard." The elephant, rhinoceros and hippopotamus come in the next chapter, The Pachyderms, and it is interesting to know that the elephant is still destroyed by ancient methods, such as the spear, trap and pitfall.

There are chapters on Asses and Zebras, the Giraffe and Okapi, Hartebeests and Gnus, Antelope and Gazelles, the Buffalo and one on Deer, Sheep, Goats, Pigs and Ostrich.

Part II. of this volume, dealing with Asiatic Big Game, has for us an especial interest because it treats of the land where many of our big game animals undoubtedly originated. Here are marvellous sheep and goats, certain deer so like some American species that they cannot be separated specifically from them, giant buffalo and bison, so-called, though very different animals from those which Americans know by the name, and the tiger. All these chapters are by Major Cumberland, and the volume closes with a chapter on Big Game Shooting in Burmah, by Mr. E. D. Cumming. Major Cumberland's account of Asiatic big game is extremely interesting, especially his chapter on sheep and goats, and every hunter will look with great interest at the very beautiful engravings which adorn this chapter.

Of the material found in the volumes the most interesting is that which deals with Africa and Asia. It is to be regretted that the different chapters are of very unequal interest. On the other hand, the illustrations are of great beauty, there is much matter in the volumes and they should be in the library of all big game hunters. Price, \$7.50 net.

### THE MANY-USE OIL

Cleans out smokeless powder; keeps bore bright and ready for use. —Adv.

## The Quails of the United States.\*

BY SYLVESTER D. JUDD, ASSISTANT, BIOLOGICAL SURVEY.

(Continued from page 855.)

### Legislation in Behalf of Bobwhite.

In addition to natural causes, reasons for the diminished numbers of bobwhites are diversity in the open season, shooting out of season, excessive shooting in season, and unrestricted shooting and trapping for market. Lack of uniformity in laws of adjoining States, and in some cases of adjoining counties, renders their observance difficult and their enforcement often impossible. No other game bird has been the subject of so much legislation, which, beginning in New York in 1791, now extends to every State and Territory where the bird is native or has been introduced. The length of season during which the bird should be protected by law is a matter of paramount importance. It goes without saying that no shooting should be permitted during the breeding season, which must be understood to last until the young of the year are strong of wing and fully developed for the struggle for existence. Besides this the close season ought to include months of rest, during which the birds can fortify themselves for the physiological strain of the next period of reproduction. As now established the open season varies from twenty-one days in Ohio to seven months in Mississippi. In North Carolina, however, where nearly every county has its own law, the bobwhite may be shot throughout the year in five counties. Virginia has recently abolished county laws and established uniformity, an example that other States, especially Southern States, would do well to follow. It is gratifying to note that in 1903 the open seasons were shortened by New York, Illinois, Texas and Virginia. In eight States—Maine, Rhode Island, Wisconsin, North Dakota, Montana, Colorado, Wyoming and Utah—the bobwhite is absolutely protected for a term of years, extending to 1920 in Colorado. Two conditions justify such prohibition of shooting. First, when excessive shooting or other causes have made recuperation necessary; second, when birds just introduced into a new locality need time to establish themselves. Wherever the bird cannot hold its own with an open season of three weeks, absolute protection for a period of years is demanded. The length of the open season must vary with varying conditions, but in view of the general decrease of the birds there would seem to be a growing need for shortening it. The sooner Northern States limit their shooting to one month the better. Even Southern birds cannot stand the present continuous fusillade of from four to seven months, and the open season in the South should be limited to two or, at most, three months.

The slaughter of the bobwhite by sportsmen who hunt for pleasure is insignificant in comparison with that by professional market hunters. At the present time (1904), in about twenty-five States, the law takes cognizance of this fact by prohibiting the sale of birds killed within the State or imported from other States, and the general tendency altogether to prohibit the sale is growing each year. Every State except Mississippi forbids the sending of certain game outside the State—a restriction on the sportsman as well as the market hunter, although the privilege of carrying home a limited amount of game is often granted under a non-resident license. Fourteen States have laws, also affecting both classes, limiting a day's bag to from five to fifty birds. Many sportsmen and farmers would be glad if the limit were set at twelve. Laws discriminating against non-residents protect the game and benefit the land owner, provided visiting sportsmen are not barred altogether by unreasonable fees. Thirty-one States and Territories require non-resident licenses. In addition to State game laws there are certain Federal laws, the most important of which is the Lacey Act, which provides, among other things, through the Department of Agriculture, for the preservation, distribution, introduction and restoration of game birds, and also undertakes to bring to justice persons who transport from one State to another game killed in violation of local laws. The latter clause proves effective in restricting such illegal shipments and in suppressing professional dealers that kill out of season in one State and attempt to sell in another where the season is still open. A law to prevent keeping birds in cold storage from one season to another would stop certain loopholes in the present laws and greatly aid in preserving game. An effective system of State game officials where it is lacking would aid in enforcing game laws. A number of States depend solely on county officers; but experience has shown that without a central State organization and special game wardens the law to a great extent becomes a dead letter.

Stringent laws against trapping the bobwhite have been enacted, but such legislation should permit legitimate trapping for purposes of propagation. One of the most important problems before game commissioners is the restocking of depleted covers. If, however, the bobwhite can be reared successfully in captivity, all trapping may be prohibited. The sporting magazines (FOREST AND STREAM and AMERICAN FIELD) mention cases of the bird's laying in captivity and raising its young; and in a letter to the writer, dated Sept. 2, 1904, G. W. Jack, of Shreveport, La., says:

"I now have a pair of quails (bobwhites) which were trapped last winter and which I keep in a large wire coop. They have made a nest in some grass and have laid about twelve or fifteen eggs.

"The eggs were laid very irregularly, not more than two or three a week, so that by the time the nest was full the season was far advanced, which perhaps accounts for the female not sitting. The eggs were set under a hen and proved fertile, but the young were eaten by the chicken as fast as they hatched. I concluded that this irregularity or slowness in laying was the result of the lack of insect and other egg-producing food, as the birds subsist almost wholly on grain. Of late, however, they have learned to eat with much relish the yolk of an egg hard boiled."

The failure of the female to sit was probably due to the unnatural confinement in so small a space, a difficulty which could readily be remedied if attempts to raise quail were made on a large scale. Unquestionably, too, it would be necessary to feed the quail, at least during the nesting period, to a considerable extent upon animal food. An instructive account of quail breeding in confinement

\*Big Game Shooting. Edited by Horace G. Hutchinson, London and New York. 2 vols. Cloth. Illus. Price \$7.50 net.

appears in FOREST AND STREAM for Sept. 28, 1882 (p. 164). The female had been hatched and reared by a bantam hen, and this circumstance has an important bearing on experiments of this kind. It is altogether probable that bobwhites hatched and reared in this way would lend themselves to experiments in propagation far more readily than wild birds trapped for the purpose.

The Department of Agriculture obtained three pairs of bobwhites from Kansas, which after five months' captivity are almost as wild as when first caged and show no signs of mating. Experiments in the domestication of bobwhite are well worth trying, however, because of the demand from clubs and individuals for live birds to restock their grounds. So great has become the demand in recent years that it is estimated that 200,000 birds would be required annually to fill it. During the spring of 1903 the demand far exceeded the supply, even at \$5 a dozen, and sometimes at twice that figure.

Success in increasing the numbers of bobwhite depends largely on controlling its natural enemies, which include snakes, foxes, weasels, minks, skunks, domestic cats and certain hawks and owls. Several species of snakes eat its eggs and young. Writing from Texas, Major Bendire says: "The many large rattlesnakes found here are their worst enemies. One killed in May had swallowed five of these birds at one meal; another had eaten a female, evidently caught on her nest, and half a dozen of her eggs; a third had taken four bobwhites and a scaled partridge." In Mecklenburg county, Va., the king snake has been known to eat a clutch of eggs. At Falls Church, Va., Harvey Riley captured a black snake which disgorged a newly hatched bobwhite. Reference has been made already to the marked decrease in the number of bobwhites on the 230-acre farm at Marshall Hall, from fifty odd birds in July to less than a dozen in December, though not more than a dozen had been shot. This decrease was probably due, at least in part, to gray foxes; for in August and September these animals were numerous, and often came after the chickens within a stone's throw of the farmhouse. Other predaceous mammals and birds of prey were not numerous, but foxes frequently were seen at midday searching through pastures where there were broods of bobwhites. It must be easy for a fox to exterminate a whole brood of newly hatched bobwhites, and no difficult task to catch them, even when three-fourths grown. Minks and weasels, when numerous, are probably even more destructive to young bobwhites than to domestic poultry. The domestic cat that takes to foraging in woods and fields is also a menace and should be shot on suspicion, for it undoubtedly preys on game birds, as it is known to do on song birds and young rabbits.

In Maryland and Virginia the writer has found the crow plundering nests of the bobwhite, and in these States the crow is an enemy also of poultry. Doctor Fisher states in his "Hawks and Owls of the United States" that of the forty odd species which he studied he found only nine that killed the bobwhite. Four of these—the goshawk, Cooper hawk, sharp-shinned hawk and great-horned owl—are very destructive to poultry as well as game. Dr. W. C. Strode, of Bernadotte, Ill., writes that bobwhite's worst enemy is the Cooper hawk. "A few days ago one flew up from the roadside when I was passing, and a bobwhite was dangling from one foot." During November, 1900, this species so persecuted the birds at Marshall Hall that they were seldom found far from cover. In one instance a hawk was seen to swoop to the ground and rise with a cock bobwhite. The other species of hawks and owls rarely molest quail.

If bobwhites more frequently nested along fence rows instead of in open mowing land they would abound in many places where they are rare. The mowing machine lays many nests bare, and they are either despoiled by enemies or deserted by the old birds. At Sandy Spring, Md., early in July, 1903, four nests with their eggs were cut over in a fifty-acre grass lot. In other hay fields several nests were discovered in time to leave grass uncut about them, but boys robbed them all. Between such lads and the crows and other enemies bobwhites have a hard time in certain sections.

To enable them to withstand the winter, bobwhites need suitable food and cover. In severe winters coveys are sometimes saved by being trapped and fed in confinement until spring. Naturally the birds suffer most in the northern part of their range, but there are reports of their death from severe and protracted cold in Maryland and Virginia. Sandys says: "The birds know when the snow is coming, and they creep under the brush, intending to remain there until the weather has cleared. \* \* \* Then the rain comes and wets the surface all about, then the sleet stiffens it, \* \* \* the cold becomes intense, and every foot of damp snow promptly hardens into solid ice. \* \* \* The quail are now imprisoned beneath a dome of crystal, which may endure for days." H. C. Oberholser says that in severe winters in Wayne county, O., whole coveys are found dead from this cause. Dr. P. L. Hatch reports that in Minnesota the birds increase in numbers during years with mild winters and decrease when the winter is exceptionally severe. Wilson Flagg states in "Birds and Seasons of New England" that thousands of bobwhites were destroyed by the deep snows of 1856-57. During the very severe winter of 1903-4 bobwhites were nearly exterminated in portions of Massachusetts. That quail do not always succumb to exceptional cold appears from the fact that in Susquehanna county, Pa., at an altitude of 2,000 feet, W. W. Cooke found a covey of a dozen bobwhites apparently in the best of condition on Dec. 9, 1902, though a foot of snow covered the ground and the thermometer stood at 20 degrees below zero.

A study of the winter habits of the bobwhite by the writer in the vicinity of Washington, D. C., so far has yielded only fragmentary results. In February, 1900, after a foot of snow had fallen, in a careful two days' search he failed to discover even a track of a large covey that usually frequented river flats along the Potomac at Marshall Hall. The birds must have been under the snow or back in the timber. At Falls Church, Va., after a lighter fall of snow, he saw a covey of five moving among briars on the edge of a wood, and their fresh tracks showed that they had been feeding systematically on rose hips, but had not ventured from cover. At Cabin John Bridge, Md., after a snowfall of several inches his dog pointed six birds on the south side of a river bluff, where the sun had melted holes in the snow. On one of these bare spots he saw two birds, which rose and were joined by four others. The covey had made wallows two inches deep in

the leaf mold on the bare spots. All the birds had avoided stepping on the snow. At hand was such food as the berries of sumac and the seeds of *Galactia volubilis* and *Chamaechrista fascicularis*. Examination of the droppings indicated that less than one-tenth of the food had been animal matter, the remains of which consisted of ants, the tibiae of grasshoppers, the spotted cuticle of soldier bugs, and the cowhorn-like mandibles of spiders. So far as could be made out, the remains of vegetable food consisted of the skin of kernels of corn, fragments of the akenes of ragweed, and pulverized bits of sumac seeds (*Rhus copallina*), partridge pea (*Chamaechrista fascicularis*), milk pea, (*Galactia volubilis*), and crownbeard (*Verbesina*), besides unidentified leaf material. The weather had been severe for more than a week, but the birds were in good condition.

On the Marshall Hall farm, a short distance back from the banks of the Potomac, is a swamp that has a steep bank with a southern exposure where there is usually more or less bare ground in patches. For several years bobwhites have made a winter haunt of this warm, sunny bank, and here some interesting observations were made Feb. 18 and 19, 1902, when the snow was from two to four inches deep and the minimum temperature was 4 degrees F. above zero. A covey had spent the night of Feb. 17 not on the warm bank, comparatively bare of snow, but on the level above the bank, where they had squatted on the snow under a dewberry bush among broomsedge. Their feet and droppings had melted the snow, and subsequent freezing had formed an icy ring. The birds had not flown thither, but had walked from the swamp up the steep bank and through the broomsedge level. The next morning they had flown from the roost to the steep slope, had run along the edge of the swamp to a bushy, tree-bordered stream, then up its north bank for 300 yards and back on the south bank, and thence to the steep, sunny slope again. On their journey they had gone under every matted tangle of cat-brier vines—possibly for berries, but more probably for protection. At one point they had fed freely on sumac berries. The tracks of a fox were found with those of the birds for about 100 yards. On the morning of the 19th they traveled not more than 200 yards, this chiefly among outstanding willows and alders of the swamp and along the belt of land five to twenty yards wide between the boundary fence and the reeds of the swamp. In one place two pairs of birds had walked so near together as to cross one another's tracks; two single birds had made clear lines of tracks on one side of them, and a single bird had walked alone on the other side from one to four feet from his nearest companion. All had evidently eaten rose hips, mutilated remains of which still clung to the bushes. The covey might have been expected to range far and wide in the open fields for seeds and even to straw ricks for grain, but except when traveling to their roost they had never gone more than a rod from cover. Apparently fear of enemies restrained them.

An article in the American Field, Feb. 25, 1899, by the well known sportsman John Bolus, of Wooster, O., illustrates the hardness of the bobwhite. When several inches of snow were on the ground and the thermometer registered from 15 to 27 degrees below zero every night for a week, Mr. Bolus took a tramp to see how the birds had fared. He found no dead birds, but saw six thrifty coveys—eighty-one birds in all. They were feeding on ragweed projecting from the snow, and were jumping up to reach seeds on sprays above their heads. Some coveys remained under shelter of little weed patches, but others ranged over the more open fields.

In Maryland and Virginia large land owners often feed their birds in severe weather. Wheat and corn are the best food, and should be scattered, if possible, among the briars where the birds are safe from hawks. Bobwhites have been known to feed with chickens in barnyards. By a little forethought landowners and sportsmen can easily make winter provision for their birds. Sumac bushes should be left along hedgerows and the edge of woodland to furnish food that is always above the snow and lasts well into spring. Twelve bobwhites collected in December in North Dakota had made nine-tenths of their food of sumac, having eaten from 50 to 300 berries each. A similar use, in coast regions, of the bayberry and wax myrtle has been noted. Their berries, as well as those of sumac, last till May, and the plants should always be spared by everyone who is interested in the welfare of the bobwhite. Smilax, affording little food but fine cover, and wild roses, giving both food and cover, are also valuable. Blackberry thickets, young pine woods, laurel, and holly furnish safe retreats from enemies.

The farmer can well afford to feed the bobwhite in winter, but he cannot afford to spend as much time and money as the owner of game preserves, and for the latter class further suggestions may be helpful. In the Eastern and Southern States land that will not grow profitable crops may be used for the game preserve, provided it has water and bushy coverts. The use of the mowing machine, so destructive to eggs and young birds, should be avoided when possible during the breeding season. Wheat for the birds should be sown in long strips not over fifty yards wide. The best of the grain may be harvested and the rest left standing. On the stubble a luxuriant growth of ragweed will generally spring up—a perfect food supply, except that it does not last till spring; hence the need of sumac or bayberry. In regions too dry for ragweed to grow in the stubble, sunflowers are an excellent substitute. Sorghum, millet and possibly panicum may be planted and left standing. Popcorn will be found particularly valuable, as large corn cannot easily be swallowed by the younger birds. Buckwheat, and in the South the nutritious cowpea, and the climbing false buckwheat, the thick tangles of which also afford good cover, bear excellent food. Other plants of the genus *Polygonum* are fond of moist land, and furnish palatable seeds for the bobwhite; for instance, black bindweed *Pennsylvania persicaria* and black heart. All wild leguminous plants should be left undisturbed, for the birds feed on seeds of most of our legumes. Small clumps of locusts may well be left in open fields to give both food and cover. Tick trefoil, bush clover, Japan clover, the milkpea, and the wild bean—all wild plants—are suitable for food. Of the summer fruits the dewberry is the most important, and in the absence of water furnishes a substitute; therefore these vines, nearly everywhere plentiful, should be left in places remote from water. A water supply is, of course, important. Streams with bush-grown banks through

open fields are most valuable. Beside them will be found spreading panicum, which shells out its grain a kernel or two at a time until well into spring. Birds find food, shade, water, and shelter in the vegetation along streams. Marshes also afford cover and food. If connected with estuaries they often support a rank growth of wild rice, an ideal provision for birds. Sufficient shelter to protect the birds from hawks is almost indispensable. Oak and beech woods supply mast as well as shelter, but pines afford the best cover, and some of them, notably the longleaf pine, furnish food. A comfortable retreat for the coldest weather is invaluable. In Maryland and Virginia fields of heavy broomsedge answer this purpose well, but best of all is a steep bank with southern exposure, where the sun quickly melts the snow, and gives the birds a chance to forage on bare spots for food and gravel. If such a bank is not far from cover, and has a growth of briars on it to give the bird a feeling of security, it will become a favorite winter haunt; and during severe weather is the best place to scatter grain. With a little help from man the bobwhite will be found to winter well, even in the northern part of its range.

Bobwhite is prolific. A pair of birds under favorable conditions will raise a dozen young in a season. The too, it is longlived, for a bird kept in captivity is known to have reached the age of nine years. The outlook for the future of the species is most satisfactory, provided it is given even a small amount of care, with proper legal protection. The Audubon societies, with a membership of 65,000 to 70,000, which cherish the bobwhite for aesthetic and humanitarian reasons, the sportsman who loves the whirr of its brown wings, and the farmer whose enemies it destroys and whose resources it enriches, can do much to favor the bird in its natural environment and to protect it by adequate and effective enforced laws.

## Massachusetts Game.

BOSTON, Mass., Oct. 28.—Editor *Forest and Stream*:—is a source of gratification to your correspondent to receive so many letters from all parts of the State descriptive of the present game conditions and offering suggestions for their improvement. I can but regard this as indicative of a wide-spread and constantly increasing interest.

Judge Bassett, of Northampton, in a recent letter corroborates the testimony of others by saying that there are but few quail, but ruffed grouse are "quite abundant." He says while the laws are generally observed, yet "there are too many violations." If a competent paid warden were employed here, his service would make both trout and game more abundant. There would also be an improvement in river fishing. He expresses the opinion that the same would be true with reference to all sections of the State. Too many of the lawless feel that they are in no danger of "being caught." The opinion of such men as Judge Bassett are entitled to great weight.

A prominent sportsman of southern Worcester county called at our office this week and reported that with friend he got eight birds last Monday—seven grouse and one woodcock. They could have killed several more, but concluded they had enough for one day. This gentleman said he could show any one quite a number of quail, but not, of course, to shoot before Nov. 1.

Mr. Vincent, of Cottage City, writes prospects for quail not good. Trout streams in great need of stocking.

Mr. Bamford, writing from Ipswich (Essex county) expresses the opinion that there are no quail and but few partridges in his vicinity. He believes there is much Sunday hunting, but carefully guarded against any possible discovery. Most of the people observe the laws, but there is a class of people who set at defiance all laws.

Mr. Coffin, of Gloucester, says, in his opinion, there are not two dozen quail in Essex county, but the people are very desirous of buying quail to restock the cover. He believes the sale of native game of all kinds should be stopped. He would like to have every other week close time in black ducks, so that they may have a chance to feed and not be kept "on the run" all the time.

George Emerson, of Franklin, Norfolk county, says owing to the vigilance of Warden Bent, the laws are well observed, but prospects for game birds are poor. More stocking of streams much needed, and he wants more planting of quail, "or stop shooting."

I learned from the commissioners yesterday that they do not think the decision of Judge Avery, of Quincy, in the case of Mr. Elery Clark, of Cohasset, in accordance with the law, and they have the opinion of the law department that Mr. Clark violated the law by using power boat, and they are proposing to carry the case to a higher court. The case is attracting much attention, and the final outcome will be awaited with good deal of interest by all the hunters of sea fow. Mr. Clark claimed that his boat being anchored where he killed the bird he was not "pursuing" birds and had a right to shoot them from the boat at anchor. They are a good many such boats in the towns of the south shore, and, in fact, in all our shore resorts.

While on their trip to the Maritime Provinces, Commissioners Field and Delano visited several establishments for the rendering of dog-fish, and the results of their investigations will be embodied in the next report of the board.

Since their return, Deputy Burney has resumed field work, and has made several arrests for illegal hunting and these cases will be heard the coming week. Mr. Burney informs me that the Sunday prohibition is unpopular with members of certain clubs, that they will not make any contribution for protection or propagation while it remains on the statute books. He, however, considers the law a great factor in protecting game.

Men busily employed during the six working days claim that Sunday is the only day they can get on with dog and gun, and that the law favors the men of wealth and leisure and is a species of class legislation. In answer to the question whether the Sunday prohibition of hunting should be surrendered to accom-

date those who make this claim, he replied emphatically in the negative. In his judgment, it would be possible for them to take now and then a day or half a day off for field sport, and the consequent loss in wages would not be seriously felt.

One day this week an electric car in Swansea (near Fall River) was held up by a big buck, which would not leave the track till driven away by the motorman, who stopped his car for that purpose.

At Mt. Sunapee, N. H., many are enjoying the hunting season, treeing coons by moonlight being one of the diversions. Mr. D. W. Chandler, of the B. & M. Railroad, has secured his quota of birds. A 200-pound buck was recently brought out from Colebrook by Arthur Gilchrist, who has been in camp with his family.

Mr. and Mrs. George Rogers, of Boston, have been hunting in Corbin Park. Dr. Sherman, one of a party from Cambridge, occasioned a good deal of merriment this week at Bristol by shooting one of farmer Pike's rams, which he mistook for a deer. Of course the doctor settled.

The six days' deer season in Vermont closed to-day and reports are current that not less than 1,000 deer have been killed in that time. Commissioner Thomas' record is not yet at hand.

A sad shooting accident is reported from Essex Junction, it being the probably fatal wounding of Howard French, a lad of seventeen years, by the accidental discharge of a gun in the hands of his companion.

In the action brought against H. E. Popp, of Boston, for the killing of guide Daniel Durgin, reported from the Forks of the Kennebec, after a careful investigation Mr. Popp has been found blameless. The hunter was one of a party of three artists all in the employ of the Boston Globe. Mr. Popp was walking a short distance behind the guide carrying his rifle at the half-cock through a thick growth of underbrush, when a limb swept back with such force as to throw the trigger to full cock and cause the discharge of the rifle. Everything possible was done to save the life of the wounded man but without avail.

The receipts of game at Bangor have been running large through the week, more than equalling those of the corresponding period of last year, both of deer and moose.

Hunting conditions have been excellent and can only be improved by a fall of snow, which is pretty sure to come very soon.

A few Massachusetts hunters who have been successful are G. and W. Hubnell, F. W. Lane, R. R. Smith, T. H. Wheeler and A. J. Cummings, of Boston; E. Ward, Newton; L. B. Allen and J. B. Howard, Medford; Messrs. Colburn and Elliott, Andover; F. N. Downes and H. Lovering, Somerville, and G. M. Converse, of Cambridge.

Two active members of the State Association have had a wonderfully successful trip to New Brunswick, Messrs. George B. Clark, of Boston, and F. P. Royce, of Dedham. They went about forty miles back from Boisetown into the Dunganen district. Each of them secured a magnificent moose with over fifty inches spread of antlers. They found partridges galore, and report seeing not less than 125 moose. Mr. Clark says he feels much safer in the wilderness of New Brunswick than in that of Maine, and willingly paid the license fee of \$50. Many admirable trophies are to be seen in his office in the Tremont Building.

In a letter from your valued correspondent, Edward A. Samuels, he writes that moose are plentiful in Shelburne county, N. S. He was privileged to eat a portion of one killed by a friend a few days ago—the finest moose steak he ever ate.

Two other hunters in the woods from Monday to Friday returned with three. Another party, two brothers, got three good moose on a trip of a few days. He says it is a pity hunters are not restricted to a single moose in a season, which ought to be enough for anyone.

CENTRAL.

### Maine License and Sunday Shooting.

BOSTON, Mass., Oct. 27.—*Editor Forest and Stream:* In your most interesting journal I notice from time to time various criticisms as to the game laws of Maine, and while on the whole these laws seem to me right and desirable and I would gladly see in addition to them a universal gun tax as in Europe, which would have the tendency to stop the destructive shooting of everything that flies by foreigners—Italians and others—and by irresponsible boys, all of whom can in these days buy a fair gun for a few dollars, still there are some points in the situation in Maine which seem to be open to question.

One is that, unlike New Hampshire, Maine requires a license from all persons who are not actual residents of the State (i. e., who do not vote there I suppose it means), no matter how much property they may own in the State or how large taxes they pay there. Under this law a man with a house and surrounding property taxed for, say, \$25,000, which house is kept open the year round and is occupied by the owner perhaps half the year and off and on the rest, yet who votes in Massachusetts, is called upon for a license, even to shoot on his own property, while a man voting in Maine, paying no taxes at all perhaps, and passing the winter in Florida, for instance, is exempt.

What, in my mind, however, is more serious than this is the way the existing laws in some instances are not enforced. Notably the law prohibiting shooting on Sunday. A stream not ten miles from Augusta, which for the fifty years that I can remember such things, has given excellent duck shooting and where the wood duck have always bred, a place almost under the eyes of the game authorities at Augusta, is practically ruined for shooting, and this year for the first time not a woodduck could be found there. The Sunday shooting on it has always been openly carried on. One Sunday last year over thirty shots were counted from one standpoint, and the birds can get no rest and are abandoning the place. For at least four years the attention of the Game Commission has been called to this time and time again, and yet apparently not the slightest effort has been made by them to prevent it, although a stop could easily be put to it under the circumstances.

I think the question can be fairly put to the Maine Legislature whether it is fair to tax a man (perhaps a native of the State) for a license, no matter what amount

of taxes he pays in the State, and also whether it is fair to take his money and then not use reasonable efforts to enforce the laws that make such payment of any practical value to him.

B. VAUGHAN.

### Canine Crosses.

THE notes we have printed on this before make pertinent the following correspondence and comment in the London Field on some wild dogs found in Spain. A Malaga correspondent wrote:

"During the month of June last several predatory animals were found to be playing havoc on the mountain sides around Malaga, and opinions differed as to whether they were wolves, hybrids between wolf and dog, or descendants of domestic dogs that have run wild and bred for generations in a wild state. Numbers of kids, fowls and peacocks have been killed by these brutes, and at least one dog that I know of, a medium-sized watch dog, near my house. A Spanish farmer sat up one night with a gun and killed two of the animals, a full-grown bitch and her bitch puppy. The ears do not seem to me like those of a wolf, and I have seen many in North America and elsewhere. They are more like those of a fox. In color the animal is a yellowish gray with long gray hairs interspersed, and it is very long in the leg for its size, like all the Spanish foxes."

Mr. Abel Chapman, the author of "Wild Spain," commented on this:

"On looking at the photographs we were struck with the similarity of the animal to the *podenco*, a very common breed of dog in Spain, about half-way between a

SPANISH WILD DOG.

smooth Irish terrier and a greyhound. These dogs are commonly used in Spain for hunting both large and small game, and we have known instances of their running wild, as domestic cats often do. They are generally believed in Spain to have been originally crossed with a fox, the smaller breeds—that is, those called the *paterna* breed—the larger with the wolf, as in the Sierra Morena.

"It is a curious circumstance that in 1891, when we were after ibex in the hills between Malaya and Gibraltar there was some excitement about an irruption of 'wild dogs,' which were playing havoc with the flocks of sheep and goats. The local Spanish papers called them jackals. We did not see any ourselves, nor have I ever heard of them again until now. I should think those mentioned are *podencos* run wild, possibly having some fresh cross with the fox if they have been running wild for a few years. I do not know if there are any wolves in the Malaga hills or not."

### Vermont Blackcock and Deer.

SHELDON, Vt., Oct. 27.—*Editor Forest and Stream:* Mr. Harry Noyes, of Hyde Park, Vt., shot this season a pair of birds that I think were without a doubt hybrids, a cross between ruffed grouse and blackcock. These birds were found in Cambridge, this State, not far from Middlebury, where the writer had some years ago a few pair of blackcock released. These hybrids were fully one-half larger than a large ruffed grouse, and the dark bands were a light chestnut color. As the men were short of meat in camp the birds went into the pot instead of being sent to a taxidermist.

For several years after blackcock were released we had favorable reports of their breeding, and have no doubt that they have by this time spread over a considerable extent of territory, and if they are crossing with our native grouse it will please the majority of our sportsmen, as they will make a larger mark to shoot at, and also give a little more meat in the pot.

So far there have been about twenty large buck deer shot in this section of the State, and in some cases the scenes here are much like those in Long Island on the opening day—intense excitement and abundant profanity and shooting [cuss] Bang! bang! bang! In one instance a party were heard shouting, "Shoot that doe; she'd no business to be without horns. Give it to her." When we consider that these animals are semi-domesticated and have been running among our cattle unmolested during the greater part of the season, it seems little short of murder to give them the kind of treatment that they now are receiving. There is a strong feeling expressed here among the farmers to have a close season for at least five years on deer. Then post their farms and keep the factory and village rabble off their property. Now nearly every boy that we meet has a high power rifle, and is out to kill something, and we expect that investigation will show that there has been a general massacre of both does and fawns. As there is generally sooner or later a "falling out among thieves," we may expect to at some future date receive information that will be used to make some of these fellows contribute \$100 to the game protection fund.

Woodcock shooting has been fair since the migratory birds have arrived; ruffed grouse are scarce; our open

season on these birds (grouse) should be shortened to Oct. 1, and close Dec. 1. Foxes and mice are numerous. Gray squirrels also scarce.

STANSTEAD.

### Venison in Season.

NOW THAT many populous sections of the country, especially in New England, are likely soon to be overrun with deer (which are even now depredating on the farmers) and venison is to become a frequent, if not a staple, article of diet, the suggestion may be opportune, in view of the near convencing of the legislatures, that measures be taken to make these viands as palatable and wholesome as possible so that the appetite may not sour on it. As the season stands at present, under the laws, whatever deer meat is sold in the markets or even distributed by amateur hunters who are out for pastime is hardly fit to eat. Why? Because it is allowed to be hunted and killed *only when it is strong*, and permeated with animal odors, caused by inordinate sensual excitement and stimulation of the functional glands during the season of rutting—that is, during October and November. It is indeed a remarkable fact that no State law extant permits venison to be eaten when it is healthiest and of choicest flavor, so that it may be impressed upon all that none of us taste it at its best except we eat it clandestinely.

This is certainly a grating reflection upon the astute law-makers who devise and designate the close season. It shows that the laws have not been enacted advisedly, or with regard to the natural laws which govern animal habits and pathology. They have not been wisely drawn, either in the interest of the creatures which they ostensibly are framed to protect, nor in the interest of the people who are supposed to be wards of State paternalism.

In Great Britain buck and stag venison; that is, fallow and red deer meat, is in season in August and September, and so it ought to be in this country. Some stags are shot in early October, but that date is rather late, even for Scotland, for the stags are "roaring" then, and beginning to be out of condition, while in English parks October is too late altogether. On the other hand, hind venison and doe venison are in season at Christmas and in January, as by a curious provision of nature, although the pairing season is early in autumn, the hinds and does continue to lay on fat and improve when the stags are really worthless.

No one would enjoy to eat the flesh of a billy goat whose presence to windward was detected by a whiff of rank body odor, nor even that of a sheep or cow. Even the milk of cows is often tainted by the undue secretions of the glands by hasty driving from pasture, so that it is hardly fit to use, and meat of cattle killed at the abattoirs is affected by undue excitement or over-exertion.

Obviously our laws on big game ought to be amended.

CHARLES HALLOCK.

### A Special's Experience with Italians.

SCHENECTADY, N. Y., Oct. 26.—*Editor Forest and Stream:* I have been reading with interest your articles on bird protection and thought perhaps you would like to hear of some of the experiences I have been through in that line myself. I have been a special State protector for three years or more and have done quite a little to help the good work along, having convicted a large number of violators of the game laws in that time. The death of Protector Bradley some time ago reminds me of a rather narrow escape from death I had about three months ago. I arrested two Italians at a place about two miles from the city for shooting robins. They had sixteen robins and other birds in their possession. One of the Italians broke away and ran. I took after him; and after a chase of about two miles was overhauling him rapidly when, without a minute's warning, he whirled and fired at me at about 60 feet range. The shot were No. 5, and about fourteen of them lodged in my head and breast. I got on my feet as soon as I could and fired at him. The blood was running down my face and I could not see very well; but think I hit him once, as he fell but regained his feet and jumped in front of a freight train, which was passing at the time, and by the time the train passed he had disappeared. We hunted for him four days, but could not find any trace of him. The other day one of his friends received a letter from him stating he had fled back to Italy. I was laid up for about two weeks, but have got all right again.

I arrested two of them last Sunday. They had eight robins and three song sparrows in their possession. One paid a fine of \$50, the other is spending fifty days in the county jail. This class of people have slaughtered song birds for a long time until we got after them pretty strong, and now we have got the practice pretty well broken up, although every once in a while one will take a chance at it. I arrested two last month for killing song birds; and one of them I had stopped about two hours before and warned him and gave him a sign printed in Italian warning them about the shooting of song birds and telling them the penalty for so doing.

F. P. VIELE, Special State Warden.

### Massachusetts Deer.

THE Hampshire Gazette, published in Northampton, Mass., of Oct. 24 says that deer are increasing in alarmingly large numbers in Hampshire county, and it uses the word alarmingly advisedly. There is trouble ahead for farmers and fruit growers, and they know it. C. H.

### MY SIXTY YEARS ON THE PLAINS

THE volume of old-time prairie life by William T. Hamilton, reviewed last week in the FOREST AND STREAM, and advertised this week on another page, is meeting an extremely cordial reception everywhere. Out in Montana, where Mr. Hamilton still resides, and where so many of his stirring adventures took place, the book has made a real furore, and a thousand copies were sold in advance of publication. This is not strange, since the book is a Montana product, and one of which residents of Montana may be justly proud. Its author is perhaps the oldest resident of the State, while Mr. Chas. M. Russell, its illustrator, is an artist in whom the State feels a personal interest and a natural pride.

The great charm of this volume is its simplicity, its directness and its modesty. Among all the exciting and daring adventures with which the volume abounds, the author never speaks of himself as having performed any special deed of skill or bravery, but he is lavish in his praises of the courage and dexterity of his fellow trappers. The volume is one which every outdoor man, and especially every Western man, should read.

# SEA AND RIVER FISHING

## In Defense of the Carp.

Editor Forest and Stream:

I have read with much interest your editorial on the "Curse of the Carp," and the paper by Mr. Starbuck, which gave you your text. Neither the editorial strictures nor Mr. Starbuck's alarmist cry has persuaded me that the carp is anything to be worried about. On the other hand, it is a valuable addition to our food supply, and I am sending you an argument to this effect contained in the last report of the Fish and Game Commission of Illinois. As we all know, President S. H. Cohen, of the Commission, always has been a defender of the fish, and presumably this present exposition is from his pen:

As in former seasons, we find the carp well to the front, as an article of food and money producer, and we see no reason to find any fault with them from any standpoint.

We have given the subject serious and close attention because of the great amount of unfavorable criticism it has received all over the country, but with our knowledge of the real situation in regard to them we feel that their introduction has been of real benefit to a large majority of the public. Illinois, as has been frequently stated, is a large State, nearly 400 miles in extent from north to south. It is intersected in every direction by streams, adjacent to which are wide, rich bottoms filled with lakes, shallow for the most part, and filled only by the overflows of the rivers. With thousands of acres of such water specially adapted to the rapid growth of the carp, and used but little by the game fishes, why should it not be utilized in producing good, cheap food for the people? It cannot be done to advantage with other fishes, so that nothing is sacrificed to the carp. The Illinois River, 250 miles long, as a navigable stream, is for the greater part of it an ideal stream for such fishes. The spring lakes, adjacent, and of which there are thousands, afford ample breeding places for the bass and other gamier varieties. Fox Lake, which is a part of the head of the river, has been and always will be one of the greatest breeding grounds in the country for game fishes, which find their way into the Illinois River, and there they find plenty of food to their taste in the carp and its product of spawn and fry.

That the commercial side of the industry is a large one can be easily verified by consulting the reports from the various cities along this river. Take from the towns of the Illinois River the fishing industry and it would practically put most of them out of business, and a personal investigation of the conditions existing there will demonstrate the correctness of this assertion. We clip the following from the Bloomington Pantagraph of Sept. 11, 1904. It is a clear statement of facts, evidently taken by the writer from personal investigation:

"The Illinois River, it is claimed, furnishes more fish than any other in the United States, with the single exception of the Columbia in Oregon. The product of the latter river is largely salmon, while the Illinois furnishes in greater or less abundance fully eighty kinds. Havana, in Mason county, is the largest market for fish there is on the Illinois, and more is shipped from that town, it is claimed, than from any other place along the river.

"Up to Nov. 1 there had been shipped from Havana by freight 1,300,000 pounds of fish, while fully one-third as many more had been shipped by express and sold at home to peddlers. The peddlers' trade is very large, as scores of towns depend for their supply on local people, who ship in fish from Havana and retail them from house to house. The finer grades, too, are usually sent by express to the eastern cities, so that it will be quite within the truth to say that fully 2,000,000 pounds of fish will be shipped from Havana during the year of 1904.

"Nearly or quite half of the fish shipments consist of German carp. Next comes buffalo, then bull pouts, then dogfish, then white perch, then sunfish, then black bass, then catfish, then crappies, then striped bass, then turtles. These are the principal varieties that are shipped, but there are some eighty sorts caught in this river.

"A good many varieties of fish never attain an adult length of more than five inches. These are commonly taken for the young of other fishes, and are referred to indiscriminately as 'minnows' by the uninformed.

"Another important factor is that at least sixty fishes of the rivers of Illinois have no common names, and that such names as bass, perch, stoneroller, hornyhead, grindle, stickleback, etc., all have more than one application, the same name being applied not infrequently to very different fishes.

Up to Nov. 1 there have been shipped from Havana fifty-five carloads of fresh fish. Each car contains 26,000 pounds on an average, the carloads ranging from 20,000 to 32,000 pounds each. Fish are always packed in boxes holding just 150 pounds. From 150 to 200 of these boxes constitute a carload. These boxes are three feet and six inches long by eighteen inches wide, all being new. There is a factory at Havana where these fish boxes are made, which gives employment to some fifteen men constantly. The wholesale price of these boxes is 43 cents apiece and 25,000 are annually made. The cities of Pekin and Bath both get their supply there as well as Havana.

"Without ice there could be no shipping of fish during the greater portion of the year. Ice is a very important factor and immense quantities are used during the spring, summer and fall months. Ice is put up at Havana from nearby ponds and from Spoon River. Ice from the Illinois River is not made use of. All fish are packed in layers of broken ice, it requiring four tons just for the boxes in one car. In addition to this amount seven tons are used in each car containing fresh fish, making a total of eleven tons for every car. During the year some 100 cars are sent from Havana, so it can easily be seen that the ice trade there is a big thing. About a third as much

more is used for packing the fish that go by express, and that are taken away by peddlers.

"All coarser sorts of fish are sent by freight in carload lots, while the choicer kinds are shipped by express in much smaller packages. New York city furnishes the greatest market for German carp. This fish seems to be a favorite article of diet for the poorer Jews of many Eastern cities, and large quantities are sent to Boston, Baltimore, Philadelphia as well as to Chicago, St. Louis and Southern cities.

"In every Northern city carp can be found on the menus of many restaurants and good hotels. At the Waldorf-Astoria cafe carp with Rhine wine sauce is quoted at sixty-five cents per portion, just the same as fresh mackerel. Kansas City and Memphis are also large users of carp from Havana.

"Carp were introduced into the Illinois River some fifteen years ago, but are already largely in the majority and may soon claim sole occupancy of that water. They were planted by the United States Fish Commission, but have increased in numbers so rapidly as to threaten the life tenures of all other fishes there.

"Carp do not eat other fish as a rule, as is commonly supposed, but they are enormously prolific, are voracious eaters and grow very rapidly. Like the English snarrow they monopolize the territory and the other fish are starved out. They eat moss, as do other fish, but being pugnacious they keep the other fish from the feeding grounds. They also dig deeply into the mud stirring up the water and making it so muddy and thick that other varieties of fish which require clear water die off quickly.

"Carp grow twice as fast as do other fish. At eighteen months they will frequently weigh 3 pounds if they have plenty to eat.

"Buffalo are a higher-priced fish than carp, the latter retailing in the large cities as low as five cents a pound. Buffalo are a favorite fish in the South, and large quantities are sent from Havana to Memphis, St. Louis, Lexington, Atlanta and Vicksburg. Crappies, sunfish and catfish come next in point of demand.

"There are four wholesale dealers at Havana. These men own tugboats and lease extensive fishing grounds, one man, Capt. John A. Schulte, himself owning 3,000 acres and leasing as many more. Mr. Schulte has been in the business there for thirty-two years, and is reckoned to be worth fully \$100,000. Each of these wholesale dealers own a large market boat, which is stationed at the foot of Main street, and here their fishermen come daily with tugboats of fish, freshly caught.

"At these market boats the fish are packed in boxes, 150 pounds of fish and 100 pounds of ice being placed in each box. Catfish are always skinned. Other fish, when shipped east or north, are sent away whole, but for the western and southern trade they are always dressed, that is, they have their heads taken off and their intestines removed. This is one of the peculiarities of the trade. The freight on a carload of fish from Havana to New York averages \$235 per load.

"Dealers own many boats and employ many fishermen. Quarter boats; that is, quarters for provisions and cooking, are sent out to the grounds, which are not always in the Illinois River, some excellent grounds being located in adjacent lakes and creeks. These men are paid good wages and like the life. As in other occupations, some save money and others are always in debt, it depending on the man. It is claimed, though, that when a man once becomes a regular fisherman he seldom goes into any other occupation. There are also private fishermen who dispose of their catches to the dealers, but the latter are not numerous.

"Fish are caught in seines and set-nets, never by hook and line, except by amateurs. The State guard the fish rigidly, and inspectors watch every catch to see that all fish are of the proper length and size, others being returned unharmed to the water. No seines at all can be used during the spawning season, which is from April 15 to June 1.

"The fish heads and intestines are used for fertilizers for garden patches and as food for fowls, being much in demand. Seines are from 800 to 1,500 yards long, and eight men are required to make a haul. Usually 5,000 pounds of fish is an average haul. These seines are thrown out from boats, and are drawn in to shore by hand. Seines are from 12 to 24 feet deep, although like seines are deeper than those used in the river. Seines cost from \$500 to \$750 apiece, and are made largely in Chicago, although some are manufactured in Joliet and St. Louis. Set-nets are made at home, and sell for about \$7 each. Capt. Schulte has 300 nets and four seines. All seines and nets are tarred twice a year in order to preserve them. Over 250 barrels of tar are used each year for this purpose at Havana, it being shipped from Jacksonville, where it is produced by the gas company. Two hundred men are employed the year round in fishing within ten miles of Havana."

At the meetings of the American Fisheries Society, at whose annual meeting all matters of interest relating to the propagation and protection of fishes are taken up and discussed, the carp question seems to come up regularly as a question for discussion. When it is considered that for years none but adverse reports on the carp had been entertained by the members of this society and all kinds of crimes had been attributed to this fish, it is pleasant to observe what a radical change has taken place in public sentiment in regard to its merits. The Pennsylvania Fish Commission has secured legislation making it a misdemeanor to plant carp, and one of the members in discussing the carp, said: "I am stating the cold, hard fact, when I say that the Legislature of Pennsylvania has practically declared it an outlaw by prohibiting the planting of it any longer in our waters." On the other hand, a mem-

ber from Michigan said: "I think the carp was sent here as a blessing to the poor. The carp is here to stay, and all the barrels of money we can open will not destroy them. I like them and am going to keep on eating them." Mr. Titcomb, of the U. S. Fish Commission, said:

"I did not intend to say anything on this carp question. It has been threshed over at every meeting, and still it comes up. I was only going to say that it seems to resolve itself into a sectional question; it is a sectional issue. For instance, with our present knowledge of the carp, we would not ship them to the waters of Maine, or the waters of Pennsylvania, but there are a great many States in the Union where the carp to-day is a very valuable food fish, and where the people enjoy it on the table; there are places even where they enjoy it as a game fish to catch with hook and line. The United States Bureau of Fisheries continues to receive applications for carp, which, owing to this feeling in certain sections of the country and among the influential classes of sportsmen, perhaps, are not distributed any longer; the people who have asked for them then refuse to take any other fish in many instances, and are often quite indignant because they cannot have the carp. Some of them persist until they find out where they can secure the carp and take them to their own private ponds. But all through the West there are waters that can be made very useful by the introduction of the carp, and which otherwise are practically unproductive. I think I have told this story once before the society, but I will tell it again. When I was president of a fish and game association, all of the members sportsmen, some of them commissioners from the New England States, others commissioners of fisheries from Canada, 224 in number, we sat down to a table on one occasion and ate carp under the name of baked red snapper. Most of them knew they were not eating baked red snapper; some of the old lake fishermen told me they thought they were eating whitefish; another one said pike-perch; all declared them delicious. 'As you know, a rose would smell as sweet by any other name.'"

It is true carp are vegetable feeders, and in small, clear lakes are destructive to vegetation, and for such places or for small rivers may be, in some sense, objectionable; but the question with us is and has been, Are not the benefits derived greater than the damages? In the natural adjustment of the fishes of our waters the percentage of coarse fishes to the game varieties is largely in excess, but from various causes this balance has been largely decreased, and to replace this deficit is undoubtedly the proper work of the Commission, and the carp has been the means by which we have done it.

For many years the buffalo fish was the principal coarse fish of our markets, and the most common one produced by Illinois waters. The time was when every blade of grass in the overflows from the river was covered with their spawn, and the fish themselves were seen in these shallow waters in thousands during the spawning or "rolling" season. Then the people took them in thousands and with almost every device available, and they were shipped to markets mostly outside of the State, on commission, and as a rule, only a small proportion were realized on, the rest, owing to glutted markets, were thrown away, an immense quantity of good food being thus lost to the people of the State. This practice continued for years, until the waters of the State were nearly depleted of this variety of fish, and even after protective laws, preventing such wholesale destruction, were obtained, the increase was so slow that the output showed but little gain. This loss to the market was made good by the introduction of the carp, which grows and increases rapidly, hardy, tenacious of life, and defying unfavorable seasons, it has retored to the waters the natural balance of the proportions of coarse fish to fine, so rigidly held as a prime necessity to successful fishculture by the scientific fishculturists. Now we have them in large quantities. They are good food, good producers. They have some faults, but more good qualities, and as a money producer they are unequalled by any or all of the other fishes of the Illinois inland water. If we, as Commissioners, are to deal with sentiment only and consider it our duty to propagate and protect only such fishes as are of interest to the anglers, eliminating the question of food supply from our work, then perhaps the carp is a "mistake," but if the law creating a fish commission was made with a view to the interests of the people as a whole, and the duty of that commission was to endeavor to make the waters of the State produce their full share of food for the people, then one of the wisest moves of the U. S. Fish Commission was in introducing the carp, which is here to stay, and this fact will ultimately be appreciated by the whole people.

Now, we do not wish to be understood as in any way antagonistic to the angler element, or as dealing with their sport as a matter of sentiment only. We believe in the protection of the game fishes and in their development, but as one cannot well change nature's laws, and in the waters of Illinois it is impossible to raise game fishes exclusively or in such numbers as to make them sufficient for the necessary supply for food, why is it not economy to encourage the coarse fish, which, while producing good food and plenty of it, will fill the waters to the limit of their capacity?

With us carp are not spawn eaters, but do destroy vegetation, and, as stated, are detrimental to clear lakes and rivers; but they get into them, and we are doing the best we can to relieve the situation in that respect, as will appear by another section of this report. Immense catches of carp are reported for the season of 1904, all along the Illinois River. Bass are more plentiful than ever. This seems to speak for itself as to results.

## Fish and Fishing.

## A Letter and a Reply.

A CORRESPONDENT who has been reading "The Ouananiche and its Canadian Environment," and who has lately had his first experience of ouananiche fishing, at Grand Lake Stream, Maine, writes me a long letter in anticipation of a trip to the Lake St. John country next year, and appends such a string of pointed questions, covering almost every phase of the sport, that it has occurred to me that the replies which he solicits may interest many other anglers. I therefore propose to answer him through the medium of FOREST AND STREAM, and as I am unaware whether or not he is a subscriber, I shall refer him to this column for the information of which he is in search.

First of all, let me quote what my questioner says of his experience at Grand Lake Stream, and elsewhere. He writes: "My two weeks this past season in Maine was my first introduction to the ouananiche. I enjoyed them immensely. They are magnificent fighters. As such, I place them a little ahead of the small-mouthed black bass and far ahead of the square-tail trout. I think I should rank them a trifle ahead of grise, weight for weight, though I am not able to judge well from my limited experience, as my largest ouananiche weighed only 2 pounds 5 ounces, while I have never caught a grise under 2 pounds 12 ounces. I was a little disappointed in the average size of the fish I caught at Grand Lake Stream—I pound 7 ounces. I found them all that could be desired as fighters, however, especially in quick water and with a 4-ounce rod. My guide was inclined to look rather disparagingly on this rod as somewhat of a toy, but I netted sixty fish out of a possible seventy-four, which he allowed to be very fair for a novice. Candidly, I would rather have landed 50 per cent. with that 4-ounce rod than ninety-five with an 8-ounce rod, which I let the guide take several times and which he greatly admired. With the heavier rod I had a quadruple multiplying reel, but with my lighter rod a simple little single-action Leonard fly reel. In the heavier waters that you describe and with larger fish, no doubt I would have to haul in my horns somewhat, and resort to a little heavier tackle, but I confess to enough conceit to long for a chance to try a 5-ounce rod and double multiplier on the ouananiche of Lake St. John. I have hanging over my library mantel shelf a 22-pound salmon caught in the Grand Codroy in Newfoundland two years ago with an 8-ounce rod, after a fight of over two hours, and I suppose too much contemplation of that beauty has made me vain and left me just the sort of pride that those ouananiche of your north rivers are just waiting to take a fall out of."

I know enough of the pleasure of killing a salmon upon a trout rod, to fully appreciate the delightful memories retained by my correspondent of his interesting struggle with the Codroy fish, which was quite a large one for that river, even though some have been taken out of it still larger. There are, of course, a hundred and one accidents, any one of which might have occurred to prevent him killing the fish, but conditions being favorable, and barring accidents, there is no reason at all why an angler of such experience and skill should not succeed in killing a number of Lake St. John ouananiche upon a 5-ounce rod. I have been lucky enough to kill several upon a tool weighing but 3½ ounces, and on one occasion successfully landed with it a fine double, weighing respectively 3½ and 2½ pounds. I had a good guide with me at the time—John Morel—so often referred to by Dr. Henry Van Dyke in his books—and as I was fishing from a canoe, Johnny landed me on an island in the Discharge, in order to facilitate the successful netting of the fish.

The following quotation from his letter shows what my correspondent wants to know about the fishing at Lake St. John, and there are doubtless many more readers of FOREST AND STREAM in the same boat with him:

"I hope that I shall not be imposing upon the masonry of anglers, if I ask you to give me some information and advice. In the first place, I shall probably not be able to spare more than two weeks for the trip, and I should prefer to make it toward the close of the season rather than in the early part.

"Secondly, I have in view one and only one fish for this trip, the Ouananiche (and spelled with a capital), and one and only one method of taking him—with a fly.

Thirdly, I would like very much to take my wife. She has never had an outing of that kind in the woods, but is exceedingly fond of nature and the country. She would be able to stand a fair chance of roughing it, I am sure.

"Now, sir, the proposition is before you. Can you suggest a particular spot, where I could probably have fair sport and my wife could enjoy an experience in the north woods, not too 'strenuous' for a woman? And let me post you as to the particular definition of 'fair sport' in this case. It would be an average of from four to six fish per day of an average weight of two pounds, with a good chance in ten days' fishing of a 4-pounder, and a possibility of even a 5-pound fish. Perhaps I am asking too much in my definition, but let me add, that I am too good a sportsman to 'kick,' however small the returns, and I have also had enough experience to appreciate how much the most sage advice is dependent on conditions of weather and water and season for the fulfillment of the expectations it leads to. The fisherman and his flies are also, of course, most important factors, and the selection of flies is another point upon which I should crave your advice. As to the fisherman, I am far more enthusiastic than skillful, though fortune helps out my deficiencies.

"In your book, if I remember correctly, you mentioned two places in particular as being good fishing spots for the last week of August and first of September.

These places were the Fifth Falls of the Mistassini and the pool below the Falls of the Metabetchouan, about five miles up that river. I remember specially a reference to a marvelous catch made at the latter place by Dr. Van Dyke in the first week of September

"I should add that I would prefer a place, if the choice were open, where I would hook fewer fish but of a larger size. I think you mentioned the Metabetchouan pool as containing fish of a larger relative average at the end of the season; fish on their way up to spawn. And here I have another question to ask: Do you consider that the fish about Sept. 1 are inferior in fighting qualities (more particularly the females carrying spawn) to those caught in the early fly-fishing of June?"

There is no reason in the world that I know of why my correspondent should not be able to gratify every desire expressed in his letter, except in the matter of fishing in the ouananiche pools of the Metabetchouan River. These pools are the favorite spawning beds of the ouananiche, and while it is always quite easy for anybody who may drop a fly over them in the latter part of the season to kill many and big fish there, there is certainly not the sport in the killing that there is in the early fishing in the month of June. Any angler who has killed brook trout full of spawn in the last few weeks of the season will quite understand the force of this reply to my friend's last question. The Metabetchouan is therefore now closed to anglers, so far as ouananiche are concerned, and its pools carefully preserved as a nursery for the spawning fish. Here, too, are sometimes taken the parent fish for the supply of spawn for the Roberval hatchery.

It is quite a pleasure to give advice concerning places and seasons for fishing to an angler who so fully appreciates, as my correspondent does, the difficulties surrounding such a case, and the many underlying conditions to success.

In the first place, let him by all means take his wife to Lake St. John. There are few trips in that country which cannot be taken by a woman who is prepared to camp out under canvas, while at the Grand Discharge nearly everybody sleeps at night at the Island House. As a rule, the fishing at the Discharge cannot be depended upon late in the season, because of the danger of low water there, such as we had in September last.

Because of the great difference in the level of the water at different seasons it is not quite easy to say, a year in advance, what might be the best fishing ground to try, nor is there any necessity to fully decide that point before reaching Lake St. John, where guides and others are always familiar with existing conditions. I usually endeavor, too, in this column to keep the readers of FOREST AND STREAM posted as to the condition of water, movements of fish, etc., in these northern waters. As a general thing, I would say that good fishing is to be had about the end of August or beginning of September at either Lac a Jim or Lac Tschotagama, each of which is only a few days' trip from Roberval. One of these lakes is reached by the Ashuamouchouan River, the return being by the Mistassini, while the other is reached by the Peribonca. Both of them are described fully in the book to which my correspondent refers, but which, unfortunately, is now out of print. In either of these localities the average of the take suggested by him has often been surpassed, as well as the weight mentioned in the letter from which I have quoted. Earlier in the season, when the fish afford the strongest fight, I prefer the struggle in the more active waters of the Grand Discharge.

The choice of flies is another point upon which I am asked for advice. This, too, will depend largely upon the choice of time and place, but as a general rule, I have found a good selection of small salmon flies, Jock Sects, Silver Doctors, etc., together with brown hackles, professors, grizzly kings, General Hookers and B. A. Scotts to contain all the killing patterns necessary for a successful campaign against the ouananiche.

E. T. D. CHAMBERS.

## Frog Fishing.

IN my youthful days, an indulgent father furnished me with an old-fashioned rifle, made at Harrodsburg, Kentucky, for the purpose of slaughtering wild turkeys and squirrels, and when I made further use of it—for killing bullfrogs—he taught me how to secure my game without going to the expense of purchasing ammunition. Taking an old fishing line, he fastened a large hook to one end, and some ten or twelve inches above attached a single buckshot. The line was knotted to the end of a small pine pole, some twelve feet in length, which completed the entire apparatus. I was then taken to the head of a mill pond, some half or three-quarters of a mile away, and quietly passing along its margin, soon spied a number of frogs, squatted on the lily pads, which covered a large portion of the water. Selecting what seemed to be the mammoth of the throng, he gently lowered the hook alongside his body, just aft of the foreleg, and a sudden twitch to the left given, which caused the hook to fasten just underneath the breast, and the game was switched on shore in a twinkling. After capturing several others, I was permitted to take the rod and endeavor to whip up the game. My eagerness and excitement were so intense, that I was completely oblivious to the direction of my parent; consequently made a miserable failure in my first attempt. On my second, heeding his constant warnings, delivered in a low tone, I managed to firmly hook and land a fine fellow, which was followed by several other captures to my intense delight and gratification, and from that date forward I supplied our family table with dishes of bullfrogs whenever desired.

Years afterward, when I reached maturity, I experienced several extraordinary encounters with this batrachian, some of which I will endeavor to describe. I once happened to spend Sunday at a small station on the Rome and Watertown Railroad, and while lazily enjoying a cigar on the front of the hotel, my attention was attracted by the bellowing of the bullfrogs in a mill pond in the immediate vicinity. Hastening into my room, I picked up my fishing rod, which, with the frog-catching line, was always my companion in my wanderings; and while passing out of the door, in the direction from which the sounds emanated, I was stopped and questioned by the clerk as to the cause of my hasty movements. On receiving my answer to his inquiry, he requested the privilege of accompanying me, which was cheerfully given, and we started

post-haste down toward the margin of a mill pond which lay but a short distance in rear of the hostelry. On arriving at the water's edge, I found it tenanted by a host of bullfrogs, and immediately rigging my rod, I soon had one dangling in mid-air; whereupon my companion burst into a roar of laughter, which was quickly silenced by my irritable gestures. On hooking a second prize, he stuffed his handkerchief into his jaws, fell upon the grass, rolled and kicked, until he was completely exhausted. By this time I had secured quite an accumulation of booty, when he regained his feet and proffered to seek help, in order to transfer my game to the hotel. On my acceptance of his kind offer, he immediately started for the hotel, while I redoubled my efforts. On his return, in company with a waiter and hostler, they were staggered by the pile of frogs which met their view. The difficulty was how to transfer the catch to the hotel, as they had come totally unprepared for any such difficulty. Suddenly the clerk darted off, after requesting us to exercise a little patience until his return. While he was absent, I added a good many others to the huge heap, much to the surprise of his companions, and was still busily engaged in enlarging the mass, when he put in an appearance, dangling a bunch of strings and carrying a fence rail on his shoulder. Thereupon there was a cessation of angling, and we turned our attention to stringing and binding the game to the fence rail. When this was finished, it required all the strength of the waiter and hostler to stagger along with the load, after the clerk and myself had assisted in placing it on their shoulders. On our arrival at the hotel I selected six dozen, to be shipped to a friend in New York, while the residue was turned over to the cook, for the delectation of the guests of the hotel.

Some years subsequent to the above, business called me to Machias, Maine, in order to deliver some pythons to the proprietors of a traveling show. Ellsworth was as far as I could travel by rail, and from thence I proceeded by an open spring wagon, hired for the purpose. I arrived at my destination on Saturday afternoon, and after delivering the reptiles, concluded to make an early start the next morning on my return. While conversing with my landlord, I learned that a short time previous, a young Canadian lynx had been captured by a party near Calais, who was anxious to part with it. As Calais was to be the next stand of the show, it was necessary for them to make a Sunday drive, in order to reach there in time for Monday's performance. So I concluded to accompany them, and endeavor to secure the lynx. The next morning the show folks made an early start for their long drive, while I waited for the regular breakfast hour before moving, and jogged along quite comfortably, until arriving at a place where the road crossed a stream by using the dam of a sawmill in lieu of the bridge. The surface of the pond was a mass of lily pads, nearly every one of which was occupied by a bullfrog. Of course I couldn't resist the temptation, consequently rigged my rod for frog fishing, and in making a circuit of the pond, filled the wagon about one-third full of game. How to get at those on the pads further out in the pond than I could reach with my rod bothered me, until I determined to rip up the floor of the short bridge, used for crossing the forebay, and construct a rough raft of it. With the assistance of my driver, we soon fabricated an affair which served our purpose. The driver acted as poleman, while I hauled in game enough in a very short time to nearly submerge us. My poleman carefully pushed the affair ashore, where it was unloaded, and we again made for the center of the pond, where it soon again freighted and returned to the shore. Some three or four trips gave us a sufficiency of booty to fill the wagon, when the bridge timbers were replaced and we resumed our journey at an abated pace, in consequence of the ponderous load. On our arrival at Calais, we were received by the slow folks with expressions of joy, and looks of surprise by the townsfolk. In unloading our wagon, I noticed that the frogs were larger than any that I had ever captured, which surprised me, as I very naturally supposed that they would be smaller than those which I had frequently caught further south. The next morning every showman had his fill of frog meat for breakfast, and by noon I had succeeded in purchasing the young lynx. This was about my last experience in big catches in the frog line, and I am sorry to say that the general introduction of steam has nearly ousted the old-fashioned mill ponds out of existence, consequently the frogs lack one of the great essentials for their assemblage in huge numbers in comparatively small spaces. FRANK J. THOMPSON.

## Black Bass in the Delaware.

PHILADELPHIA, Pa., Oct. 25.—*Editor Forest and Stream:* A singular fishing condition existed in the Delaware River during the last week or ten days of September, and extending for a like period into October. The river all at once seemed to become alive with bass, and everybody, from the farmer boy with his "pole" and red worm bait, to the city angler with his \$50 outfit and minnow bait seemed to get all they wanted. It was no trick for two men in a boat to take twenty to twenty-five bass weighing 50 to 60 pounds in a few hours, and the fellow who could not get a boat cast from shore with about equal success. Any kind of bait seemed to be good enough, and the fish taken were not small ones, either, very few running below a pound, and from that to 4 pounds and over. The river men say they have never known any such fishing since the bass were introduced in the river, and they are unable to explain it, though some of your scientific correspondents may be able to give an explanation.

The fishing stopped as suddenly as it began, almost between two suns, and thereafter no delicacy was tempting enough to induce a strike. The writer has frequently gone more than a thousand miles in search of bass, and never had half the success that he met with here while it lasted.

## A Big Halibut.

It was late of a July morning when we left the wharf in the little punt, but the lateness of the hour was not due to laziness, but was because there had not been a breath of wind since sunrise. My companion had been out early to his net, which lay out at mooring near the Duck Rocks, and had taken from it a bucket of squid and some hiacks, so when the breeze finally came about 8 o'clock, we were ready and quickly slipped our mooring and sailed out through the Gut, past Smutty Nose, and around the point of Manana, choosing the inner fishing grounds, as the wind served.

Our boat was an old-time sloop, 20 feet long, battered by many hard winters in the lobster business, but still staunch and able, and looking almost respectable with a new coat of paint. Having passed into the hands of a summer resident, she was familiarly known as the "rusticators'" boat, for by that name went all those who were not natives.

As we left Manana, the fog, which up to then had hung heavy upon the water, began to "burn" under the hot sun, and slowly filtered away. But with the fog went the wind, and only by resort to an "ash oar breeze" were we able to reach the grounds—a twenty-fathom ledge, easily found by getting the point of Manana in range with the Eastern Duck Rock, and the light showing out by.

Having rounded, and finding the depth right, let our killick go, made all snug, cut the squid up on the bait board, and put our lines overboard.

In one day the preceding year two of us had caught eleven hundred pounds of fish on these same grounds, so the prospect was fair for a good day's sport. But our hopes soon vanished, an hour's fishing yielded but a few small cod. Quite discouraged, we were lolling over the wash board, idly holding our lines, when suddenly and without warning a terrific yank nearly pulled the line from my hands. I tried to pull in—no easy task—but with some difficulty about three fathoms of line was hauled aboard, when zip, out it flew, till the halibut had reached bottom. This process was repeated perhaps a dozen times, each trial bringing the fish nearer the surface. The rig—a six-pound cod line—was new luckily, and stood the strain. One hauled, carefully keeping the line clear of the gunwale, while the other coiled the line so that it would run out smoothly when the fish dove. At last we got him to the surface, just for a second; but this was time to slip the gaff in his mouth and jerk it under the hard, bony substance which formed the upper lip. Thus, pulling and hauling, we dragged him over the gunwale and in to the bottom of the boat, where he lay slapping his great tail upon the flooring, making a noise like a small battery.

A breeze having come up, we sailed in and weighed our fish before an admiring audience, the scales tipping to 150 pounds—a rather good fish.

G. P. PUTNAM.

## Are Fishes Deaf?

READERS of Brehm's "Tierleben" (Animal Life) will recall a statement to the effect that the carp inhabiting a pond in a certain continental town are accustomed to come up to the landing steps at the sound of a bell to be fed. And from this and other circumstances it has been commonly held, at least up to the middle of last century, that fishes possess the sense of hearing. In the year of 1851 were discovered, however, the so-called organs of Corti in the internal ear of mammals, which there is good reason to believe alone receive and transmit to the brain the vibrations giving rise to the sense of hearing. Now these organs of Corti, together with the bony "labyrinth" of the internal ear in which they are contained, are absent in fishes alone among the whole group of vertebrates; and it accordingly seems highly probable that these creatures lack the power of hearing, more especially since there seems reason to believe that the aforesaid organs of Corti are absent in such few members of other classes of vertebrates as are deaf. If this be so, it follows, of course, that the so-called otoliths (the familiar solid white bones in the head of a cod, for instance) in the ears of fishes have nothing to do with the sound of hearing.

The whole question has recently been discussed in an exceedingly interesting manner by Professor O. Körner, director of the ear hospital at Rostock, in the German Aurists' Journal, published at Berlin. The learned professor commences his essay by urging from analogy that we ought not to expect to find the power of hearing among fishes. Nature is never wasteful, and since fishes possess keen power of sight, smell and touch (in the so-called lateral line on the side of the body), it is improbable that they are also provided with the sense of hearing. He incidentally cites as a proof of this, the presence of numbers of sharks at the battle of Aboukir Bay and other naval battles, pointing out that if those fishes heard the roar of the cannon they would scarcely have swum about in their usual unconcerned manner, intent only on business. Another argument used is that the sense of hearing would be useless to fishes, since the enemies by which they are attacked rush silently upon them in the waters, or swoop down upon them from above. The vibrations caused by the breaking of the waves on the beach are probably communicated by the lateral line system, so that fishes are warned in this manner of the proximity of land.

Brehm's anecdote of the carp coming to be fed does not by any means imply that these fishes hear the sound of the bell; and it is much more likely they feel the vibrations communicated to the water by the feet of the person coming up to the landing steps.

Moreover, according to the German professor, it appears as the result of direct experiment, that while fish are able to take cognizance of numerous rapid vibrations in water, such as those communicated by an electric bell; they take no notice whatever of loud single explosions under water, such as those made by dynamite. This strongly points to the conclusion that they receive impressions of the former type of vibration by means of their sense of touch or feeling, but

that they have no perception of either kind of vibration by means of hearing. When we add to this the above mentioned fact, as to the absence of the organs of Corti in the internal ears of fishes—and in no other class of vertebrates—Dr. Körner's contention that fishes are absolutely deaf becomes very difficult to discredit. Assuming this absence of the power of hearing, the function of the imperfectly developed ear of fishes has yet to be explained; but it is probable that this is merely part of the highly developed sense of touch or feeling characteristic of these creatures. This presumed deafness in fishes seems at first somewhat difficult to realize, but a little reflection soon leads to the belief that the possession of the power of hearing would be altogether useless and superfluous.—London Field.

## Concerning Bass.

NEW YORK.—*Editor Forest and Stream:* Some friends and I were discussing the respective merits and claims to popular vote—pardon me if I speak in the prevailing phrase of the time—of the large-mouth and small-mouth varieties of black bass. Up in Lake Champlain we never noticed when a big bass came over the gunwale whether his "slit" or mouth ran away around under his eye or not. Our fish often took the trolling spoon, especially just at night, and was generally conspicuous for the way that he would run right out into the lake at right angles to the course of the skiff that we happened to be in. One of the largest bass I ever saw came to my hook one day in an estuary leading into the lake just east of old Fort Frederick's ruins. He seemed bound to take a turn about a stake standing in the clay-stained water at the bridge, and in the struggle my old store fish pole broke near the end, and I had to work the line through the second ring and the pendant tip. I presume my honest endeavors to save that noble fish and my final successful netting of it, after my little brother had grabbed at the landing net handle three or four times and could not hold it

A BIG HALIBUT.

from sheer excitement over the fight, would have caused a laugh from those masters of the rod who are represented as being so cool and deliberate—in the story books—when killing a big fish.

All this leads me to the question, will the large-mouth bass breed in the same lake and do well in water inhabited by the small-mouth variety; or does each prefer a peculiar part of the same lake? I have in mind a large mountain pond well filled with the small-mouth bass on the reefs and along the rocky shores at various points. I find, however, that few, if any, of these fish inhabit the somewhat shallow portion of the lake thickly grown up with lilies and rushes or the outlet running for half a mile or so, navigable for rowboats, and full of shiners, small perch and other kinds of bass food.

Would not the large-mouth largely congregate in the shallower and weedier portions of our water, find its food there and thus by its introduction greatly increase the chances for sport? I am very fond of fishing near lily pads and in the deep holes along the course of smoothly flowing outlets of mountain ponds. Should there be no objection, why would it not be a good plan to introduce large-mouth bass into the water now inhabited by small-mouths, there being an abundance of fish foods, and the drain upon the water by local and city anglers being very great.

A little expert testimony on this important question will be greatly appreciated.

PETER FLINT.

## Salt Water Fishes in Fresh Waters.

GALVESTON, Tex., Oct. 25.—*Editor Forest and Stream:* I wrote you some months ago as to the fact that the salt water mullet at very high water, occurring years apart, has been thrown into Lake Surprise on the main land near Galveston Bay, and is in the lake in great numbers and apparently thriving and breeding there.

It is accepted that the landlocked salmon of the lakes, lake trout and possibly the sturgeon of the lakes, all originated from accidental salt water fish of their kind that were lost when going to fresh water to spawn. I can establish the fact that striped bass have lived and thrived in fresh water millponds in Virginia; whether they spawned I do not know.

We have data enough to justify the United States Fish Commission in trying some experiments with the redfish of the Gulf and the striped bass of the Atlantic, and the

soft water mullet as food for them, and to ascertain whether they cannot be made so accustomed to fresh water as to breed there.

I suggest these fish as the striped bass in Virginia and the red fish in Texas have been caught in fresh water ponds where they appeared to be thriving.

Our Federal Fish Commission is enterprising and in the best position to try such experiments, the only trouble is want of sufficient appropriations. The importance of such experiments will justify the expense, and I hope it is only necessary to get attention directed to this matter; push it on and keep it before the public, and let every fisherman interested in such work see that his Congressman has a marked copy of the FOREST AND STREAM whenever you have an article on this subject.

If those interested in the work of the Fish Commission would urge at the right time their representatives to see that the commission has ample appropriation, much would be done by the commissioner that has now to be left undone.

G. E. MANN.

## Sunfish Destroy Carp.

NATIONAL MILITARY HOME, O., Oct. 28.—*Editor Forest and Stream:* In your article on "The Carp Curse" you say that in waters already infested with carp "the only thing left is to be content with the coarse fish which has taken the place of native species." We are not so helpless and much may be done to control the over-production of this friendless fish. I have seen the problem fully worked out in one of the ponds in this place during the past ten years. The carp makes no nest but emits the eggs while swimming, and they fall to the bottom and are left without any protection. Sunfish eat them eagerly, and I have often seen a number of these alert friends of our youth following two carp when spawning and the eggs went where they would do good, or at least were prevented from doing harm.

Further on in the breeding process, when the young carp hatch, they flock together and when attacked, instead of scattering as bass and other fish do for safety, they huddle closer and then the ever hungry little two and three-year-old bass gets his fill, going through the school of helpless carp minnows with wide open mouth, making a heroic effort to swallow them all before taking a rest.

You may bank on it in confidence that if plenty of little sunfish and young bass are put in the same waters with carp the fittest will survive, and carload lots of carp will soon be scarce in that locality.

CHARLES CARROLL.

## The Kennel.

### Virginia Field Trials Association.

RICHMOND, Va., Oct. 24.—For the Virginia Field Trials entries close Nov. 8. The trials this year will be very much bigger and better than ever before. The club has guaranteed a purse of \$300 in the free-for-all stake. A good many entries have already come in. The secretary will be glad to hear from those handlers who have not received entry blanks. They have been mailed to the last known addresses, but probably not received by the handlers.

We are just in receipt of a letter from our first vice-president, Dr. Leigh Buckner, of Roanoke, in which he says: "I am sending you under this cover application for fifteen new members, and will send you some more as soon as you forward me application blanks. I got these in about one hour's work to-day." He also says the Fox Hunters' Club will probably take their hounds over and run them against the Martinsville dogs. It will give lots of sport and create interest in the Virginia Field Trials. He also says if the Maryland and District of Columbia people will bring a select number of their dogs to our trials and run a special stake, as they propose, he thinks we can accommodate them. I will enter one or two, but I cannot go to Maryland. See if you can't arrange this, it will add a very attractive feature to our trials."

This is the kind of men who are working for the Virginia Field Trials Association, and all those who enter dogs attend the trials personally and run them. It is our endeavor to build up a strong and attractive circuit on the east coast, and we hope that all of the sportsmen interested in field trials and hunting dogs will lend a helping hand. Every single entry counts and adds interest to the game. No one can tell how good a dog he has until he is placed in competition with the other fellow's dogs, and we hope that none of the members of the Virginia Association will hold back because they think they have not dogs good enough to win.

CHAS. B. COOKE, Sec.

Meadowgrass—"Si Oatcake seen a advertisement in th' Bunco Bulletin what sed ter send on er dollar an' git instructions as waz guaranteed t' make enny slow hoss fast. So he took an' sent th' money."

Cornstassel—"An' did he git th' instructions?" Meadowgrass—"I low he did. He got a postal card on which wuz written in red ink: 'Don't feed him.'"—Chicago Daily News.

"When I die," said Cholly, "I'm going to will my brain to some medical college."

"Oh, you stingy thing," replied the girl.—Chicago Record-Herald.

"Sometimes de man dat's workin' de hardest in dis world," said Uncle Eben, "is de one dat los' roo much time tryin' to pick out de easies' job."—Washington Star.

Mistress—Bridget, that cigar Officer Keegan was smoking in the kitchen last night was simply awful. Bridget—Yes'm; he says he don't see how your husband can smoke thim.—Puck.

Tommy—Say, pa, why did Peary name his ship the Roosevelt? Pa—I guess he wanted to scare the bears away from the pole, my son.—Chicago Daily News.

# YACHTING

## Tainui's 1903 Cruise.

BY JAMES W. COMMEFORD, JR.

(Continued from page 319)

Aug. 2, Sunday.—At 4:30 A. M., Charlie and the mate were still fast asleep. George dipped a pail of water and dumped it in through the fan light, in a minute all was confusion. Some one had to go overboard. The Skipper made for the foremast, intending to go aloft, but was too slow. In he went. George in the meantime got away in the dinghy. The Skipper evened things up by swimming to the dinghy and upsetting George and a battle royal took place, much to the enjoyment of the mate and Charlie. This over, the little schooner was soon under way, again with the wind free. Reached Massassage Park, and after one hour's ramble left for Belleville 4 miles away. At Belleville's waterfront is a park, and we tied up by the promenade and jaunted off up-town. At 11:30 left Belleville with wind aft and headed for Trenton 12 miles away, reaching there at 2:30 A. M., and turned in.

Aug. 3, Monday.—Stayed in port all day and visited the large saw mill. The mate stumped us to run the logs, he leading, Charlie, George and the Skipper close on his heels. There was a splash and a yell, George was in and each time he grabbed at the logs they would roll over and he would get another ducking. The mate and Charlie went to his assistance and soon had him out. He had enough. Tainui was log enough for him. That afternoon all went fishing except the Skipper, who met with old friends and during the afternoon was the recipient of a sailor's sheath knife. Thursday was to be fireman's day, and arches were being erected at the principal corners and the town decorated generally. We were asked to stay and join in the fun, but as our time was limited, we had to decline and left at midnight with fresh wind over the beam, and made Twelve O'clock Point at 1 A. M., after an exciting sail.

Aug. 4, Tuesday.—Rained hard all morning. Left at 9 A. M., with the wind over the quarter, for up the Murray Canal and made the run through in an hour, after which we again cut the channel buoys, and upon reaching the outer range light, anchored and close reefed the main, fore and jib, as it was blowing a gale from the S.E. Outside a large sea was running. We now headed for the open, the wind and sea dead ahead, and to beat out in that narrow channel was no easy task. The canvas had to be kept on to make her drive into it, and Tainui would rise on a sea and dive into the next and bury her horn and half the jib. It was hard work and the canvas had to be continually worked to keep her right side up. She would no sooner get steerage way when we would have to go about. As we rose on the crest of a sea the islanders could be seen grouped together watching and beckoning to us. Once outside and we would get it over the quarter, but there was a quarter mile of it yet. We were now in the breakers. "Stand by," called the Skipper. A hitch now meant the loss of a spar or to be driven on a lee shore. "Hard a-lee!" came the order. Tainui banged into a large breaker and missed stays. The next sea lifted her up and backed her down on the dinghy, which had been given a long line. The masts swayed like switches. The mate climbed forward and backed off the jib to starboard, the mainsail was eased and Tainui payed away on the starboard tack and commenced to forge ahead. The next tack was made successfully and the Skipper ordered the canvas eased off a bit until the wind was over the quarter. The little schooner would rise on the wall of a 12ft. sea and rush ahead, nestle for a moment on the crest and then drop into the hollow and seemed to wait for the next. The back stays were now set to brace the spars. The dinghy began to rush upon us on a following sea, then stop dead and come up again with a jerk. To stop this, about 20ft. of 1/2 in. bolt rope was attached to the then long line, but still she would pull and jerk. The mate complained of a pain in his back and was soon stretched out in the cabin. Fifteen minutes later there was a heavy jerk from the dinghy, she had parted her painter. "Marsh, the dinghy's gone," called the Skipper; "get a stout rope and stand by to pick it up." The back stays were cast off, and the helm put hard down, the jib let fly and Tainui laid down cabin awash for a moment, then headed S. in the trough to wait for the dinghy to get ahead of us. At the proper moment we again went about and headed for her. As we came near the Skipper jammed his tiller down, sheeted in his main a little and the crew grabbed the dinghy, while the mate quickly tied the new line with a square knot to the broken painter. The mainsail was then eased a bit to give her steerage way, as we had to again go about, for to gybe in that gale would cause an accident. She came about without further trouble and again was set on her course. This happened twice more before we reached Cobourg. With the mate below useless and an unexperienced crew on deck, the Skipper had his troubles. At times it was hard to keep her from broaching to. George, who had been watching the shore line, saw that we were gradually leaving it, and heading for the open. He would look at the Skipper, then at the shore and at last asked why we kept so far out, and being told that an open sea is better than a lee shore, and that if the wind was to lighten it would be better to run with the sea for the harbor than by it.

When about 2 miles E. of Cobourg and 7 miles out Tainui was headed for the harbor, entering it at 6 P. M. The seas were washing over the piers. We ran up the harbor a way for shelter and were met by a crowd of people who had been watching us rise and disappear in the big sea outside. In the harbor we found several yachts that had run

for shelter, and after seeing the mate snugly in bed at a hotel, we visited the drug store and called for our mail. A telegram was waiting for George. He was wanted home at once, and he accordingly prepared to leave the next morning. A lively time was spent in the harbor that evening, a visit being paid to the different craft, and it was a tired crew that turned in that night.

Aug. 5, Wednesday.—George was up and away at 4 A. M., to catch the train for home, and Charlie and the Skipper went to the hotel to see their patient. Found him greatly improved, but far from well, and after breakfast, helped him down to our floating hotel, bundled him up in his bunk and left at noon for Port Hope, 6 miles W. The wind had fallen light and left a long roll which did not improve the mate any.

The postmaster at Cobourg had informed us that the Port Hope post office would close at 3 P. M. that they might attend the funeral of one of the officials who had been drowned in the Bay of Quinte on the day that we left Prêsquê Isle in the gale, and at the rate we were going we would be late for our mail, so Charlie put off in the dinghy and reached the post office in time and was rewarded by getting a letter for the Skipper. Arriving back as we entered the piers he was given a line and towed us well up the harbor to escape the incoming swell.

A hot meal was in order, and the mate felt quite like himself again after a couple of cups of hot beef tea. After the meal we all strolled up-town and that is quite an undertaking. Port Hope is built on the side of a hill. The main street is quite steep, the residential part being located at the top. An excursion came in that night from Twelve O'clock Point on the steamer Argyle, and nearly all on board were sea-sick.

Aug. 6, Thursday.—Up early and saw the steamer away, well loaded with passengers, some for the trip, but the majority on a shopping expedition to hunt up the bargains in Toronto's department stores.

Breakfast was hardly over when it began to rain. A heavy swell was still running. It cleared again at 11 A. M., and a little breeze sprang up from the S.W., and we got away. It was a beat, but anything is better than a calm. One mile out the wind died away and it took us two hours to make the harbor again. And for something to do we went out in a tug, which was towing sand away from a dredge that was working in the harbor, and dumping it a couple of miles out in the lake. Before the trip was over it began to blow quite fresh from the S.W. We had left Tainui tied up inside the pier with all canvas up and were anxious to get back, and on arriving found that kindly hands had lowered it. At 6 P. M., with a couple of reefs put in the foresail, one on the main and full jib, headed out once more. The wind increased steadily until we were down to the cabin, at times throwing the spray in all directions as we drove into the head seas. About 7:30 a cutter-rigged yacht hove in sight. She had a couple of reefs in her mainsail and was running before it like a race horse, heading for Port Hope. Following closely on her heels was a schooner running light and reefed. It soon became dark and the wind shifted a bit more W. and blew hard. The foresail was taken in and the backstays set up.

The boys began to get chilly and tired, and all wished they were back in the harbor. But their minds were soon set at ease when the Skipper pointed the twinkling light of New Castle over the bows, and announced his intention of making for it and laying up for the night.

About 11 P. M. the Argyle passed close to us on her return trip.

At midnight the wind lightened a bit and the foresail was again set, and at 1 A. M., entered the piers and found a couple of stone hookers inside. It did not take long to get the canvas stowed and all hands were soon in their bunks. Beat 22 miles.

Aug. 7, Friday.—Left New Castle at 6 P. M. Wind light from N.W. When 2 miles E. of Darlington Harbor and 1 mile from shore the wind came in hot puffs, followed closely by heavy squalls. The foresail was quickly taken in and we headed inshore, but before we got there had some excitement.

Luffing or paying away as the equals hit us, we ran close in under the cliffs and dropped anchor, put in a double reef in the mainsail and foresail and one in the jib. With this scrap of canvas we clawed close along the shore. At times it blew so hard that the sand from off the shore could be felt against our faces. After passing Darlington, the shore ran more southerly, which gave us the wind over the beam. For about 3 miles we kept close in shore. Our centerboard struck a rock, after which we headed out a quarter of a mile, where we got the full force of the wind and had our hands full. Now and then would take a short tack in shore and passed Oshawa, which has no harbor. A long pier stretches out into the lake, so we kept on and in another hour had Whitby Harbor in sight, but we were well out and seemed to get a steadier breeze. At noon Whitby was passed.

As a word of warning Whitby Lighthouse stands on the west pier, other lights on north shore are on east pier. The writer made a mistake at Whitby the year before, which he will not soon forget. While making the harbor in a gale off the lake in his excitement he left the light to starboard and found himself in the breakers on a lee shore and had a rough time beating out again.

The mate suggested that we make Frenchman's Bay, which is 4 miles W. of Whitby, and 18 miles E. of Toronto. All were agreeable, but from where we were it would be a dead beat to windward. Tainui was put on the port tack and headed in shore a mile and the

order had just been given to stand by to go about, when the Skipper noticed the sky had suddenly darkened and a hot gust of wind blew by. The order was countermanded, and he paid her off a bit, so that she would foot a little faster, and headed for the shore now about half a mile away. In ten minutes it was very dark and the Skipper ordered the foresail taken in, and it was no sooner done than the jib was ordered in also. The mate had just uncleared the halliard, when we were struck by a regular cyclone, which brought sand and dust off the shore with it. The mate let go the jib and it lashed about on the end of the horn. The Skipper sheeted home the mainsail which kept us up in the wind, and his orders came thick and fast, but could not be heard by the mate, who had gone out to bind down the jib. With the help of the crew the topping lifts were put up and the mainsail dropped into them. Tainui began to back down at a rapid gait and the dinghy threatened to break the rudder. The jaws of the gaff were lashed to the boom, and the peak raised about 2ft. and with about the same amount of jib to the wind. The mainsail was eased and she went down to the cabin, but would do no better than abeam and was headed for Whitby. In about another fifteen minutes it had eased up a little, and the reefed main and jib were set, and in half an hour we were close in shore and came upon a table, two chairs and a mattress. The anchor was let go, canvas taken in, and all went ashore in the dinghy, and after climbing the cliff, found the remains of a tent held by the pegs, which explained where table and chairs came from. Branches had been torn from the trees, and apples galore on the ground in an orchard a little further inland occupied us for another half hour.

When we again got back to the beach, or cliff, Charlie in his hurry lost his foothold and in falling grabbed the mate and both rolled to the bottom unhurt; but the supply of apples were strewn about the beach. Once more on board the stove was lit and a hot meal prepared, which was enjoyed, as we had not eaten since early morning.

At 3 P. M., canvas was again hoisted, and before reaching Frenchman's Bay the reefs were cast out and full sail carried, and it was decided to keep on for the city, which gave us the wind abeam, but still very squally, which kept the mate going as the foresail was taken in and reset a half a dozen times in the next two hours. About 5 P. M., we were off Kew Beach in the eastern city limits and were hailed by a man in a canoe going our way. We laid to and got him aboard, and after tying the canoe astern, he told us of the bad weather in and around Toronto in the last week, it being so rough that the Lake Yacht Racing Association meet had to be postponed, and that a good many craft had been washed up on the beach, his own included, and on nearing the eastern pier he left us to go in search of her.

We entered the pier at 6 P. M., and beat up the bay in a light breeze, and inspected the challenger, Irondequoit, and defender, Strathcona, who were getting ready for the first race for the Canada cup, on the morrow.

In the harbor were also Genesee and Wave Crest, of the Rochester Y. C.; Cadillac and Minx, of Detroit, and many others.

We made our moorings at 7 P. M. "Right side up with care," remarked the Skipper. Canvas was soon stowed, and in half an hour we were on our way to our respective homes.

### Seawanhaka Cup Conditions.

THE following letter has been received from Mr. Richard deB. Boardman, Chairman of the Seawanhaka Cup Committee of the Manchester Y. C.:

BOSTON, Mass., Oct. 26.—*Editor Forest and Stream:* The Manchester Y. C. has as yet received no challenge from any foreign club, but some little inquiry as regard to conditions has been made.

The time limit, however, for challenges for the year 1906 does not expire until Dec. 1, so there is yet ample time. We are greatly in hopes of receiving one.

The only changes in the conditions from the match sailed last summer with the Royal St. Lawrence Y. C., of Canada, are as follows:

In article 9 of the mutual agreement, the limit of sail area has been increased from 500 sq. ft. to 625 sq. ft., so that the article now reads: "Competitors must not exceed 625 sq. ft. of sail area, and must not exceed 25ft. limit of racing length under the following rule: Load waterline plus square root of sail area divided by two equals the racing length. Waterline length found with no dead weight on board."

To article 10 is to be added, "no sliding gooseneck or other device used to change the position of the mainsail on the mast shall be allowed."

The weight of the crew may be 680 lbs. instead of 665. These changes were made by a special committee of the Manchester Y. C. after much careful thought and consideration. Some pressure was brought to bear on us to change the type to a keel boat, but although this type would, of course, have been best for us, we decided to stick to the original kind, as it seems to us the cup was given in the interest of speed.

RICHARD DEB. BOARDMAN,  
Chairman Seawanhaka Cup Com., Manchester Y. C.

HOUSEBOAT FOR GEORGE INNESS, JR.—Messrs. Macconell & Cook have completed plans for a houseboat for Mr. George Inness, Jr., and the boat is now being built at Rye, N. Y. The boat is 50ft. long, 14ft. breadth and 12in. draft. She will be used in the waters near Tampa, Fla., and she will have as a tender a powerful launch.

19. Irons for struts and fore and aft iron for runner plank stays.

## An Ice Yacht for \$75.

BY H. PERCY ASHLEY.

INTEREST in ice yachts is becoming more marked each year, but the average man wants a boat costing complete less than \$100. After years of experience in the designing, building and sailing of these craft I feel that the design published herewith is the type of boat best adapted for ordinary use, and the simplicity of the craft in all particulars enables the boat to be built for \$75 or less.

**How to BUILD.**—Select your wood well seasoned with the heart on top side of the runner plank and back-bone. This is quite essential, as it gives the upward spring to the planks. The best material for runner plank and back-bone is bass wood, but a good stick of clear spruce well seasoned will do very well. The runners and steering gear are the first essentials. We will turn to Plate II., Fig. 7 and Fig. 8. The fore runner is made of seasoned oak, being exactly 4ft. over all, and a depth of 6in., including shoe. The shoe is of soft cast iron, being 2in. deep. The cutting surface on the ice is 45 deg., and is held by screw bolts with octagon heads, the center one being a screw head, as is shown in Fig. 7 and Fig. 8.

**BACK-BONE OR CENTER PLANK.**—Should be of well selected spruce or bass wood. The back-bone should be 20ft. over all, 9½in. broad and 3¾in. wide at center when dressed, 9in. tapering at nose to 3¾in. by 3in. At heel of back-bone the measurements are 4in. by 3¾in. Details of plan will be readily seen in Plate III., Fig. 13.

**RUNNER PLANK.**—Of spruce or bass wood, over all 12ft., 1ft. wide at center and 10½in. at ends. Depth 3¾in. at center and 2½in. at ends.

**RUNNERS AND STEERING GEAR.**—All runners should be made of seasoned white oak, the bolts of the same being ½in. in diameter. Note that on the fore runner, Plate II., Fig. 7, is inserted a brass plate, details of which will be seen in Fig. 8. The rudder post is 1½in. The tiller is of light construction, 2ft. 10in. over all, and served with cord at handle. Plate II. gives full details with two scales to their construction.

**COCKPIT.**—By referring to Plate III., Fig. 9, details of the steering box will be seen. It is solid oak, bent, of 1½in. by 4¼in.; in its lower side is cut a groove (before bending) of ¾in. by ½in. deep to receive the oak flooring for cockpit, which is of tongued and grooved oak ½in. thick. As this is screwed and glued it makes a very strong and substantial structure.

**IRON WORK.**—Clearly shown in Plate IV., Fig. 14, is the nose of the boat with formation of the iron work. Fig. 16 shows the yard and iron work of the boom. Fig. 19 shows the runner plank and end of the struts, which is practically the mast of a lateen ice yacht. By referring to Fig. 17 the heads of the two struts are seen as joined by bolts and a triangular oak piece. Fig. 18 shows the nose with eye-bolt for toggle iron and loop of ¼in. diameter steel rigging for side stays.

**RIGGING, ETC.**—Plate I. and Plate III. shows all the rigging required. All runner plank stays are of ¼in. steel rigging, ending up at nose and heel in a loop served and parceled in marlin. White soft twine is used in serving the splices. A stay of ¼in. steel rigging runs from the struts to end of boom ending in two thimbles with seizing of ¾in. manilla rope. From the nose to the shear holes extends ¼in. steel standing rigging, ending in a loop, and from another loop it runs aft. This is of ¼in. steel wire and is fastened at the runner backstay just forward of the cockpit a lanyard is placed on.

Any practical man who can handle tools for ordinary work will quickly understand the accompanying plates, which speak for themselves.

Messrs. Merriman Brothers, whose advertisement will be found on another page, carry a large line of ice boat fittings.

[Mr. Ashley will be pleased to answer any questions regarding this boat.—Ed.]

**RACES FOR ICE YACHT CHALLENGE PENNANT.**—The Orange Lake Ice Y. C. is to challenge the Hudson River Ice Y. C. for the challenge pennant of America. The first race for the pennant was sailed on March 5, 1881. The pennant is now held by Commodore Archibald Rogers' Jack Frost. The Orange Lake Club will enter Cold Wave II., sailed by Commodore Henry C. Higginson, and the Windward, sailed by Capt. James O'Brien. The Hudson River Club will probably enter Jack Frost and a smaller boat of new design. The race will be sailed above the Poughkeepsie Bridge. Windward carries 620 sq. ft. of canvas and has a solid back bone. Cold Wave II. carries 410 sq. ft. of canvas with hollow back bone. Jack Frost carries 749 sq. ft. of canvas.

## Boston Letter.

**BOSTON Y. C. MEETING.**—The fall meeting of the Boston Y. C. was held at the Rowe's Wharf club house on Wednesday evening, Oct. 25. Some important amendments were acted upon, principally with regard to the dues of the Dorchester and the Marblehead divisions. It was proposed to abolish the Dorchester division, retaining the station only as one of the main club. This proposed amendment was defeated, but it was voted to raise the dues of the members of the Dorchester division from \$8 to \$12. The dues of the Marblehead division were raised from \$10 to \$15. A proposal was offered to create junior membership, admitting those less than twenty-one years of age; but this matter was laid over indefinitely. The committee on nomination, as suggested by the Executive Committee, was confirmed. In the discussion regarding the dues of the Marblehead division, it was brought out that the station at Marblehead has been growing more and more in favor by the members of the club, and it is likely that still further improvements will be made on the property for the accommodation of those members who resort to the Marblehead anchorage during the summer.

**DEVELOPMENTS IN CLASS Q.**—Since the adoption of the classes under the uniform rule up to 40ft. rating by the Yacht Racing Association of Massachusetts there has been considerable speculation as to which class will be first to be favored by prospective builders. It is now said that there is a strong movement among members of the Eastern Y. C. toward developing class Q, of 22ft. rating. If a number of boats are built for the class it is expected that they will be raced on the Y. R. A. circuits and that considerable sport, as well as interesting data, may be obtained. The Eastern Y. C. does not recognize yachts of less than 30ft. waterline, in its regular races, but considerable interest has been shown by the Regatta Committee in the popular Y. R. A. classes, for which special races have been given during the past three seasons. Many members of the Eastern Y. C. are members of the Boston Y. C., which is enrolled in the Y. R. A., and it is probable that the majority of entries from class Q boats owned by Eastern Y. C. members—if the promised development should materialize—would be entered from the Boston Y. C. However, it is considered immaterial by those interested which club a boat may enter from, so long as the class is developed.

**COMMITTEE ON RULES.**—At the fall meeting of the Eastern Y. C., held on Tuesday evening, Oct. 24, Messrs. Louis M. Clark and Henry Howard were appointed a committee to attend any conferences that might be held during the winter for the revision of racing rules.

**NEW DESIGNS.**—Messrs. Small Brothers have an order for an auxiliary yawl for Mr. M. W. Torrey, of New York. She will be 44ft. over all, 29ft. 6in. waterline and 12ft. breadth. They have completed the design of an 18-rater to be used south of Cape Cod, the lines of which are said to be quite a little different from any that have yet been turned out under the new rule.

**SHOAL-DRAFT YAWL.**—Mr. Fred. D. Lawley has completed the lines of a shoal draft yawl for Mr. J. H. Cromwell, of New York, which will be used in southern waters. She is 80ft. over all, 57ft. waterline and 19ft. breadth.

**NEW BOATS BUILDING.**—At Lawley's the deck is being laid on the new 60ft. schooner for Rear Commodore Alfred Douglass, of the Boston Y. C. The schooner designed by Messrs. Tams, Lemoine and Crane for Vice Commodore H. A. Morss, of the Corinthian Y. C., has been laid down. The keel of a cruising power yacht, 71ft. 6in. over all for Mr. E. B. Dane has been set up. The schooner Merlin is receiving a new top from the waterline up, and the schooner Corona is receiving a new deck.

JOHN B. KILLEEN.

**MOTOR BOAT CLUB OF AMERICA.**—There was organized on Thursday evening, Oct. 26, at the Hotel Astor, the Motor Boat Club of America. Mr. Charles P. Tower was elected president, Mr. H. S. Gambel is the secretary, and the committee on plan and scope is Messrs. Charles Francis, H. S. Bease, Dr. S. Oppenheimer, A. D. Roach and George J. Vestner. The club is already negotiating for permanent quarters on Riverside Drive, where they will have a modern club house.

**ROXANA CHARTERED.**—The twin-screw houseboat Roxana, owned by Mr. J. W. Gates, has been chartered through the agency of Messrs. Cox & Stevens to a member of the New York Y. C.

## British Letter.

**THE DECLINE OF YACHT RACING.**—A correspondence has been going on in the London Field on the above subject for some weeks past, and many ideas have been put forward by various people to account for the disappearance of the large rating classes, generally by correspondents who are merely interested in yachting as a sport but who do not own a yacht, and sometimes by those enthusiasts who wish to back up the Yacht Racing Association and cover up its faults of omission. So far only one letter has appeared which really carries any weight with it, and that is one from Mr. A. K. Stothert, the owner of the handicap class yacht Rosamond, who said that owners were not going to build to the Y. R. A. classes until the Y. R. A. protected them from flimsy bandboxes of boats by introducing an efficient system of scantling restrictions. Sir James Pender, owner of the big yawl Brynhild, wrote a letter to the same effect in the Yachtsman some time ago. The letters of these two gentlemen, who are themselves yacht owners and who race in the handicap classes which for some years have so efficiently filled up the gap produced by the disappearance of the 65-footers and the first-class raters, are deserving of every consideration, and it is something to know that the Y. R. A. have at last roused themselves up and are trying to induce Lloyds to alter their rules for yacht classification so as to make it possible to apply them to the modern racing yacht. The work appears to be going on more or less in camera, which is a pity, but any reasonably strong form of construction would be better than none at all.

The last letter on the above subject, which appeared in the Field of Oct. 14, was from Mr. W. P. Burton, owner and helmsman of the 52-footer Britomart. Mr. Burton has owned boats in this class for many years, is an ardent sportsman and an excellent man at the helm. He always steers his own boat, and no professional can afford to give anything away to him. His enthusiasm for class racing, however, appears to have clouded his judgment with regard to the reasons for the decline of yacht racing and the remedy thereof. He says the remedy is in the hands of the yacht clubs; that if the clubs give more prizes for class racers and fewer for handicap boats class racing will revive. How Mr. Burton comes to this conclusion it would be difficult to say, but he does not think that scantling restrictions and the abolition of hollow masts, or any other of the remedies proposed, such as the alteration of the rating rule, or the removal of the tax on sail area would be of any use. There is no doubt that some of the clubs give very small prizes for class raters, but the remedy is not in the readjustment of the prizes—there are other matters of far more importance which require immediate attention before any improvement in yacht racing will take place.

**RACING FIXTURES FOR 1906.**—Mr. Burton is much more to the point in a letter he has written to the Clyde yacht clubs containing a suggestion to the effect that the Clyde Fortnight should open the yacht racing season instead of the Thames and East Coast regattas. There is much to be said in favor of this arrangement, for racing yachts could be fitted out and sent round from the South of England in time to start racing on the Clyde at the beginning of June, and their owners could join them there and take the Irish regattas and Plymouth on the way back to the south. Mr. Burton says that if the Clyde regattas are held later the 52-footers will in all probability not attend them, as it takes the best part of a fortnight to get round there, and that is too much time to give up during the busy season. Moreover, the handicap class are not willing to sail another race from Cowes to the Clyde, but if they went to the Clyde in June, instead of July, they could get back in time for Kiel and Ostend. It is disappointing to think that there is any necessity to alter the dates of the Scottish fixtures, but if it is in the interests of the sport of course it would be well to break through precedent and fix them for the most convenient time. No doubt the matter will be thoroughly discussed at the meeting which the Y. R. A. have convened for Nov. 3, when delegates will be present from most of the principal yacht clubs.

E. H. KELLY.

## "Supplement to Small Yachts" Free.

To any one sending us one new subscriber to FOREST AND STREAM before Nov. 15, 1905, we will present one copy of W. P. Stephens' book "Supplement to Small Yachts." This work contains 104 pages text and 43 plates. Size 11 by 14 inches. Cloth. Price \$4. This offer does not apply to renewals.

## GAS ENGINES AND LAUNCHES.

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

## Yacht Racing Association of L. I. S.

THE representatives of the clubs belonging to the Yacht Racing Association of Long Island Sound held a meeting at the Hotel Astor on Monday evening, Oct. 30. The president of the Association, Mr. Oliver E. Cromwell, presided. A number of questions were brought up and it was finally decided to leave them in the hands of the executive committee. This committee will also confer with a committee of the New York Y. C., which was appointed to accomplish very much the same ends. The meeting of these committees will be held at the New York Y. C. house on Nov. 20. At this meeting, which will be attended by committees from other clubs and associations, the question of the international rating rule will be discussed among other things, and delegates will be appointed to attend the meetings in England.

The members of the Y. R. A. of L. I. S. Executive Committee are Messrs. Oliver E. Cromwell, Charles P. Tower, H. Wilmer Hanan, Edward M. MacLellan, G. P. Granberry, Fred. A. Hill and H. deB. Parsons.

President Oliver E. Cromwell addressed the members, and among other things he said:

"The Yacht Racing Association has accomplished much for the benefit of yacht racing. One of the most important innovations was the introduction of permanent racing numbers for all yachts, and still more serviceable is the arranging of dates for the season's racing so there shall be no conflict of events. The uniform racing rules for all clubs in the Association are another valuable contribution to yacht racing, and the introduction of the championship series in 1900 has proved most interesting and attractive.

"Last winter, in conjunction with the New York Y. C. and other unrepresented clubs, several meetings were held at the New York Y. C. house with the object of arranging a universal measurement rule. The meetings were most successful and resulted in the general adoption of the present rule.

"The effect of this rule upon the model of the future yacht fleet bids fair to realize the yachtsman's long cherished dream of a yacht that will be something more than a mere racing machine, and to produce a vessel of roomy proportions, with small sail plan, a small crew to handle it, large displacement, abbreviated overhangs and excellent weatherly qualities, together with great speed.

"Such a combination would seem almost too good to be true, yet we must feel encouraged to hope when we consider the performance of the Doris, built to the new rule and fulfilling the qualities I have mentioned, rating 45.72ft., and the New York Y. C. one-design class, rating at 29.69ft. The Doris won handily from her competitors of about the same rating built under the old rule, and the New York A. C. one-design class and the Gravesend Bay Q class have made remarkably good records during the season.

"It has been claimed that this was in great measure due to excessive time allowance, but even if such be the case it does not remove the fact that these small yachts have frequently beaten those much larger, boat for boat, without benefit of time allowance. All this would seem to indicate that the vessels built to the new rule are faster as well as more wholesome than those produced by the old rule.

"As to the time allowance scale, it seems to be generally accepted that it favors the small yacht too much as against the larger. It must be borne in mind, however, that in the New York Y. C. cruise, in nearly every case it was the new rule yachts against the old. What the result would be if the larger yachts were built to the new rule also is as yet undemonstrated. It would seem, therefore, that changes in time allowance should be approached with caution, until we have more definite data to work upon, and the changes be made slight at first, and by degrees. It would probably be better to divide contesting yachts so as not to have any great difference in size. It is a very severe test on any time allowance system to race 30-raters against the 70-footers, and in such races as the squadron runs of the New York Y. C., where it is necessary to race the small against the large yachts, there should be a dividing line at say 50ft. rating, allotting a prize to yachts above that class and another to those below it.

"The New York Y. C. is about to call a conference of the Yacht Racing Association and all other clubs in the neighboring Atlantic seaboard, to endeavor to arrange a uniform system of racing rules to be adopted by all the clubs, in the same manner as the measurement rule was adopted. If this can be accomplished it will still show, however, that nothing will be done to change in any way the present measurement rule.

"As there appears at present an inclination to build small schooner yachts, it seems desirable to divide this rig into smaller classes. The smallest class of schooners at present is 55ft. and under. It would therefore be advisable to divide this class as follows: 55, 47 and 40. At present all yachts launched after Jan. 1, 1905, have to be rated at the highest limit of their class, therefore a schooner rating at 45, has to go up to 55, which is a grave injustice."

NEW ROCHELLE Y. C.—The New Rochelle Y. C. went out of commission on Saturday, Oct. 28. On that evening a club dinner was given and it was thoroughly enjoyed by the men there. The dinner brought to a close the most successful season in the club's history. Boats enrolled in the club have been particularly fortunate in the racing. In addition to holding several large regattas the New Rochelle Y. C. has been brought into unusual prominence by having three of its fleet win out in as many important events. The yawl Tamerlane, owned by Rear-Commodore F. Maier, won the handsome challenge cup offered by the Brooklyn Y. C. for the ocean race to Hampton Roads, Va. The New Rochelle Y. C. will defend the cup against all comers next year. Sloop Gauntlet won the long distance race to Block Island given by the New York A. C. Okee won the race to Stratford Shoal and return given by the Manhasset Bay Y. C. Many attractions in the way of dances, smokers, beefsteak dinners and clambakes have been enjoyed by the members during the summer. The club's finances are in excellent condition, and many improvements are contemplated for next season.

## New Steam Yacht Building at Morris Heights.

A PROMINENT western yachtsman who has been identified with the sport on the Great Lakes for several years, has given a contract to the Gas Engine & Power Co. and Chas. L. Seabury & Co., of Morris Heights, for a high speed cruising steam yacht, for next season's service. He intends to cruise along the coast to the eastward as far as Nova Scotia, and thence through the Gulf of St. Lawrence and to the Great Lakes. The new craft promises to be one of the finest cruising steam yachts, in the matter of speed, comfort and substantial construction. Mr. Chas. L. Seabury, the naval architect, is now at work on the vessel, and the keel is laid, and frames almost ready.

The dimensions are 140ft. over all, 118ft. on the waterline, 17ft. breadth, 6ft. 6in. draft. The keel will be of steel, with stem, frames, floors, reverse frames, keelsons, deck beams and plating of steel, well riveted and fastened. The vessel will have five steel bulkheads located two forward, two amidships, and one aft.

The plan of the yacht shows a fine looking and able craft, with pole masts and schooner rig. There is a deck house with necessary interior space for dining room, with sideboard, buffet, etc., and at the after end will be arranged a steward's pantry, etc. There will also be a commodious after deck house or social hall, the interior of which will be finished as a music room or saloon, having entrance from deck at side. A stairway will be arranged in this house for entrance to owner's quarters below.

In the after portion of the vessel the owner's quarters are located. The first room aft of the machinery space is the bath room and lavatory, with hot and cold, and fresh and salt water, and other conveniences. On the starboard side adjoining the bath, will be a dressing room, fully appointed. The finish of these rooms will be in white enamel.

The owner's staterooms, a suite of two, will be located on the starboard and port sides of the vessel. They will be fitted with brass bedsteads, wardrobes, dressing cases, etc. The woodwork is finished in white mahogany. Following the owner's quarters to starboard and port will be arranged the guests' bath rooms, fitted with all conveniences and accessories. These rooms are finished in white enamel. Directly aft of the guests' bath rooms, is to be arranged two staterooms, and aft of these is the saloon, which is to be of liberal proportions and fitted with gun and fishing rod racks at either side, book cases, etc., all finished in white mahogany. On the port side will be a storage room. Following the saloon aft and opening from the passageway will be three staterooms, fitted with berths, wardrobes, dressing cases, lavatories, etc. Two of these are quarter rooms or single size, and one stateroom aft, the full width of yacht, for the use of guests, is fitted with two berths, wardrobes and other accessories the same as the other rooms. The deck houses, skylights, hatches, companionways and deck fittings will be of mahogany. The interior finish of both deck houses will be in mahogany, the lower part paneled. The carpets, curtains and other appointments will be suitable. The galley is to be forward of the engine compartment, and in the fore-castle will be found two staterooms for the officers, and berths for the crew, and all other accommodations needed. The yacht will be handled from an officer's bridge, and will have a mechanical telegraph and the usual bells and pulls to the engine room. There is ample space on top of deck house for guests' bridge forward of the officer's bridge, which is to be utilized for chairs, settees, etc.

The yacht will have a Seabury engine of the triple expansion type with 12in. stroke, and a Seabury water tube boiler. There will be a complete electric lighting plant, with dynamo and storage batteries and searchlight. Three small boats and a 2ft. naphtha launch will be carried on the davits, and in every respect the yacht's equipment will be complete. The delivery of the craft is fixed for May 1, 1906.

## YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

WORK AT GREENPORT, L. I.—The Greenport Basin & Construction Company, of Greenport, L. I., are building a shoal-draft cruising schooner for Mr. William H. Langley. The boat was designed by Capt. Phil. Ellsworth and is built of wood. She is 60ft. waterline, 64ft. over all, 18ft. breadth and 2ft. 6in. draft. Power is furnished by a gasolene engine and the stern is tunneled in order to admit of the using of a large propeller. The same firm is rebuilding the steam yacht Altair, ex Orienta. In addition to new planking other alterations are being made.

A RESCUE AT SEA.—The auxiliary steam yacht Aloha, owned by Mr. A. C. James, arrived at New York on Oct. 29. She left Southampton, England on Oct. 5, and bad weather was encountered on the passage. Strong S. and S.E. winds were met during the early part of the voyage. On Oct. 17 the vessel ran into a gale from the S.E. The weather got steadily worse and all hands were at work shortening sail. Andrew Anderson and two other members of the crew were at work on the jibboom. While these men were making things snug Aloha jumped into a big head sea and all three men were swept off the jibboom. Two of them were thrown by the sea with terrific force on the fore-castle head, where they were picked up unconscious. Anderson was less fortunate than his shipmates and was carried by the sea clear off the vessel. It was about midnight, and although it was impossible to see any distance ahead, Captain Benzanson rounded his vessel up and a boat was launched. The boatswain, Clifford Benzanson, a brother of the captain, was in charge and with him were three men. For over fifteen minutes these men rowed around trying to find the missing man. Although Anderson could not be seen those in the boat hallooed to him constantly to keep up courage. An occasional cry from Anderson gave the rescuers some idea where he was and he was finally picked up when his strength and courage had about given out. The men got back to Aloha after a hard pull and Anderson was soon brought around. The other two men were not seriously

injured and the vessel was again kept on her course. Aloha will winter in Tebo's Basin, South Brooklyn.

AUXILIARY MOHICAN SOLD.—The auxiliary steam yacht Mohican, ex Norseman, ex Lady Godiva, has been sold by Mr. Tracy Dows to Messrs. Oliver and J. Borden Harriman. The sale was made direct but the transfer is being made through the office of Messrs. Tams, Lemoine & Crane.

## Knew the Danger Signal.

A LITTLE West Side girl of more than four and less than five years old spent most of the summer with her parents on one of the big bays on the Massachusetts coast. Her father is an enthusiastic sailor, and frequently took her out in his sloop. Whenever in tacking or coming about the boom was about to swing around he would cry, "Hard-a-lee!" as a signal for all hands to put their heads down.

This fall the little girl was taken to visit her grandparents, who live in a Southern State. The grandfather is a devout churchman and never fails to say grace. The first meal the little girl looked on in wonder at the unusual preliminary. When they left the table she was reproved for not having bowed her head as did the others.

Imagine the consternation when all were seated at supper that night, and the old grandfather was about to begin the blessing, when she sung out in a shrill, piping voice:

"Hard-a-lee, eberybody!"—New York Tribune.

## Canoing.

### Officers of A. C. A., 1906.

(Assumed office Oct. 1, 1905.)

Commodore—H. Lansing Quick, Yonkers, N. Y.  
Secretary—William W. Crosby, Brighton Mills, Passaic, N. J.  
Treasurer—Frederic G. Mather, 164 Fairfield Ave., Stamford, Conn.

#### ATLANTIC DIVISION.

Vice-Commodore—Woolsey Carmalt, 82 Beaver St., New York.  
Rear-Commodore—Matthias Ohlmeier, Francis H. Leggett & Co., 128 Franklin St., New York.  
Purser—George S. Morrissy, 73 Mercer St., New York.  
Executive Committee—William A. Furman, 846 Berkeley Ave., Trenton, N. J.; Louis C. Kretzmer, Schepp Building, New York; Clifton T. Mitchell, 46 E. Sedgwick St., Germantown, Pa.  
Board of Governors—Robert J. Wilkin, 211 Clinton St., Brooklyn.  
Racing Board—Daniel B. Goodsell, 36 Washington Sq., New York.

#### CENTRAL DIVISION.

Vice-Commodore—Henry R. Ford, 45 N. Division St., Buffalo, N. Y.  
Rear-Commodore—Edward H. Demmler, 526 Smithfield St., Pittsburgh, Pa.  
Purser—B. Irving Rouse, 981 Lake Ave., Rochester, N. Y.  
Executive Committee—John S. Wright, 519 West Ave., Rochester, N. Y.; Lyman T. Coppins, 681 Main St., Buffalo, N. Y.; Jesse J. Armstrong, Rome, N. Y.  
Board of Governors—Charles P. Forbush, 164 Crescent Ave., Buffalo, N. Y.  
Racing Board—Harry M. Stewart, 85 Main St., E. Rochester, N. Y.

#### EASTERN DIVISION.

Vice-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.  
Rear-Commodore—Frank S. Chase, Manchester, N. H.  
Purser—Edgar Ward, 112 Highland St., West Newton, Mass.  
Executive Committee—Daniel S. Pratt, Jr., 178 Devonshire St., Boston, Mass.; Arthur G. Mather, 84 South St., Medford, Mass.; H. L. Backus, 472 Lowell St., Lawrence, Mass.  
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; Herman D. Murphy, alternate.

#### NORTHERN DIVISION.

Vice-Commodore—J. McDonald Mowat, Kingston, Ont., Canada.  
Rear-Commodore—James W. Sparrow, Toronto, Canada.  
Purser—Russell H. Britton, Gananoque, Ont., Canada.  
Executive Committee—Charles E. Britton, Gananoque, Ont., Canada.  
Board of Governors—John N. MacKendrick, Galt, Ont., Canada.  
Racing Board—J. McDonald Mowat, Kingston, Ont., Canada.

#### WESTERN DIVISION.

Vice-Commodore—John A. Berkey, St. Paul, Minn.  
Rear-Commodore—Lucien Wulsin, The Baldwin Co., 142 West Fourth St., Cincinnati, O.  
Purser—Wade Hampton Yardley, 49 Pioneer Press Bldg., St. Paul, Minn.  
Executive Committee—George H. Gardner, 149 Kennard St., Cleveland, O.; Augustus W. Friese, The Journal, Chicago, Ill.  
Board of Governors—Henry C. Morse, Peoria, Ill.  
Racing Board—Frank B. Huntington, 90 Sheboygan St., Fond-du-Lac, Wis.

### How to Join the A. C. A.

"Application for membership shall be made to the Treasurer, F. G. Mather, 164 Fairfield Ave., Stamford, Conn., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

## Rifle Range and Gallery.

### Fixtures.

Nov. 7.—Greenville, N. J.—One hundred shot championship match.

### Steady Holding.

CHICAGO, Ill.—In FOREST AND STREAM of Oct. 21, Yellowstone wrote interestingly on "Steady Holding." He quotes from an editorial in FOREST AND STREAM as follows: "There are two essentials in rifle shooting, namely, steady holding and accurate aiming." He then asks, "Is this entirely true?" He in opposition cites the accurate shooting exhibited by big-game hunters as evidence that steady holding, in the sense of holding a rifle perfectly motionless, is not an essential. That contention is quite true, as it concerns big-game shooting; but the latter is so distinct from target shooting that they become distinct specialties, each having methods and principles foreign to the other.

In big-game shooting the measure of success is the kill, and to kill does not necessarily impose that the shooter shall hit precisely where he aimed. If he hits within two or three inches of where he intended, the result may be a kill just the same. Indeed, the shooter at big game might hit a vital part without aiming at any definitely defined spot on the animal shot at. Also, a miss now and then is not counted.

However, be that as it may, holding a rifle steadily at a target and swinging it while shooting at game, introduce a special distinction by itself. In swinging the rifle, the tremors, always present as a result of the heart's pulsation, are largely eliminated by the momentum of the heavy barrel, acting much after the manner of the heavy fly-wheel on a steam engine in so far as it regulates the uneven, throbbing forces which are a part of its dynamics. In like manner the weight of the hand in motion may act as a regulator of motion, as may be observed in frechand drawing. Conversely, let any one attempt to draw a straight or curved line very slowly, so slowly that no momentum is imparted to the hand, and the re-

sult will be apparent at once. Or let any one, who, having steady nerves, refuses to believe that the body is in a state of constant tremor, take a pin between the thumb and forefinger of each hand, hold his hands out before him and extending his arms about as they would be in rifle shooting, holding the two points of the pins within a hundredth part of an inch without moving, and note the results. The slightest hand cannot hold the pins immovable. Such disturbance profoundly affects the flight of a bullet.

Let us now consider shooting at a modern target in a gallery, at 25 yds. The target registers mathematically any variation from a point about one-quarter inch in diameter.

There are target shooters who cannot hold steadily, so they utilize the momentum of the rifle, holding as steadily as they possibly can, but pulling the trigger on a swing that will cross the bullseye. It is impossible to line this style of shooting to the precise nicety for steady scoring. A marksman may succeed in making a bullseye, shot after shot, and then, through an error of the thousandth part of a second in timing the swing, drift off the bullseye, and lose a contest by one wild shot. In target shooting one bad shot in 100 spoils the other 99 good ones in a competitive sense. In big game shooting, one bad shot in 100 would be entirely negligible.

To eliminate as much as possible, by mechanical aids, the dynamical movements of the body, caused by the heart pulsations, uneven muscular tensions, and changes from the accustomed poise, the new poise forcing the shooter to adjust himself to a new center of gravity in rifle shooting, gallery rifle shooters use the Schuetzen butt plate, the spur trigger lever, the palm rest, the check piece, thus obtaining as many army and advantageously fixed points of contact with the body, to promote steady holding. All these would be an obstruction in big game shooting, though so essential for steady holding where results are measured by small fractions of an inch as against the method of measuring results in big game shooting, where mathematical accuracy is not considered.

Any one who has observed the crack gallery rifle men in action will have noted that they endeavor to hold the rifle perfectly motionless. Sometimes one will take five minutes to make a single shot while endeavoring to tighten his muscles evenly, to inflate or deflate his lungs to the right degree of fullness, and to school his nerves to the right steadiness. If he fails to reach the point of physical and mental co-ordination, which he judges necessary, he will place his rifle on the rest, relax, and after a few moments begin the shot all over again. Even those best equipped by nature and by training cannot entirely eliminate the dynamic disturbances, for, while they can almost reach perfection in scoring, they cannot quite do so. If they were to use hunting rifles, with shotgun butts, and otherwise devoid of all the mechanical aids of the Schuetzen rifle, their target scores would make merry the spirit of the novice. I may not have succeeded in making my distinctions clear, in a full and complete manner, but in a general way, I think, Yellowstone will concede that the subject is at least debatable.

Ohio Rifle Notes.

THE Dayton Sharpshooters held their forty-second annual king shoot and the monthly cup contest on Oct. 26. Owing to the rain of the previous day and the threatening cold weather, the attendance was not what had been expected, but there was a good representation of the clubs of Montgomery, Darke, Preble, Shelby, and Warren counties. The day was dark and lazy, making a very poor light, and a light wind across the range affected the scores. The club celebrated to-day the seventy-ninth anniversary of John F. Beaver, one of the charter members of the club, which was organized in 1833. Mr. Beaver was presented with two large bouquets of "mums" and pinks from friends, and with a handsome chair from the club. He is as young as the youngest member, apparently, and his score indicates that he still retains his skill. The shooting was all at 200 yds., the free-for-all contests being at muzzle rest and offhand, on targets with 12 in. butt, 1 1/2 in. center, 3/4 in. rings; center value 25; three shots in each, possible 75; re-entries allowed. Ten money prizes in each. The winners in the muzzle rest match in order as given, were: Adolph Schwind 68, J. Bochner 67, C. W. Sander 66, G. R. Decker 66, C. Whealen 65, M. J. Schwind 65, W. H. Sander 65, D. U. Berg 62, A. N. Cummery 61, C. Lang 61. The ties were shot off. Prizes ranged from \$6.20 to \$1.20. There were over eighty entries. In the offhand match there were forty-two entries. The winners in order were: A. N. Cummery 62, J. Johnson 61, T. N. Parks 61, M. J. Schwind 56, C. W. Sander 49, C. W. Matthews 43, F. H. Duke 41, G. R. Laudonback 41, J. Brandenberg 37, J. Behner 35. Prizes ranged from \$3.30 to 65 cents. The king shoot was at 200 yds., muzzle rest, 5 shots, possible 120. The target used in this match was the Schuetzen target, 1/2 in. rings, center value 25. H. K. Schwind won the honor with 100. He takes the vacant and wears the regalia as king for the coming year. The medal was presented to him by Col. Ashley Brown, a duty regalia he has ably performed for a number of years. This is which members pay, and each received a merchandise prize in open to all. J. Bochner 105, J. F. Beaver 104, A. Schwind 102, order given: G. H. Sander 96, M. J. Schwind 95, W. J. G. R. Decker 94, D. Berg 93, C. W. Sander 94, C. Lang 94, G. W. Kernan 90, E. J. Bunderthal 82, W. M. Eisenberg Sander 88, J. Capper 85, C. Whealen 78, B. Mescher 76, Wm. H. Sander 79, C. Whealen 79, was won by John F. Beaver with Schwind 69. The tie shot: Schwind 101, A. Schwind 100, G. H. 108, John Rappold 100, H. K. Schwind 100, J. Bochner 94, Sander 100, C. Whealen 100, D. U. Berg 90, C. W. Sander 85, M. J. W. J. Kernan 91, E. J. Bunderthal 82, G. W. Sander 81, G. K. Decker Schwind 84, W. H. Sander 81, G. H. Sander 81, G. H. Sander 81, and 95, B. Mescher 63. The prize ranged from \$3.00 to \$1.20, and were five in number. The cup has been shot for six times this season, the winners being: May, J. W. Sander, 107; August and Schwind, 108, 104 and 104; July, J. W. Sander, 108. Mr. Beaver has won the October, John F. Beaver, 120 and leads Adolph Schwind, cup nine times since it was put up points in aggregate scores, who has won it eight times, by 44 as usual, and lunch was to dinner was served by Adolph Sander. An open grate of the club house made comfortable conditions for the shooters and scorers.

At Shell Mound—Steady Handicaps.

SAN FRANCISCO, Cal., Oct. 23.—Some good scores were made at Shell Mound Park yesterday. F. A. Kingston in the re-entry pistol shoot of the Golden Gate Club, made 90, 93, 95, 95, 93—86 yds., Standard American target.

In the three-shot re-entry contest of the Schuetzen Verein, 200 yds., good scores were made, as follows: Louis Bendel 67, 72, 66; D. Salsfield 66; F. P. Schuster 66, 68, 61; Doel 70; Herman Huber 72, 71; O. A. Bremer 70, 71, 73; D. E. Faktor 67, 69, 67, 70; H. Bornholt 73, 66, 68, 73; Fred. Brandt 67, 65; Otto Lemcke 67, 72, Adam Schaefer 63, George H. Bahns 66, 67; F. Koch 67, Charles Peck 66.

I am somewhat astonished at the argument of Yellowstone in your last issue in the matter of steady holding for successful target work. His lack of target experience explains, if it cannot excuse, his attitude. Every target shot knows the fatal consequences of trying to "snap them in." A few good shots may in this way be made in succession; but, as a "flyer" presently is flagged, and the malfunctions of the shooter are fearful to hear. The writer has had many years' experience in both field and target shooting with the rifle, and he has found field shooting only to accomplish the latter a sine qua non is steady holding. ROEEL.

Zettler Rifle Club.

The regular weekly shoot was held at headquarters, 159 West Twenty-third street, New York City, the night of Oct. 24, with a fair attendance for the season. High score was made by the club's secretary, Wm. A. Tewes, who scored 1224 out of the possible 1250 points at 75 ft. offhand, using a telescope sighted rifle. The results follow:

Table with 5 columns: Name, Score 1, Score 2, Score 3, Total. Includes names like W. A. Tewes, Louis C. Buss, H. C. Zettler, Charles Zettler, Jr., Louis P. Hansen, H. D. Keller, T. H. Muller, Barney Zettler, C. G. Zettler, A. P. Fegert, G. J. Bernius.

THE MANY-USE OIL.

Six-ounce can, 25 cents. Safe and Handy for Campers' use.—Adv.

Schuetzen Park Fire.

THE famous Schuetzen Park, at North Bergen, N. J., owned by the Plattdeutsche Volksfest Verein, of New York and vicinity, suffered great loss by fire on Monday afternoon of this week. Two men at work in the park discovered the fire about 2:30 o'clock and hastily notified the lessee, Mr. John Moje, who forthwith, by the aid of the Central Telephone office at Union Hill, alarmed the volunteer fire department of North Bergen, West Hoboken and Union Hill. In the meantime, Mr. Moje fought the flames with a fire extinguisher, but the flames spread so rapidly through the large buildings that his efforts were unavailing. He was soon surrounded by fire and was forced to rush through it to escape. He was burned slightly. When the fire companies arrived, the shooting house, well equipped with rifle ranges, and in size 150 by 100 feet, and the one-story dancing pavilion, 100 by 50 feet, and the new dancing pavilion, 100 by 100 feet, were all in flames and were destroyed quickly. This is a great loss financially, and a great loss to the thousands of the park's patrons, who found in it so much wholesome pleasure.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Nov. 16.—Bound Brook, N. J., G. C. shoot, and Fleming-Bissett contest for the individual championship of New Jersey.
Nov. 16.—Bound Brook, N. J., G. C., all-day shoot. F. K. Stelle, Sec'y.
Nov. 23.—Edgewater, N. J.—Palisade G. C. A. A. Schoverling, Sec'y.
Nov. 28-29.—Marsailles, Ill., G. C. R. E. Loring, Sec'y.

NORTH NEW JERSEY SHOOTING LEAGUE.

- Nov. 2.—Montclair at Morristown.
1906.
Jan. 16-19.—Hamilton, Ont., G. C. annual winter tournament. Ralph C. Ripley, Sec'y.
May 24-25.—Montreal, Can.—Canadian Indians' first annual tournament. Thomas A. Duff, High Scribe.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Chicago, Ill., Gun Club closed their season on Saturday, Oct. 28.

Mr. Frank Lawrence, of New York, left for the West last week on a business trip for the Winchester Repeating Arms Co., of which he is a representative. He will be absent several weeks.

The little birds twitter that Mr. J. S. S. Remsen, of New York, renowned as a skillful trapshooter, has been punctured by Cupid's arrow, and will join the ranks of the Benedicts about this season of this year. "Leaf by leaf the roses fall."

In the third contest for the live-bird championship of Indiana Mr. Hugh M. Clark, of Wabash, defeated Mr. Max Witzgreuter, on the grounds of the Corner Rod and Gun Club, at Fort Wayne, by a score of 89 to 88. Thus Clark scored two wins out of the three contests.

The Hell Gate Gun Club of New York held their regular 10-bird club shoots for August, September and October. Mr. L. H. Schortemeier, of the fourteen contestants, was high man. He scored 29 out of the total of 30, and the one lost bird was "dead out." He shot from the 30yd. mark.

The nineteenth contest of the North New Jersey League series was fixed to take place between Dover and Montclair, on the grounds of the latter club on Saturday of last week. Dover was absent. Montclair won by default. He who fights and runs away obtains vigorous exercise; but he who does not fight doesn't need to run.

Messrs. Von Lengerke & Detmold, during many years conspicuously identified with the highest grade of sporting goods at 318 Broadway, will remove on Dec. 1 to 349 Fifth avenue, New York, and will there resume their present business on an enlarged scope. Their new location is situated opposite the Waldorf-Astoria.

A correspondent informs us that the Corner Rod and Gun Club, of Ft. Wayne, Ind., proposes to open in the spring the most active season in target and trapshooting ever known in Indiana. The ball will be started rolling on April 24, when a three days' tournament will be held at the club's range. Two days will be devoted to targets and one day to sparrow shooting.

The amateur sparrow championship of the United States was won by Mr. Ed. Voris, of Crawfordsville, Ind., at Indianapolis, Ind., Oct. 24, on the grounds of the Indianapolis Gun Club. He also therewith won the amateur live-bird championship of Indiana and the Lieber trophy. He scored 86. Messrs. Hugh M. Clark and E. H. Tripp scored 85. The weather conditions were rainy.

The Carteret Gun Club, of Garden City, L. I., opened their fall season on Saturday of last week. The Chapin cup was the main event at 25 targets, and for it Messrs. H. F. Whitney and John Caswell tied on 21 for high score. In the shoot-off Whitney won. As Mr. Whitney had won the cup twice before, respectively in 1903 and 1904, it is now his property. In a special cup event, Dr. J. C. Ayres was winner, and he also was high average for the day.

On the grounds of the Wawaset Gun Club, Wilmington, Del., Oct. 26, there was positive action in trapshooting matters. Mr. Wm. M. Foord, champion of Delaware, defeated the renowned Mr. Lester A. German, champion of Maryland, in an interstate champion match by a score of 89 to 79. This was followed by a four-man race, \$10 a corner, winner take all. The contestants were Messrs. J. T. Skelly, W. M. Foord, L. A. German and Edward Banks, scoring respectively 91, 88, 87 and 82. Thus Mr. Skelly calmly merged the \$40 with his personal belongings, while showing at the same time that all champions look alike to him.

The Eastern amateur championship will be held at Travers Island, by the New York Athletic Club, some time in December. Competition open to all amateurs. Those who are not amateurs may shoot for targets.

In the Philadelphia Trapshooters' League series, Oct. 28, at Wissinoming, the Florists defeated the Merchantville ten-man team by a score of 208 to 173. On the grounds of the Meadow Springs Gun Club, the Meadow Springs team defeated Clearview team by a score of 225 to 203. The Highland team, on its own grounds, defeated Media, score 199 to 193. Lansdale defeated Narberth by a score of 207 to 171. The North Camden, N. J., Gun Club team defeated the S. S. White team by 208 to 200.

BERNARD WATERS.

New York Athletic Club.

TRAVERS ISLAND, Oct. 28.—The New York Athletic Club weekly shoot to-day was well attended. The October cup will be shot off on next Saturday. Messrs. S. Scott, Grieff and Dr. Brown have each one win on it. The targets were thrown 50 yds., from a set of new expert traps. A big crowd is expected for the Election Day shoot for trophies. Shooters of the club seem to take a greater active interest this season than ever before. All seem to be satisfied with their handicaps.

Hearn won events 6 and 7. Dr. Brown did not shoot for trophy in No. 7.

Practice event, 25 targets:

Table with 2 columns: Name, Score. Dr De Wolf 19, G E Grieff 21, W Hearn 20.

Trophy event, 25 targets, handicap:

Table with 4 columns: Name, Yards, Score, Name, Yards, Score. W Hearn 7, 23, W A Hibbard 5, 25, Dr De Wolf 4, 24, F Vilmar 7, 13, G Grieff 0, 21.

Event 3, 10 targets:

Table with 4 columns: Name, Score, Name, Score. De Wolf 9, P R Robinson 0, Grieff 8, H Keller 7, Hubbard 7, J Tanty 3, Vilmar 5, F Ehlers 3.

Event 4, 15 targets:

Table with 4 columns: Name, Score, Name, Score. De Wolf 8, Dr Brown 10, Grieff 14, Marshall 7, Hearn 14, Tanty 1, Hubbard 8, Kuchler 4, Keller 10, Vilmar 10, Robinson 6.

October cup, 25 targets, handicap:

Table with 4 columns: Name, Yards, Score, Name, Yards, Score. De Wolf 4, 14, Markell 7, 19, Grieff 0, 23, Vilmar 7, 15, Hearn 1, 22, Kuchler 7, 15, Hibbard 5, 17, Tanty 7, 16, Keller 2, 17, Ehlers 4, 20, Robinson 7, 17, Whitney 3, 21, Ramey 4, 21, F Burns 5, 21, Dr Brown 6, 19.

Event 6, 25 targets, handicap:

Table with 4 columns: Name, Yards, Score, Name, Yards, Score. Dr Brown 6, 23, Markell 7, 23, Ramey 4, 25, Tanty 7, 14, Grieff 0, 23, Vilmar 7, 19, Hibbard 5, 24, Ehlers 4, 22, Keller 2, 21, Burns 5, 17, De Wolf 4, 25, Hearn 1, 25, Robinson 7, 22, Ehlers 4, 22.

Trophy shoot, 25 targets, handicap:

Table with 4 columns: Name, Yards, Score, Name, Yards, Score. Dr Brown 6, 25, De Wolf 4, 21, Payne 4, 23, Markell 7, 19, Grieff 6, 21, Hearn 1, 24, Hibbard 5, 21, Ehlers 4, 22.

Clark—Witzgreuter.

FT. WAYNE, Ind., Oct. 23.—A large crowd was present to witness the third sparrow contest between Messrs. Hugh M. Clark, of Wabash, and Max Witzgreuter, of Fort Wayne, for the championship of Indiana, on the grounds of the Corner Rod and Gun Club. The contest was at 100 sparrows. Clark won on the narrow margin of one bird, but that was sufficient to capture the live-bird championship of the State, the Freese & Gale medal and the purse of \$100 hung up for the occasion. The Wabash man scored 89 to his opponent's 88.

The skies were cloudy, making difficult for the men to see the small birds; the air was cold and a brisk wind blew, and the birds were lively. Considering these conditions the score was remarkably good, even if below the records established by the men in the two previous races this season.

The race yesterday was the third shot by Witz and Clark within the past few weeks. One was won by Witz, two by Clark. Including the preliminary events, shot along with the three 100-bird events, Clark and Witz have each made a score of 335 birds in the series.

The preliminary events scheduled for yesterday were called off because of the inability of the managers of the shoot to procure enough live sparrows. The shooting yesterday will be the last of the season at the Corner Rod and Gun Club's grounds, and the handsome club house will be given over during the winter for social events.

The scores in the big race were as follows:

Table with 2 columns: Name, Score. Witz 89, Clark 88.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Oct. 24.—Mr. Ed. Voris, of Crawfordsville, Ind., with a score of 85 out of a possible 100, won the sparrow championship of the United States for amateurs, and also the amateur championship of Indiana, and the Lieber live bird trophy.

Mr. Hugh M. Clark, of Wabash, and Mr. E. H. Tripp (E. Z. Pash), of Indianapolis, were only one bird behind Voris, and tied for second place on scores of 88 each. The weather conditions were bad all day—rain.

Table with 5 columns: Name, Shot, Killed, Name, Shot, Killed. Includes names like Sparrows, H M Clark, E Z Pash, Voris, Howard, Moore, Smoke, Parry, Hillis, McIntosh, Moller, Johnson.

WM. ARMSTRONG, Sec'y.

New England Kennel Club.

BRAINTREE, Mass., Oct. 28.—Close competition was in evidence at the shoot of the New England Kennel Club to-day. W. F. Beal and Harry N. Richards were tied on 24 at the end of the regular contest, and in the shoot-off Mr. Beal won out. The weekly club cup was won by Col. R. H. Morgan. The scores:

Table with 4 columns: Name, Brk. Hdp., Tot'l., Name, Brk. Hdp., Tot'l. Includes names like R H Morgan, Dr C G Weld, R O Harding, W F Beal, H N Richards.

### WESTERN TRAP.

#### At Lilly Lake.

LILLY LAKE, Ill., Oct. 23.—There are many shooters along the lakes that are connected by the Fox River. Where you find traps there you generally find trapshooters. So it came in the natural order of things that, with the opening of the fall duck shooting that a tournament and a game dinner should be held. Lilly Lake was the place selected, and John Boulett was the host. The dinner was a great success, and those present enjoyed the duck and "fixings" immensely.

Only part of the shooters reported before dinner, and after dinner most of those who made away each with a whole duck, could not shoot well. The regular programme was not followed by the management, and most of the events were 10 targets. There were some events open only to green shooters, and these proved popular. Billings was the only man to shoot in all the events; he made 129 out of 145. Mr. Stodfield made a good score for the number of events, getting 53 out of 60 shots.

The Graham that you see as present is a brother of J. R. and L. and the Dunnell is a cousin of Bert and Harry Dunnell, the best Fox Lake shooters. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	Shot at.	Broke.

#### Cincinnati Gun Club.

Saturday, Oct. 28, was a good shooting day, and the boys took advantage of one of the old-time crowds taking part in the grand shoot for the Ackley trophy. In addition to the practice events, a couple of exciting team matches were shot. A good crowd will be present on Oct. 29, and a number will shoot their scores in the trophy event on that day.

On Oct. 22 the following shot their scores in the first contest for the Cements trophy, as they could not visit the grounds on the 21st: Blech (18yds.) 46, Tuttle (16) 44, Gambell (16) 39, Zimmerman (16) 41, Peters (16) 37, Lockwood (16) 37, J. T. Williams (16) 39, on Minto (18) 42, H. Sunderbruch (16) 38, Myers (16) 32, Sohner (16) 40, Villie (16) 40, Tennett (16) 40, J. Zimmerman (16) 42, Schery (16) 36.

In the practice shooting, Keplinger shot at 205 and scored 160. Williams is doing fine work, and Maynard is also going a lot. McKee, of Portsmouth, O., was a visitor and smashed a few. McKee returns from Duck Island on the 30th in time to celebrate allowance. A team match with Chicago would be an interesting event, and if any of the clubs want some good sport, the secretary should correspond with Supt. Arthur Gambell, St. Bernard, Mo., and terms can easily be arranged for a twenty-five-man team match at 100 targets per man.

Ackley trophy, 50 targets. Scores:

Yards.	Total.	Yards.	Total.

#### Rohrer's Island Gun Club, Dayton, O.

The club closed the series of thirty-two weekly handicaps for a medal and cash prizes on their grounds, on the Mad River, Oct. 27. The event is at 25 targets, with handicap of extra targets, one winning the most times to receive a cash prize of \$15; second, \$10; third, \$5, and fourth, a leather medal suitably engraved. The first of the series was shot on March 22, and four postponed events were shot to-day. The first was won by Phil Hanauer, Gus A. Hodapp the second, M. J. Schwind the third, and Ed. Cain the fourth.

Hodapp has won the medal four times during the season; Cain, three; Miller, four; Miller and P. Hanauer, three each; Rike and Oswald, two each; Heikes, Whitacre, Lockwood, Kuntz, Carr, and Hanauer, J. Schaeff, and M. J. Schwind, one each. First prize was won by Ed. Cain, after a shoot-off. Wm. Oldt second; Miller third. Oswald was awarded the leather medal. Rike was not on hand to receive it. Several sweeps ended a year of good sport, as well as a successful season. The scores: Medal match No. 1, 25 targets, handicap:

	Shot at.	Broke.		Shot at.	Broke.
P Hanauer	30	25	E Cain	28	21
H Oswald	30	24	W Oldt	29	21
G Hodapp	32	24	C Miller	29	21
L Whitacre	32	24	J Schaeff	30	19
M Schwind	26	23			

Hanauer won, being the only one to score 25 or better. Medal match No. 2:

	Shot at.	Broke.		Shot at.	Broke.
E Cain	29	26	Miller	29	24
Hodapp	32	26	Whitacre	32	24
J Schaeff	35	26	Oswald	30	23
Oldt	29	25	Schwind	28	21
Hanauer	30	25			

Shoot-offs of ties:

	No. 1.	No. 2.	No. 3.

#### Garfield Gun Club.

Chicago, Oct. 28.—The appended scores were made on our grounds to-day on the occasion of the seventh and last trophy shoot of the fourth series.

In the club trophy event, Dr. Meek and George tied in Class A on 22, Stone won in Class B on 21, and John Wolff won in Class C on 11.

In the Dupont cup event, Dr. Reynolds won Class A on 20 straight; Stone won Class B on 17, Mrs. Wolff won Class C on 9.

In the Hunter Arms Co. event, 10 singles and 5 pairs, John Wolff and George tied in Class A on 18, Stone won Class B on 15. No Class C shooter in contest.

The day was not a good one for target shooting, as a Lake breeze from the rear chilled the shooters, and caused the targets to beat down very quickly, and as a consequence few good scores were made. This closes the season on our grounds.

Events:	1	2	3	4	5	Events:	1	2	3	4	5
Targets:	25	20	20	10	10	Targets:	25	20	20	10	10
Dr Reynolds	19	20	14	9	10	T Smedes	21	17	16	9	6
Thomas	20	13	16	7	9	George	22	13	18	6	7

Eaton	19	14	17	4	7						

No. 1 was the trophy contest. No. 2 was the Dupont cup. No. 3 was the Hunter trophy. Dr. J. W. MEK, Sec'y.

#### Columbus, O., Gun Club.

The Columbus Gun Club held a most successful tournament on Oct. 26 and 27, although the attendance was not quite up to anticipations, owing to the heavy rains the first of the week and

threatening prospects on Thursday. The occasion was the dedication of the club's new grounds and house, and the members are to be congratulated on their elegant home. Every one present praised the fine equipment and also the manner in which the managers handled things. Not a bit of friction during the two days.

The trade was represented by C. A. Young, C. W. Phellis, R. L. Trimble, R. O. Heikes, C. O. Le Compté, T. A. Marshall, D. D. Gross and L. H. Reid.

On the first day forty-two took part, twenty-six shooting the entire programme of 200 targets. R. S. Rhoads was high gun with 194, leading professionals and amateurs. Tryon and Hulshizer, amateurs, tied for second with the expert C. A. Young, with 191. C. W. Phellis and Ralph Trimble third with 190 each.

On the second day forty-three were on hand, and thirty-one shot through. Tryon was high with 190, Rhoads a close second with 189, Fisher and Phellis third with 188 each.

Rhoads was high amateur for the two days with 383. Tryon second with 381. Phellis was high professional with 378. Young second with 377. The scores:

#### First Day.

deed was assigned. He was forty-nine years of age, quiet and unassuming in his demeanor, and apparently had no reason, if there can ever be a reason, for such an act. He will be missed at future tournaments by a host of friends.

Raleigh Tournament.

THE fifth annual tournament of the Raleigh, N. C., Gun Club, held Oct. 17 and 18, had a very fair attendance, and every one was pleased with his visit to our city, although we were taxed for accommodations on account of our State fair being held at the same time.

Several familiar faces were absent, and we were sorry that it was so they could not be with us. Walter Huff, the popular representative, was in the far West, out of his usual stamping grounds, but no doubt he is winning averages and friends there, as he does with us.

George Lyon, of Durham, N. C., the best amateur in the State, has been in the Northwest with Mr. Huff, and he cut his trip short just to get back for our shoot, much to the pleasure of all.

An extra event was shot on the first day for a \$50 grade Parker trap gun, and was won by R. T. Gowan, of the Raleigh Gun Club, score 48 out of 50. The following scores were made, shooting at 25: Lyon (20) 24, Walls (18) 24, Gowan (17) 24, McLelland (18) 23, Killeit (17) 23, Ellington (18) 23, Todd (19) 22, Collins (19) 22, Johnson (18) 22, Crayton (18) 20, Anthony (18) 20, Fultz (17) 19, Barrett (18) 19, Simms (19) 18, Webb (18) 16.

The tie between Lyon, Walls and Gowan resulted as follows: Gowan 24, Walls 23, Lyon 20.

The scheduled event of 100 targets for the beautiful loving cup donated by the Laffin & Rand powder Co., was won by G. M. Collins, of Due West, S. C., score 90. It was very dark before the last event was shot, and some of the boys fell down owing to darkness, which was very much against them. Lyon was 4 targets ahead until the last event, and every one was sure he would win the cup, but Collins proved a better night shooter than any of the rest, and won over Lyon by one target. Lyon has to use glasses, and of course was out of the race when it began to grow dark.

The following scores were made in the cup race:

Table with 2 columns of names and scores. Includes Collins (24), Walls (18), Lyon (19), Todd (18), Crayton (18), McLelland (13).

Several more started in the race, but dropped out when they found they could not win out.

Mr. Jas. I. Johnson, the president of our club, could not finish out the programme on the second day on account of official business connected with the reception of President Roosevelt. He is the honored mayor of our city, and takes great interest in trap-shooting, being the best shot in our club. It was a great disappointment to him not to be able to finish the programme.

We were all pleased to have Mrs. J. Mowell Hawkins as an interested visitor to our tournament, and we hope she will continue to visit our shoots with her husband, who is the best shot in this territory, sent out by the trade, and a decidedly clever gentleman. We are always glad to welcome him to our city and tournaments.

The other trade representatives present were Col. J. T. Anthony and Emory H. Storr. They have friends by the score, and are always expected to attend our tournaments.

Every one in the trapshooting fraternity knows Mr. J. Mowell Hawkins by his many good records and averages won. He made the longest run during our shoot.

We were very fortunate in securing Mr. John W. Todd, of Charlotte, to manage the finances, and every one knows that he is an expert when you put him in this position or any other where calculations are to be made. He is also a fine shot, making five straights in the first day's shoot.

J. Mowell Hawkins won high average on both days, while Geo. Lyon was second, and Emory H. Storr was third.

Scores, fifth annual tournament Raleigh Gun Club:

Large table with columns for First Day, Second Day, Total, Shot at, Broke. Lists names like Hawkins, Lyon, Storr, McLelland, Todd, Walls, Collins, Crayton, Simms, Anthony, Ellington, Fultz, Killeit, Harris, Johnson, Gowan, Daughtreige, Barrett, Webb, Goode, Watson, Simms, Pierce, Guildford, Slater, Pearce, Whitaker, Jenks, Gibson, Bobbitt.

Wawaset Gun Club.

WILMINGTON, Del., Oct. 26.—There were events of importance on the grounds of the Wawaset Gun Club to-day. An interstate amateur championship match between Mr. Wm. M. Foord, of Wilmington, champion of Delaware, and Mr. Lester A. German, of Aberdeen, champion of Maryland, was an important feature. Mr. Foord won by a score of 89 to 79. A stiff wind affected good shooting.

The championship scores at 100 targets, were as follows: Wm M Foord... 22 23 22 22—89 L A German... 20 18 20 21—79 This was followed by a four-man contest at 100 targets, \$10 entrance, thus making a purse of \$40. Winner to take all. Mr. J. T. Skelly won with a score of 91 out of 100, an excellent performance, unfavorable weather conditions considered; or, indeed, if the weather was favorable, it was a good score.

Mr. Foord was second high man, and Mr. German was third. At the close of the third string of 25 Mr. Skelly was ahead of Mr. German by 2 targets. In the last round Mr. Skelly missed one target, while the Maryland champion dropped 3.

The other contestant in this race was Mr. Ed. Banks, while J. B. McHugh shot to complete the squad. Both races were shot from the 16yd. mark. The scores follow:

J T Skelly... 22 24 21 24—91 L S German... 19 23 23 22—87 W M Foord... 22 21 22 23—88 Edward Banks... 24 17 20 21—82

In addition to the championship and four-man races, there was sweepstake shooting, and the full scores for the day follow:

Table with columns for Shot at, Broke, Av. Lists names like German, Foord, McHugh, Skelly, Banks, Armstrong.

THE MANY-USE OIL

Polishes and preserves stock, barrel and case; 6oz. can 25c.—Adv.

Jacksonville Gun Club.

JACKSONVILLE, Ill., Oct. 25.—At the shooting grounds used by the Jacksonville Gun Club during the past two days a lively tournament has been in progress. While the contestants were limited to twenty, there was much enthusiasm, and many big scores were made.

The big scores were made possible by good weather conditions, assisted by good trapping and perfect flights. The two Scotts and Jim Groves are a great combination, whether they are managing a shoot or pointing a scatter gun. They attend many shoots throughout the State and are deservedly popular.

The traveling men turned out well, as there were present Messrs. Viemeyer, Spencer, Lord, Fitzsimmons, Stannard and Steensberg.

Spencer was high man with 383 out of 400, having made 194 on the second day. Lou Fisher was second with 378. Ed. Scott, the home boy, third, 375. Bart Lewis made 191 first day, but lost so many the second day that he came in third. Scores:

First Day.

Table with columns for Events, Targets, Names, Scores, Shot at, Broke. Lists names like Viemeyer, Ed Scott, Thos Hall, Lou Fisher, C Spencer, Lord, Habilt, Groves, B Scott, B Lewis, W B Stannard, Gilbert, Fitzsimmons, Steensberg, Morris, Perrine, Geobel, Moshier, Magill, Kiley.

Second Day.

Table with columns for Events, Targets, Names, Scores, Shot at, Broke. Lists names like Viemeyer, Groves, Z Scott, Lou Fisher, Fitzsimmons, Ed Scott, Morris, Magill, Habilt, Englebrecht, C Spencer, T Hall, Steenberg, Stannard, Lewis.

Crescent Athletic Club.

BAY RIDGE, L. I., Oct. 28.—Good competition and pleasant weather marked the last of the October shoots of the Crescent Athletic Club. The Snyder trophy was won by Dr. J. J. Keyes. The Lott trophy was won by Mr. W. W. Marshall. The Mullerite trophy was won by Mr. O. C. Grinnell, Jr. All the events were handicaps. The scores follow:

Trophy shoot, 15 targets: W. W. Marshall 12, D. C. Bennett 12, J. N. Teeter 12, A. G. Southworth 7, W. C. Damron 7.

Shoot-off, same conditions: D. C. Bennett 13, W. W. Marshall 9, J. N. Teeter 8.

Trophy shoot, 15 targets: A. G. Southworth 15, D. C. Bennett 11, L. C. Hopkins 11, W. W. Marshall 10, W. C. Damron 10, G. L. Blake 10, E. W. Snyder 9, J. N. Teeter 9.

Trophy shoot, 15 targets: E. W. Snyder 14, A. G. Southworth 13, D. C. Bennett 13, O. C. Grinnell, Jr., 13, L. C. Hopkins 12, J. N. Teeter 12, W. C. Damron 10.

Snyder trophy, 25 targets: O. C. Grinnell, Jr., 22, A. G. Southworth 21, Dr. J. J. Keyes 21, W. C. Damron 15, W. W. Marshall 14.

Mullerite trophy, 25 targets: A. G. Southworth 23, W. C. Damron 23, O. C. Grinnell, Jr., 21, Dr. J. J. Keyes 19, W. W. Marshall 17.

Lott trophy, 50 targets: W. W. Marshall 48, A. G. Southworth 42, Dr. J. J. Keyes 41, W. C. Damron 36.

Trophy shoot, 15 targets: C. A. Lockwood 15, W. C. Damron 13, H. W. Bissing 12, D. C. Bennett 12, E. W. Snyder 11, J. N. Teeter 10, Dr. Keyes 10, W. W. Marshall 9, A. G. Southworth 9, O. C. Grinnell, Jr., 9, L. C. Hopkins 6.

Trophy shoot, 15 targets: A. G. Southworth 14, H. M. Brigham 13, C. A. Lockwood 13, O. C. Grinnell, Jr., 12, E. W. Snyder 10, W. W. Marshall 10, Dr. Keyes 10, W. C. Damron 10, H. W. Bissing 9, J. N. Teeter 9, L. C. Hopkins 8.

Trophy shoot, 15 targets: C. A. Lockwood 15, Dr. J. J. Keyes 15, H. W. Bissing 13, W. W. Marshall 13, A. G. Southworth 13, E. W. Snyder 12, W. C. Damron 12, H. M. Brigham 12, J. N. Teeter 11, L. C. Hopkins 5.

Trophy shoot, 15 targets: C. A. Lockwood 15, A. G. Southworth 14, L. C. Hopkins 13, W. W. Marshall 11, W. C. Damron 10, Dr. J. J. Keyes 7.

Trophy shoot, 15 targets: C. A. Lockwood 15, A. G. Southworth 14, W. C. Damron 13, L. C. Hopkins 8, H. M. Brigham 6.

The regular monthly cup season begins on Saturday of this week. In the three shoots held in October, about 4,300 targets were trapped. The totals of the scores made for the three trophies, Snyder, Mullerite, and Lott, follow:

Table with columns for Name, Oct. 14, Oct. 21, Oct. 28, Total. Lists names like Dr J J Keyes, O C Grinnell, Jr., A G Southworth, W W Marshall, W C Damron, V W Marshall, Dr Raynor, H M Brigham, C E T Foster, Dr H L O'Brien, H B Vanderveer, J N Teeter.

Mullerite trophy: O C Grinnell, Jr. 25, A G Southworth 20, Dr Keyes 22, W C Damron 20, V W Marshall 21, Dr Raynor 19, H M Brigham 22, C E T Foster 20, Dr O'Brien 19, E H Lott 16, H B Vanderveer 9.

Lott trophy: W W Marshall 47, A G Southworth 36, Dr Keyes 43, W C Damron 43, O C Grinnell, Jr. 42, H M Brigham 47, H B Vanderveer 21.

Club cups and trophies:

Table with columns for Name, Shot at, Broke, Per Cent. Lists names like C A Lockwood, H M Brigham, T W Stake, Dr Keyes, Dr Raynor, Dr O'Brien, L C Hopkins, D C Bennett, O Grinnell, Jr., E H Lott.

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., Oct. 28.—Some twenty-eight men were present at the regular weekly shoot of the club. The day was also the day set apart for the nineteenth team race among the clubs of the North New Jersey League, and it was Dover's turn to visit Montclair.

Dover did not arrive for some unexplained reason, and the match went to Montclair by default. Scores made by the Montclair team were: Perley 19, Howard 19, Moffett 18, Bush 16, Allan 17; total 89 out of a possible 125.

Besides the team race, some eight other events were run off for silver prizes. Among the winners were Messrs. Moffett, Bush, Babcock, Sovarel, Chickner, Perley and Crane. The trade was represented by Messrs. Glover and Elliott.

The final team race of the present series will take place at Morristown, on Nov. 2; Montclair shooting against the Morris Club.

The Montclair Club will hold a silver shoot on the afternoon of Election Day.

Table with columns for Events, Targets, Names, Scores, Shot at, Broke. Lists names like Elliott, Glover, Moffett, Gardiner, Perley, Bush, Wallace, Woodward, Crane, Nott, Talbot, Babcock, Milliken, Hartshorne, Allan, S R Sovarel, W I Sovarel, Holloway, Holmes, Cockefair, Batten, McDonough, Doremus, Winslow, Connett, Howard, Count, Chickner.

Hell Gate Gun Club.

OCT. 23.—The Hell Gate Gun Club to-day held three monthly shoots in one, for August, September and October, each at 10 birds.

The weather was partly cloudy, with a wind blowing strongly across the traps from left to right. Most of the members made some excellent second-barrel kills. Some strong incomers escaped. Schortemeier was favored somewhat by the birds flying into the shot charge—so the other contestants claim. A good dinner and a fine time made a pleasant day.

Contest for August had scores as follows:

Table with columns for Name, Points, Rise. Lists names like C Lange, J Klenk, P Garms, L H Schorty, J H Voss, J Schlicht, Baudendistel, Albert, Muench, Weber, Belden, Selg, Kreeb, Woelfel.

September shoot, 10 birds, follows:

Table with columns for Name, Points, Rise. Lists names like C Lange, J Klenk, P Garms, L H Schortemeier, J H Voss, J Schlicht, Baudendistel, Albert, Muench, Weber, Belden, Selg, Kreeb, Woelfel.

October shoot, 10 birds, follows:

Table with columns for Name, Points, Rise. Lists names like C Lange, J Klenk, P Garms, L H Schortemeier, J H Voss, J Schlicht, Baudendistel, Albert, Muench, Weber, Belden, Selg, Kreeb, Woelfel.

Total for the three contests: Lange 23, Klenk 22, Garms 21, Schortemeier 29, Voss 26, Schlicht 24, Baudendistel 22, Albert 27, Muench 27, Weber 27, Belden 25, Selg 18, Kreeb 23, Woelfel 23.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., Oct. 25.—The Rochester Rod and Gun Club held their regular shoot to-day. A number of members made up back scores and re-entry strings were shot. The contest will end with the next shoot, and interest is keen. The results:

Table with columns for Name, Brk. Hdp, Tot'l. Lists names like Stoddard, Sterling, Weller, Rickman, Kershner.

Back scores: Newton 19, 2, 21, Kershner 20, 2, 22, Newton 19, 2, 21, Sterling 19, 8, 23, Sterling 19, 8, 27, Sterling 15, 8, 23, Kershner 17, 2, 19, Sterling 14, 8, 22, Kershner 19, 2, 21.

Allen withdrew on six strings. Re-entry scores:

Table with columns for Name, Points, Rise. Lists names like Sterling, Newton, Stoddard, Rickman.

Stoddard withdrew on seven strings. Rickman withdrew on three strings. Weller withdrew on three strings.

PUBLISHERS' DEPARTMENT.

After Nov 1, "Charities," of New York, and "The Commons," of Chicago, will be merged. The combined weekly journal is a distinctly American idea—more or less of a co-operative undertaking among those who know conditions first hand, and are shouldering such movements as housing and child labor reform, the prevention of tuberculosis, and the social utilization of public schools. The editorship will be in the hands of Edward T. Devine, of New York, and Graham Taylor, of Chicago.

### THE ANGLER AND THE BOY.

WHY is it that in this country—and this country only, far as we know—the practice of fly-fishing and the use of fine tackle should be rated a sort of huge joke by those who cannot appreciate them? Is it not because the masses are not educated to that point where they may comprehend these refinements of the art?

It is not so in Great Britain. There the common people along the streams are anxious to secure fine tackle, well aware that it is the most killing of all tackle. But in some of the rural parts of America a fine fishing tackle appears to be held as synonymous with the outfit of a "luffer"; and the use of such implements by an angler is accepted as *prima facie* evidence that he must be a greenhorn, unskillful and unsuccessful in his sport. On the other hand, the employment of primitive tackle is associated in the minds of your rural reasoner with a big ring of fish at the close of the day—the length of the ring and the size of the fish being in inverse proportion to the diminutiveness and raggedness of the small boy who wields the pole.

We venture to assert our belief that these common notions of the rural angler's belief arise from a total misconception of the facts and principles involved, and from a wrong association of ideas in the mind of the rustic reasoner. We will try to explain what we mean.

A certain country angler has a large local reputation. He uses tackle of the coarsest description. He cuts his "pole" in the woods. He is a successful fisherman; that is, he captures many fish. But his success is most certainly not due to his primitive tackle. He catches lots of fish because he knows every foot of the stream and just where the fish are to be caught. He loses no time in trying stretches of water where there are no fish. As a matter of course he comes home with a good "mess of trout." And, by the way, it may be that this man has not the first conception of what sport is. His only thought is fish. If he has taken twenty trout in a day more than another man he deludes himself with the belief that he has had more sport, and that it is something to brag of. It matters not how the fish are taken. If another man came up with a net and 40 pounds of fish more than he has, our genius of the pole would "knock under" to him as the superior fisherman.

The bait-fisher, with his coarse tackle, may, at times, say in the middle of the day, take more fish than his companion with the fly, but in the long run, day in and day out, granting to each man an equal knowledge of the waters fished, the angler with fly and delicate tackle will excel the other both in amount of sport had and in weight of creel.

The ragged country boy with a bean pole cannot begin to compete with the man who has light tackle, if the latter be an angler and know how to use his tools. And yet a fiction to the contrary has been going the rounds of the press for the past century, its corrupt doctrines perverting the minds of our angling youth. Stories without end of the urchin's string of fish bought by the "dandy" are rife in the rural press, but are not true in one case in ten. There may have been duffers who have thought that all that was necessary to make them anglers was to buy a great assortment of fancy tackle; but such men do not fish often. A trial once or twice convinces them of their error, and they lay their rods aside for the last novel, or for some other plaything. As for the bare-footed boy, we don't believe in him.

The fly-fisher can fish over more water than the bait-fisher, and can thereby take more fish; and he has a higher kind of sport than the latter knows nothing of. The fly-fisher can take more either of trout or salmon, in a day than the bait-fisher if he knows the ground equally well; and assertions to the contrary would not be listened to by the most ignorant poacher in England, Ireland or Scotland, for he knows that the fly and fine tackle are the best equipment for taking fish.

Does any man mean to say that the boy with the disreputable trousers and the bean-pole would not take as many fish if he had finer tackle, say a fine hook on a fine gut leader and a fine line nearly invisible to the fish? If so, he is severely mistaken. No, the boy with the letter in the post office would be a better angler for a little familiarity with fine tackle. He would take more fish and would learn to enjoy their capture as an evidence of his skill, for this constitutes the chief pleasure of angling. So much for the tackle; and as for the fragmentary

habiliments—there is no connection between the trout and the trousers. Clothes do not make the man, nor the lack of them the fisherman.

### GAME REFUGES.

AMONG the subjects which should come up at the next session of Congress is a bill authorizing the President to set aside within forest reservations, existing or which may be established, game refuges where hunting shall be forbidden.

The notion of such game refuges, first suggested by the FOREST AND STREAM, followed naturally on the establishment of the forest reserves. The Boone and Crockett Club was quick to see the importance of the measure and championed it with ardor. A few other people advocated the action that we urged and it has been more or less written and talked of ever since. A year or two since a bill was introduced in Congress giving such power to the President, but it was opposed by the Speaker and by one or two Congressmen from States in which forest reserves are situated, and failed to be acted on. All the time, however, public opinion in its favor has been growing stronger. The State of Wyoming recently established, adjacent to the Yellowstone National Park, a great State Park, where the killing of game is forbidden. A game refuge has been set aside in the Wichita Mountains, and the people of Los Angeles are preparing to petition Congress for the establishment of a refuge in the forest reserve near to that city.

It is high time that this action should be taken. Big game is growing scarcer. A number of species are approaching perilously near the point of extinction. Except in half a dozen restricted localities in the West, there are no longer any places where a man can go with reasonable certainty of killing the meat that he needs for camp use, to say nothing of getting a good head. One of the most recent books on big game shooting, speaking of the wapiti, or elk, declares that a good head bears six points to the antler; yet, it seems but a short time since a man who wished to carry home with him an elk head would not shoot at anything with less than seven points to the antler, and was always hoping for a head with eight or nine points. The elk are now so constantly hunted that they have no time to grow good heads, and the older and better animals are killed off as soon as they show themselves. The same thing is true of mountain sheep, and in a less degree of deer.

It is difficult to conceive of any valid objection that can be urged against a law authorizing the President in his judgment to set aside such game refuges. No appropriation will be required for their care; no additional force of men need be hired to guard or protect them. They are already in charge of forest wardens, whose pay is provided for under another bill, and would be also in charge of State game wardens to be paid by the various States. The Federal Government would not be called upon at present to expend a single penny for their maintenance. This should be a strong argument in their favor in these days when economy is a favorite Congressional slogan.

Moreover, we have to-day in the Presidential chair a man completely equipped by experience and training to select such refuges. Over considerable portions of some of the forest reserves the President himself has hunted and he is familiar with their adaptability to such a purpose. Moreover, he is in intimate touch with the best sportsmen and the best naturalists of this country, and it need hardly be said, has the entire confidence of the whole people. Mr. Roosevelt himself is in hearty sympathy with this idea, and has frequently advocated it in his written and spoken words.

Since the plan is wholly unobjectionable, since it will cost nothing, and since the Executive favors it, it would seem that Congress should be ready to act favorably on any bill that may be introduced to carry this proposition into effect. But, as has so frequently been said, Congressmen take but slight interest in matters non-political which do not interest their constituents, and unless the residents of States and Territories in which these forest reserves are situated—the people who would be most benefited by the setting aside of these refuges—unless these residents, we say, bestir themselves and urge the matter on the attention of their Representatives in Congress, the matter is likely to be overlooked.

### ADIRONDACK LAND SALES.

THERE was printed in our issue of Oct. 14 a communication from Mr. Raymond S. Spears concerning the sale of Adirondack public forest lands. It was charged that in a long list of transactions, which were specified in detail, the law prohibiting the sale of State land had been violated, because these plots had been sold. We give to-day from a special correspondent in Albany the results of an examination of the record on the books concerning every item in the list cited by Mr. Spears. The result of the examination is to show that the several transfers were made in accordance with law. Very many of the transfers, indeed most of them, were redemptions by the owners of lands which had been held temporarily by the State for payment of taxes. The same law holds as to Adirondack lands that prevails elsewhere, namely, the delinquent taxpayer is given by the terms of the statute a certain time in which to pay back taxes and redeem his property. Commissioner Whipple has already explained that when taxes were unpaid on land, the plot was listed as State land and was so marked in red on the official map, but the actual title of the State to such land was only tentative. It might become valid, if in accordance with the legal procedure the land should eventually be forfeited to the State by reason of non-payment of taxes, or the State title might lapse at any time upon payment of the taxes. When the State's tentative title thus lapsed, the indication of the lands as State lands, shown in red on the official map, would be discontinued and the new map would show the plot again in white as private property.

In many other cases cited by Mr. Spears the State's assumed title was vacated by cancellation as the result of suits brought by the owners to test the right of the State and to establish their own titles.

An examination of the list as presented by our correspondent will show that these two factors of redemption and cancellation account for the vast majority of the changes on the official map from the red color, signifying State lands, to the white marking, signifying private holdings.

It is further shown by the record that the remaining transactions, in which parcels of wild land were sold by the State, were within the warrant of the law prior to the adoption of the constitutional provision of 1895 prohibiting the sale of wild lands within the forest preserve.

As to the legality of the Adirondack land sales, then, the examination of the record, as reported by our correspondent, appears to demonstrate that they were within the sanction of the law.

The transactions under review were of the past. Even had they shown irregularity or corruption on the part of former Forest, Fish and Game Commissioners, they would not have reflected on the present incumbent. Commissioner Whipple has held office for a short time only; but his attitude toward Adirondack timber stealing and his prompt and vigorous prosecution of trespassers and timber thieves have gladly been accepted by the public as an earnest of an honest and independent administration. He should have, and will have, the heartiest support and co-operation.

WE are rapidly coming in the United States to the conditions prevailing in foreign lands as to licenses for hunting. But in a country where the possession and use of firearms by the citizen are so untrammelled, it is almost impossible to realize that in many other countries the enjoyment of these privileges is closely restricted. In our sister republic of Peru, where the frequent revolutions of the past have made every sportsman's gun a potential implement of war, laws have prevailed forbidding the importation of firearms, except under certain rigid conditions, requiring a special license from the ministry of war. The stability of the government of recent years has now prompted a relaxation of the old order, and the instituting of larger liberty. Consul-General Gottschalk reports that a decree has been promulgated at Lima permitting the importation into the republic of arms, powder and shot for hunting purposes, of parlor rifles and their charges, and of revolvers of a caliber not to exceed .32, without the formality of obtaining special license from the ministry of war. The decree will prove a boon to immigrant miners, rubber hunters, etc., whose hunting weapons are often really a part of their business equipment.

## THE SPORTSMAN TOURIST

### Bogus Indians.

I WAS engaged as escort for a mail line in 1879, having charge of two men in each of three stations, the stations being about thirty miles apart. One of the men would accompany each mail wagon on a round trip, while I was supposed to boss the job and see that they did it.

One of my men at the station at which I made my headquarters, Mountain Pass, was taken sick, I sent him in to the post; then took his place myself.

The mail route ran from Fort Sill up in the Indian Territory to Fort Concho, Texas, and the mail was carried on buckboard wagons drawn by two half-broken bronco mules. Only the driver and his escort rode on the wagon. Some of these mules had not been broken at all. When a team of this kind had been hitched to a wagon and the ropes that held them to a post while they were being harnessed were taken off, the mules would start on the dead run and never stop short of the next station. The only way they could be stopped would be to knock them down with an ax.

We had three drivers on this end of the route, two of whom should have been somewhere else. They were deathly afraid of Indians. Why they ever stayed here at all puzzled me. Pay of \$35 or \$40 a month and three meals a day, when they were where they could get it, of saleratus bread, fried bacon and black coffee, would be no inducement for me to do this work, whether I was afraid of Indians or not. I never wanted to go with these men if I could help it.

There were Indians in this country at times. When they came in here they generally came from the north or west, and after making a raid through here, went back there again. I did not expect the driver to fight Indians; that was what I had been sent here to do. Still I did not want him to get rattled, then let his team run into the Indians, or wherever it might take a notion to go, when I began firing.

The third driver, Charley Parton, or as he was called Dutch Charley, was all right; he had served in our cavalry and was not afraid of Indians.

The man I had with me at Mountain Pass was a new recruit that we had lately got from the East, and he also had no use for Indians then; he got over his fear of them later on. Dutch Charley would not let this recruit go with him. On some former trip, when he had the man with him, they had an Indian scare—there were no Indians at the end of it though—and the man had got rattled. Charley said the man had come near shooting him; that he was a coward.

I told Charley what was wrong. These "smart Alects" we had, had been stuffing the man with hair-raising stories of how the Indians would first burn him to death at the stake, then to make sure of it kill him some more, then scalp him.

"You know the stuff we keep on hand to amuse a Rookie," I told him, "you have been there yourself. That man is all right. Let a real Indian open on him and he will fight right enough."

Well, he would rather go alone than take him.

I had just made a round trip with one of these tender-foot drivers who could see an Indian behind every rock and bush, and we had got into the station just as Charley was starting to go alone. That round trip had taken me two days and over 140 miles in a rough buckboard, and I did not much fancy jumping into another wagon nor to go over it again; but I would not let the man go alone.

I could order the man that the driver did not want into his wagon, then tell the driver to pull out. I was in command here, and had it been one of the other drivers, that is what I should have done; but I did not want to do this with Charley.

I swallowed my dinner, then started with Charley. We made the Concho, seventy miles, that day, and the next came as far as Old Fort Chatbourne on our way back. Here we were given a pair of these unbroken mules, about the meanest pair on the line. Charley always got them; the other fellows were afraid of them.

The road out of Chatbourne for a mile or two ran through a grove of post oaks and was partly down-hill. Here our team began to jump and plunge, and the off mule got his left hind leg over the trace and tongue. He managed to get it back off the tongue, but still had it over the trace. He might keep it there now for the next thirty miles. If we tried to free him our heads would get kicked off. So we let the trace stay sawing there under his belly and against his leg; if it suited him, it ought to suit us.

The road ahead of us for the next twenty-five miles ran through a prairie thickly covered with bushes or chaparral. We had gone several miles over this road when I noticed two men off to the left and a mile or two ahead of us. They sat on their horses behind a bush that just showed their heads and shoulders above it, and were 200 yards from the road. When we had got closer I saw that both of them had blankets pulled up around their shoulders.

"Yonder are our Indians," I told the driver. "But there is only one apiece for us."

We got our carbines up from where they lay under our feet, Charley standing his up between his legs while I held mine. We were two miles away yet, but the mules were going over these two miles very fast. I kept my

eye on the men and also on the road in front of us. If they were Indians the two were not the only ones here.

We were nearly opposite to them now, and, jumping up, I braced my left leg against the seat to steady me, then sprung my lever. I had a Spencer and the driver had another one.

"Don't fire," the driver told me, "if they let us go, let them go. I am afraid of this team."

I sat down again. I knew that the driver was right. If this team began to plunge again—and they would—they might get tangled up worse than they were now or break the tongue. We had another team do that later on; they broke the tongue short off at the neck yoke. If that should happen then we might stop here and fight Indians all day, and we would stand a poor show with them among these bushes.

The men sat there looking at us but never moved, and in a minute or two they were far in our rear.

"I hate to leave those fellows without letting them know we are alive, Charley."

"So do I; but it is best. We may get plenty more of them yet. Those are not the only ones here. I can't exactly understand their game, though."

I had on two pistols, the driver had none.

"If we get into a hot place, Charley, take my left pistol. I leave it for you," I told him.

"I hardly think those were Indians," I told the driver.

"Of course they were. Have we not both of us seen enough Indians to be able to tell one at 200 yards? White men would not be fools enough to try to play off Indian on us. Every man in this country knows that we carry arms, and knows that you can shoot him on sight if he tries any funny business. That mail is your warrant."

We kept a good lookout ahead, but saw no more Indians. We got in sight of Mountain Pass at last, and about two miles south of it a wide creek crossed the road. The banks had been cut down at the ford, and we could not see the creek until nearly on top of it.

"If we don't see Indians down there," Charley said, "we won't see any more this trip."

"I am not sure we have seen any yet. I think we saw two white men back yonder. If those were Indians and did not want us—and it seems they did not—why did they let us see them at all? They had only to dismount there to be out of sight."

"Oh, they were Indians." He knew that.

We were close to the creek now and a band of coyotes came charging up from it; they had just heard us coming. Charley gave a whoop. "Put your gun up," he told me, "no more Indians to-day or them fellows would not be here."

The Pass ran between two mountains here, the one on the left was not quite as high as its neighbor on the right, and the stage ranch was built at the northern end of it. Just as we had got to the ford I happened to look across the left mountain, and saw a column of smoke rising behind it. There was nothing to burn over there except the station.

"That's what it is," Charley said. "Now what will we do? We can't pass them if they are there yet. I'll do as you say."

We could not pass there if they did not want us to pass. The station stood on the left of the road; the ground between it on that side was covered with bushes; the ground on the right of the road clear to the mountain half a mile away was cut up into deep gullies.

"Go right ahead," I told him. "We can't turn back. If they are there yet and have not got the road closed dash right on. You do the driving. I'll do the shooting. Then keep on to Phantom Hill; that team can stand it. If we see we can't get through I'll shoot your mules; they shan't get them. Then you and I each take a mail pouch and get up among the rocks there. We can stand them off until help comes."

We were in the Pass now. It ran from north to south and was nearly straight, but the cañon here was full of bushes and trees and the road made several turns here to get past trees.

When half way through it, just before coming to one of these turns, an Indian rode around the curve. I jumped up and had my gun up and my finger on the trigger. The Indian was only thirty yards away; in another moment he would be a dead Indian.

"Don't shoot!" the Indian sung out, calling me by name, then yelled "Tonkaway."

I dropped back in my seat. He was a Tonkaway Indian, one of the scouts from Fort Griffin, and my favorite hunting companion. He and I had slept together many a night on the prairie when out looking for trails or turkeys. These Indians all went under English names, and this young fellow had taken my middle name, Anderson. I ought to be able to recognize him a mile away. I must be as badly rattled now as that man of mine would be. We swept past him just as he called out, "Some more Tonkaway back there."

"All right, Anderson, I won't shoot them now."

In a minute we met half a dozen more of them under the first lieutenant of our troop. He wanted me to stop.

"We can't, sir. You will have to come to the station," I told him. Or where the station had been. I was sure now it had been burned; else what was he doing out here? The troop was probably miles in the rear of him; he commanded the scouts.

We were out of the Pass now, and the station stood here with nothing wrong about it. The prairie behind it was on fire, though. Charley and I shook hands.

"I won't have to shoot your mules after all," I told

him, "though that is about all they are fit for."

The lieutenant came after us. We could stop now and talk to him. He wanted to know if we had met any men. I told him about the two "Indians."

"Did you not recognize those Indians?" he asked me.

"No, sir; they were too far away. Who are they?"

"Graham and Finney. They have deserted. Do you think they will go through Chadbourne?"

"No, sir, they won't. Graham is not fool enough to do it. I know I would not. He knows the country. He will go around Chadbourne."

"Well, I'll get him, if I have to follow him to the Gulch of Mexico," he said, and left.

He would have followed them there, too, but he did not have to do it; he caught them in a cornfield below Fort Mason and brought them back.

Graham did go through Chadbourne, though. The post had been abandoned, but a sergeant of the Ninth Cavalry (colored) and a party of men were here. Graham told him that a lot of Indians were after him, then kept on. He took care not to tell the sergeant that the Indians were Tonkaways; and when the Indians got up here the sergeant had his men out in this post oak grove deployed as skirmishers, and he sent the Tonkaways back in a hurry. It took the lieutenant half an hour to hammer into the sergeant's head that these Indians did not want him or the post.

This Graham was a friend of mine. I had known him for years; and had he come down to the road to-day where I could have seen who he was I should have thrown the lieutenant off his trail and let him go; he was one of but very few men that I would do it for though. He belonged to my troop, and had been a sergeant in it, but had been broken for selling some old carbines, then thrown into the guard house. He escaped from there. The other man, Finney, I knew little about and cared less; but I should have helped Graham off. He told me after he was brought back that this was the only wrong move he had made. He knew who I was and knew I would not give him away.

But I have begun this tale at the wrong end and will have to begin again.

Several months before this a large emigrant train going to California pulled into our post, Fort Griffin, and went into camp on the North Fork of the Brazos, below the post, stopping here for several days to rest their teams. They had over twenty wagons, part of them ox wagons and a good bunch of loose horses along. They were from Arkansas, and most of the older men had been Confederate soldiers. These men were then generally only rebels up at the North, but I had long ago found out that it did not take me much longer to call a man a Confederate and his army the Confederate Army than it did to call him a rebel; and it did not hurt his feelings quite so much. When these men had quit fighting so had I and had not kept it up since in the papers and with my mouth. I always got along with them without having to tell them that they were right and we were wrong. I did not have to take anything back, we had whipped them but it was not necessary to tell them all about it once a day. I put in some time in their camp and got quite well acquainted with them.

Their leader had been a Confederate captain. He had lost his left arm. He had brought it home from the army with him, but had since blown it off with a shotgun; it can be done that way easy enough if you only know how to do it. That shotgun had to stand the blame for the loss of several arms belonging to men I know. One in particular had served with me in the Army of the Potomac three years, had been shot at times without number, and not hit; then had come home and in less than a month had lost his arm by the shotgun route.

Two or three days after this train had pulled out again our quartermaster found out that he was short about a dozen old Spencer carbines that he had to arm his citizen teamsters with. A wagon never left here without the driver being armed, he carried his carbine in the front box. These guns had about outlived their usefulness, but would cost that quartermaster \$22 a piece if he did not find them or have a board of survey sit on them. He most likely would get that board of survey. If we had lost them we would find them on the pay roll; and he could swear them off. He was doing some swearing now, but it did not get him his guns. I got them afterward, though, without doing any swearing.

The only Government property that I ever lost was an old condemned horse, saddle and bridle, that a Mexican stole. The whole affair was worth \$50, but I expected to have to pay \$200. I had no more right to take this outfit than I would have had to take the captain's horse. I was riding the plug to save a race horse I had. When I had about made up my mind to serve a year and pay for it, the commanding officer sent for me, wrote out an affidavit and told me to swear to it, then let the condemned horses alone after this and ride my own. Not every commander would do that, though. This is called "swearing the horse off the papers." Nobody has to pay for him now. The taxpayer paid for him when he was bought. We let it go at that.

Two or three days after the emigrant train had left us a big detail under the same officer who was after Graham now, had been sent after it to find those guns.

As soon as we were clear of the post the lieutenant told me to start off, keep up a slow gallop and go on until I overtook the train. If I did not get up to it before sunset, then rest a while, then keep on. When I found the train I was to hold it until he came up. It would

not be over thirty miles away yet; the wagons had to travel slowly on account of the ox teams.

I went out at a gallop. I thought I had a rather large contract on hand to try and arrest twenty or more men all by myself; but I could make a bluff at it anyhow. These frontier citizens are never in a hurry about disobeying any order we give them. A soldier could arrest a party of them after they had run a sheriff and his posse clear out of the county.

At the end of about twenty-eight miles I saw the train just ahead of me. They had camped on Dead Man's Creek last night and were just now pulling out—a rather late start; it was 10 o'clock now. As I rode past each wagon I told its driver to pull out and stop; then kept on until I came to the head of the train. The wagon in advance was an ox team—three yoke of them—driven by a colored boy.

"Pull to the right, Sam, and stop," I told him.

"Yes, sah."

Just ahead of this wagon and leading the procession was an old-fashioned country carryall with a fine span of iron-gray horses. The driver was a woman, thirty-five years old, as she afterward told me when she offered herself and a 400-acre farm to me. She was pulling away at a corn-cob pipe. Lifting my hat to her I said:

"Madam, I have your train under arrest. Drive to the right of the road and stop, please."

"What fur?"

I told her what "fur."

"I hain't got ary one of your blame guns. I don't need 'em. I got plenty guns of my own."

"I am glad to hear it; but you must stop here. I can't let you go on."

She stuck her head past the side of her carryall and yelled: "Alf, git that thar team back in the road! You hear me? An' come on!"

Alf was the negro ox driver.

"Keep your team where it is, Alf," I told him. "I am in command here now. You obey me."

"Yes, sah, I does."

"That thar team is mine, an' I want it. I am going right on."

"You can't, Madam. There may be Indians not ten miles away. There often are."

"I don't keer fur no Indians. I can help myself. I got a gun." And she reached behind her and hauled out a Winchester rifle.

"Can you use that?" I asked.

"You find me a deer an' see if I can't use it."

Had this been a man I should have helped him over on the grass long since, but you can't drive a woman.

"Madam," I told her, "my orders were to stop every one, but I will make an exception in your case. Drive on."

"I reckon I had better stop," she said, after studying the question a moment.

"Yes, I think so; but I won't try to stop a lady. You can go on if you want to do so."

I knew she would not go, else I should not have given her permission to go. She drove off on the grass and jumping down out of her carryall yelled: "Alf, git them thar oxen out now an' let 'em git a bite. You hear me?"

Alf heard her. So did every one else within half a mile. She began to unharness her team, and while she got the harness off one horse I took it off the other, then put drag ropes on both of them. She was going to let them run. Next I hung the harness up on the front wheels. She was watching me and now said: "You seem to know how to do things."

"We have to know how to do many things in our business, Madam. We never know when we may be called on to do them."

"Are you a sargint?"

"That is what they call me."

I was only a corporal, but the civilians here did not know the difference, and called us all sergeants. I never took the trouble to explain the difference, either; I would almost as soon be called a sergeant. I was waiting patiently until the Captain would call me one—if he did not break me before that. He did not, but gave me the third stripe when it came my turn to get it.

As soon as the men had got their teams on the grass they had gathered in a knot, and were now holding a council. A half-grown boy came to me and throwing up his hand to his hat, as he had seen us salute our officers, said: "Mister, my father wants to see you." Returning his salute I said: "I'll see him now," and was about to start when the woman was heard from again.

"See here, Bill," addressing the boy, "you call that man 'sargint' after this. Don't forget it now. He ain't none of your 'misters,' he is a 'sargint'."

I walked over to the group of men and said: "I ought to have told you sooner, gentlemen, why I stopped you here, but the lady detained me. I have been ordered to place you under arrest for having Government arms in your possession. I will have to hold you here until the captain comes up. You had better camp. He may not be here for hours yet. You can't go on to-day; the next water is too far ahead."

"I have all those guns, Sergeant," one of the men said. "Those other men know nothing about them. I'll give 'em up now; you can let these other men go."

"I am sorry, but I can't. I have my orders and must obey them. You will all have to stop here. The Captain, when he comes, may let you go. I can't."

"Where have you those guns?" I asked. He took me to a wagon, and, taking out the tail gate, pointed to them. They lay on the bottom of the wagon under the whole load. The rest of the men had followed us.

"Gentlemen," I told them, "this is no way to keep your arms. You should have them where you can get them at a moment's notice. There are Indians in this country. We should know it, I think; we are often called on to drive them out of it."

"You have your families here. Keep your arms where you can get them in a hurry. You may need them in a hurry."

"We have some Winchesters where we can get them," the one-armed captain told me.

"Can you park your train, captain?"

"Yes; I have showed them how to do it."

"If I were you I would always from this out camp in a park, and go in to park at a gallop every evening. Then it will come easier if you have to do it in a hurry some day."

"I'll do it," he said. "That is a grand idea."

The man had his guns out now, all laid side by side on the grass. "I did not steal these guns, Sergeant; I paid for them."

"Whom did you buy them from?"

"The men called him Sergeant Graham."

I gave a low whistle. I was one point nearer a sergeant than I was five minutes ago; Graham was a sergeant in my troop; he would be a general prisoner now, but I would not succeed him; there were several ahead of me yet.

"Sergeant Graham told me that he had bought the guns, but for me not to let them be seen until after we had got past Fort Concho. He said he dare not sell them to a citizen, and the soldiers might take them from me."

"No; the guns belong to the quartermaster. He had no right to sell them to anyone."

Graham had been acting post quartermaster-sergeant. He is a fool, I thought, his time would expire in a month or two now and instead of getting an honorable discharge he will now get about three years in the penitentiary, and all for \$50; he had sold ten guns at \$5 apiece.

In about two hours the Captain came up. He was a brevet captain; we always addressed him as Captain. I told him that I had the guns, and that these men had given me no trouble. I wanted to see them released.

The Captain got the man's story, then released all hands; but they could not go on to-day, it was a long drive for them to good water from here. They had taken my advice and were in camp now half a mile away from last night's camp. We went into camp at the creek, and as soon as our horses were staked out, I asked to be let go hunting. The Captain told me to go and take my horse if I wanted him. I had ridden him hard to-day, and wanted him to rest, so I went off on foot.

I kept out on the prairie for two miles, then struck off toward the creek. I wanted an antelope, but could not find even a rabbit. When I had got to the creek I wanted water, so I got under a tree to lie down and drink out of the creek; but before doing so, took a look up into the tree. It pays to do it. I have looked up in a tree I had meant to lie down under and found a snake in it. He was harmless, and had he kept down here where he belonged I would not have hurt him; but he was up there after young birds, and I brought him down. I would only shoot a black snake on the ground when I found him prowling in among briars and weeds, hunting for Miss Bob White's eggs or young; then I let him have a dose of bird shot.

This tree had no snake in it, but a large limb ran out straight from the trunk partly over the water, and lying along it up there looking down at me was a wildcat, *Felis catus* is the only college name I know for him; he may have another; the *Felis* seems to be Latin all right, but the *Catus* bears the ear-marks of hog Latin; however, it may be good Latin also. My college education I got in a public school, and it did not embrace Latin. He has several common names. Down here, where I found him now he is the catamount. When he gets to the Rio Grande or across it he is the Mexican lion. I have shot him under all three of his names, and always found him to be the same old wildcat. If there was any difference in him, I was not naturalist enough to discover it.

But I did not want him on my back under any of his names, and got out from under that tree.

Going about thirty paces down the creek below the tree I aimed at where I thought the cat was—I could not see him now—and fired three shots. No cat came down, but my balls were going where I aimed for; the leaves they cut told me so. I fired the next shot nearer the creek, and was just springing another load in when the cat came down with a thud. He landed on the bank half in and half out of the water, then drew himself out and lay there. I went to him and sent several pistol balls into him, then kicked him into the creek and left him there.

Just after stables to-night the boy who drove my "lady friend's" team came down and said that Miss ——— wanted me to come up to supper. Every woman is a "Miss" with these southern darkies; so I took this opportunity to question him and find out if this one was a widow. I did not want to have much to do with widows; they know too much.

No, the boy said, she had never been married. Her father had died a few years ago, leaving her a big farm and a lot of money in the bank. "She is awful rich, I tell you," the boy said, "she has the big house where she lives and a lot of small ones that colored people live in. They work her farm." She was only coming out here to see the country. She meant to go back again.

"All right, Alf," I told him. "You need not tell Miss ——— I asked about her." And I handed Alf a half dollar.

She had a good supper for me. If I had sent up my order this was what I would want, and I told her so. She had baked fresh corn bread, fried bacon and a beef-steak, and boiled sweet potatoes and good coffee. She could cook as well as shoot, I thought.

After supper she began to cross-question me.

"How old are you, Sergeant?"

"Thirty-two years old now."

"Why, I thought you might be about twenty-six, I am thirty-five. I don't look old, do I?"

"What church did I belong to?" "None," I told her. "I call myself a Methodist, I was raised one."

She was a Baptist; but liked the Methodists; there were lots of them where she lived.

Did I like critters? Critters are horses in English. "Yes, I like critters and dogs. That is why I am in a critter company."

What kind of dogs did I like? "Oh! any kind; I like hounds and setters and pointers best. I can use them."

She had houn's, rabbit houn's and greyhoun's, and she could get me sitters and pinters; there were lots of them out there.

"I'll get you and that 400-acre farm next," I thought.

She told me all about her farm now and about the country she lived in. I had been pretty well over it and knew it. Next we exhausted Fort Smith. It was her ideal of a city; she had never seen a larger one. I had been in it and knew how large it was.

She kept me talking until 9 o'clock, then made me promise to come to breakfast next morning. I did and got a good one. Then bade her good-bye and the train got under way, while we pulled out for home.

I heard months after this that the train had been jumped by Indians west of the Pecos River and that half of the party were killed. I think that had I been there and had plenty of arms for these men and large boys, about forty in all, and had been given a few minutes to park that train, or I could have parked it under fire if I had to do it, then we would have turned in and made any party of Indians that would be likely to attack a train in New Mexico "look like thirty cents," in about thirty minutes.

When we got home Graham had his stripes cut off and was put in the guard house to be tried by a general court-martial. There was no general court in session there then, it had to be appointed by the department commander, and while they were waiting on him Graham's time expired and he was given a bob-tail, a discharge with no character on it; the Captain signs this with a penknife instead of a pen, and cuts the character off. It is locally and generally known as a bob-tail; if it has ever been catalogued and given a scientific name, I do not know it. I never had one given me. Mine were all good.

I had a lot of legal opinions always on hand to give to any one who wanted them. I never charged anything for them. What I charged was probably what most of them were worth, but the advice I gave Graham would probably be pronounced good law. He sent for me to advise him what he should do.

"When they call on you to plead, refuse to be tried by their court, and demand a civil trial. You are a citizen now. They should either have tried you before your time expired or else not have given you that discharge until they had tried you. Tell them that you insist on your rights as a citizen and this State is not under martial law. Then if they still persist in trying you, all this will go before the reviewing authority and he will no doubt disapprove the finding, then let you go. They may give you a civil trial, but I hardly think so."

"That man you sold the guns to is half way to California now (I did not know at that time that the Indians had got him), and he can't be got as a witness. What he told us won't go in a civil court. It will in the military court though. When you are being tried before a civil court, if I were to start to tell what that man told me your lawyer would shut me up very quick. He won't have to do it. I know as well as he does that what some one else told me is not evidence."

When he was called for trial the officers scared him into taking the military trial, telling him that a civil court would give him five years. So it might if he were convicted, but he would not be. The officers knew that they had no evidence a civil court would take and most likely had he insisted on being tried by a civil court, they would not have tried him at all. He was sentenced to two years in the penitentiary; but escaped from the guard house after night. The man he took with him was on guard over the stables; they broke in and took two of the fastest horses we had then. I had a middling fast one in there, but they left him.

Graham knew the country, and keeping away from the road and taking care not to make any trail when leaving the post. He started for the lower country; but took a round about way to reach it.

When I passed him he had been out two days and had only come near the road now because he wanted to pass through Chadbourne and get something to eat.

He got to the road just in time to see us coming; and his companion proposed that they pass off as Indians. Graham knew that I was in this stage line, and seeing a corporal on the wagon, wanted to stay on the road and speak to me; but his companion was afraid I would try to arrest them or give them away.

The man who deserted with him was given five years, he had deserted his guard. Graham got off with the two he had been given for stealing the guns.

CABIA BLANCO.

#### A Vision of October Days.

OSSINING, N. Y.—Editor *Forest and Stream*: I send you a little poem which I clipped from the *Star of Hope*, a paper published bi-monthly in Sing Sing prison and made up of articles written by prisoners in Auburn, Clinton, Naponock and Sing Sing prisons. It is a pretty little thing, and worth copying.

C. G. BLANDFORD.

#### OCTOBER DAYS.

Sing Sing, 52,430.

October days! October days!

A turquoise sky o'er hills ablaze.

Dun-colored grass in the marshes, where

The red-heads wheel in the frosty air.

Down in the swamp in the heart of the woods

Sumac bushes raise scarlet hoods;

And my weary eyes, with restful gaze,

Find relief on October days.

October days! October days!

Over the river a pearly haze.

In upland meadows the golden-rod

Nods to the dried-up milkweed pod.

Dandelion- and thistle-down blows

Over the country-side. Where? Who knows?

The south wind whispers, "It pays! It pays!"

To be alive on October days!"

October days! October days!

Summer heat gone I may not laze.

From the stubblefield, in the bright sunlight,

The quail are calling, "Bob White! Bob White!"

The hoar-frost frescoes in bold relief

On a background blue, each twig, each leaf.

The paths though the fields are a silv'ry maze

In the early morn of October days.

October days! October days!

Each deserving of infinite praise.

The air I breathe is strong, like wine,

And I am a drunkard—I, and mine.

The dying year from its garnered store

Gives a little to some—to others more.

Though the gods are many, and strange their ways,

I render them thanks for October days.

## The Old Kitchen Fireplace.

## A Reminiscence.

IN these days of ranges, furnaces and steam-heated apartments, how many persons, especially the younger ones, have ever seen a fireplace, or more especially enjoyed seeing an open fire in one? Not any of those diminutive  $2\frac{1}{2} \times 2\frac{1}{2}$ -foot fireplaces that one so often sees in modern up-to-date houses, with the pair of little highly polished brass andirons about the size suitable for a doll's playhouse, and on the andirons a pile of gaslogs emitting pale, sickly and lifeless jets of flame; or perhaps in place of gaslogs a short-lived fire made of broken-up boxes or barrel staves; but a real old-fashioned fireplace of ample proportions and capable of taking in a big pile of wood; say, one of four feet by five, and some three feet in depth with a flue large enough for a person to crawl through.

Just such an ample fireplace was in the kitchen at my boyhood's home.

Although the house was a very large two-story one, the kitchen was often used, and especially during the winter, as the family sitting room. The fireplace was not only the place for the family to gather about, but was made for utility also, for all of the cooking for our large family, with the exception of that done in the great old-fashioned brick oven on each Saturday, was done by its fire as well.

It had a long, stout crane hinged to one side, with some half a dozen pot hooks—we called them crane hooks—of different lengths strung along for the purpose of hanging pots and kettles over the fire. The two andirons were not pretty little brass affairs, but were heavy and made for business out of wrought iron by some village blacksmith. A large, flat, wrought-iron shovel and a stout pair of tongs—also made by some blacksmith—always stood near.

At the close of a winter's day, when the farm work was over and supper disposed of, the fire was fixed for the evening thus: A large log, some three and a half feet in length, called the backlog, was first placed upon the andirons and pushed against the back of the fireplace, then another, a trifle smaller, called the forestick, was placed in front of the backlog, then other still smaller logs and wood were piled up on the top of the other two. Chips or brush were put under the heap of wood to start it going and the evening fire was ready. So one can see that it took no small quantity of wood to keep the big fire going.

Chopping the trees and getting the wood from the forest, cutting it into suitable lengths, and bringing it into the house altogether made quite an item of labor; and had we had that wood to buy the expense would have been considerable, but on the home farm was a big acreage and an almost unlimited supply of oak, shellbark hickory, sweet birch and other kinds of hard wood, so there was no need of our being at all economical in the use of even the best of it.

Early in the evening our large family, with friends and callers, gathered around the fire; the adult members in a semi-circle and the girls and boys—"youngsters," as we were called—between them and the fire, either seated on stools or on the big hearth or the floor, or else reclining in easy positions before the blaze.

At the left of the family half-circle sat old "Jim Injun" as he was always called—an old Narragansett Indian who made his home with us. While sitting there he was very taciturn, seldom speaking unless spoken to.

At the proper time some couple with a lighted candle (let me here remark, that home-made tallow candles were the only lights we then used) would take the great pitcher and a pan or a basket and repair to the cellar after the evening's supply of cider and apples. There was no stinting in the quantity of either. Then shellbark hickory nuts, butternuts and chestnuts in ample quantities were brought forth, and the evening's enjoyment commenced.

There was always in evidence a thick white mug of coarse ware with a handle on one side, and holding perhaps a quart. This mug was specially for the old Indian's use, and it was called "Jim's mug." It was filled with cider as his allowance for the evening.

How well do I remember the way he would carefully set that mug of cider near the fire, reach for the tongs and take one of the hooks from the crane and place it among the live coals. When it was suitably heated he would again take the tongs, lift the hook and carefully drop it endwise into the mug. Then how the cider would bubble and foam, and how old Jim's eyes would sparkle with delight as he took long draughts of the foaming liquid. It seemed to be just the right article going to just the right place.

In due time nuts were cracked, then they, with the cider and apples, were disposed of in the jolliest possible ways; and chestnuts and apples were roasted and tin cups of cider were heated before the blazing fire by us youngsters, while the freezing and pitiless blasts of a New England winter whistled mournfully about the corners of the house and piling the snow in huge drifts around it.

One who has never experienced any such pleasures as we had during those winter evenings can scarcely have an idea of the enjoyment we had. Then when the evening's jollity was over, when the friends and neighbors had left, and the rest of the family had retired, some one of the older ones would "bank" the fire for the night. It was done in this way: All of the ashes were scraped with the shovel from a space between the andirons, then the firebrands and large live coals were taken with the tongs and carefully placed together and the ashes piled thickly over them with the shovel.

Next morning the ashes were taken off and there was a splendid bed of live coals to start a fire for cooking breakfast.

In these later years, when in a reminiscent mood, my thoughts often wander with pleasure to these scenes, and to the happy times we had by the great roaring fire in that big kitchen fireplace on those cold winter evenings away back in the long ago.

## Adirondack State Land Sales.

Special Correspondence Forest and Stream.

ALBANY, N. Y., Nov. 3.—A recent number of FOREST AND STREAM contains an article by Raymond S. Spears, in which it is asserted that 117,000 acres of land belonging to the Forest Preserve "have been lost to the people of the State." His assertion that these lands were conveyed "contrary to law," and his use of the word "connivance" constitutes a serious charge against former officials connected with the Comptroller's Office and the Forest Commission. While the transactions referred to occurred before the appointment of Commissioner James S. Whipple, and therefore do not affect him personally, nevertheless the influence of Mr. Spears' article cannot but cause popular misapprehension as to the conduct of the State's forestry affairs by those now in control. Acting on the request of the FOREST AND STREAM, your correspondent has undertaken to learn the facts in the several cases cited by Mr. Spears, and the result is herewith presented.

The land records in the office of the State Comptroller and in the office of the Forest Commission are open to the inspection of the public at all times. Any citizen is at liberty to call any day, at any hour, and ask for the records concerning any particular piece of land that belongs to the Forest Preserve, or that at any previous time was a part of it. If I may judge from my own experience, the information will be furnished such an inquirer cheerfully and every opportunity will be afforded to examine every detail.

To go through the records and ascertain the facts in the cases cited by Mr. Spears has been a task of some magnitude, but the results may compensate for it, if the showing thus made shall serve to quiet any apprehension on the part of the people arising from the publication of the charges of illegitimate dealings.

It is a fact that in 1881 117,000 acres of land or more were borne upon the land list in the Comptroller's office which are not now in the possession of the State; but that these lands were conveyed "contrary to law" and through the "connivance" of any officials is not true, as Mr. Spears could easily have ascertained if he had taken the trouble to make proper inquiries at the office of the State Comptroller. He lays great stress upon the fact that a law was passed in 1883 prohibiting the further sale of State lands in the Adirondack counties, but neglects to state that this law was modified at various times by acts of Legislature.

For instance: In this same year of 1883, and subsequent to the act referred to, the Legislature passed another act, chapter 470, entitled "An Act in relation to State lands," providing for sale in tracts where the State held an undivided interest. A portion of the Tupper Lake lands mentioned by Mr. Spears in his charges was sold pursuant to this act. Again, in 1887 the Legislature enacted, chapter 475, "that whenever any of the lands now constituting the Forest Preserve shall consist of separate small parcels or tracts wholly detached from the main portions of the Forest Preserve and bounded on every side by lands not owned by the State, then it shall be lawful and the Comptroller shall have power to sell and convey such separate tracts or parcels to such person or persons as shall have offered the highest price therefor. Such separate tracts or parcels of land may be exchanged by the Comptroller for lands that lie adjoining the main tracts of the Forest Preserve; but the values of said lands so exchanged must be first appraised by three disinterested appraisers sworn to faithfully and fairly appraise the value of said land, and report to the Comptroller." And further, "The proceeds of lands so sold, or the receipts from all exchanges so made, shall be invested by the Comptroller, with the approval of the Forest Commission, in the purchase of forest land adjoining great blocks of the Forest Preserve now owned by the State." Pursuant to this act some isolated lots were exchanged for other lands, the acquisition of which tended to the consolidation of the Preserve. While Mr. Spears takes pains to point out the lands that were thus conveyed by the State, he conceals the fact that other and better lands were acquired in their place. No lands were sold under this act, but some exchanges were made.

Again, the Legislature enacted, chapter 332, laws of 1893, "An Act to establish an Adirondack Park," that, "The Forest Commission shall have power to sell and convey any part of the Forest Preserve, the ownership of which is not, in the opinion of the Commission, needed to promote the purposes of this or the preceding article. All such sales shall be made on sealed bids and to the highest bidder. The proceeds of land sold under this article shall be paid to the State Treasurer, and held by him as a separate fund and special deposit at all times available for the purchase of other lands under this article.

Acting under the provisions of this act the Commission sold some of the scattered parcels of lands which were situated outside of the Adirondack Park, and with the proceeds bought lands within the Park, obtaining thereby lands that were equally well timbered, better located and of much greater area.

It must be borne in mind that at that time the State had not made and was not making any appropriations for the purchase of forest lands, and the only way at that time by which the badly scattered tracts in the Adirondack Park could be consolidated was by purchases made possible by the sale of the outlying lands. These sales and purchases were all published at the time in the annual reports of the Comptroller's office, and the lands offered for sale were duly advertised in all the county papers in which the tracts were situated, and there is no excuse for the concealment by Mr. Spears of this part of the transactions. If, as he may claim, he is ignorant of these facts, then he should not attempt to discuss these transactions in the newspapers.

With the liberal appropriations for purchasing lands made in subsequent years the consolidation of the interior tracts of the Adirondack Park can be accomplished without resorting to the sale of the outside lands. Furthermore, in 1895, the adoption of the new constitution prohibited the sale of any lands either within or without the Park. Since 1895 no land whatever has been sold by the Forest Commission, and no lands have been conveyed except through the compromise of some lawsuit

in which the conveyance is made pursuant to proceedings in some court of record.

But the greater part of the lands mentioned in Mr. Spears' schedule were held temporarily by the State under a tax sale. The State did not own these lands; it never bought them; it was merely holding them as a security for the amount due for taxes. The owners, acting under the law which gives every citizen the right to recover his property under such circumstances, paid the back taxes, interest and penalty, after which the lands were redeemed. All these lands were redeemed from ten to twenty-three years ago, at which time a greater latitude was allowed by law for redemptions than is accorded under the present act governing such transactions. For instance, the time for redemption may have expired, but if there was an occupant on the tract who had not been officially notified by the Comptroller's agent of the sale, the redemption could be made at any time, no matter how long it might be after the sale. To allege that these redemptions were made "contrary to law" may answer as a roorback, but is not creditable to the intelligence of the person who makes the charge. Another thing: In many cases lands were recovered by the owners through an application for a cancellation of the tax title, in which application certain irregularities on the part of the assessors and supervisors were alleged, and which, under the law of the State at that time, rendered the tax sale invalid. These applications for redemption set forth various alleged errors; land assessed in the wrong town; lack of jurisdiction on the part of the assessors; that the lots had been doubly assessed as resident and non-resident; that the assessors had failed to make affidavit to their roll; that they had not handed in the roll before the second Tuesday in August; that the board of supervisors had adjourned without extending the amount of the tax on the assessment rolls, etc. Under the law, any failure in these respects made it the duty of the Comptroller to cancel the tax sale upon application of the owner. To understand this thoroughly, it seems well to mention here that at the present time these laws are still in effect, and that within the past year the State has granted cancellations and redemptions for hundreds of acres, properly and legally, which it had acquired at tax sales. But for any newspaper writer to wait twenty years and then assert in a reputable journal that the lands thus lost in 1905 were conveyed "contrary to law," and in addition to talk about "connivance," would be a reprehensible act to say the least.

While the motive which has prompted Mr. Spears to write the articles under consideration may have been most praiseworthy, the following detailed explanation of the specific cases cited by him would seem to indicate that he has shown himself to be lacking in that judicial poise, unrestrained by which one should not publicly charge State officials with dereliction of duty.

## State Lands Acquired Prior to 1881, But Not on Land List of 1905.

## ESSEX COUNTY.

Essex Tract, Henry's Survey: Lot 128—The State owned only one acre in this lot in 1886, and owns the same acre now. This area is too small to show on the map. Lot 142—Redeemed April 18, 1885. Lots 168, 181—Error. Was not acquired by State. Lot 228—Sold to David Hinds, pursuant to Chapter 332, Laws of 1893, April 16, 1894.

Jay Tract: Lot 5—Redeemed June 2, 1885. Lots 6, 51—Cancelled Jan. 21, 1889.

North River Head Tract: Lots 13, 14, 22—Sold Jan. 5, 1894, to Geo. F. Underwood, pursuant to Chapter 332, Laws of 1893. Lot 23—Redeemed Nov. 28, 1892. Lot 83—Sold Dec. 31, 1894, to Geo. F. Underwood, pursuant to Chapter 332, Laws of 1893. Lot 84—Cancelled. Lot 104—Sold April 17, 1894, to Edward F. Stokes pursuant to Chapter 332, Laws of 1893.

Old Military Tract, Township 1, Thorn's Survey: Lot 115—Cancelled March 5, 1883. Richard's Survey: Lot 13—Cancelled Nov. 20, 1904. Lot 51—Was not acquired by State. Township 11, Lot 117—Patented to Byron Pond, July 6, 1894, pursuant to Chapter 332, Laws of 1893. Lot 291—Cancelled Jan. 31, 1885. Lot 317—Redeemed Dec. 1, 1892. Township 12, Richard's Survey: Lot 35—Cancelled April 11, 1893. Thorn's Survey: Lot 57—Patented to Byron Pond, July 6, 1894, pursuant to Chapter 332, Laws of 1893. Lot 101—The State owned 2,400 square feet in 1886 and owns the same small piece now. Lot 120—Redeemed Dec. 1, 1892.

Paradox Tract: Lot 24—Cancelled Dec. 28, 1888. Roaring Brook Tract: Lot 14—Sold pursuant to Chapter 332, Laws of 1893, to Geo. F. Underwood, Jan. 5, 1894. Lot 15—Sold pursuant to Chapter 332, Laws of 1893, to Geo. F. Underwood April 11, 1894. Lots 48, 50—Cancelled Jan. 31, 1885. Lot 51—Sold pursuant to Chapter 332, Laws of 1893, to Geo. F. Underwood Dec. 31, 1894. Lot 52—Cancelled Jan. 31, 1885. Lot 59—Sold to Geo. F. Underwood, pursuant to Chapter 332, Laws of 1893, Dec. 31, 1894.

Totten & Crossfield Purchase, Township 14, N.  $\frac{1}{2}$  and S.W.  $\frac{1}{4}$ . Lot 32—Cancelled Jan. 19, 1884. Lot 62—Redeemed Dec. 9, 1885. Lot 102—Redeemed June 30, 1890. Lot 103—Cancelled Jan. 19, 1884.

Township 27: Lot 35—Redeemed June 26, 1888.

## FRANKLIN COUNTY.

Core, East of Township 9, O. M. T.: Lot 9—Redeemed May 10, 1884.

Old Military Tract, Township 8: Lots 65, 66, 85, 87—Sold pursuant to Chapter 209, Laws of 1894, to W. W. Wheeler, June 21, 1894.

Township 9—Lots 28, 127, 147, 228, 241, 242, 263, 264, 274, 279, 305, 316, 339, 342, 346, 350, 355, 356, 357—Cancelled April 12, 1887. Lot 30, 102, 173, 176, 182, 184, 249—Cancelled June 14, 1887. Lots 95, 150, 152, 174, 177, 186, 206, 283—Cancelled March 17, 1887. Lot 191—Cancelled Jan. 4, 1887. Lot 213—Cancelled May 30, 1887. Lot 214—Cancelled April 30, 1887. Lots 278, 329, 331—Cancelled April 12, 1887. Lots 97, 171, 246—Cancelled Jan. 11, 1887. Lot 225—Cancelled Jan. 12, 1887. Lot 255—Redeemed Jan. 12, 1886. Lot 295—Cancelled June 19, 1887.

Township 10: Lot 22—Redeemed April 2, 1891. Lot 185—Sold pursuant to Chapter 332, Laws of 1893, to M. V. B. Turner, Jan. 9, 1884. Lot 186—Sold pursuant to Chapter 332, Laws of 1893, to M. V. B. Turner, Feb. 10, 1894. Lot 187—Sold pursuant to Chapter 332, Laws of 1893, to M. V. B. Turner, April 11, 1894. Lot 213, 214, 215, 223, 224, 227, 228, 252, 253, 331, 332, 350, 351—Sold pursuant to Chapter 475, Laws of 1887, to Luther C. Warner, Dec. 1, 1891. Lot 218—Sold pursuant to Chapter 332, Laws of 1893, to Chas. P. Stevens, April 12, 1894. Lot 219—Sold to Ferd W. Chase, Feb. 18, 1893, pursuant to Chapter 475, Laws of 1887. Lots 221, 22—Redeemed June 25, 1885. Lot 255—Sold pursuant to Chapter 475, Laws of 1887, to M. V. B. Turner, Feb. 10, 1893. Lots 254, 319—Sold to Leonard & Smith, Nov. 14, 1894, pursuant to Chapter 332, Laws of 1893. Lots 266, 268—Sold to Leonard & Smith, Feb. 1, 1893, pursuant to Chapter 475, Laws of 1887. Lots 269, 292, 293, 296, 307, 308, 309—Sold to Luther C. Warner, Dec. 28, 1891, pursuant to Chapter 475, Laws of 1887. Lot 310—Redeemed March 26, 1889. Lot 311—Redeemed Dec. 26, 1888. Lot 335—Sold to J. C. Merrill, April 24, 1894, pursuant to Chapter 332, Laws of 1893.

Macomb's Purchase, Great Tract 1, Township 12: Lots 9, 10, 11, 25, 26, 33, 34, 35, 42, 43, 50—Conveyed to Everton Lumber Co., in exchange for lands within the Adirondack Park, Dec. 19, 1891, pursuant to Chapter 475, Laws of 1887. Lot 12—Sold to Henry Kerr, April 7, 1894, pursuant to Chapter 332, Laws of 1893. Lot 48—Redeemed June 15, 1887. Lots 46, 47, 54, 55, 56—Sold to J. C. Shay Dec. 20, 1894, pursuant to Chapter 332, Laws of 1893.

Township 14, S.  $\frac{1}{2}$  and N.E.  $\frac{1}{4}$ : Lot 6—Never acquired by State. Great Tract 1, Township 14, S.  $\frac{1}{2}$  and N.E.  $\frac{1}{4}$ : Lots 11, 12, 1, 14, 15, 16, 17, 18, 20, 23, 24, 25, 26, 27, 28, 29, 34, 35, 36, 38, 4, 42, 44, 45, 46, 47, 48, 51, 52, 54, 55, 58, 59, 61, 62, 64, 66, 6, 70, 71, 72, 74, 81, 82, 84, 90, 92, 96, 99, 101, 103, 104, 108

Conveyed to Everton Lumber Co., in exchange for lands in the Adirondack Park, Dec. 19, 1891, pursuant to Chapter 475, Laws of 1887. Lots 19, 57—Cancelled Jan. 27, 1890.

Township 15, N.E. ¼: Lots 1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16—Sold to J. C. Shaw, Dec. 20, 1894, pursuant to Chapter 332, Laws of 1893.

Township 15, S.W. ¼: Lots 4, 56—Sold to A. R. Fuller, Dec. 20, 1894, pursuant to Chapter 332, Laws of 1893. Lot 33—Redeemed Aug. 28, 1888. Lots 51, 52, 61, 62, 71, 72—Conveyed to Everton Lumber Co., Dec. 19, 1891, in exchange for lands in the Adirondack Park, pursuant to Chapter 475, Laws of 1887. Lots 53, 63—Sold to J. C. Shaw, Dec. 20, 1894, pursuant to Chapter 332, Laws of 1893.

N.W. ¼: Lots 4, 7, 16—Conveyed to Everton Lumber Co., Dec. 19, 1891, in exchange for lands in the Adirondack Park, pursuant to Chapter 475, Laws of 1887. Lot 14—Sold to J. C. Shaw, Dec. 20, 1894, pursuant to Chapter 332, Laws of 1893.

Township 18: Lots 2, 12—Sold to C. A. McArthur, Jan. 9, 1884, pursuant to Chapter 332, Laws of 1893. Lots 49, 78, 97—Sold to Luther C. Warner, Dec. 2, 1891, pursuant to Chapter 475, Laws of 1887. Lots 56, 66—Conveyed to Henry Patton, Dec. 19, 1891, in exchange for lands in the Adirondack Park, pursuant to Chapter 475, Laws of 1887.

Macomb's Purchase, Great Tract 1, Township 20: Thirty thousand, six hundred and fifty acres is not the size of this township. It was all sold for taxes in 1881, excepting one-half of two lots, which, figured in, make the acreage 27,140 acres. The State owns at present 25,013 acres, thus leaving in other hands 2,122 acres. The entire township was sold for taxes in 1877, and the sale was subsequently cancelled. Later cancellations of later sales were: Lots 1, 2, 3, 9, 10, 11, 12, 13, 14, 15, 16, 21, 22, 23, 24—8,960 acres, July 16, 1888. Lots 4, 5, 6, 7, 8, 17, 18, 19, 20, 25 to 42—18,330 acres.

Township 25, 2,399 2/3 acres—Sold to Weston, Dean & Aldrich at partition sale, Jan. 24, 1884, pursuant to Chapter 470, Laws of 1883.

FULTON COUNTY.

Chase's Patent: Lot 37—Sold to Robert E. Bowler, Jan. 27, 1894, pursuant to Chapter 332, Laws of 1893. Lots 41, 42, 53, 56, 69, 70, 71, 72, 73, 74, 75, 77, 78, 81, 83, 101, 115, 116—Sold to John M. Peters, Jr., April 30, 1894, pursuant to Chapter 332, Laws of 1893. Lot 48—Sold to Robert E. Bowler, May 9, 1894, pursuant to Chapter 332, Laws of 1893. Lot 103—State land now.

Glen, Bleccker & Lansing Patent: Lot 25—Sold to John M. Peters, Jr., April 30, 1894, pursuant to Chapter 332, Laws of 1893. Lot 35—Sold to H. J. Carpenter, April 2, 1894, pursuant to Chapter 332, Laws of 1893. Lot 45—Sold to Fred Servis, April 12, 1894, pursuant to Chapter 332, Laws of 1893. Lot 59, Sub. 1—Cancelled May 14, 1888.

HERKIMER COUNTY.

Jerseyfield Patent: Lot 61—Cancelled May 3, 1884.

HAMILTON COUNTY.

Arthurboro Patent: Lots 88, 89—Cancelled Nov. 20, 1888. Lot 93—Cancelled Jan. 5, 1889.

Morehouse, 8,060 acre tract: Lots 8, 9, 10, 11, 22, 23, 24, 25, 26—Cancelled Aug. 16, 1883.

Bergen's Purchase, Tract 6.—West side of Sacandaga River, 250 acres—State land now.

Benson Township: Lot 64—Redeemed April 16, 1886. Lot 117—Cancelled May 11, 1885. Lot 225—Cancelled July 20, 1898. Lot 227—Cancelled July 3, 1888. Lot 381—Redeemed Sept. 20, 1873.

Lewis (Morgan), Small tract, 100 acres—State land now.

Moose River Tract, Township 9: Lots 214, 280—No such lots. Jones Gore: Lots 2, 3, 4, 5, 6, 7, 8, 9, 14, 15—These lots stricken from land list per resolution of State Board of Land Commissioners.

Totten & Crossfield Purchase, Township 1, N. ½: Speir & Brown Lot—Cancelled on application of Silas Call. Lots 10, 12—Cancelled March 15, 1893.

Township 2: Lot 10—Cancelled April 18, 1892. Lot 11—Redeemed Aug. 4, 1885.

Township 3: Lots 49, 50—Cancelled Dec. 22, 1887. Lot 75—State land now.

Township 6: Lot 37—Cancelled Sept. 24, 1884.

Township 7: Lots 8, 9, 10—Cancelled May 29, 1885.

Township 9, Elm Lake Road Tract: Lots 1, 2—Not acquired by State. Lots 16, 17, 18, 19, 20—Cancelled Jan. 29, 1892. River Lot, 704 acres—Cancelled Feb. 4, 1891.

Totten & Crossfield Purchase, Township 19: 1021 Acres—Exchanged with Everton Lumber Co. for other land in the Adirondack Park, pursuant to Chapter 475, Laws of 1887. N.W. ¼, 5,660 acres—Cancelled July 6, 1886.

Township 22: Lots 26, 27, 28, 47—Cancelled Sept. 24, 1884. Lots 39, 50—Cancelled Feb. 22, 1892.

Township 23: Lot 165—Cancelled July 28, 1898.

Township 33: Lots 5, 19, 29, 30, 43, 44, 45, 48, 49, 52, 53, 54—Conveyed to Finch, Pruyin & Co., June 11, 1900, in making a partition, pursuant to Chapter 20, Laws of 1900.

Township 34, 13,575 acres—Cancelled Aug. 4, 1884.

Township 35, N.E. ¼, 2,915 acres—Cancelled May 4, 1894.

Township 37: Lots 38, 50, 52, 54, 56, 58, 100—Conveyed to Amos C. Hall in exchange for other lands in the Adirondack Park, April 14, 1892, pursuant to Chapter 475, Laws of 1887.

Township 38: Lots 6, 7, 26, 38, 43, 49, 55, 56—Redeemed June 24, 1890.

Township 40.—The State has not parted with any land in this township. The parcels about Raquette Lake, colored white on the map, were not acquired by the State.

Township 50: Lot 30—Cancelled Sept. 21, 1892. Lot 47—Cancelled Jan. 9, 1887.

HERKIMER COUNTY.

Jerseyfield Patent: Lot 40—Redeemed May 29, 1890. Lot 49—Not acquired by the State. Lot 79—One hundred acres, owned by State now. Lot 57—Not acquired by State.

Moose River Tract, Township 3: Lots 76, 77, 88, 89, 90, 100, 101, 102, 112, 113, 114, 124, 125, 126, 136, 137—Cancelled April 20, 1885.

Nobleboro Patent, O. S.: Lot 97—Cancelled July 20, 1898. Lot 99—Redeemed April 2, 1890. N.S., Lot 20—Redeemed March 19, 1896.

Remsenburgh Patent: Lot 12, N. ½—Redeemed April 2, 1890.

LEWIS COUNTY.

Brantingham Tract: Lot 6—Sold to Matthias Gavan, Jan. 6, 1894, pursuant to Chapter 332, Laws of 1893. Lots 73, 75 acres—Cancelled Jan. 30, 1886. Lot 118—Sold to Wm. H. Greeley, Jan. 3, 1894, pursuant to Chapter 332, Laws of 1893. Lot 178—Not acquired by State. Lot 208—Sold to Scudder Todd, April 16, 1894, pursuant to Chapter 332, Laws of 1893. Lot 312—Sold to E. W. Hubbard, March 19, 1894, pursuant to Chapter 332, Laws of 1893.

Macomb's Purchase, Great Tract 4: Lots 337, 338—Redeemed April 11, 1892. Lot 906—The State owned only 50 acres in this lot in 1886, and owns the same parcel now. Lots 988, 992—Redeemed Dec. 12, 1885. Lot 991—Sold to George Meade, May 14, 1894, pursuant to Chapter 332, Laws of 1893.

SARATOGA COUNTY.

Glen (John) and 44 Others' Patent: Lot 6—Not acquired by the State. Lots 59, 60—Sold to Geo. West, Jr., May 14, 1894, pursuant to Chapter 332, Laws of 1893. Lot 65—Sold to J. W. Olmstead Dec. 14, 1891, pursuant to Chapter 475, Laws of 1887.

Kayaderosseras Patent, 24th allotment, Great Lot 3: Lot 2, Sub. 2—State land now.

Sander's Patent: Lot 12—Cancelled June 12, 1883. Lot 16—Sold to D. A. Towey, April 17, 1894, pursuant to Chapter 332, Laws of 1893. Lots 38, 39—Sold to H. J. Carpenter, April 2, 1894, pursuant to Chapter 332, Laws of 1893.

Small lots: Lots 1, 2—Not acquired by State. Lot 3—State land now. Lot 48—Can't locate; tract not stated.

ST. LAWRENCE COUNTY.

Macomb's Purchase, Great Tract 2, Township 2, S.W. ¼: 1,885 acres—Conveyed to James Spears at partition sale, Aug. 10, 1889, pursuant to Chapter 475, Laws of 1887.

Township 4, 1,115 acres—State land now. Acreage reduced since 1886 by correction of description.

Township 7, 9,092 acres, in southern part—Cancelled Sept. 24, 1889; 1,572 acre parcel is included in the 2,100 acres. Lot owned by State now.

Great Tract 3, Township 3: Lot 8, Sub. 8—Redeemed Sept. 8, 1885. Lot 14, Sub. 6—Redeemed Aug. 18, 1885. Lot 14, Sub. 8—State land now.

Township 11: Lot 123—Sold to Martin Luther, April 17, 1894, pursuant to Chapter 332, Laws of 1893. Lot 139—Redeemed Nov. 26, 1891. Lot 178—Redeemed Nov. 20, 1884.

WARREN COUNTY.

Brant Lake Tract: Lot 107—Sold to C. C. Lester, April 17, 1884, pursuant to Chapter 332, Laws of 1893. Lot 141—Sold to E. H. McConliffe, Dec. 20, 1884, pursuant to Chapter 332, Laws of 1893.

Dartmouth Patent, Range 4: Lot 8—Sold to Lewis Thompson, Dec. 31, 1894, pursuant to Chapter 332, Laws of 1893. Range 5, Lot 9—Not acquired by State. Small Tract—Lot 3—Cancelled Feb. 20, 1886.

Gores.—Gore between Dartmouth Patent and Township 11, T. & C. P.: Lot 5—Cancelled June 12, 1890.

Gore between Townships 29 and 31, T. & C. P.: Lot 11—Cancelled Dec. 15, 1893.

Hyde Township: Lots 73, 74—Sold to P. Moynihan, Nov. 14, 1894, pursuant to Chapter 332, Laws of 1893.

Totten & Crossfield Purchase, Township 14: Lots 1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 12—Sold to P. Moynihan, March 27, 1894, pursuant to Chapter 332, Laws of 1893. Lot 16, Redeemed Dec. 7, 1889. Lots 18, 19, 26, 27—Sold to P. Moynihan, Dec. 31, 1894, pursuant to Chapter 332, Laws of 1893.

State Forest, Fish and Game Commissioner Whipple yesterday gave for publication a detailed answer to an article written by Raymond S. Spears and published in Brooklyn recently asserting that the State had been mulcted of much valuable land in the Adirondacks several years ago. Commissioner Whipple says that the official records in the comptroller's office and in the forest department refute Spears' assertions. In his answer to the published article, the Commissioner says:

"Taking the transactions in their order as mentioned in the article, we find first the paragraphs raising a question as to the title of Dr. Webb's preserve. The land records show that Dr. Webb had a good title to all of the lands which he sold to the State in 1896. At one time, however, years previous to this sale, there were a few lots included in this territory which then belonged to the State of New York; pursuant to the provisions of chapter 475, laws of 1887, these lots were exchanged for other lands which were equally well located and of larger acreage. Although the State paid Dr. Webb \$600,000 for 75,000 acres, these lands are worth to-day, in the opinion of experts, more than double the amount the State paid for them nine years ago.

"The Saranac Inn Township No. 20, Franklin county, was acquired by the State in 1881 through a comptroller's tax sale. In 1891, Comptroller Wemple granted a cancellation of the State's title to this property in response to an application in which it was claimed that the assessment and valuation in 1872 of this land was erroneous and illegal; that the assessment roll of the town of Brandon for 1879 was not verified, and that the board of supervisors of Franklin county in 1877, 1878 and 1879 failed to extend the taxes on the assessment roll of said town. Under this cancellation the State lost title to 18,330 acres, in addition to 8,170 acres, the title to which was cancelled by the comptroller in 1887. These cancellations undoubtedly should not have been made.

"The Forest Preserve after its organization in 1897, commenced legal proceedings to have this action of the comptroller annulled by the courts to regain possession of the property of the State. As the attorney of the board, Judge Edwin Countryman submitted a written opinion that the State had little or no chance to win the suit, the board offered by way of compromise, to pay the Saranac Inn Association a small price per acre for the land, and in addition to refund the amount paid by the Association in taxes and interest to the State. The Association, when it obtained the cancellation, had to pay back taxes on the land to the State amounting to \$34,000, or thereabouts, and had paid a large additional sum in taxes during the time in which they held nominal possession of the property. The total sum paid to the Saranac Inn Association as a compromise in order to regain the disputed title, together with the refunding of the taxes and interest, amounted to \$6.02 per acre. The lands thus recovered are undoubtedly worth over \$30 per acre at the present time.

"The DeBar Mountain lands referred to by Spears were sold in accordance with the provisions of chapter 707, laws of 1892, establishing the Adirondack Park. These lands, although situated within one of the Rockefeller preserves, are outside the Adirondack Park, and in accordance with the provisions of the act the proceeds of the sales were used for the purchase of land within the park. The land records in the comptroller's office show that the lands thus purchased were well forested and had an area of nearly three times that of the outside lands which were sold, which was a great advantage to the State.

"The article refers also to certain lands near Tupper Lake, in Township 25, and to lands around Blue Mountain Lake, in Township 34. These lands were redeemed from tax sale or otherwise disposed of prior to 1885, the year in which the forest commission was established. It does not seem necessary here to review the acts of the comptroller's office over twenty years ago, or to furnish an explanation for transactions that took place before the forestry department of this State was called into existence. Still, as the matter has been mentioned, I might add by the way of information, that the land near Tupper Lake, in which the State had an undivided interest, was sold at a partition sale Jan. 24, 1884, in accordance with the provisions of chapter 470, laws of 1883, entitled, 'An act in relation to State lands.'

"As regards the land in Township 34, on which Blue Mountain Lake is situated, the State acquired title to these lands at the tax sale of 1881, but the title was cancelled by Comptroller Chapin in 1884 on an application that set forth certain irregularities in the assessment which invalidated the title thus acquired.

"It seems proper to say here that while various lots have been dropped from the State land list, and are no longer included in the red area of the Adirondack map, other and larger tracts have taken their place—a fact which should always be considered in connection with these particular lands.

"The forest preserve board immediately after its organization in 1897 made a systematic attempt to recover the lands which were lost through cancellation, their efforts being confined to these as the redemptions in each case were final and irrevocable under the State tax law. The forest preserve board, through the legal measure adopted, recovered over 100,000 acres of land in the Adirondacks that had been lost through cancellations; but there still remained large tracts to which the State's title was so defective through irregularities in the tax sales that it is doubtful whether the State could ever regain those properties. It must be remembered that if the State acquires a tract of land by tax sale, and it is on the map for a time, and then is legally redeemed or tax sale cancelled that the State loses nothing. It acquired the land because of the neglect of the owner to pay taxes. It gets its tax with interest and costs when the land is redeemed, the same as an individual. Most all of the changes in the map are caused in this way.

"Any one who will carefully examine into the facts

will be convinced that there is little chance to find fault for loss of land. The State on the whole has got the best of individuals on tax sales. The thing to do is to center all our efforts to prevent the stealing of timber. As commissioner, I desire every citizen to help in that direction. The thieves are numerous and bold. We want quick, sure information of trespasses. To preserve is more important than to collect money for trespass. Public opinion must be aroused until no man will dare defend or intercede for a timber thief be he high or low."

Stories of the Day.

NEW YORK, Oct. 31.—*Editor Forest and Stream:* The hunting stories in the newspapers are full of unconscious humor and have long been a joy to me, and no doubt to many another of your readers. Two quotations that have appeared within the last week or two are especially interesting. The New York Sun of Oct. 27 quoted Game Warden Rose, of Maine, as follows:

"Two and a half weeks of open season on Maine game have brought out several surprising results. There are more than 10,000 men in the woods hunting for large animals, and since open season there have been eleven men and boys killed or wounded and only six bears have been brought out.

"Professor Knowlton, of the Presque Isle Normal School, has fired at what he took to be a wild goose and shot the biggest bald eagle ever seen in Maine, the bird measuring eight feet from tip to tip of its wings and weighing forty-two pounds. Dr. Martin, of Boston, has shot a white moose, the only one ever seen in Maine. George Archer, of Clifton, has captured and killed a genuine North American panther that measured eight feet one inch from end of nose to tip of tail, and weighed 123 pounds. It is the first panther that has been slain in Maine since 1875, when Henry Snow, of Lincolnville, shot a small one, which was supposed to be the last of its race in New England.

"Wild geese have come down from the north and are feeding among the inland lakes a month earlier than usual, indicating that the weather is very cold under the Arctic circle. More wood ducks and partridges have been shot this season than for the past five years. Nobody has seen any evidence to indicate that there is a caribou in Maine, and the chances are that these animals have gone for all time. The most exciting and least expensive sport in the State is that of shooting men for deer, a form of outdoor amusement which is becoming very popular among the visitors."

Maine is certainly a marvellous State, where they grow bald eagles weighing forty-two pounds, white moose and panthers. The ordinary bald eagle weighs, I believe, only seven or eight pounds; white moose must be a good deal scarcer than white crows; and there are many of us who have been looking all our lives for evidence that a panther was ever killed in Maine. It is true, that your old correspondent, Mr. Libbey (Penobscot), a good hunter, once thought he saw one, but he did not kill it. On the other hand, such veterans as Mr. George A. Boardman and Mr. Manly Hardy believe that the animal was never found in Maine.

A new enemy has risen up to destroy our wild fowl, and well-to-do sportsmen are offered a new method of hunting which make that sport easier than ever. It seems—according to the newspapers—that wild geese rush joyfully to meet the swiftly advancing automobile, being deceived by the tooting of the horn in the belief that it is a wild goose or a flock of them. Here is what the Sun said a day or two ago:

"Dr. Walter O. Gayler crossed the Pennsylvania ferry last night with two wild geese in his automobile, conscious that he had run a risk of being held up by rapacious game wardens in Jersey City for hunting on Sunday, but feeling secure in the knowledge that he could put up a good defense, as it was not himself but his automobile that killed the geese.

"He was speeding at the top of the hill at Hilton just after dark, tooting the horn, when he heard an answering honk and saw something rushing toward him through the air. 'Ducks!' he shouted to his companions, and they ducked as a flock of Canada geese swept over the machine. Jeder Goldmann, who was in the front seat, had his hat swept from his head by a wing and one of the women in the rear seat fainted. One of the four headlights of the machine was smashed.

"When Mr. Goldmann went back to look for his hat he found two geese in the road. One was dead and the other dying. They were genuine wild geese, with black heads and white throats, and weighed about 12 pounds each.

"A similar accident was narrowly avoided on Tuesday night by a flock of geese which were attracted by Aaron Whiteley's automobile near Caldwell. In that case the geese got away after giving the colored driver a bad scare."

There are automobile accidents enough as it is, but if this sort of thing is to continue, persons who travel in the country during the wildfowls' season of migration will be obliged to protect themselves by the erection of heavy wire netting over their automobiles. Thus, day by day, life becomes more and more strenuous for man and beast.

President Roosevelt's "Wilderness Reserves."

*Editor Forest and Stream:*

Of a verity our sportsman President in his virile essay, "Wilderness Reserves," in the Book of the Boone and Crockett Club, has shown by precept and example that the truest, keenest and most wholesome pleasure to nature lovers, and especially sportsmen, comes in forming the acquaintance of and carefully conserving the lives and environment of the wild creatures yet remaining with us. It is a voice crying out to us from the wilderness. Let us give thanks that it is destined to be heard and heeded to the uttermost parts of the earth.

The best gun oil made. It never gums, nor separates in cold weather. —Adv.

# NATURAL HISTORY

## The Biography of a Bear.—VIII.

ONE of the spurs to our ambition was a legend which told of big trout, that were to be found somewhere at the source of one of the Cow creeks. Few things live longer in the memories of men than anecdotes or data concerning big fish or big deer. About any lake, river or shore where fishers go, there are legends of big fish. There is always an old resident or an old explorer to keep these legends forever burning like the temple fires of the Montezumas. In any region where there are or have been deer there is some patriarch to tell about the big ones of former times—or perhaps of a big one of the present that haunts some inaccessible mountain or difficult wilderness. Births, deaths, plagues, floods, fires and national calamities may be forgotten, but the annals of the big fish and the mighty buck live forever.

The propensity of people to fatten on legendary diet can be traced throughout other perspectives, and it may be not altogether pernicious. While the rumor of a big deer or the whispers about the big fish will inspire the laziest and most conservative inhabitant, or migrant, to get up in the night and steal away (as well as anything else he needs) for the purpose of acquiring the big one, his impulses are not always universally beneficent. Sometimes the legends are lies, without vestige of foundation. Some of them are such wholesome, fascinating, absolutely pure and unadulterated lies that they stand out as singularly honest and genuine among the many bogus products of human genius or conception—they are irresistible. We believe in them and worship them even when they cost us money.

There are lies about fish and game, and about a few other things—so profoundly insincere and deceptive that they elevate men to entrancing levels, and open to them infinite vistas of hope, promise and personal advantage. Some of the lies of remote ages, of inconceivable antiquity, have outlived all other artificial fabrics, and stand to-day to be gaped at and gorged by successive generations of men. It is no wonder we have trouble with aborigines, and that we find civilization and art somewhat incompatible with original natural conditions. It is true that even savages and barbarians lie, and that they will bow down and reverence some of our exports; but their achievements are so crude and so primitive, and they use such bad judgment in their selections of foreign goods, they melt like butter in contact with the intense enlightenment that is cooking the world.

Fish stories will coax a man into the wilderness about as far as anything, and get him full of briars, splinters and other uncomfortable things—but as empty in other respects as anything he can tamper with. It may be that they are providential precautions devised by the Creator to relieve and disintegrate constipation. When Christopher Columbus discovered America—that is to say, when that gentleman did not discover America, and when he did not know what America was when he reached it, he nevertheless exemplified the infinity of possibility, and the wonders and bewilderments that may spring from fish stories and legendary theorems. As one result, however, the Old World was perceptibly relieved by an exodus with which the new one has been having a hot time ever since. When George Washington chopped the cherry tree with his hatchet \* \* \*. Although this topic is a good one, I feel that I am in a measure obliged to leave some of it here. I have been dragging it along, hoping that I might attach it to this history, but I am unable to use any more of it to advantage. I merely intended to illustrate with it that men will go out into the woods and out upon the waters, and thereby put city money into circulation. At first I believed this to be a good thing, and it is, for those who do it. They get their blood into circulation, get full of health and energy, such as it is—but heaven help the rest of us when they resume financial activities! I now leave this ballast out, like a sandbag from a balloon—if it falls upon any one's house it is a pity; but aerial navigation is not impeded.

The fish story that impelled us, in effect was that there is a mountain meadow somewhere at the head of one of the Cow creeks, which is really a lake overgrown with rushes or tules, and that one might chop a hole in the sod anywhere, let down a hook baited with grasshoppers and haul in all the trout he wanted, as long as he could stand work. People who told us of it said they had seen fish up there somewhere that were large, very large—huge; in fact, they were given proportion in rather monotonous accord with the abilities of our several informants. None of them knew the exact location of that meadow, or if they did, they reserved that part of their knowledge for home consumption or a rising market. We proposed to go there, wherever it was, and lift a few of those fish from their obscure residence. The meadow was said to be some miles from the road and surrounded by heavy timber, with mountains upon three sides of it—one of the mountains we believed to be Magee's Peak (I will offer my readers a peek at Magee himself, after awhile), about the next highest mountain to Mt. Lassen, in that region. Learning of McMullen's ranch, situated to the southwest of the peak, and that there was a meadow there, we decided to follow the road—such as it was—that branches in that direction.

Accordingly, after unreefing our harness and regearing it in several ways, so that it would encompass our horses and the hay they had collected by this time, we attached them to the wagon and started for McMullen's. We could not help but remark that our horses were now considerably wider than the road and our wagon. Enochs wanted to hitch them on tandem, but our wagon was only equipped for doubletrees. When we came to narrow places between banks or trees some of us had

to go forward and either dig out the road some, bend the trees back or cinch in the horses. Once or twice we stuck—the horses looked like they were skewered, with trees for pins, and we had to chop them out. Jack was usually first to get into the wagon when we broke camp, and he took his favorite position, standing on the wagon bottom, with his hands on the seat. In this posture he could see forward between Dick and Enochs, while nothing obscured his view at either side. He was greatly interested with new scenery, and if he had been adorned with goggles and a few other accoutrements, he would have looked as wise, sedate and perhaps almost as intelligent as the average tourist. He seemed by this time to accept the whole routine of camping and traveling by wagon as commonplace and now and then tiresome. Sometimes he looked to be as much bored as the tourist from Punktown who sees something else for the first time. But this would only be when he was getting very hungry.

The road to McMullen's was through forest all the way, and part of the way over some of it—such as fallen trees and all sorts of shrubbery and smaller timber. Where there were no logs to separate us from the alleged road, we had trouble in crossing gullies and cañons, while nature had also contributed fragmentary slices off the mountains here and there to test our fortitude and, as it seemed, our vocabulary.

We eventually reached a pole fence and some log huts that we conceded to be McMullen's ranch, but it was little more than a camp or temporary rounding-up place for cattle. The meadow was not much, being like the Indian's description of the telegraph wire, all long and not any wide. In truth it was little more than an alley in the forest caused by standing water in the winter seasons. The huts were empty and showed no evidence of recent occupation except by chipmunks and squirrels. The timber was full of chipmunks and squirrels, all the way from the size of a peanut up to that of a woodchuck. The forest about us had been little disturbed, and we were welcome to all we wanted of it, and before daybreak next morning we expected to need the most of it for fuel to keep us from freezing; but as it had to be chopped up some for that purpose, we left a great deal of it where it was. As for one or two of us it was about as easy to freeze as to cut and carry logs. We were not lazy—not at all lazy; but energy is somewhat like a college education, it is not adapted to practical matters exclusively.

We tethered our horses as best we could, and spread out blankets in one of the huts. About midnight we got so cold in the hut, which had no fire-place, that we all moved outside, built a fire near a large log and tried to keep warm by rolling in our blankets between the fire and the log. We put on fuel and extended the fire parallel with the log, and we nearly broiled ourselves on one side; but this was not wholly satisfying. While we were freezing one side, and cooking the other, even the delights of comparison and variety were insufficient to gratify us excessively. About the time we had begun to wrangle as to who should sleep next to Jack, there was commotion among the horses, and I got up and took the lantern to investigate. The horses were pitching wildly about, being either frightened or suffering from the cold. My saddle-horse, Billy, a clean-limbed gray, with good blood and plenty of fire and speed in his veins, had broken loose and was now tearing away through the forest in the direction whence we had come. I feared he would go through to Shasta without a stop, as he had done upon a former occasion, but I followed in his wake for about a mile with the aid of the lantern. The forest was black as ink. Apart from the little halo of light from the lantern, I could see nothing, and I was on the point of abandoning the pursuit, when I heard brush cracking at a distance, then sounds growing louder and coming nearer until with lunges and snorts here came Billy back again. Whatever had sent him away something else had certainly frightened him back again, and he now stood snorting and trembling at the sight of the lantern. It was some time before I could get near enough to him to catch his halter and lead him back to the camp. We had to take the horses all into an old shed that we were afraid might collapse before we got them quieted.

When we got back to the fire and our blankets we found it impossible to keep warm, as we had but light blankets, and we had reached the place too late to fix properly for the night. Besides, we had not anticipated freezing to death when we left the Sacramento Valley shimmering like a furnace. We were glad enough to get out with the first signs of dawn, reconstruct our fire and prepare hot coffee and breakfast. Jack for the first time failed to show up for breakfast and remained out upon an excursion of his own until late in the morning. After our breakfast we explored the little meadow without finding signs of sufficient water to contain fish. We next got our rifles and hunted around an isolated peak, where we saw plenty of timber grouse and found considerable deer sign, but we saw no deer. In returning to camp. I did find two deer on the way, but it was one of the saddest things I ever saw in the woods—an old doe lying shot through, while her fawn, evidently but a few days old, lay at her side curled up as if it had died there in the little glade waiting for its silent mother to awaken. Both of them had been dead for some days, and I was at a loss to account for so young a fawn at that season of the year.

We decided to go back to the main road and then take another branch road which led to the north of Magee's Peak. We got all ready to move before Jack returned, and we had begun to fear he was not coming back. Here he had a splendid opportunity to take to his natural element, where he could soon find companions of his own family. Sometimes I half hoped that

he would do it, for I could not conceive of an untroubled future for him in his contact with humanity. Enochs insisted that he was a gone bear, but I believe we would all have waited for the chance of his return until our provisions gave out. As it was he came lumbering in and insisted upon breakfast without delay. After getting his ration he was prompt to clamber aboard and abide further developments.

After regaining the main road, we followed it for some miles without finding the turn out we wanted to take. We passed out of the main forest and got into the "tamaracks," after which this road was called. The tamaracks are a wilderness comprising millions of telegraph poles—slim, symmetrical stems that need only barking and the trimming off of a few twigs to finish them for wires and insulators. The sun began to get to us again, the hot dust and the drowsy weariness that made us moody. Jack had subsided to his nest in the wagon bed, and as he was unusually quiet, I looked in to see the cause for it.

I saw that he was sitting but half erect and ready, as it would seem, to collapse altogether. His face wore a look of utter despondency and despair. He dropped all over and finally began to retch violently. We at once stopped the wagon and helped him out to the ground at the roadside, where he continued to droop and then to choke. We jumped to the conclusion that he was poisoned. We thought of mustard as an emetic, and of whisky as a bracer, but before we could get them Jack began to go into active upheaval without assistance. He began to yield up everything he had taken unto himself—just as people pay tribute to the ocean from the decks of boats, the smaller the boat the more generous the contribution.

It was astonishing to see how liberally Jack gave all he had with him. He gave up everything, and it was so formidable in its proportions that he was a little frightened at his own generosity and backed away from it with a good deal of solicitude. About that time I began to feel as though I suspected something, and I got into the wagon, opened our duffle box and inspected the supply of tobacco. The smoking tobacco was all right, but when I asked Dick about the chewing tobacco it figured out one plug short. These plugs weighed about a pound each, and were a combination of vegetation and nicotine with more or less molasses in them to flavor them. I think they were Lorillard's best. It would not appear that a single pound plug of this tobacco could develop into the formidable mass that Jack so freely relinquished, but we determined that as nothing else could swell that way, it was, it must have been, the plug. Jack felt ill for an hour or more, and then we had to feed him something all over again before he seemed repaid for the heroic liberality he had displayed.

Jack was not entitled to very much credit in this matter, for he had taken the tobacco from our box of supplies in an arbitrary and tricky spirit. Yet even here we do not have to scan as far as the horizon to find a parallel for his generosity. Some of our most conspicuous public benefactors, who yield up unexpectedly, do so after having accumulated substances in about the same way. No creature, not even the ostrich, the goat, the whale—not even the ocean or a man—can swallow everything and retain it eternally. But men will keep on trying it, I expect. However this may be, hereafter we kept our jewelry out of Jack's reach, together with the tobacco. Even if he did give it up after he was tired of it, we objected to the process.

After Jack had recovered his self-respect and assurance to some extent, we again went forward, and after going through the tamaracks for two or three miles, we came to an open, swampy flat, a mile or two wide and perhaps three or more miles long. It had all the appearance of being a dry lake, or a big meadow, from which the water had receded at some time. The tamaracks were growing around it and gradually encroaching upon the open ground. Ahead of us we saw two or three log houses, or rather these were pole houses, being constructed of timber too small to make logs. I then realized, from what I had been told of the road, that we had passed the branch road we had intended to take, and that this place was "Old Kentuck's" ranch.

Old Kentuck was one of the original settlers of this region, and he had been identified with the Tamarack Road as long as any one could remember. In bygone years he had been an industrious man, and he had done a great deal of very hard work upon the road, and upon this dry lake which he called his ranch, and from which he collected more or less wild hay which he disposed of to travelers. At the time of which I write it appeared that Kentuck exchanged most of his hay for whisky, and under its influence he developed into a sort of narrow-gauge desperado and a local terror. We had been told of his goings on with unsophisticated travelers, to whom he would give false information about the road, intimidate into stopping at his place, and then supply them with hay for which he would demand all he thought they had. When he was drinking he was considered an ugly customer. The place was many miles from any other habitation, and Kentuck was often in position to practice his imperial methods.

As we approached his emporium, we had agreed upon certain matters, and I did not think Kentuck was going to have much fun at our expense. We were in no mood to be joshed or imposed upon, for we had missed our road and come some miles out of our way, while we were tired and, as usual, very hungry.

As we reached his long, low shack two dogs jumped into the road with a great show of ferocity, mixed with joy at seeing us. While they pranced about the wagon Kentuck himself appeared, evidently with a good deal

(Concluded on page 392.)

THE GRAY SQUIRREL.

From Audubon and Bachman's "Viviparous Quadrupeds of North America."

### The Serpent's Fascination.

THE illustration is a reproduction of Plate VII. of "The Quadrupeds of North America," by Audubon and Bachman. Audubon's account of the species, together with that of the northern form, which he calls the migratory squirrel, and Dr. C. Hart Merriam's interesting story of the gray squirrel in the North Woods, in his "Mammals of the Adirondacks," give an admirable idea of the squirrel's habits.

The supposed power of fascination or "charming" which snakes are supposed to possess over birds and small animals has been thought by some persons to be exercised on squirrels among others; and from time to time we have published notes from readers who believed that they had observed cases of this power of fascination or "charming" of which squirrels were the victims.

Of this Audubon says: "As long as we are able to explain by natural deduction the very similar maneuvers of birds and squirrels when 'fascinated' by a snake, it would be absurd to imagine that anything mysterious or supernatural is connected with the subject; and we consider that there are many ways of accounting for all the appearances described on the occasions. Fear and surprise cause an instinctive horror when we find ourselves

unexpectedly within a foot or two of a rattlesnake; the shrill, startling noise proceeding from the rattles of its tail as it vibrates rapidly, and its hideous aspect, no doubt produce a much greater effect on birds and small quadrupeds. It is said that the distant roar of the African lion causes the oxen to tremble and stand paralyzed in the fields; and Humboldt relates that in the forest of South America the mingled cries of monkeys and other animals resound through the whole night, but as soon as the roar of the jaguar, the American tiger, is heard, terror seizes on all the other animals and their voices are suddenly hushed. Birds and quadrupeds are very curious, also, and this feeling prompts them to draw near to strange objects. "Tolling" wild ducks and loons, as it is called, by waving a red handkerchief or a small flag, or by causing a little dog to bound backward and forward on a beach, has long been successfully practiced by sportsmen on the Chesapeake Bay and elsewhere.

"The Indians attract the reindeer, the antelope and other animals until they are within bowshot, by waving a stick to which a piece of red cloth is attached, or by throwing themselves on their backs and kicking their heels up in the air. If any strange object is thrown into the poultry yard, such as a stuffed specimen of a quadruped, or a bird, etc., all the fowls will crowd near it and scrutinize it for a long time. Everybody almost may

have observed at some time or other dozens of birds collected around a common cat in the shrubbery, or a tortoise or particularly a snake. The squirrel is remarkable for its fondness for 'sights,' and will sometimes come down from the highest branch of a tree to within three feet of the ground, to take a view of a small scarlet snake (*Rhinostoma coccinea*) not much larger than a pipe-stem, and which, having no poisonous fangs, could scarcely master a grasshopper. This might be regarded by believers in the fascinating powers of snakes as a decided case in favor of their theories, but they would find it somewhat difficult to explain the following circumstances which happened to ourselves. After observing a squirrel come down to inspect one of the beautiful little snakes we have just been speaking of, the reptile, being a rare species, was captured and secured in our carriage box. After we had driven off, we recollected that in our anxiety to secure the snake we had left our box of botanical specimens at the place where we had first seen the latter, and on returning for it, we once more saw the squirrel darting backward and forward and skipping round the root of the tree, eyeing with equal curiosity the article we had left behind; and we could not help making the reflection that if the little snake had 'charmed' the squirrel, the same 'fascinating' influence was exercised by our tin box!"

## THE BIOGRAPHY OF A BEAR—VIII.

(Concluded from page 390.)

of hilarity on hand. He was a man of fifty or sixty, tall, gaunt, tanned like an Indian and looking as tough as a sundried rawhide.

"Hooray fer old Kaintucky!" he exclaimed as he came out.

We sat quietly and looked at him, Enochs and Dick from the wagon seat and I from the saddle. We said nothing.

"Hello, fellers; hooray fer Old Kain—; whar'd yer git the b'ar, fellers?"

We maintained our silence, meeting his eyes as he glanced from one to another of us, with expressionless gravity. His glances fell and he began to look a little uncertain; then he assumed some more hilarity and exclaimed:

"Hooray fer Old Kaintucky! I've got a dog hyar thet ken lick ary b'ar in these mountains. Turn yer b'ar loose. Hooray fer—"

I had estimated the capacity of his dogs and had quietly signaled Dick to unfasten Jack's collar, which he had done without hesitation. None of us had said anything.

"Ef thet dog kain't lick thet cub, we'll hev raw dog fer supper. Ef he do lick him, we'll hev b'ar. Turn 'im loose, fellers—hooray fer Old Kaintucky!"

As I observed Jack clambering out of the wagon, I rode up between him and the dogs, and Jack slid down and passed under the wagon to Kentuck's side. The old dog immediately attacked and nipped Jack smartly in the flank and then sprang away. He was doubtless a b'ar dog, for he repeated his maneuver several times before Jack got his bearings.

Jack was a little out of humor, and while the attack of the dog was sudden and in earnest, he did not get excited, but his lip curled and he snarled savagely. He was insulted. The dog was now full of assurance and enterprise, and he made a savage lunge that carried him about a yard too near the danger line, and he collided with a slap from the shoulder that sent him into the wagon wheels; as he caromed from them, and tried to present his front to the enemy, he received a right and left that knocked him fully ten feet, in which performance he nearly knocked his master down. The dog was game, and would have come again to center, but for the interference of our own dogs. Kentuck's other dog was a mere pup, and a gentle cuff from Jack had sent him off ki-yi-ing frantically.

We separated the dogs, Kentuck trying without success to kick our dogs with his iron-shod heels. Jack had meandered off to some water, with an indifference that implied his contempt for trifling annoyances. The dogs having quieted, Kentuck's b'ar dog went away and laid down by the house. He was not entirely satisfied, but he was not nearly as enthusiastic as he had been.

Kentuck was grieved that his dog had undertaken more than he could carry out, but he maintained his aggressive demeanor.

"He don't wanten fight yer pet b'ar, fellers. Git out and climb down and make yerselves easy. Hev yer got any whisky? Hooray fer Old Kaintucky!"

"Hang you and old Kentucky! What do you mean by stopping us on this road? Isn't this a public road? What do you mean by holding us up in this way? Do you want to rob us? What kind of a spindle-legged gorilla do you think you are, anyhow?"

I had assumed this tone with full assurance that I was backed up by moral right, as well as by Enochs and Dick, and I now proposed to outdo Kentuck at his own game. We all looked it, whether we were tough or not.

"Hold on, pardner, go slow. I hev'n't held ye up; but I'm likely ter do it!" he replied, adding some profanity.

"If you are going to do that or anything else, it's your move. Come, play up, boys, this old scarecrow is the man who says he can scare the livers out of a wagon load of emigrants, any time. We're emigrants!"

"What do you want to do with him!" exclaimed Enochs, as he got out of the wagon with a little more indifference than I expected. "He wants raw dog—an' I'm blessed if we don't feed him some!" Dick was also getting down, while three or four magazine guns of the latest models had somehow got around to the side of the wagon within reach. Kentuck had a belt on with a long knife in it, while at the side of his doorway stood his long muzzle-loading rifle, that was doubtless very certain for a single shot. With just a little hesitation he weakened ingloriously, however.

"I never said it, boys—er, if I did, I was drinkin'; yer welcome to this ranch. Do yer want hay? Hoor—"

"Come here, Kentuck, an' take a drink," replied Enochs. "Confound it, man, we're tenderfeet and you had us skered. But it's all right. These boys are a little careless. Come and take a drink."

The second invitation was superfluous. At the first appearance of a bottle Kentuck got under way to it, and I do not think I ever saw a man show as much unmistakable satisfaction as he did as he grasped it, laid his head back and drank from the gurgling contents. After having taken about a pint he let go to observe, "Hooray fer Old Kaintucky!" and added: "Here's tu, agin, fellers," and he repeated the operation with more satisfaction than ever. If our whisky was not first-class, it was certainly high-proof, and Kentuck praised it effusively. It tasted of old Kentucky.

He was now hospitality personified, and he urged us to camp, make his house our quarters and help ourselves. We liked the open air too well, however, and told him how we had missed our road. He gave us explicit directions, which afterward proved correct, for we found our turning off place without trouble. It was up the course of a little creek, where all signs of the road were covered with gravel and sand, which accounted for our failure to see it in the first place.

As we were about to set out, Kentuck brought out a venison ham, from some cranny about his house, and firmly insisted upon our taking it along. It was as fat as mutton, but we did not want to take it from the old chap.

"Yer got ter take it," he insisted. "Ef yer don't wanten eat it yourselves, giv' it ter the b'ar. When thet b'ar gits growth he's gwine ter be considerable."

We finally accepted the venison after he told us it "warn't enny tr'uble fer him ter git all ther meat he wanted." We left him in exchange a bottle that had a nectar in it which, to his notion, was richer than gold, for it reminded him of old Kentucky.

The old man was not such a wicked customer after all—not when he perceived that it wouldn't pay.

RANSACKER.

[TO BE CONTINUED.]

## The Quails of the United States.

BY SYLVESTER D. JUDD, ASSISTANT, BIOLOGICAL SURVEY.

(Continued from page 312.)

## Food Habits of Bobwhite.

BOTH field and laboratory investigations of the food habits of the bobwhite have been conducted by the Biological Survey. The field work was confined chiefly to Maryland and Virginia, and, although it represents in some degree every month in the year, has been limited mainly to the breeding and the hunting seasons. The laboratory work to determine the different kinds of food and their proportions has included examination of the contents of crops and gizzards from 918 birds. This material was collected from twenty-one States, Canada, the District of Columbia, and Mexico, but chiefly from New York, Maryland, Virginia, Florida, Illinois, South Dakota, Nebraska, Kansas, and Texas. Stomachs were obtained each month of the year, but unfortunately few were collected in the breeding season. Laboratory work included also feeding experiments with three pairs of captive bobwhites obtained from Kansas.

The bird's digestive organs are well adapted to the character of its diet. The stomach, or gizzard, as it is commonly called, is provided with powerful muscles for grinding seeds on which the bird largely subsists. The crop, a sac-like enlargement of the oesophagus, is a mere membranous receptacle for first receiving the food, and is without muscles. Its capacity is usually from four to six times that of the stomach.

The bobwhite is insectivorous as well as graminivorous. It is, in fact, one of our most nearly omnivorous species. In addition to seeds, fruit, leaves, buds, tubers, and insects, it has been known to eat spiders, myriapods, crustaceans, mollusks, and even batrachians. The food for the year as a whole, calculated by volume and determined by analysis of the contents of 918 stomachs, consisted of vegetable matter, 83.59 per cent., and animal matter, 16.41 per cent. In addition, there was mineral matter varying in amount from 1 to 5 per cent. of the gross contents of the stomachs, and in exceptional cases rising to 3 per cent. This usually consisted of sand, with coarser bits of quartz 2 to 7 mm. in diameter, which were taken to pulverize the food and thus render it easier of assimilation.

The vegetable part of the food consisted of grain, 17.38 per cent.; various seeds, chiefly weeds, 52.83 per cent., and miscellaneous vegetable matter, 3.18 per cent. The animal matter in the food was distributed as follows: beetles, 6.92 per cent.; grasshoppers, 3.17 per cent.; bugs, 2.77 per cent.; caterpillars, 0.95 per cent.; miscellaneous insects, 0.70 per cent.; and other invertebrates, largely spiders, 1.36 per cent.

The insect food of bobwhite, in comparison with that of other birds, is interesting. It includes fewer caterpillars, ants and other hymenoptera, but more bugs; and, singularly enough in a terrestrial feeder, nearly twice as large a proportion of beetles as of grasshoppers. The meadow lark, per contra, another terrestrial feeder, takes 29 per cent. of grasshoppers and only 18 per cent. of beetles.

The food of the bobwhite for the year is noteworthy in several respects. Its character varies with the season. From October to March it consists almost exclusively of vegetable matter—for February and March 99.8 per cent. of vegetable food appearing in analysis—while in late spring and in summer it is made up largely of insects, August showing 44.1 per cent. of insect food. The grain taken, as a rule, is derived neither from newly sown fields nor from standing crops, but is gleaned from stubble fields after harvest. Grain forms a less prominent part of the food than the seeds of weeds, which are the most important element of all and make up one-half of the food for the year. The most distinctive feature of this, as a whole, is the large proportion—15.52 per cent.—of leguminous seeds, a food seldom eaten by the various species of sparrows or other terrestrial feeders. A small fraction of this seed comes from cultivated plants, especially the cowpea; the rest is derived from wild plants, most of them classed as weeds. Leguminous seeds appear to be most largely consumed during December, when they form 25 per cent. of the food. The 15.05 per cent. of insect food, although a comparatively small part of the total, is of extreme importance, since it contains many pests that are generally avoided by non-gallinaceous birds. Noteworthy among these are the potato beetle, twelve-spotted cucumber beetle, striped cucumber beetle, squash ladybird beetle, various cut-worms, the tobacco worm, cotton worm, cotton bollworm, the clover weevil, imbricated snout beetle, May beetle, click beetle, the red-legged grasshopper, Rocky Mountain locust, and cinch bug.

It should be observed that in the search for these pests and for weed seeds the bobwhite, unlike many birds of the woodland, hedgerow, and orchard, extends its foraging to the center of the largest fields, thus protecting the growing crops.

## Grain as Food.

Vegetable matter has long been known to be an important element of the food of the bobwhite; indeed, many people suppose that it constitutes the entire food of the bird. The impression that the bobwhite eats little else than grain has prevailed even among many sportsmen who have bagged most of their game in the stubble field. The present analysis, however, discloses that grain forms scarcely more than one-sixth of the food. Laboratory study shows that it is eaten in every month of the year, the maximum, 46 per cent. of the food for the month, having been taken in March.

In the specimens examined corn amounts to 11.96 per cent. of the total food for the year, while all other kinds collectively amount to only 5.42 per cent. Wheat (4.17 per cent.) is next to corn in importance. As experiments with captive birds failed to show marked preference for either corn or wheat, the disproportion between the two above noted is probably due to the fact that more corn than wheat is grown in the country where our birds were obtained. The remaining cereal food (1.25 per cent. of the total) is miscellaneous grain, including Kafir corn, sorghum, millet, buckwheat, barley, oats, and rye.

Grain-eating birds are likely to do much harm to crops. They may pull up sprouting grain, plunder the standing crop when it is in the milk, or forage among the sheaves at harvest time. The bobwhite, however, is a notable exception. The period of germination is the time when grain is liable to serious injury by birds. But not a single sprouting kernel was found in the crops and stomachs of quail examined. Field observations, during the years 1899 and 1900, at Marshall Hall gave similar evidence. While crows injured sprouting corn so seriously during May that several extensive replantings were necessary, bobwhites, unusually abundant in the vicinity at the same time, were never seen to disturb the germinating grain. During November, 1899, sprouting wheat was saved from crow blackbirds only by diligent use of the shotgun; but both then and in other seasons the bobwhite was rarely observed in winter-wheat fields and never was seen to molest the crop. Sprouting oats apparently were not molested, though extended observations were not made. No data are available for rye and millet, but in newly sown buckwheat fields in Essex county, N. J., which the writer saw ravaged by doves, there was no sign of injury by the bobwhites. Publications on economic ornithology and reports received by the Biological Survey add testimony of like character. It may safely be stated, therefore, that so far as at present known the bobwhite does no appreciable harm to sprouting grain.

In order to learn to what extent the species injures ripening grain, observations were made for several years at Marshall Hall. Unlike the crow and several kinds of blackbirds, the bobwhite did no damage there to corn in the milk, nor did it injure ripening wheat and oats. Flocks of English sparrows, however, might be seen feeding on wheat in the milk, and not uncommonly a score of goldfinches swayed on the panicles of ripening oats. A hen bobwhite shot in a field of ripe wheat, June 18, 1903, had much of the grain in its crop, though whether obtained from standing heads or from fallen kernels did not appear. As the bobwhite usually feeds on the ground, and as it was never seen feeding from the stalk at Marshall Hall, it appears probable that it seeks only the fallen grain. At wheat harvest it follows the binder, and at Marshall Hall was often seen in the harvest field picking up scattered wheat. It was not observed there on the shocks, appearing to find an abundance of waste kernels. At corn harvest also bobwhite takes its share from exposed ears; but the bird is not able to shuck corn, as do the crow and wild goose. Several crops of ripe oats at Marshall Hall were watched during harvest time and furnished no evidence against the bobwhite. No report of injury by it elsewhere at harvest time has come to the Biological Survey, though damage may be done where peculiar local conditions conjoin with an overabundance of birds.

The bobwhite, however, is a persistent stubble feeder. As Mr. Sandys puts it, "He is the gleaner who never reaps, who guards the growing crops, who glories over a bounteous yield, yet is content to watch and wait for those lost grains which fall to him by right." Where fields of wheat stubble support a rank growth of ragweed the sportsman is most likely to find a feeding covey. At Marshall Hall, during September, October and November, such fields are the favorite haunts of the birds. On this farm corn has a greater acreage than wheat, but the birds are much less often found in corn stubble; and, as stomach examinations show, they eat much less corn than wheat. Since experiments with captive birds showed no preference for wheat, food other than grain may have kept them on the wheat stubble. Along the Roanoke in Virginia, where wheat is not grown, bobwhites feed in corn fields.

On the Western prairies, where cornstalks left standing in the fields afford good cover, the birds are more often found in cornfields. Six birds collected from such fields in November, 1891, at Badger, Neb., contained 181 whole kernels of corn; the smallest number in a crop was 20 and the largest 48.

It is not unusual to find from 100 to 200 grains of wheat in a crop. A bobwhite shot at West Appomattox, Va., in December, 1902, had its crop distended almost to bursting with 508 grains of wheat. This habit of gleaning waste grain after harvest is beneficial to the farm, for volunteer grain is not desirable, especially where certain insect pests or parasitic fungi are to be combated. As the scattered kernels are often too far afield to be gathered by domestic poultry, the services of the bobwhite in this respect are especially useful.

The bobwhite sometimes eats the seeds of certain cultivated leguminous plants. Both the black-eye and the clay cowpeas (*Vigna sinensis*) have been found in stomachs, and one contained thirty-five peas of the latter variety. In Westmoreland and Mecklenburg counties, Va., cowpea patches are favorite resorts for the birds in November and December. Garden peas were found in crops collected by Mr. Walter Hoxie at Frogmore, S. C. In rare instances the bobwhite picks up clover seeds, and it has been known to eat a lima bean. It may take also Kafir corn and sorghum, and it has a decided liking for millet (*Chatochloa italica*), a taste particularly noticeable in birds of Kansas, Nebraska and South Dakota. A crop from Onaga, Kans., contained 1,000 millet seeds. No significant damage to millet has been reported and the birds may secure most of this food from stubble fields.

## Weed Seeds as Food.

Weeds appropriate the space, light, water, and food of plants that directly or indirectly support man. A million weeds may spring up on a single acre, and a

single plant of one of these species may mature 100,000 seeds in a season. This process, if unchecked, may produce in the spring of the third year 10,000,000,000 weeds. The problem of weed destruction is perennial in every land; indeed, soil culture may be called a never ceasing war against weeds. Of the birds that aid the farmer in this struggle the bobwhite, the native sparrows, and the mourning dove are the most efficient. They attack weeds at that vital stage—the seed period—hence their work, especially against the annuals which depend on seeds for perpetuation, is of enormous practical value.

The bobwhite is pre-eminently a seed eater, 52.83 per cent. of its food for the year consisting of seeds. The bulk of these are the seeds of plants belonging to the general category of weeds. Many of them are injurious plants with which the farmer is constantly at strife; others are less noxious and some are seldom, if ever, troublesome. Sixty-odd species are known to be eaten, and thorough observations would probably raise the number to a hundred or more. The food of no other bird with which the writer is acquainted is so varied. At Marshall Hall and in Mecklenburg and Westmoreland counties, Va., a somewhat detailed study was made of the weed seed eaten by the bird. At Marshall Hall fields of wheat stubble grown up to ragweed were favorite feeding grounds. Among others found there were buttonweed seeds, each like a miniature horsehoof, complete even to the frog; twenty or thirty of these were sometimes contained in a single stomach. A number of birds shot on wheat stubble had eaten largely of bastard pennyroyal seeds, which are rough and resemble blackberry seeds. Goldfinches and other seed eaters also find these palatable. Along ditches the abundant grasses—witch grass and spreading panicum—provide the birds with shade in summer and a continuous harvest through the winter. The grain, inclosed in a cylindrical sheath which opens at the top, is rattled out, a few kernels at a time, by the strong fall and winter winds. Along the same ditches, especially in damper places among trees and bushes, another plant, the jewel weed, flourishes. Its ripened seeds, hurled from the opening pods by elastic coiled spring-like valves, are eaten in large numbers by the bobwhite. The jewel-weed cotyledons are inclosed in a plain seed coat; but the cotyledons themselves are of a delicate robin's-egg blue, rounded and colored like tiny turquoises.

Several weeds injurious to truck crops are useful to the bobwhite. In a field where crab grass as a thick mat had overrun a patch of yams a covey spent much time gathering the seeds. In another place where lamb's-quarters was six feet high and pigweed still higher, a flock of busy weeders could almost always be flushed at certain hours. Patches of green foxtail grass often attracted a covey for an evening feed. In the northern part of the United States this plant grows rank, and in many sections furnishes the bird its main food for September and October. Near a stream in a truck flat was a forest of giant ragweed from 8 to 10 feet high and here bobwhites were frequently seen picking up scattered seeds. Their favorite weed seed, however, is the common, or smaller, ragweed. At Marshall Hall this weed springs up, not only on truck land, but most luxuriantly in wheat stubble after harvest, covering the field with a rank growth 3 feet high. When abundant, its seeds are eaten in the fall more than those of any other plant, supplying a little over 16 per cent of the total food during October, November, and January. The fruits beset with a crowning circle of spines are taken into the crop whole. In the stomach the brown oval seeds are freed from the spiny outer

coat, crushed by the powerful muscular action, and made to yield their rich meat to the digestive juices.

In Mecklenburg county, Va., during the last week of December, 1902, a covey of a dozen bobwhites resorted to a cornfield to feed on the shining black seeds of smartweed, often a troublesome plant on low ground. In Westmoreland county, November, 1901, bobwhites fed freely on seeds of climbing false buckwheat, which festooned all the shrubbery along streams and afforded the birds admirable cover as well as food. The seeds of knot grass, a species related to the smartweeds and false buckwheat, also contribute to the food of the bobwhite.

The fondness of bobwhites for leguminous seeds has already been mentioned. On the edge of woodlands, along hedgerows, and to some extent in open ground, they consume large quantities of seeds of tick-trefoil, Japan clover, and bush clover, and their crops have been found distended with these seeds. They also find the partridge pea massed in great patches at Marshall Hall and in some places in Virginia, but it appears to be of less importance to them. A few stomachs contained as many as 100 of these seeds. In several sections the butterfly pea was eaten in about the same proportion as the partridge pea. The hog peanut, like the butterfly pea, a trailing plant bearing a small grayish-brown bean, furnished several times as much food as the partridge pea and butterfly pea combined. Of these seeds 600 are sometimes eaten at a meal. Southern birds relish the Florida coffee seeds and lupine seeds. Seeds from locust pods are also frequently eaten by the bobwhite.

In the northern part of its range the bobwhite has been reported as feeding on seeds of the ill-scented skunk cabbage. Four of eight birds shot in October, 1902, at Wilmington, Mass., by Edward A. Preble, of the Biological Survey, had eaten them. These seeds are somewhat flattened and subspherical, and average about three-eighths of an inch in diameter. Two crops were filled with them, one containing ten of these great seeds. This plant, abundant in northern swamps, may furnish food for birds in game preserves.

Seeds of different species of violets are often eaten. In some cases the three-valved seed pods, each valve containing a dozen or more seeds, had been swallowed entire. Seeds make up 50.36 per cent. of the bobwhite's food, and a quantitative study of it shows that the grass family contributes 9.46 per cent.; leguminous plants, 15.52 per cent.; smartweed and other polygonums, 4.41 per cent.; ragweed, 7.28 per cent.; and miscellaneous weeds, 13.69 per cent. The number of seeds eaten at a meal may suggest the value of the bird as a weed destroyer. As many as 200 to 300 smartweed seeds, 500 seeds of red sorrel, and 700 seeds of three-seeded mercury have been taken at a meal. Crops and stomachs crammed with nothing but ragweed seeds are often found. A bird shot Nov. 6, 1902, at Marshall Hall, had eaten 1,000 ragweed akenes; another killed there the previous November had eaten as many seeds of crab grass. Birds shot in Mecklenburg county, Va., contained about 2,000 leguminous seeds, mainly tick-trefoil, and various kinds of bush clover. A bird shot in October, 1902, at Pine Brook, N. J., had eaten 5,000 seeds of green foxtail grass, and one killed on Christmas day, 1901, at Kinsale, Va., had taken about 10,000 pigweed seeds.

Mast, including acorns of the swamp oak (*Quercus palustris*), the white oak (*Q. alba*), beechnuts, the blue beech (*Carpinus caroliniana*), and the chestnut, amounts to 2.47 per cent. of the food of the year.

In the pine lands of Florida the bobwhite freely eats

the seeds of the long-leaf pine (*Pinus palustris*). Of the thirty-nine birds from Walton county (November, December, and January, 1902 and 1903), twenty-one had their crops and stomachs mainly filled with this nutritious food. They had usually clipped off the wings of the samaras close to the large seeds. Several crops were full of germinating pine seeds, some of the embryos having cotyledons two inches long. In the region about Washington the seeds of the scrub pine (*Pinus virginiana*) also are eaten to a small extent. The fact that these seeds are a good winter food should be remembered by holders of game preserves. Observations show that the key seeds of the maple also are eaten, though much less extensively.

[TO BE CONTINUED.]

### The Wild Pigeons.

ST. LOUIS, Mo., Oct. 28.—*Editor Forest and Stream:* The query of Guatemala in your issue of Oct. 21 regarding the disappearance of the pigeons and the statement that "when a boy I lived in North Carolina, and in the year 1869-70 millions of these birds used to pass south; and I cannot remember ever seeing these birds on return north; did they take another route?" is of interest in that it confirms a dim recollection of my own, and one I have tried to verify lately, and with some success, viz., that we, whose point of view was in the Mississippi valley, saw these birds invariably in the spring and passing from south to north (I refer to the general flight), and I do not recall ever having seen them south-bound.

In my opinion, they did take widely different routes and made an oblong or triangular flight, passing due north to their breeding grounds in the spring, then by easy stages, as the young became stronger, to the east; and with the approach of fall made one grand flight back to the Gulf States for the winter.

That these birds were pilated, as are wild geese and many other migratory birds, I am convinced; and if ever the leaders were blown out of their course and into the Gulf or the Atlantic, there they surely perished, for where they were led there went the flight.

Granting that every published authority is to the contrary, also conceding that, say, 500 millions or more, were netted and shot up to the time of the disappearance of the birds, I venture to say that seventy-five per cent. of the vast flock of these beautiful birds perished in some way other than by man's slaughter, and suddenly.

Had disease killed them at their breeding grounds, or where they passed the winter, we would have known it long ago.

Blown into the sea they would have been devoured by fish in schools as vast in number as the birds themselves, every trace of them extinguished.

Personally, I would like to see this subject threshed out in a discussion similar to the Kipling "Red Gods" and "raw right-angled log jams," etc.

Perhaps some of us may end up with the "rare left-handed jim jams," but what's the odds; therefore, I affirm "the pigeon died a-tryin' to swim."

W. D. KENYON.

### The Linnaean Society of New York.

A REGULAR meeting of the Society will be held at the American Museum of Natural History, Seventy-seventh street and Eighth avenue, on Tuesday evening, Nov. 28, at 8:15 o'clock. Mr. William Lovell Finley, of Portland, Oreg., will lecture before the Society on "Western Bird Life," illustrated with stereopticon views. Special postal card notice later. C. G. ABBOTT.

# GAME BAG AND GUN

### Criticises Minnesota.

BALTIMORE, Md.—*Editor Forest and Stream:* This season I became interested in the Minnesota game laws, as a foreigner to Minnesota, but as a shooter who wished to shoot within the borders of that sovereignty, and who was ready to pay the full admission fee—called game license—for the misdemeanor of being a non-resident, although the non-residents, citizens of the United States, enjoy the beatitudes flowing from Article IV., Section 2, of the Constitution of the United States, which squints one eye wisely and declares: "The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States."

"But what is the Constitution among friends?" a great man once upon a time asked. He hadn't read the game laws.

But the foregoing is not the real issue, therefore the gentle reader will please see that it is stricken from his mind, for we have matters of importance to tackle, i. e., the game laws of the foreign and sovereign State of Minnesota. Section 28, of the Minnesota Act of 1905, according to the *Game Laws in Brief*, reads as follows concerning dogs: "Shooting with Dogs.—\* \* \* The use or running of either pointer or setter dogs in fields or upon lands frequented by or in which game birds may be found during the month of August, or at any time during the open season for killing game birds, and the keeping or maintaining of any dog at or about any hunting camp or lumber camp used by hunters, situated in any locality frequented by deer, moose or caribou is hereby prohibited and made unlawful."

The sub-head of this section is to be viewed amiably, because of its sociability. "Shooting with dogs" signifies that the dog was shooting, too. The sportsman-like phrase is shooting over dogs, a sportsman shoots *with* his companions, but *over* his dogs. Nevertheless, when a foreigner from Baltimore shoots in the sovereign State

of Minnesota, having paid his license to shoot according to law, he *must* shoot *with* his dogs. If he shoots over them he violates the majesty of the sovereignty.

But note that the law, wise reader, specifies "pointer or setter dogs" in respect to the use or running of them, as quoted above.

Now, my dogs were droppers, therefore did not come under the law, in section 28, which reads: "Any dog or dogs used in violation of any of the provisions of this section is hereby declared to be and is a public nuisance, and it shall be lawful for any person to kill any dog or dogs so being used."

My dogs, being droppers, that is to say, a cross breed between a setter and a pointer, were neither the one nor the other, therefore they did not come under the provisions of the act. Notwithstanding all that, a grass-fed native of Minnesota assured me that under the law, as administered in his State, the judge would consider that I had violated the law twice in the body of each dog, and that I would be fined twice accordingly, once for the pointer half, once for the setter half. I called his attention to the law which carefully states "pointer or setter," therefore if I had both pointer and setter I was not violating the alternative law at all. If the legal Solons had contemplated both, the law would have read, but does not read, "pointer or setter, or both." He then unfolded a pastoral grin, and declared that the judges read the law and interpreted it according to time-honored custom in Minnesota. Now, I contend that a judge has no right to read into the law such personal vagaries as may please him, and which may force a conviction. I maintain that my dogs, being cross-bred, are exempt from the statute. If the sovereign people of Minnesota could determine which half of my dog was pointer and which half setter, they might kill one half, but not the other; for the law is alternative, because of the "or," i. e., pointer or setter.

The wise legal lights of the Minnesota Legislature are respectfully referred to the Scotch precedent in a similar

case. Two Scotch boys were presented with a collie puppy, each owning half of it. Said young Sandy to his partner, "Which half will you take?"

"I'll take the head half," was the reply.

"Well," said Sandy, "you'll have to feed your own half."

With this legal wisdom for guidance, I maintain that, unless the bench of Minnesota could have differentiated the setter from the pointer in my droppers, my dogs were entirely outside the pale of the law.

Again, on a point of grammar, I quote the following from section 28: "Any dog or dogs \* \* \* is hereby declared to be," etc. Mr. Editor, please explain the "is" in its grammatical relations. I am sure that the Legislature of Minnesota would do well to consult with Game Commissioner Fullerton before it again sets out to tinker at law-making, for I am sure he will advise them wisely concerning droppers, setter or pointer (or both) dogs, and is as a singular verb referring to a plural subject, and also that hounds and cur dogs of all degrees are quite as destructive if permitted to self-hunt as "is" dogs shooting with any person. Also he should advise them that anyone, taking dogs into the garden or the orchard in the close season is liable to the penalty, because they are "upon lands frequented by or in which game birds may be found during the month of August." As a native foreign citizen of the foreign State of Maryland, I may sign myself,

NATIVE FOREIGNER.

### Trapper Killed in His Bear Trap.

OGDENSBURG, N. Y., Nov. 1.—A trapper named Lacoque, of Wolfstown, was accidentally caught and killed in one of his own traps, a deadfall for bears. It is supposed that in changing the bait he set off the trap, which fell on him with such force as to break his neck. He had been away from home several days before his body was found.

## Waterloo Camp.

"You asked me how this place came to be called Waterloo Camp," said the game warden, when we had eaten our supper and lighted our pipes. "You must have heard of Tommy Keen, he was the best moose hunter in the five counties, and I honestly believe that he never set a snare or dogged a moose for twenty years before he died. How many snares he destroyed, and how many moose-dogs he poisoned none but himself knew. He used to look on the moose as his own property, and a nice thing he made out of them from one year's end to another. If you wanted a trip in the woods with Tommy Keen, you had to book it in April at the latest. He was always engaged from the first of the season until the end of November, or the middle of December. After that he used to go in and kill his winter's meat, and if any one wanted meat after he had filled his own house up, he would go along and help get it for them. I don't say he never outshot his limit, but when he did so, it was always for some one else; the meat was never peddled around, nor did it go to his house. His son, Malcolm, over to Keensville, about six miles from where we are now, has his 'death register,' as the old man called it. It's got the measurements of over sixty bull moose, and the photographs of twenty-five or thirty, with the certificates of the men who shot them to Tommy's calling. The rifles and guns that man had given him would stock a small-sized armory, and the house is almost furnished with the presents the army officers and rich Americans gave Mrs. Keen. They used to get all the best sporting papers free gratis for nothing, and every dog he had round the place was a thoroughbred, and a free present to boot. He had a pretty decent education, and before he'd take a stranger into the woods, he would have an understanding in writing as to the smallest time he was engaged for, and how the stranger was to obey orders.

"Tommy used to start 'work' in April, taking trout-ing parties out. When trouting was over, he would go cook and guide for Americans, who just wanted to go to the woods and 'laze around.' Then he went in calling and still-hunting, got his own meat in December, and from that out, he hunted foxes and cats. He never set traps, except dead-falls for bears, and he never used poison; he used to say the game and fur was worth more to him alive than any other way, and he was right there. Why, I've known a rich American go in with him, and pay \$20 for a flashlight shot at a beaver at work, and he got a splendid photograph, it came out in one of the magazines. There was one thing none of us could understand. Tommy always seemed to get his moose just at the last minute—that is, if the weather was at all decent. Several times he kept strangers over for two or three days when they got nothing in the time they had hired him for, and then he almost always got them some sort of game—moose, bear or caribou. Every now and then he'd run foul of some crowd he couldn't pull with, and he made short work of them. I remember him telling a rich Englishman that he hired to go into the woods with a man, and not with a jackass, and he wanted neither his money nor his company. The fellow would have lost himself in a good-sized orchard, and he presumed to try to teach Tommy Keen how to hunt moose.

"There was an old Judge Richardson, from Philadelphia, who used to come here year after year and pay his license to hunt. He wasn't at all particular as to how much game he got, but Tommy always saw that he got something. He just loved the woods, and took his three weeks with Tommy every year. Last time he was down here, he got a fine bear, and when he went home, he sent Tommy's boy, Malcolm, a book called 'Tracks and Traces.' It is about the best thing of its kind I ever read. Tommy took charge of the book, and he used to carry it into the woods with him and read it in his spare time. The author's name wasn't signed to it, he wrote under the name of 'Cinchona.' I fear the author didn't make much out of his book, for we people can't afford to pay \$3 for such a book, and city men don't understand that kind of thing.

"Next year the Judge couldn't come down—his wife died, and he wrote to Tommy and asked him to take a friend of his instead. The friend was to bring down a couple of young fellows the Judge had invited to join him. One of them had just graduated from Harvard, the other was just through at West Point. Tommy wired back for him to send them along, and in the course of a week, they turned up at my place to buy their licenses. The boys were gentlemanly young fellows. The man who came with them was about thirty-five of forty, I should judge. He was a quiet sort of chap, just medium size, and he looked as if he could take his share in a portage or a tramp with any man. The shoulders of his hunting coat were worn, and so was the inside of his right sleeve, where the gun had rubbed the corduroy, and he carried a rifle that looked as if it had seen service, though it was as clean as a new one. They wanted me to drive them over to Keensville, and I did so. We had supper at Tommy's, and he showed them the 'death register,' with the names and addresses of all the different people signed on it. While we were looking over the book, we heard oxbells, and Tommy's boy came up to the house with a bark canoe on a wooden-shod sled, drawn by a single ox—the kind of rig we call a 'dagon.'

"If you gentlemen had the moose meat that ox has hauled out of the woods," said Tommy, "you could keep the Philadelphia market going for a week at least. I've been working him for five years, and between the game visitors he has killed, and what I've killed myself, he's averaged six carcasses a year, besides bear meat and caribou."

"After supper Tommy asked the men how many days they could stay in the woods, and the elder one said that they would like to leave for home in a fortnight's time. After some talk, he said that they could stay for three weeks, if it was necessary. The next morning was a fine one. I helped them over to the First Lake, and wished them good luck. Tommy never carried a rifle with him on one of these trips, only a .22 target pistol in a holster—and a dandy little weapon she was. They made their camp about four in the after-

noon. It came on to rain next morning, and it rained and blew for three solid days. Of course all the crowd could do was to stay in camp and cuss the weather. The morning of the fourth day it was fine; but the wind was still high. Tommy said it was no use to call, but as the rain had washed out all the old tracks, he would circle round until noon and see if he could find any fresh sign. About two in the afternoon he came back with some partridges he had shot with his pistol, and he told the crowd that there were two bulls not more than a mile away, but they were both mated, and that a little further on he saw the track of a small bull, not more than two years old. Had it been later in the season he might have tried to call one of the mated bulls up, but everyone knows that it is almost impossible to call a newly mated bull away from his cow. They left the camp and went to a small shack about four miles off, crossing two tracks on the way, both of them of big lone bulls. In the morning they called and got an answer, but the bull wouldn't come up. They moved over to another camp, and tried in the evening. The bull was coming through the bushes to beat four of a kind, but by the time he came within shot, it was too dark to see him. They called again next morning, but they got no answer, he had worked round to leeward of them, and got their scent. Early in the day it began to blow like fury, and Tommy went off to look for fresh signs. He came back about sundown with another man, a Dutchman called Lutz. He told the party that he had hired him for a dollar a day as cookee, so that he could put in more time hunting round for signs instead of chopping wood and cooking.

"They had very bad weather for the next four days, and Willis the elder man used to go rock-breaking—so he said—while Tommy cruised around after fresh signs. The young fellows just lazed around the camp. Lutz was afraid Willis would get lost at first, but he soon found that he could steer himself round all right. One thing Tommy was particular to bargain for when he took a crowd in, was that no one should fire a shot unless it was at the game they were after. Of course if the party were after moose, and happened on a bear or wildcat, it was all right to shoot; but there was no cracking off round after round at rocks in the lake, or wasting cartridges on loons and cranes. Of course, there was no objection to a .22 rifle for small game, but Tommy's pistol was enough to supply the camp with partridges and rabbits, and they caught quite a few trout in the streams.

"The evening of the fifteenth day they were out, Tommy came back to camp just at dark. Willis had been away all day, breaking rocks, and hadn't come back. The young fellows were pretty sick of the trip. It had been nothing but wind and rain for a week; the leaves were too thick for still-hunting, and they had only heard two moose in the distance. Tommy had been going since six that morning, and he was pretty tired. He had a drink, and told Lutz to put up a day's grub for the party as soon as he got the supper dishes washed. Just as supper was ready Willis came in. His rifle was as clean as it was the day he came in, he had never fired her once. They had supper and after it was over and the things washed up, Tommy told them that he had found two more bulls, a big one and a small one, and neither of them mated, not four miles from where they were. 'Now,' says he, 'these bulls may take to traveling this evening, and be in the next county to-night, or by to-morrow morning, but the chances are they won't. We can run over to Sickle Lake in good time to-morrow, camp in the old shanty there, and call until an hour after sundown. The moon goes down at ten to-night, tomorrow she sets at eleven, and we have the advantage of an hour more light, and a day's fulling. If we get an answer, we can call again in the morning, and if you can stay a day or two longer, I can come back here, and Lutz and I can run up enough grub in two or three hours, to last us our stay at Sickle Lake. Lutz will stay here, while we go over, and see that no one steals anything.'

"The boys were beginning to get tired of lying in camp and shooting nothing. Willis said he was game for the tramp, and the boys said they would come too. Early in the morning they took their packs and rifles, and hit the trail. It wasn't the best of walking, and the four miles was an uncommon long bit of road. After going for some time, they came on a logging road, leading to the camp, and in a miry place they found the fresh tracks of the big bull. Tracks, browsing, and dung were all as fresh as they could be. They gathered enough pine knots and dead wood to keep on a fire when they came in from calling, and just at sundown they went down to Sickle Bog, about a mile from the shanty. Tommy posted them, and then he got up on a rock and began to call. He was a 'slow' caller; that is to say, he called about once, where most men call three times. Just as the moonlight was getting stronger than the daylight, they heard an answer. Tommy quit calling, and the moose kept coming in good shape. Sickle Bog is all covered with little spruce and hackmatack trees, and it's a bad place to shoot by moonlight. The answers came louder and louder; then another answer only much deeper came, then the boughs began to crack and snap, then all was still, except for one or two grunts the bigger moose let out of him. They lay there half the night, every now and then they could hear the old fellow give 'wough—wough' in the distance.

"They went back to camp, and early next morning tried it again. They got no reply, however, and about 8 o'clock, they went down to the place where they had heard the little bull last, and found his fresh tracks in the soft bog. Further on they came on the tracks of the old bull. He had come out on the edge of the bog and gone back into the woods; the little fellow had gone to the eastward. 'Now,' says Tommy, 'the little fellow and the big one have rowed before, and the little one is scared to death of him. He's put for the eastward and the big one is round these parts still; he's the one we want. I told Lutz to start for here at 8 o'clock, with some more grub, unless he heard a lot of shots fired one after another. That would mean that we had killed, and that he was to take the canoe and put for my place after the ox-sled and steer. He

will happen along in about two hours' time, and you men can stay here, while I take a circle around and see what I can of the night's work.'

"Off he went, and about an hour later Lutz came into camp. Willis had gone down to the bog, and just as Lutz came in, he returned. He and the young fellows talked for a while, then he turns to Lutz and says, 'Leave that stuff and come along with us for a while; we want you down on the bog.' First of all Lutz didn't want to come, but Willis had a way with him he couldn't get over, and he promised to make it all right with Tommy if he found fault with him.

"Lutz told me afterward that he never saw a hound on the trail like that man Willis. He went right to the tracks of the little moose and began to follow them. It was easy going on the bog, but when the track came on to hard ground it was different. Hard or soft, the ground didn't bother Willis very much. At last Lutz says to him, 'The big bull must have scared this little fellow mighty bad, for he's had an attack of diarrhoea'—pointing to the 'sign' on the ground. They went about half a mile further—Willis keeping the track like a weasel after a rabbit—when he stoops down and picks up something off the ground. 'Your moose get their clothes made in New York, I conclude,' says he, and the two boys commenced to laugh.

"They followed the tracks into a little bunch of fir trees, and white birches, some of the fir trees had been stripped of their rinds, and most of the birches had been barked. 'This is the smartest little bull I ever came across,' says Willis, 'he wears pants made in New York; he has a boy to tend him, and he sleeps in a shack roofed with fir rinds—or else the boy does.'

"Another hundred yards took them into the road we came up this afternoon; it was just about as muddy then as it is now. The moose tracks ran right down it, and on the nigh side were the tracks of a small foot, and a little further on Willis picked up the yellow wrapper of a stick of candy.

"This moose wears trousers, gathers rinds, and birch bark, eats candy, smokes cigarettes—picking up an old cigarette butt as he said so. 'I wonder if he drinks whisky?'

"They came round the turn by the big hemlock tree and saw the camp, or rather the old one that stood here at that time, right in front of them. Tommy Keen's sled was in the door-yard, and they could hear the 'ting, ting, ting, of an ox-bell from the little hovel we put the dunnage into to-night. 'There's your moose,' says Willis. The boy and the explanation of this is inside the camp. The big moose track we saw on the edge of the bog was a genuine one, but it was two days old, and the moose who made it browsed down a dogwood just before we came out. No one ever knew a bull to browse when he was answering a call, and there was another bull ahead of him. This has been a put-up game, and a clever one, too, but I'm on to it. Let's circle round and see if there is any more devilment to be unravelled.'

"Lutz and the boys were some tired, they sat down. Willis forbid them going into the camp, and after an hour, he came back to them and said it was all right, they could go in. The first thing they saw was Malcolm Keen, dead done out, asleep in one of the bunks. There was a birch-bark call, and a wooden rattle on the table. The kid had undressed himself and his pants were hanging on a nail. Willis took them down, and compared the button he had picked up, with those remaining on them. 'An old pair some visitor has left with Tommy, and his wife has cut them over for the boy,' says Willis. 'Wake up you young scamp,' says he, shaking the kid. The boy sat up and rubbed his eyes.

"Father told me you were going to be at the camp at Sickle Lake all day,' says Malcolm. 'Have you killed the big bull?'

"We have been hunting you all the morning,' says Willis. 'Do you know that last night you were within two hundred yards of our rifles, playing that fool game with that ox, and the call and rattle?'

"Crack went a pistol outside the camp, and in a minute or two Tommy walked in with a partridge still fluttering in his hand. No owl ever had rounder eyes than he had when he saw Willis, Lutz and the two young men there. Willis didn't wait for him to open his mouth.

"Mr. Keen,' says he, 'you lit on the wrong crowd this time, I began to suspect you the night you called up the first bull, and changed your call just as he was coming up. I followed you twice when you were cruising round after sign, and I know where you have the bottle of rye whisky hidden under the maple stump, and if you deny it, I can take you there. Several days when you pretended to be cruising for us, you went home and worked on your place, and the furthest we have been from your door-yard is a short four miles, though you led us round the woods and over lakes and streams until any one who wasn't an old hand would have believed himself twenty miles back. You take that boy and send him up to the muzzles of three rifles, so you can swindle the party you're guiding out of a few extra dollars, and then I suppose you intended to let us kill at the last moment, when you'd sucked the very last dollar out of us. You're an infernal scamp, and if you weren't an old man, I'd take a stick and give you a thrashing you'd remember as long as you lived.'

"Tommy's face grew whiter and whiter while he was talking, then he sat down on the deacon seat and commenced to cry. It wasn't sham crying either, the tears rolled down his cheeks, and he sobbed like a woman.

"Thirty years I've been a guide in these woods,' says he, 'and never anything like this happened. Are you the devil himself, or are you only a witch, that you can track me, or my boy over open barrens, and through bushes for miles? I saw those young fellows were getting tired of bad weather, and I wanted to encourage them along, so I told Malcolm to go to Sickle Bog and work the moose racket last night. I've met my Waterloo here, and I can't but own up to it. Come back to Sickle Lake camp with me to-night, and if we don't get a good head before the moon goes down, I'll give you men back the money you paid out

## Maine Big Game.

BANGOR, Me., Nov. 4.—*Editor Forest and Stream:* Today marks the close of the fifth week of the open season on deer and the third in the moose season, and under the conditions the results are certainly surprising. Those who have maintained that the deer and moose of this State are not on the decrease, as some pessimists have claimed, have been more than vindicated in the large increase in the number of both that have been shipped over the railroads of eastern Maine thus far, an increase of about 100 deer, and a material increase in moose over the corresponding period of 1904. To be sure, the high water mark of 1902, the last season before the introduction of the hunters' license, has not yet been reached, nor will it be until the falling off in numbers due to that innovation and other causes is made up for by an increase in sportsmen visitors during the hunting months. But the extreme dryness of the woods, a condition not known in the last thirty years, has made hunting so exceedingly difficult that it would have been surprising if the number of deer brought out equalled the same period of 1904. While certain sections report that the deer seem to have completely left them, there is reported a generous increase in most portions of game land, and the proportion of bucks has been very large for the first month of the season, a month which usually sees more does by a large majority than bucks, shipped out of the game section by the hunters. This year there has been a decided increase in the number of sportsmen going into the woods, as well as increase, in spite of the untoward conditions, in the number of shipments, both deer and moose.

The moose have been well distributed over the game region, although Patten, which once held the banner for moose shipments, is doing splendidly this season, and has sent out a large number of those recorded, besides having several remain in the care of local taxidermists. Other shipping points are doing their share, and when the season is over it looks now as if the record would surpass any year since 1902.

The conditions for hunting have, in the main, been reported as very poor, some hunters contending that not for thirty years have they seen it so noisy in late October, while a very few with whom your correspondent has talked have suggested that there were a few days when, for a day at a time, the conditions were not nearly as bad as they might have been.

Birds, which in mid-summer were reported as very plentiful throughout the State, and in large broods, seem to have utterly disappeared, although every hunter who can possibly find some is taking home a string of the delicious biddies, a privilege permitted the non-resident for the first time in many years. What has caused the birds to so thoroughly scatter or disappear hasn't yet been satisfactorily explained, but certain it is that with the right to take them home, the visiting sportsman is shooting all that he can find, although it is doubtful if the wardens at the Bangor station have had occasion to count many strings to see if they exceeded the legal limit. Were the birds plenty this year a blunder of the printers (or of some one in the fish and game department) would give the non-residents claim to more even than the newly enacted law does, since the licenses of this year bear a partridge coupon, permitting the holder thereof to take or ship home twelve ruffed grouse instead of ten, as permitted by the statutes. If the scarcity of birds is real instead of only apparent, the number to wear the red tags across the border line into other States will be even smaller in 1906 than has been the case this season. For the sake of the sport, the State and of the sportsmen, we shall live in hopes that adverse conditions, and not a shortage of birds, has made it difficult for any man to get his limit.

Since the seizing of the big bull moose by Chairman Carleton, who was on an investigating trip, with sport as an incidental feature, and who caught a sportsman and his guide red-handed dressing the moose on Sunday, the first day of open season, a bulletin has been issued to all the wardens calling for a rigid enforcement of the law which gives the game one day in seven for a breathing space. This law, which Mr. Carleton has himself said he did not favor, and to repeal which efforts have in the past been made, that were not entirely unknown to him, has been observed more in the breach than in the enforcement, except possibly in the neighborhood of the settlements, where public opinion has demanded that disturbances arising from making the day one of hunting should be prevented in the interests of Sabbath observance. It has surprised not a few to read in the public press his instructions to the wardens "to as thoroughly enforce the law against shooting on Sunday as on any other close time on game and birds." Letters of inquiry directed to the fish and game commissioners, and seeking to learn if this law is to be enforced in the remote hunting sections as well as in the neighborhood of the settlements, fail to receive any reply, or rather such a letter on the part of the writer met with such silence, so that this must be accepted as the State's policy for the remainder of this season at least. If any modification of this bulletin has since been sent to the wardens, who have arrested several for Sunday violation and secured their conviction, it has not been made public. It is a fact that those roads which lead through wood lots outside of Bangor and probably in many other sections of the State where there are partridge and woodcock covers, have hardly been safe on Sunday since partridge hunting began, the middle of September. Persons driving along or walking were kept in continual state of alarm because of the frequent reports with the occasional whistle of shot or bullet that came too close for comfort.

At last the accident list appears to have reached its highest point, and for the last two weeks the number of casualties has been on the decrease, so that now one doesn't read every morning of some unfortunate whose weapon, or whose friend's weapon has gone off unexpectedly. It is yet too early to congratulate ourselves that the awful record is over, but it is devoutly to be hoped that the number of fatalities, and of serious injury to humanity, shall grow no longer in the more than a month left for hunting big game. The majority of the casualties have been among residents, it is true, and with one or two exceptions non-residents have seemed to be better able to handle their firearms with care than the "natives," but there will be plenty of

men in the Maine woods who vote and pay their taxes in other States, who are just as careless by nature with their rifles as any resident of Maine—may their opportunities, and those of all who shoot, be cut off when human life shall be endangered. The tendency now is to investigate such events thoroughly, both through the services of coroner and in the courts, which is well. One non-resident only has been arrested for negligently shooting a man, and he was acquitted of any guilt under the law, his rifle having been discharged purely by accident, when the two were traveling through the woods. In some other cases, the men who did the shooting are being held for the thorough investigation of the courts.

At last it is raining, and all day to-day the rain has fallen upon the thirsty earth in a steady downpour, that is as much greater than the little showers of the past month, as the winter winds are stronger than the gentle zephyrs that make a summer in Maine so delightful to the over-heated city residents. At the present writing it shows no sign of abating, and a few days of this, which is snow in the big woods to the north. In fact, sportsmen who passed through the city to-day reported that it was snowing hard up the B. & A. R. R., when they got aboard the morning train. If this doesn't change to rain, which is unlikely, there will be some great hunting days next week, and the big moose whose tracks have been so eagerly followed without success, as well as the monster buck that glides in safety just out of range, will have to look out for themselves.

HERBERT W. ROWE.

## Caribou Shooting in Newfoundland.

ST. JOHN'S, Newfoundland, Oct. 21.—*Editor Forest and Stream:* Every year this colony is visited by an increasing number of sportsmen. Foremost among the English celebrities are F. C. Selous, the world-renowned African explorer; H. Hesketh Prichard, the well-known novelist and famous cricketer, and J. G. Millais, son of the great Sir John Everett Millais, president of the Royal Academy and the greatest painter of the Victorian age. It is hard to say in which branch the son is most distinguished. In the home country he is well known as a marvelous shot. In the world of literature he is distinguished as the best natural history writer of our day. His great work on the mammalia is destined to become an English classic. Its size and immense cost (£18 18s.) will keep it from the general public. It is specially a work for the learned and the rich. Mr. Millais is very much taken with Newfoundland and comes here every year.

Mr. Selous is also on the warpath, and I will give you an account of his expedition in my next letter.

Mr. J. G. Millais, like his friend Mr. Selous, shows his appreciation of Newfoundland as a sporting country, by paying frequent visits to our island. This year, with his companion and neighbor, Mr. McGaw, he went to the head of Bay D'Espoir. With the help of a number of Mic-Macs from Conne River he portaged all his belongings over to Long Pond. Through a chain of lakes and rivers the party worked their way up to N. E. Dog Pond. They intended working out west either to Red Indian Lake or to St. George's Bay, but they found the portage too long and with the assistance of some Indians that they met in the country they finally portaged over to the headwaters of the Gander and finally down to Glenwood. The march over the hills to the river was a very heavy job that took them more than a week. Mr. Millais speaks in very high terms of the Mic-Mac that Mr. Leslie, of Conne River, selected for him, also of his two men, Fred Wells and Robert Saunders, of Alexander Bay. Mr. Millais, who is a geographer, mapped out the country, and will lecture on the subject before the Royal Geographical Society in London. They saw over 3,000 caribou and got some very good heads. The season for sporting has not been very favorable. Owing to the mild weather, the big stags did not show themselves in the open as they always do on the first coming of snow and first touch of frost. Just at present Mr. Millais' chief literary work is the completion of the third volume of his great work on the mammalia. For this purpose he had fine opportunities at St. Lawrence, Newfoundland, of seeing a big whale captured, and he was enabled to make sketches and photographs for his new volume. He feels very much indebted to Dr. Rismuller, both for his valuable information about these great mammals and for assistance in painting the animals, both alive and dead. The distinguished visitor is going to write a book on Newfoundland with special reference to the caribou. It will take him a couple of years to complete the work, and he expects to visit Newfoundland again in 1908 to put the finishing touches on his book and obtain more sketches of our animals. Every one who has read his splendid paper on the natural history of the caribou in my Guide Book will understand what the complete and elaborated work will be like.

D. W. PROWSE.

## Moose Hunting in Nova Scotia.

SOUTH BROOKFIELD, Queens Co., Nova Scotia, Oct. 30.—*Editor Forest and Stream:* Once more I will call your attention to our success in moose hunting in this section. The month of October has been an ideal month for hunting and the sportsmen have had a good time and good luck in getting game. Dr. C. E. Lane, of Lititz, Pa., has been here and got his two bulls, and goes home a happy man, pleased in every way with his trip. He was only sorry that he could not take another, as the chance offered but the law would not allow him. A gentleman from Grand Rapids, Mich., got one bull, and just then had to leave the woods, as his guide was called home by the death of his father. Two others got two fine bulls and a bear. Some of my neighbors were out only forty-eight hours, others only twenty-four, and got their game. There have been a great many moose killed this season, and all report them very plentiful. As we still have two months for still-hunting I expect to hear of a great many being killed yet this season. Bears have put in their appearance again, and are quite plentiful; wildcats plenty.

I am sorry to have to report the death of our old friend, guide and hunter, Mr. W. S. Crooker, who passed away on the 4th inst. in his seventy-fifth year.

G. S.

## North Carolina Fields.

RALEIGH, N. C., Nov. 1.—The hunting season in nearly all of North Carolina opened to-day with extremely fine weather and a very good prospect for birds, by this meaning partridges. These wintered well, and good broods were raised this year. There are some small birds, but most are very well grown indeed. Very large areas of land are planted in peas, the best food for the birds, and there is plenty of feeding for the winter. It seems from what can be gathered that there will be more sportsmen from the north in the State than usual. Most of these have been in the habit of going west of Raleigh after birds, while east of here there are really quite as many. Chatham county is an excellent locality for partridges.

Game warden John W. Upchurch, whose headquarters have been at Raleigh for the past two years has been assigned to special duty on Currituck Sound, where the most important work is to be done. He has a swift gasoline boat at his disposal for patrol purposes, and will no doubt do thorough work. His work here, tofore has covered some forty or fifty counties. He tells me that the Audubon law has been very well observed and that it has steadily grown in popularity, this being, of course, a very strong point.

The Sapphire Inn, up at Toxoway is to be open all the winter and I hear that some large hunting parties will be there mainly out for big game, particularly bear and deer. The shooting seasons for both bear and deer has opened very well in the eastern part of the State, and there have been a number killed. Some very large bear have been shot there during the last part of October. In the canebrake and thick swamps known as pocosins, these bear are very numerous. The weather has been so warm until the past ten days that hunting was hot work, but now there have been good frosts and the weather is very agreeable for the purpose, in that rather heavy country, where, of course, there have to be guides for outsiders.

Of other game than that referred to there seems to be a lot. The Audubon law has certainly multiplied the game of various kinds. The season for squirrels did not open until to-day and these are becoming very numerous in some localities. There are very few deer in the thickly settled parts of the State. Hyde county is an excellent place for deer, and perhaps Craven and Jones counties come next. There will be two or three new hunting clubs in operation during the season along North Carolina Sounds. Of nearly all these, New Yorkers are apt to be members or guests. The clubs now run down the coast to within a few miles of Morehead City, and some are built directly on the ocean beach.

The best shooting so far as partridges are concerned, will not really begin until the first of December, after more rains and frost have taken the edge off the weeds, which are now pretty stiff, as the autumn has up to the past few days been phenomenally dry.

There is nothing after all that North Carolinians enjoy more than hunting, and at night, since the first of October, much of this has been done for possums. Some of the darkies have made statements to the effect that the possums are getting scarce; but there really seems to be about as many as usual, and around the towns they are about as thick as they are in the wilder country, as they can find food they like.

### Maine Deer Not Being Protected.

WORCESTER, Mass., Nov. 3.—*Editor Forest and Stream:* In making this statement, I cast no reflection on the State Commissioners or their wardens. I believe they are fully alive to the importance of Maine's protecting its large game, and doing the very best they can under their limited conditions. Careful observation on my trips to the Maine woods has convinced me that more deer are killed by campers and lumbermen during the close season, than are killed by licensed sportsmen during the open season.

I am sure I voice the sentiment of the licensed sportsmen when I say we have a claim on the State of Maine for allowing this to be done. What Maine wants, and will have to have, in order to better protect its large game, is a law to prohibit campers and natives alike from taking firearms into the woods with them during the close season. I am fully convinced such a law would be worth as much as twenty-five paid wardens, and would not cost the State a cent. Such a law would have the hearty support of all true sportsmen, and would not be objected to by any other than those who take the rifle into the woods to supply meat.

Visits to the Maine woods for the last thirty years have convinced me long ago that there is no game or animal there that is dangerous to campers. To-day, there is no State in the Union, nor in North America, where, in the same length of time, and for the same amount of money, a man can get as good fishing and large game shooting as he can in the State of Maine. The State has an abundance of large game, which, if properly protected, will furnish legitimate sport for a long time to come. And it is the duty of the lawmakers to see that they have laws to protect it; and when they have a law to prohibit campers and natives alike from taking firearms larger than a .22 rifle, or a .32 revolver into the woods, without written permission from the State Game Commissioner, Maine will have a law easy to enforce and a great game protector.

A. B. F. KINNEY.

### Venison in Season.

*Editor Forest and Stream:*

The communication of Mr. Charles Hallock, on the unfitness of venison for food during the months of October and November, deserves the respectful consideration and action of all true sportsmen, of whom I am which. The deer meat in those months, being strong as the fragrance of a billy goat to windward—as graphically described by Mr. Hallock—should not tickle any palate which is pitched in the proper key of gustatory appreciation and discrimination.

But the phase of this mephitic subject of the open game season which is difficult to comprehend, is, how the public has been consuming this billy-goat venison all these years without any consciousness of its spice island fragrance.

If the American gourmet has no discrimination of nose or palate—and that is the only conclusion we can draw from his consumption of venison all these years without detecting the wrong of it—I am constrained to believe that he is past reformation, if indeed he be worthy of any trouble to reform him at all.

What is the use in bothering with a gentleman who is eating offensive dainties and does not know the difference? If educated to the higher criticism of venison, as enjoyed by Mr. Hallock and myself, he might even then prefer his venison in the same old startling manner to which he was long habituated. There are men who would break away from a dish of canvasback duck, and the things thereunto appertaining, to revel in the delights of Limburger cheese and chitlings—and they may be right at that. Who knows?

Therefore, Mr. Hallock and I may be wrong about the deer meat, because our palates may be out of focus, our noses discredited and our notions oblique.

But, nevertheless, we can continue to take our deer when they are sweet of body and pure of mind. Eheu!

SQUARE HEAD.

### Wildfowl in Maryland.

STOCKTON, Md., Oct. 30.—Once more the wildfowl are moving south, and goodly numbers of black ducks and mallards are stopping on our marshes; in fact, there are more here now than I have seen at any one time for years. The marshes are in fine condition, every pond on them being fairly choked with rich duck grass. Out on the shoals the same conditions prevail, a rank growth of grass making the wide stretches of shallow water look like meadows. There are some geese here, and more are coming every day, but the large open-water fowl have not arrived yet in any considerable numbers; brant and redheads should be well represented about the first week in November.

We have a way of guessing the weather, that I find from years of experience about the safest guess work of any of the many ways. That is, the direction the wind is blowing when the sun crosses the line in September will be the prevailing wind for the next six months. This fall it crossed with easterly winds, which are fine ducking winds, sometimes they are a little boisterous, but down here they never freeze or get very cold; then fowl are always restless, fly low, and make good decoying.

We will use a power launch this season, the first and only one in Chincoteague Bay in use for that purpose. With it we can get on the ground in half an hour, shoot until dark, and back again in same time wind or calm. This will be far better than living on the boat, as it puts you home to a fine, hot, 6 o'clock dinner and comfortable rooms and beds. O. D. FOULKS.

### Adirondack Moose and Elk.

*Editor Forest and Stream:*

The following extract from a letter received by me to-day from D. Frank Sperry, Esq., an old-time "guide, philosopher and friend" of Old Forge, on the Fulton Chain Lakes, in the Adirondacks, may possibly interest some of the readers of FOREST AND STREAM. Mr. Sperry is a staunch advocate for the protection of the Adiron-

dacks and the game therein, and when, some three years ago, just after his return from a trip to Alaska, the bill to restore moose to the Adirondacks was before the Legislature, he proved a most valuable assistant in procuring signatures to a petition in favor of the bill, traveling to Adirondack settlements far and near on snow shoes in the dead of winter. He is a sportsman in the highest sense of the word.

"The moose (i. e., liberated by the Forest, Fish and Game Commission) are thriving where they can dodge greenhorns. They have wandered some thirty miles or more from the locality where they were liberated (i. e., not far from Old Forge), and there are none now near our locality. There is no disposition to drive them off or kill them, as every one, campers, residents and guides, are very anxious to have them and the beaver back in the Adirondacks once more. I have never known of a case of a moose being killed that I think was an intentional killing. But we had one case of four elk shot by a miserable hound simply because they had been given to the Brown's Tract Guides' Association, and this 'cuss' was down on the association and there is no doubt that he killed them. We offered \$500 to get proof of who killed them, but there were no witnesses. The sentiment has changed in regard to the protection of game in the last five years wonderfully. I would like to tell you about the beaver we placed in the woods last spring, three on the headwaters of South Branch of Moose River and four on the South Fork of the main inlet to Big Moose Lake. They are all doing well and laying in supplies for winter."

JOHN N. DRAKE.

### Duck Shooting in Illinois.

We are enthusiastic over shooting as are the many other hunters throughout America, and so we listen with interest to many stories told us by the older hunters who hunted here thirty years ago with muzzle-loaders. The great thing was to shoot them when there was a big flight. I was told once about a man who was near-sighted and could see the large ducks, such as canvasbacks, mallards, etc. He would tell the boys to "Let go at 'em," but when smaller ducks would come along he would say, "Don't shoot; them's too small."

It is somewhat different now, as the hunter is very glad to take any kind that choose to come his way. My father, who has done a great deal of shooting in his time, and has shot along the Atlantic coast and bays, moved to the northern part of Illinois on the Fox River, where he could settle down somewhere near good shooting grounds, where the boys could always have some shooting and bring the ducks and game home where all could enjoy the game, and also where he can watch the flight of ducks from the window.

W. C. H.

### Birds Taken by Rod and Line.

WHILE trolling for bass outside the mouth of Waterville River Mr. Connell captured a puffin, which took the bait (a spoon) under water, got hooked, and was safely brought to boat. On the same day Denis Currane, Mr. Connell's fisherman, who was with him in the boat, was fly-fishing for bass, when a puffin took the fly and was hauled in. Shortly after Currane took another in the same way. It appears that there was a big shoal of sprat at the spot, on which many puffins were feeding. Currane cast his fly, which was an ordinary white one, over the shoal of sprat, hoping to get bass, when instead he caught those puffins. This made three puffins, all captured by rod and line from one boat in a comparatively short time—a strange, if indeed not unparalleled occurrence.—London Field.

### A Chance for a Wild Hog.

HOUSTON, Tex., Oct. 14.—*Editor Forest and Stream:* The second annual hunting and fishing excursion, now being organized by the general passenger department of the Southern Pacific Railway Company, will leave Houston, Tex., Nov. 15, remaining in camp and on trail in southwest Texas until Jan. 1. The party will be composed of thirty prominent northern and eastern capitalists, bankers, business and professional men, aside from guides and camp servants. Col. T. J. Anderson holds out as an inducement to take the trip the fine chance the hunters will have to run into a drove of the wild hogs, which add zest to the game in Matagorda county.

### Adirondack Deer.

KEESEVILLE, N. Y., Oct. 27.—From all sections of the Adirondacks come reports of successful deer hunting. The popular resorts are well filled with hunters and a number of deer have been killed daily. The average kill of deer in the entire Adirondack region has averaged about 1,200 to 1,500 carcasses for several years past, and the score this year is likely to be up to the average.

While hunting in the vicinity of Ampersand Pond, near Saranac Lake, Saturday, John Moody, of Saranac Lake, shot a ten-pronged buck, weighing more than 200 pounds.

### Stray Carrier Pigeon.

SCHENECTADY, N. Y., Oct. 30.—I have had reported to me by Mr. Philo Avery, of Esperance, Schenectady county, N. Y., that a couple of weeks previous to Oct. 9 a homing pigeon with a metal tag marked "P. F. 7240" came to his place, and now has a nest with two eggs. He would like to be put in communication with the owner.

EVERETT SMITH.

### Sale of Partridges in Quebec.

AYLMER, Que., Sept. 28.—According to an order in council passed dated at Quebec, Aug. 29, the law for the buying of, the sale of, or having in possession for the sale of partridges, has been extended to Oct. 1, 1908.

N. E. CORMIER.

### THE MANY-USE OIL

Prevents rust on hot, cold, wet or dry guns. Thin oils will not. —Adv.

### Game in New Jersey.

THE Newark Call thus sums up the shooting prospects of New Jersey:

The greatest drawback to gunning in New Jersey is the increased acreage of "posted" property. In Passaic, Bergen, Morris and Sussex counties a large majority of the acreage is advertised against gunning or trespassing. Large areas are leased by clubs, or preserved by individual owners, and in these counties there is little free shooting ground. Warren and Hunterdon are said to be over 70 per cent. free, and there is little land posted in Monmouth county, except along the shore. Ocean county is almost entirely free shooting ground. Essex and Union are almost out of the question, except for popping over rabbits in open lots. Hudson does not count either, and Mercer county is pretty well staked off by private owners, while Burlington county presents a great expanse of free shooting, with little game to the square mile. It was said by an old gunner last year that a man would have to travel forty miles up the Lackawanna Railroad to find anything better than a "no trespass" sign to fire a load of shot at.

South Jersey will afford some fine shooting this year it is said, but few Newarkers think of going there for quails or rabbits. It seems like foreign country to people from this end of the State, and they have long become reconciled to giving it up to Philadelphians, who formerly made laws for the regulation of shooting in Salem, Gloucester, Cumberland and Cape May counties.

It is possible to get some excellent quail shooting along the line of the Camden and Amboy division of the Pennsylvania Railroad this year, and along the Freehold and Jamesburg and New Jersey Southern road in Monmouth and Ocean counties. The High Bridge branch of the Central offers attractions also.

No matter where you go it is always good to be polite to landowners, obey orders and avoid destroying property.

### The Flavor of Game.

*Editor Forest and Stream:*

Mr. Charles Christadoro wrote not long ago of the advantages of hanging up game until it had the right flavor. I sent the note to a friend, and append his letter. He certainly knows, and can give most people points on cooking game.

J. P. B.

The letter follows:

To add to the tone and flavor of moose and deer meat, it should be hung in a cooler, such as beer and fresh meat is kept in for cooling purposes, until a coat of greenish-blue wool covers it. Take care that it is kept cool enough so that the meat does not become tainted. Two or three weeks' time is necessary to bring it to the proper tone. Be careful to keep it from freezing, as this will ruin the flavor.

Moose meat when cured in this manner is the gamiest of all large game, and a steak from it cannot be surpassed. An open pie made from this meat is most delicious of all. Try one.

It matters not where the custom originated; this way of ripening game is the best and, I think, could only have come to perfection here in Minnesota, where ample moose furnish plenty of meat for experimenting.

A friend of mine, Capt. Wm. White, of mining fame in this country, who is a connoisseur along these lines, together with myself, has experimented until he claims the method perfect.

The principle is that the juices are all retained within the meat. The longer it can be kept without tainting, the better the flavor will be.

H. H. S.

### CURRITUCK CURRITUCK CONDITIONS.

CURRITUCK, N. C., Oct. 31.—Since writing you a few days ago the game conditions have wonderfully improved. A sharp northwester came down from the lakes and with it every variety of duck, goose and swan known at Currituck yesterday. I crossed the feeding grounds of the canvasback, redhead, ruddy duck and blackhead and it seemed to me there were at least a million, at any rate there were as many as at any time during the past few years. For three days there has been a great flight of black ducks and mallards coming from the northwest and southwest, as it was three years ago when we had the best mallard shooting we have had in twenty years, if ever. Canada geese also came with the ducks until the Sound seems filled with them. A few swans have also arrived. On the whole, the prospects for the opening day, Nov. 2, are very bright.

MORE ANON.

### Song of the Mountain.

Son of all the cities,  
With their culture and their code,  
What brings you to my doorway  
By the lone and starry road?  
You may come with seven pack-mules,  
You may walk or steam or ride,  
But you'll never, never know me  
Till you come without a guide.

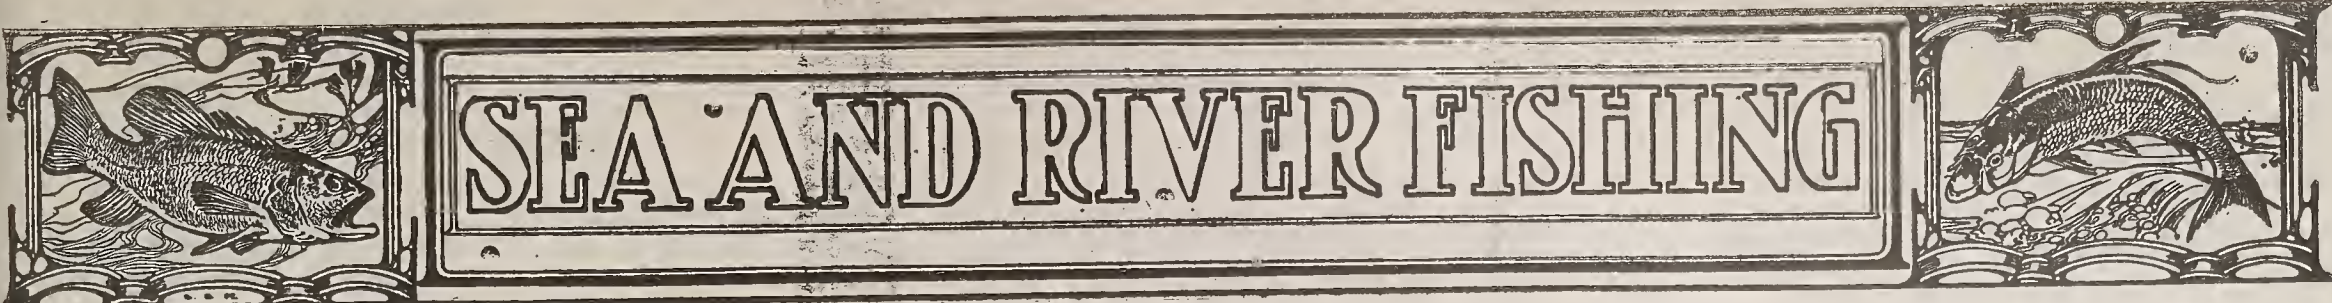

You may come with rod and level,  
With compass and with chain,  
To parcel me for profit  
And barter me for gain;  
You may tell my age in years  
By the scars on drift and slide;  
But you'll never, never know me  
Till you learn how I abide.

You may range my slopes for silver;  
You may wash my sands for gold;  
You may tally every jewel,  
Till my gems have all been told;  
You may cross my wildest cañon,  
You may top my last divide,  
But you'll never, never know me  
Till you watch me, wonder-eyed.

You must sleep for nights together,  
With your head upon my breast,  
The companion of my silence,  
The receiver of my rest.  
You may come with all your wisdom,  
To subdue me in your pride,  
But you'll never, never know me  
Till you love me like a bride.

—Bliss Carman in the Reader's Magazine.

# SEA AND RIVER FISHING

## The Dominating Carp.

### Second Paper.

EVANSTON, Ill., Nov. 2.—Blessed with a country so prosperous that neither Aladdin's lamp nor the dreams of Midas could ever conjure up its wealth, it certainly should not stand idly by with its untold millions and see the finest body of pure water which is combined in our Great Northwestern Lakes turned into a pasture for the propagation of an alien fish so coarse that even a coal-heaver would reject it.

If the magnitude of the present increase of the offensive carp now naturally progressing in these waters could only be realized, as well as its great danger to the extinction of all our fishes, there would not be a single sane person who would not desire the destruction of this foreign outlaw who is the very curse of our waters. Comprehend, if you can, that he has now allotted to him as one specialty wherein to roam and propagate at his pleasure, an area of 100,000 square miles of an unbroken reservoir of pure water as well as an addition of 1,500 rivers which are tributary to this vast basin, the pride of America. No wonder that a distinguished member of the American Fisheries Society proudly exclaimed, "That all the barrels of money we can open will not destroy them"; and therein lies the great danger to our game and edible fishes. Just so sure as the sun shines and the stars twinkle it will eventually be the dominating fish of this country. Men may come and men may go, but this coarse carp will go on forever, this with an apology to Tennyson. The annual increase of this scavenger will progress in the same ratio as compound interest, and that is a startling fact.

This is no Chinese puzzle, for the most simple mathematics will solve the problem to a nicety. He, however, who comes to seek knowledge in this matter with a mind to scorn and censure will find nothing for his instruction, for a palpable error to him is more acceptable than an unquestioned fact. His idol is the unregenerated carp, and to this he bends with the most submissive humility. To quote we will state "that ignorance, which is the wet nurse of prejudice, never yet won a case on its merits."

There is little or no use talking about the carp's edibility, for it is generally recognized as a coarse fish of low degree, and to substitute it for our magnificent fishes, which are highly appreciated the world over, is enough to make the very angels weep. I am not aspiring to be a dictator when the enjoyment of the salivaries is to be considered, for I believe in an open door in this commerce and therefore think it best to emulate the old woman of pastures green, when, after kissing the cow, she fervently proclaimed "Everybody to their own liking." That is my platform, and therefore it would not be felicitous for anyone to strive to drive an ignoble carp down the turnpike of my throat for my gastrics to disdainfully reject.

It has culminated as a sad mistake of our Bureau of Fisheries, and I deeply regret that it has, for the grand work that able and efficient corps of officials has consummated is to be highly commended. They have built up the fading cod fisheries to a great extent, established subaqueous farms for the rearing of sponges in Florida, and on the Potomac they are fattening oysters by a new process, and have also built up the shad fisheries; in fact, saved them from total destruction, and in addition placed this year some 250,000,000 whitefish in the Great Lakes, as well as accomplishing other great scientific works which have proved of incalculable benefit to the entire country.

If they can only rid our Great Lakes of this cursed carp no honors will be too great to bestow upon them. I am fearful, as others are, that it is a task like cleansing the Augean stables. They are here, I think, to stay, and grow and multiply till they become one vast army of untold millions. This fish is a marvel of longevity and growth and endurance. He will live in all waters—cold, warm, clear, dirty, stagnant and salt. He is hardy and pugnacious, and was never yet driven out of any water, no matter how many game and savage fighting fish therein. With such a fish, so wonderfully constructed and conditioned, what chance has any other fish in the same waters? Place brook trout in a grayling stream and see how quick the grayling will disappear. That fact has been exemplified in the Michigan grayling streams, which were at one time quite generously populated with them; now you can hardly find a grayling in the entire State. Not so with carp. He remains to the crack of doom and soon rules the waters with proud imperialism.

It took 100 years to prove that fossils are organic, and 150 years, according to Thorau, to prove that they are not to be referred to the Noachian deluge. Let us have no such lapses of time to ascertain that the carp is wholly unfit for the culinary, and that it would be more duly honored in its complete absence from our lakes and rivers of pure water. I have never yet heard a single person with whom I have conversed on this subject declare in favor of the carp. This alien is not in our line of progress as respects quality, and it simply stands for the entire depletion of our American fresh water fishes and sports therewith. To one who has learned the alphabet of the waters, the science of propagation and preservation, the mysteries of life and death under the seas, he will coincide with me when I state that a great mistake has been made in introducing this finny harpy into our waters. The very devil, who stands for destruction of all good, lurks behind the deleterious carp. He is a veritable outcast in American waters; and yet there are some men, and intelligent ones, too, who stand shoulder to shoulder with the carp and strive to choke him down the throats of all our people—*sans cérémonie*. It is far cheaper and better to protect the noble heritage that came to us in such rich harvests from watery realms than to experiment with a

foreign product that comes to us with such significant distrust. We have had some costly lessons of this kind taught us before, and the pestiferous sparrow is one of them, to say nothing of the wild pigeon whose flocks darkened the very heavens, and the magnificent bison, which were numbered by the millions as they roamed over our trackless prairies years ago and gave the red man of the forest his sustenance; and now we are to be red-ribboned with the anarchistic carp.

There are zealots who, in the ardor of their pursuit, forget the goal from which they started and claim everything in sight. They will find if they keep up the pursuit with such vehemence that the miraculous draught of fishes by our Saviour were all carp, and that it now has a divine flavor. They are invariably drunk with their certain belief and with that absorption their faculties are so enthused with loftiness and pride in their cause that they really opine that feathers are sprouting from their shoulder blades. This is no frenzy finance à la Lawson, but a multitude of facts that will not be obliterated as long as the carp is plowing the soil of our waters with its leathery nose and turning up and tearing up the spawning beds of our choice game and edible fishes, as well as creating a turbid condition of the water as the vast armies advance on their vandal warfare of extermination.

The introduction of the carp to our waters, which has been planted by the United State Fish Commission in some fifteen hundred or more localities throughout the country, are now coming to the fore with startling rapidity and therefore attracting universal attention, not only by the sportsmen but by others who have at heart the preservation of our lakes and rivers of pure water from the bold encroachments of this finny pariah. The cry as a defense or an apology for its incursion is that it will prove a great blessing to our indigent and improvident, as if they were the sole beneficiaries and that alone was sufficient compensation for the loss of our cherished game fishes as well as many of our choice edible fishes. Think of the delicious whitefish stepping down and out with a farewell to his imperial carps, and so of the gamy black bass, the toothsome brook and lake trout, the savage maskinongé, the pike, the perch, and so on through the entire list of our lake fishes.

What becomes of the other classes of our citizens? Are they not worthy of some consideration as to legislation relative to the transplanting and protection of our fishes, or are they to take pot luck and forever after hold their peace? There are not enough insurance companies to go around, and so, perforce, they will be left to take the topography of the heavens or go to some isolated waters where Naiads come to comb and curl their golden locks and there angle for some overlooked sunfish.

Of course, with the disappearance of our cherished fishes the devotees of the gentle art may as well hang their pliant rods upon the willows, the tackle shops close their front door, the work shops allied thereto also go into retirement and all because the carp has become the monarch of the waters and pulled in the latch-string. Woe is me, Alhama! Oh, ye gods! what thick encircling darkness blinds the minds of men. There are truths which some despise because they have not examined, and which they will not examine because they despise. There is one person, and that is our worthy President, who will, we are positive, protest against the turning of our Great Lakes into pastures for the rearing of the ignoble carp. This will be fully realized on reading the dedication of his new book to John Burroughs. In it he distinctly emphasizes his appreciation of the rich heritage which is left us. He very forcibly and feelingly says:

"Every believer in manliness and therefore in manly sport, and every lover of nature, every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the far-sighted men who wish to preserve our material resources in the effort to keep our forests and our game beasts, game birds and game fish—indeed, all the living creatures of prairie and woodland and seashore—from wanton destruction."

If the persistent advocates for transplanting and propagating carp in our Great Lakes can find a shred of consolation in the above dedication they must possess an empire in their brains and a vanity like an insatiate cormorant that soon preys upon itself.

I am not alone in confronting this problem, for it has interested every one who is heart and soul in the saving of our fresh water fishes, so dear to all. Public opinion is now becoming so strong in this matter that Congress will doubtless have to recognize it and strive to correct the evil before it is too late. It looks to me as if this scavenger has now such an overpowering hold on our great reservoirs that the work of reducing them to any material extent will prove such a gigantic undertaking as to fairly daze our officials. The State of Illinois, realizing a similar condition in Fox Lake, one of her great nurseries of game and food fishes, made an attempt last year to have the undesirable fish eliminated therefrom. They took out about 40,000 pounds of them and then retired in dismay from the hopeless task. This will undoubtedly be the fate of our Great Lakes unless some great genius discovers a method to achieve the desired triumph.

The only way, I think, to operate with hopes of success is to meet force with force. Let the Government increase its number of hatcheries, and do it generously, and so plant in the Great Lakes such a multiplicity of fry (young fish) of all species, or, specially the best. If three or four hundred millions of fry are now annually put in, run it up to the billions, and if there is anything in propagation, which I am confident there is, the increase would soon show itself. In addition to this let there be a rest of the lake fisheries for at least three years, and to make this effective, let there be an international harmony with Canada, for it is equally interested in our lake fisheries and has been loudly complaining of the evils the carp has wrought. A large number of men thus thrown out of

employment by the closing of the fisheries could find employment in the new hatcheries. If all the men could not thus secure work they could very readily find it elsewhere and at wages more remunerative than now and employment much easier than the hard work they now have. This I think feasible, and the cost of the experiment would return fourfold to our Federal uncle.

The State of Michigan will suffer more than any other State from the depletion of our Great Lakes. It is a perfect paradise for anglers, and I have not the least doubt that eight or ten thousand sportsmen visit it every year for the thrilling delights of rod and gun. Trout streams radiate it in every direction, inland lakes alive with fish dot it in every quarter, and then the lakes on its northern boundary present the best trout and bass fishing extant. Its railroad—the Grand Rapids & Indiana Railway—is called the "Fishing Line," and it is no misnomer. I have for the past twenty years or more angled in the generous waters of that State and have had more thrilling delights in there taking trout, black bass and maskinongé than any other place. Again, *en passant*, it is the great deer State of the country, while its fields and forests abound with partridge and the wild ducks are cut down by the hundreds where the wild rice grows in expansive waters and lagoons.

Let the carp once get a strong foothold in these inland streams and lakes and make a clean sweep of the lakes on the north, the loss alone of the sporting element would aggregate a most surprising sum. Railroad passenger traffic would decline, hotels and boarding houses suffer, the many summer resorts on the waters languish, and, in fact, it would throw many out of employment.

Now Michigan has a silver-tongued orator in the person of the Hon. William Alden Smith and an otherwise active, enterprising and intelligent gentleman who would be the very person to bring this matter before Congress. In his early days he was associated with the Fish and Game Commission of that State and has a complete knowledge of the fisheries, both commercially and sportively, and is thus eminently qualified to take up this game of battle. We have known him for many years, have watched his course in Congress, which has been a very honorable and remarkable one, and we know he could do more to rectify this depletion of the Great Lakes than anyone. Let his constituents request his support in this matter and we are confident he will take up the battle and win it if any one can, for it is a most honorable and meritorious cause.

If the public really knew all the facts about the introduction of this coarse and ungodly fish whose reproductivity is perfectly marvellous, and whose tenacity to exist under the most unfavorable conditions, and whose astonishing growth and longevity are the wonder of all scientists and naturalists, it would rise up in its wrath and demand its immediate removal from our waters. Think of a country—and it is a possibility—with any one absolutely dominating species of fish. Again imagine, by way of comparison, of our forests with but one species of bird and that a crow or buzzard. This gives you some idea as to how we are drifting in our natural history. If we are to continue our transplanting of the finny tribe let it be of a superior quality and not of a species with a cloven foot. The carp is really the serpent in paradise.

I have presented this additional letter on the "dominating carp," as there was much I desired to state that was not given in my first. ALEX. STARBUCK.

## The Angler of the Quais.

It is said that the French touch no form of pleasure which they do not adorn and refine. In Paris they have adorned the pleasure of angling with a pole unique for size among the fishing rods of this earth, and they have refined it to the point of infinity by eliminating from it all expectation of catching fish. I mean that in Paris there is no worry or excitement about angling. It is all pure pleasure. The panoply of sport always appeals strongly to the French heart. No one is more carefully be-gaitered, be-gunned, be-dogged, and be-bandoliced than the shooter whom one meets in the heart of Paris on the eve of the *ouverture*; no one wears baggier knickerbockers than the French cyclist, or a more pronounced badge in his cap; no one glares through bigger goggles when he rides in a motor car. So no one has a longer rod than the French angler. "But," you object, "the quais at Paris are high and steep, and he must have a long rod to reach the water at all." That is very plausible, but I fear that it is not quite a fair statement of the case. It would be more true to say that, in order to have a long rod, he must fish off the quais. Anywhere else his weapon must excite ridicule. On an ordinary bank of three to five feet height what should a man be doing with about twenty-five feet of bamboo in his hands? But I may be doing him an injustice. There is a possible alternative explanation of this prodigality of rod. Perhaps it is the complete absence of sport which brings the contemplative Parisian to the riverside; but whether it be his passion for a striking equipment or the impossibility of catching fish which is responsible for his presence on the quais he is equally worthy of study, for, vainglorious or avid of tranquility, he is surely the happiest of all fishermen.

During the past month of August I had many opportunities of observing him. I have done so with amusement when I was merry, with contempt when I was out of temper, with exasperation when I looked for sport, and with despair at all times. But I have had to spend a week on a Derbyshire trout stream since in order to think of him with envy. You must know that I am one of those unfortunate anglers whom the dry fly has robbed of all pleasure in other forms of

fishing. The wet fly wearies me; the worm I loath; the minnow has nothing to offer me; I cannot guddle; to snatch I am afraid. Yet, for lack of rising fish, I tried every lawful method during three days, in vain. I came in each night chilled and sodden with rain, and swore as often to go home in the morning. And when each morning broke with a promise of sun I put off my going for another twenty-four hours, hoping, like any angler, for a soft wind and fly on the morrow. On the fourth day the sun came out, but the fly did not, and I had but one new burden laid upon me for the rest of the week. I can say nothing of my sport more forcible than that it was of a badness sufficiently consistent to bring me to a resolution (since cancelled) to spend next summer with a big bamboo on the Quai d'Orsay.

For to the Parisian angler such an experience would have been impossible. What does he know of the hopeless glance up wind for a break in the gray? If the day is unpleasant he stays at home like a sensible man, and so he always has fine weather for his angling. What does he know of the dodges and miseries of the dry-fly angler, the crawlings and the cramps, the cross wind and the drag, the branches and the barbed-wire, and the filled waders? He is not, let me tell you, the sort of fool to creep about among nettles or kneel on jagged stones—when camp stools are so cheap. He looks for no fish, so he is never disappointed. Six whole days without a kill? Flute! This is a bagatelle to a man who only begins to think sport dull when two whole summers have gone by without his float sinking. If he has not the fierce joy of the strike home he never suffers the wretchedness of the subsequent break. Though his heart never beats as the fish which has refused a dozen patterns at last opens his mouth, his soul is never rent to pieces as the fly comes back. For him there is no futile comparing of patterns, no anxious scrutiny of the insects which float on the water, no doubts about the size of the hook, the material of the body, the tint of the wing. A lump of dough is all his bait. It requires little attention. Every now and then when the action of the water has taken away so much as was on the hook he renews it patiently. Thus he is free to concentrate his attention on the things that really matter. The steamboats which pass eternally, crowded with gay and interesting people, the digestion of his lunch, the conversation of his friends, the protecting presence of his wife who sits beside him with her crochet, the prattle of his children, who scratch in the sand not far away; these are but a few of the thousand and one delights which serve to make the happy hours glide more happily by. He is as contented as a cow in a fat pasture.—W. Quilliam, in the London Field.

## Salmon Fishing in Newfoundland.

ST. JOHN'S, Newfoundland, Oct. 26.—*Editor Forest and Stream:* During the season of 1905 a number of gentlemen in Scotland met to discuss the causes of the great decrease of salmon in their rivers. An old Highlander was asked to give his opinion. He declared, "If there's nae watter there'll be nae fish"—"watter" is an essential element we all know, but there may be too much "watter." It is from excessive floods, and a cold, damp spring that we have suffered this season. The fish were late in ascending the rivers, and the wet weather produced a regular plague of flies.

Several of our southern rivers, such as the Grand and Little River Codroy, Harry's Brook, and other streams, in St. George's Bay, have now been most carefully protected from nets, poachers and all other obstructions for the past few years. I predicted that in consequence not only would there be a great increase of fish but also that very large salmon would eventually be caught by anglers. The well known sportsman, Sir Bryan Leighton, Bart., and Lady Leighton were out in Newfoundland this season. Sir Bryan rather ridiculed my prediction until in the Grand River Codroy he hooked and held a 40-pounder. He held the fish for about half an hour, saw him jump quite close to him, but as he was badly hooked he eventually lost him. As Sir Bryan says, he has seen plenty of monster salmon in British Columbia, so he could not be mistaken about the size, which, he states, was between 35 and 40 pounds. The warden before that informed me that late last season they saw numbers of very big fish in the pools.

A large number of anglers went this year to the Upper Humber and all caught a great many fish, but I have not heard of any specially large salmon being taken; plenty of 20-pounders, but no record fish. It was the same at Little River Codroy. The biggest take was a 26-pounder by Dr. W. C. Woodward, of Middleboro, Mass., U. S. The veteran angler, F. I. Daggett, of Boston, Mass., who is generally high line on this river (last year he took a 36-pounder), had nothing heavier than a 14-pounder this year. Everyone is agreed about the immense numbers of fish in the rivers, but they were extraordinarily capricious, often sulky and would not look at a fly.

Sea trout were, as usual, plentiful, and Colonel Nicholson caught one 6½-pounder. The highest average, so far, in our southern rivers had been 5 pounds, but on the west coast there are several streams where the fish run to 7 and 8 pounds, and on the Labrador sea trout of 10 and even 12 pounds are quite common.

I send you the returns of the fish caught at Little River Codroy, the reports from the other rivers have not yet been sent in. Great Codroy River shows well.

D. W. PROWSE.

## A Large Sturgeon.

CANSO, Nova Scotia.—A local merchant bought a sturgeon caught in a trap near this town a few days ago. The fish weighed 290 pounds entire, length nine feet two inches, girth nine feet ten inches. He thinks it is a record size for these waters. I maintain no. My natural history mentions the sturgeon attaining the length of twelve feet. Kindly verify. FOREST AND STREAM is my sporting sheet anchor. The man who lives up to the teachings of our paper cannot go far wrong in outdoor life.

In re sea trout I remember very distinctly a mackerel

drifter taking over a thousand fine sea trout twenty odd miles west of Valencia Island, Ireland. That means, of course, over twenty miles off shore. Salmon begin to ascend Waterville River, County Kerry, on Jan. 1, so you see there are other early rivers.

Swordfish have afforded very good sport in our bay, some weighing 500 odd pounds have been landed; pollock are numerous along shore, and no better sport can man desire than a 15 to 20-pound pollock on a good rod. May I mention that this method of fishing pollock is as "old as the hills" in Ireland. We used to fish with flies, artificial sand eels, rubber baits of all shapes and sizes.

I have interviewed numerous old and young skippers that were or are still in the habit of voyaging to the Labrador coast, and they all agree that there is no duck egg traffic carried on now, but in years gone by quite a few hookers used to bring back a load, as one old salt remarked. During the American Civil War a large traffic was done in this business, the eggs were disposed of to hotel keepers, restaurants, etc. Even in those days the eggers had to be very careful, as the Government cruisers of Canada watched them pretty closely. One captain told me that some of his men (they were fishing down there some twenty-five years ago) landed to pick berries, he seeing a mossy spot below a bank with good berries growing near by, jumped off the bank and sank to his armpits in eggs that were cached there. But for one duck that flies past here now there were a hundred then, and in the fall they come down this bay in thousands. There is no eggng now, but every boy able to carry a gun goes after them in and out of season. It is no uncommon thing for one gunner to bag fifty or sixty ducks in a spring morning when the birds are flying north to their breeding grounds. C. K. O'D.

## Concerning Bass.

HARRISBURG, Pa., Nov. 3.—*Editor Forest and Stream:* In your issue of Nov. 4 I noticed a very interesting item entitled "Concerning Bass," by Peter Flinn. In the item he says: "All this leads me to the question, whether the large-mouth bass breed in the same lake and do better in water inhabited by the small-mouth bass variety. Or do each prefer a peculiar part of the same lake?"

From something I noticed in a pond in one of the State hatcheries last year I should say that the large-mouth bass most emphatically prefer a part of a body of water as far away from the small-mouth bass as it can get. And it is its personal safety which provokes this desire. Last year a large number of large and small-mouth bass were planted in the ponds at the hatchery mentioned for use for the Pennsylvania exhibit at the World's Fair. Within forty-eight hours after being placed therein there was a complete separation of the species, the large-mouth bass occupying the shallower and muddiest part of the pond, while the small-mouth bass occupied the other. The separation was not voluntary. If a large-mouth bass ventured anywhere near the precincts of the small-mouth there was trouble, and the large-mouth bass found some difficulty in getting back to his own corner without damage. On the other hand, a small-mouth bass could venture with some impunity among the large-mouth species. On one occasion, while at the hatchery, just to see what would happen, I threw some feed in the pond midway between the upper and lower end, and the large-mouth bass were not permitted to secure their regular share, hence my opinion, that the large-mouth bass and the small-mouth for that matter prefer to herd by themselves. W. E. MEEHAN, Commissioner of Fisheries.

## In the Delaware.

FROM Washington's Crossing, on the Delaware, comes the story of a curious freak of the finny tribe, which we give as it comes, leaving it to the experts to offer an explanation.

In October, 1903, after a four days' rain, occurred the greatest flood ever known in the Delaware. Not only was the river "bank full," but it swept over the farm lands adjacent, flooding houses and cellars, carrying away bridges, scooping out chasms in smiling meadows, and leaving huge piles of logs, bridge timbers and driftwood in fruitful cornfields.

Before this flood fishing had been good; black bass, perch, eels and catfish could be had in abundance, and in the season shad. Since the flood there have been practically no fish in the river, and anglers have almost ceased to try for them. Even the shad fishing is not half what it once was. The fishermen do not offer an explanation but are disposed to blame the flood for their ill-luck. Either, they argue, it washed all the fish out of the river or else it washed so much blamed stuff in that they left in disgust and have never come back.

Perhaps some piscatorial expert will arise and express an opinion. L.

## Propagation of Lobsters.

CONSUL-GENERAL HALLOWAY, of Halifax, reports that an Ottawa special says that one of the experts of the Canadian fisheries department has returned from British Columbia, after successfully planting, at different points in the waters of that Province, a large number of good-sized lobsters. Attempts have been made by the fisheries department in other years to transfer lobsters from the waters of the Atlantic to the Pacific, but without success, the long railway journey being too much for the crustaceans. Profiting by the experience gained in the past, extra precautions were taken this year, with the results that of the original consignment of several thousand lobsters shipped from the maritime provinces, forty per cent. reached Vancouver in good condition, and were speedily transferred to the sea at various points, both on the mainland coast and Vancouver Island, upon which a strict closed season will be observed for two or three years.

The Hay Bay fishing lodge advertised on another page will interest visitors to that angling resort.

## THE MANY-USE OIL

This famous reel oil never gums. Substitutes will fail you.—Adv.

## Canoeing.

### Officers of A. C. A., 1906.

(Assumed office Oct. 1, 1905.)

Commodore—H. Lansing Quick, Yonkers, N. Y.  
Secretary—William W. Crosby, Brighton Mills, Passaic, N. J.  
Treasurer—Frederic G. Mather, 164 Fairfield Ave., Stamford, Conn.

### ATLANTIC DIVISION.

Vice-Commodore—Woolsey Carmalt, 82 Beaver St., New York.  
Rear-Commodore—Matthias Ohlmeyer, Francis H. Leggett & Co., 128 Franklin St., New York.  
Purser—George S. Morrissy, 73 Mercer St., New York.  
Executive Committee—William A. Furman, 846 Berkeley Ave., Trenton, N. J.; Louis C. Kretzmer, Schepp Building, New York; Clifton T. Mitchell, 46 E. Sedgwick St., Germantown, Pa.  
Board of Governors—Robert J. Wilkin, 211 Clinton St., Brooklyn.  
Racing Board—Daniel B. Goodsell, 36 Washington Sq., New York.

### CENTRAL DIVISION.

Vice-Commodore—Henry R. Ford, 45 N. Division St., Buffalo, N. Y.  
Rear-Commodore—Edward H. Demmler, 526 Smithfield St., Pittsburgh, Pa.  
Purser—B. Irving Rouse, 981 Lake Ave., Rochester, N. Y.  
Executive Committee—John S. Wright, 519 West Ave., Rochester, N. Y.; Lyman T. Coppins, 691 Main St., Buffalo, N. Y.; Jesse J. Armstrong, Rome, N. Y.  
Board of Governors—Charles P. Forbush, 164 Crescent Ave., Buffalo, N. Y.  
Racing Board—Harry M. Stewart, 85 Main St., E. Rochester, N. Y.

### EASTERN DIVISION.

Vice-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.  
Rear-Commodore—Frank S. Chase, Manchester, N. H.

### How to Join the A. C. A.

"Application for membership shall be made to the Treasurer, F. G. Mather, 164 Fairfield Ave., Stamford, Conn., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

## Canoeing in the State of Washington

BY D. C. CONOVER.

THERE is probably no aquatic sport so enjoyable and at the same time so healthful as canoeing. This form of pleasure is increasing each year, and particularly so in the Far West, where streams and lakes as well as ocean waters abound. It would be difficult to find in any section of the United States a section so well adapted to canoeing as that part of the State of Washington known as the Puget Sound country, and more particularly as applied to the immediate vicinity of that great metropolis of the Northwest, the city of Seattle.

Seattle, by virtue of its many natural advantages, has grown in the past five years from a town of 80,000 people to a city of 160,000, and its population is increasing at the rate of between 15,000 and 20,000 each year. One reason for its remarkable growth, and probably the greatest, is its situation on Elliot Bay, which is a part of the inland sea—Puget Sound. This fact, together with its comparative proximity to Alaska and the Orient, has been the means of the wonderful strides in its development.

On the west side of Seattle, in fact its western boundary, is Puget Sound; its eastern boundary, four miles from the Sound, is Lake Washington, one of the most beautiful lakes imaginable, with its numerous little bays and islands, and having visible, apparently rising from the edges of the shore, although many miles away, the mysterious Cascade Range of mountains, and surmounting all the perpetually snow-capped peak, Mt. Rainier, rising nearly 15,000 feet above the level of the sea.

Lake Washington is nearly twenty-five miles in length and from one to three miles in width. Its outlet is the scenic Black River, a stream twenty-five miles, which runs to the Sound. The lake's inlet is the Sammamish River, or, as it is more commonly called, "Squak Slough." This river or slough is very sinuous, having more than 275 sharp turns in a distance of less than ten miles. These turns, however, make the distance from Lake Sammamish, from which the slough originates, to Lake Washington, thirty miles. Lake Sammamish is a splendid sheet of water, ten miles long and one mile wide, with wild and rugged shores and here and there a human habitation. Thus it will be seen that from the head of Lake Sammamish to the waters of Puget Sound is a distance of about ninety miles. This stretch of water is a veritable canoeists' paradise, and is a trip which, in its entirety, has been taken by very few canoeists.

During the latter part of the month of July, of the present year, a party of canoeists consisting of Bertrand Johnson, Walter S. Osborn, C. M. Leedham, E. P. Moran and D. C. Conover, made the trip up Squak Slough against a three-mile current to Lake Sammamish, where, after a day's outing, they returned down the slough to the canoe headquarters on Lake Washington, at Seattle, and after a few days' rest the party, with the exception of Mr. Moran, who was prevented by business engagements from leaving the city, in two canoes, fully equipped with camping outfit, blankets, sails, etc., again embarked and cruising south along the shores of the lake entered the Black River and paddled down to the Sound, where the canoes and outfits were placed on the steamer *Perdita* and the next morning proceeded to Port Gamble, a lumber mill town just inside the entrance to Hood Canal, a branch of Puget Sound, which, although not

quite so large, is about 100 miles in length and averages fully three miles in width. The use of the word canal, as applied to this body of water, is very misleading, as it is really included in the common designation Puget Sound.

There is no finer body of salt water in the world than Hood Canal and its scenery is unsurpassed. Majestic mountain ranges, some heavily timbered with spruce and fir, others snow-capped, rise from the water and give the traveler a true insight into the ruggedness of nature and inspire him with a profound admiration for the mystery of creation. Here and there, flowing into the canal, having their origin in some ancient glacier in the mountain fastnesses, are turbulent streams where speckled trout abound, affording splendid sport to the angler at certain seasons of the year.

Disembarking at Port Gamble from the steamer *Perdita* we paddled away in our canoes about 11 o'clock in the morning, and after covering a mile's distance, were agreeably surprised to find a breeze springing up and blowing in a southerly direction which gave us a fair wind toward our destination of the day, Seabeck, twenty-one miles away. Gradually the wind increased in velocity until the whitecaps were visible in all directions and the waves were running several feet high. To anyone who enjoys sailing let him ride the storm-swept waters of this inland sea, in a basswood canoe, sixteen feet long and only thirty-one inches wide, open the entire length, except for a covered space fourteen inches at each end, with only a low rail to prevent the water splashing over the ends into the canoe, and the canoe loaded down with 150 pounds of camp equipage and two men, weighing together 400 pounds, the sensation is one he will never forget. Carried along by the force of the gale, the bow of the canoe plunging into the waves one moment and then suddenly sinking beneath them at the stern, the waves breaking against one's back, holding the canoe on its course with a paddle in order that it may not expose its open sides in the trough of the sea to the breaking waves, and withal shipping very little water, was our experience, and when we had traveled this twenty-one miles in three hours, arrived at our destination safely, and, pitch-

ing our tent, prepared for the morrow's pleasures.

Seabeck is one of those old deserted mill towns, which were in the height of their boom days some fifteen or twenty years ago, and although the houses and stores are there, only a handful of people are left to tell of their former prosperity. Seabeck's mill had burned many years before, and near its site we camped for two days, enjoying the splendid fishing in its harbor, and disporting ourselves in the salt water, warmed by the hot sun beating down on its long stretches of sand and warming the water as the tide came in.

From this point to Pleasant Harbor, one of the most magnificent land-locked basins, half a mile long, 200 yards wide and 200 feet deep, was our next stopping place. Here we remained two days and enjoyed the trout fishing in the Dosewallips River and Duckabush River, two mountain streams on either side of us. These streams, cold and clear, are the angler's delight, and from their numerous deep pools have been taken many Dolly Varden trout, weighing as high as 14 and 15 pounds in some instances. The best fishing, however, is had some six or seven miles back in the mountains, although excellent fishing can be had at the mouths of these rivers.

Leaving Pleasant Harbor we set out for Lilliwaup, some twenty miles further up the canal, but encountering heavy south winds, were compelled to put into shore and spend the day and night at Quatsap Point. Here we obtained a fresh supply of provisions from a neighboring farmer, and were ready to proceed as soon as the wind subsided. Sleeping out that night on the beach with only our blankets and the starry heavens above us, we enjoyed one of the most peaceful and refreshing slumbers of the journey.

Early next morning we resumed our course, and, passing numerous small streams, arrived at Lilliwaup River, where we remained two days. The scenery of Lilliwaup is remarkable in its grandeur. The river runs a mile back from salt water to the falls, and paddling up to these we left our canoes on the shore and climbed the foothills to a height of more than a thousand feet, where we saw the river falling over the rocks in another beautiful fall. There are six of these falls in this thousand feet, and it

would be impossible to say which is the prettiest, so beautiful are they all. Besides this river with its falling waters, a small and beautiful lake, said to contain myriads of trout, lies only a short distance from the town. The Olympic Mountains peep out from the clouds and give an air of sublimity to the scene.

Leaving Lilliwaup we paddled on our way to a point some two miles from Union City, which is located practically at the head of the canal, and from this point we cruised the upper end of the canal and made one day a journey up the Skokomish River, some three miles from Union City, up to and beyond the Indian village of the Skokomish Indian reservation. Here we purchased some Indian paddles from an old squaw, through the good offices of the Rev. Edwin Eells, Indian agent in charge, who acted as our interpreter.

Union City (a city in name only) is so located that in time it will become one of the greatest summer resorts of the Puget Sound country. It enjoys hot weather in summer to a far greater extent than any other city on salt water in the State of Washington. In fact, it is so hot that one old man remarked, as he shook the perspiration from his head, that Yuma, Ariz., was cool in comparison. Nevertheless, the heat there makes it a splendid place to enjoy the bathing, as the water becomes warm and delightful.

After an absence of two weeks' time, and covering a distance in our canoes of more than 250 miles, bronzed and hardened, we left Union City for home on the steamer *Inland Flyer*, thankful for our health, and duly grateful to that wise and all-seeing Providence which has so lavishly bestowed upon the State of Washington so many natural advantages for the enjoyment of the enthusiastic canoeist.

# YACHTING

## New Boats From Gielow's Designs.

MR. HENRY J. GIELOW now has on his boards or building from his designs twenty-nine new boats. Of these the largest is a 100ft. waterline steam yacht and the smallest is an 18ft. waterline power boat. The tendency of the day is certainly toward vessels equipped with either steam or combustion engines. This is evidenced by the fact that twenty-four of the twenty-nine vessels Mr. Gielow now has in hand are fitted with either steam or gas engines. Another interesting feature is that of the fifteen power boats designed by Mr. Gielow only one is intended solely for high speed. The racing of high speed launches has not, up to this time, been either satisfying or conclusive, and owners now demand something besides speed alone in their new boats. Besides the fifteen power boats Mr. Gielow's designs include five racing sail yachts, two auxiliary yawls, three steamers, one steam launch and three houseboats.

Of these numerous designs the most interesting and most important is a 63ft. waterline racing sloop. This vessel is for one of Mr. Gielow's oldest clients and she will undoubtedly be the feature in next season's racing. She will be built entirely of Tobin bronze, by Mr. Robert Jacob, at his City Island yard. Mr. Gielow was given a carte blanche order when commissioned to design this boat, and he will not be hampered in any way by any restrictions or requirements on the part of the owner. She is 92ft. over all, 63ft. waterline, 17ft. breadth and 11ft. draft.

Of the other racing boats three are designed for racing in class P on Gravesend Bay and on Long Island Sound. The owners of these three boats are all Atlantic Y. C. members and they have all had experience in either the smaller or larger classes. The dimensions of these boats are 42ft. over all, 30ft. waterline, 9ft. breadth and 6ft. 3in. draft. These figures are only approximate, and the dimensions of all the boats will be slightly different. No contracts for the building of these three boats have been let and the owners do not wish their names to be given out at present.

The fifth boat will be raced abroad. She is for Mr. A. Brunila, of Kotka, Finland. The design shows a keel boat 42ft. 9in. over all, 27ft. 6in. waterline, 10ft. breadth and 6ft. 3in. draft with very comfortable cruising accommodations, although she is to be used mainly for racing.

The larger of the two auxiliary yawls is 65ft. waterline. She will make a fine cruising vessel and she will be used mostly along the Maine coast. The name of the owner is not available, but she will be built by Mr. Robert Jacob at City Island. Her construction will be of wood and she is 95ft. over all, 65ft. waterline, 20ft. breadth and 9ft. 6in. draft. She will be fitted with a 40 horsepower engine. The boat's lines have been completed and she will be laid down in a few days.

The smaller auxiliary yawl is for Mr. Julien T. Davies, Jr., of New York city. This boat is nearing completion, and it is quite possible that she may be used in Southern waters this winter. In the summer she will be seen on Great South Bay. Her dimensions are 55ft. over all, 38ft. waterline, 14ft. breadth and 2ft. 8in. draft. Her motive power consists of a 10 horsepower Smalley engine. The boat is being built by Mr. Willard F. Downs, of Bay Shore, L. I.

The largest of the three steam yachts is for a Californian and she will hail from San Diego. This vessel will be built on the Pacific coast. She is 110ft. over all, 100ft. waterline, 20ft. breadth and 7ft. draft. Her engines will be of 100 horsepower and she will have a

liberal sail spread, which will be used when cruising.

Next in point of size is a 20-mile steamer for a member of the New York Y. C. She is 97ft. over all, 90ft. waterline, 11ft. breadth and 4ft. 6in. draft. She will have engines of 250 horsepower.

The third steamer is for the Santee Club. She is a shallow draft vessel with a wheel tunnel aft. She is 70ft. over all, 65ft. waterline, 17ft. 9in. breadth and 2ft. 2in. draft. This steamer is building at Osborne's yard at Yonkers. She will have two 30 horse-power engines and twin screws.

The only steam launch among Mr. Gielow's new orders will be built abroad. She is for Mr. A. Ahlstrom, of Bjorneborg, Finland. She will be built of steel and her dimensions are 54ft. over all, 50ft. waterline, 11ft. 6in. breadth and 3ft. 10in. draft. Her 50 horsepower engines will be built by Sullivan, and she will have a Roberts boiler. A speed of 14 miles is expected.

The contract for the largest of the three houseboats has not as yet been let, and the name of the owner is withheld. This vessel is 85ft. over all, 80ft. waterline, 19ft. breadth and 2ft. 3in. draft. In addition to a snug sail plan, she will have a 50 horsepower gasoline engine.

The houseboat for Mr. Wilbur C. Fisk, New York Y. C., is almost as large as the vessel just mentioned. Mr. Fisk's boat is 84ft. 6in. over all, 76ft. waterline, 23ft. 6in. over all and 4ft. draft. She is equipped with two 4-cylinder Twentieth Century gasoline engines of 70 horsepower each, and it is expected that these engines will drive the boat at a speed of 10 knots. Her tank capacity is sufficient to give the vessel a cruising radius of 1,000 miles. The owner's quarters are on the starboard side forward. This cabin is 9x16ft. Connecting with this room is a bath 5x7ft. On the port side forward is another stateroom 9x10ft. A bath also connects with this room. On the same side of the boat but further aft is another stateroom 10ft. square. A companion ladder is on the starboard side and the boat is reached by passing through a large vestibule. The dining room is 12x23ft. Next comes the engine room, which is 9ft. square. By passing through the roomy pantry the galley, 9x10ft. is reached. Aft of the galley on the port side are the crew's quarters. The officers' quarters are on the starboard side of the engine room. There are bath and toilet rooms for the officers and crew. Stairs to the upper deck are provided both fore and aft. On the upper deck is a lounging room 16x18ft. The exterior finish and trim is of mahogany and various hard woods are used on the interior.

The houseboat for Mr. E. E. Roberts is about 9ft. shorter on the waterline than the Fisk boat. She is 69ft. 4in. over all, 66ft. 8in. waterline, 19ft. 6in. breadth and 2ft. 3in. draft. A 60 horsepower steam engine, which will furnish the power, has been sent to the builder's yard in Florida, where it will be installed in the hull. The vessel will be completed and ready for delivery to the owner about Jan. 1, 1906. In order to reduce the draft there is a tunnel aft for the wheel. The boat is of wood and yellow pine, and cypress enters into the construction of the hull, which is divided into 12 water-tight compartments. Each of these compartments is connected with a powerful bilge ejector, which would keep them free in case the bottom was stove in. That part of the hull below the main deck will be used for machinery, tanks, stores, spare gear and supplies. From the stem aft, for a distance of 24ft., the deck is clear, then comes the boiler and machinery space. Next aft is the galley, crew's quarters and cabins for the officers. Further aft,

extending the width of the vessel, is an unobstructed deck space 14ft. long. This deck is for the officers and crew. On the upper deck are found the owner's and guests' quarters. A deck house 42ft. long and running the width of the boat contains a dining and living room four sleeping cabins and two baths. Forward of these quarters there is a deck space of 19ft. long and aft there is a deck 11ft. in length. All windows and doors are protected by copper screens. The interior of the owner's and guests' quarters are finished in white enamel.

Two of the fifteen power boats designed this fall by Mr. Gielow are nearing completion at the Jacob yard at City Island. Dreamer, the boat building for Vice-Commodore Charles W. Lee, Manhasset Bay Y. C., is slightly larger than the one he had built at the same yard last winter. She is 61ft. over all, 54ft. 8in. waterline, 10ft. 9in. breadth and 3ft. 6in. draft. She will have the first of the new 30 horsepower Standard engines which develop 40 horsepower. The hull of the new Dreamer is a little cleaner and finer than that of the old boat, and when finished she will be a smarter looking craft. Her frames are of oak and she is planked with 1in. cedar. She has two mahogany houses. The after house contains the main saloon, owner's cabin and toilet room. The engine is located under the flush deck, which divides the two deck houses. The forward part of the engine room and the galley are in the forward house. Under the forward deck is a very roomy forecabin. The boat is steered from the space between the two deck houses. A deck seat extends the width of the forward end of the after deck house. Aft there is a sizable cockpit. The finish below in the owner's quarters is mahogany and the joiner and cabinet work is of a most superior order. There is a waterway around both deck houses.

The other cruising launch building at the Jacob yard will be known as Fern. She is a little shorter than Dreamer but she is a more powerful boat. Her topsides are carried up to form the side of her cabin and forward she has a turtleback deck. This boat is 59ft. 3in. over all, 52ft. 10in. waterline, 10ft. 9in. breadth and 3ft. 7in. draft. She will be equipped with one of the new model 50 horsepower Standard engines and a speed of about 14 miles is expected. The materials used in her construction are very much the same as those that entered into the building of Dreamer. Fern has more room below than Dreamer but it is secured by sacrificing a little in appearance. She is laid out very much the same as the Lee boat below. On deck she has a large cockpit over the engine and this stretch of flush deck practically divides what would otherwise have been a continuous cabin house in two parts. There is full head room in the forecabin. Mahogany is used on deck and below for trim and joiner work.

Only the finest of selected materials have been used in the construction of these boats, and this coupled with splendid workmanship, give a most satisfying result. When completed they will be the finest launches of their size and type in this country.

The high speed launch mentioned previously is for Mr. A. F. Jay, of New Orleans, La., and she will be constructed by some Southern builder. The boat is 60ft. over all, 58ft. waterline, 7ft. breadth and 3ft. draft. A 100 horsepower engine will drive her at a high rate of speed.

One of the smaller launches is for Mr. J. F. Revilliod, Astana, Nyon, Switzerland. She will be used on Lake Geneva. She is 29ft. 6in. over all, 28ft. 9in. waterline, 5ft. 6in. breadth and 2ft. draft. A French engine of

LINES OF 70 FOOT STEAM YACHT—DESIGNED BY SMALL BROS. FOR HARRY M. RUBEY, 1905.

20-25 horsepower will be installed, and she is expected to develop a speed of over 16 miles.

Among the smaller craft is one for Mr. J. B. Palmer. This boat, which is being constructed in New Jersey, is 21ft. over all and the same on the waterline, 5ft. 3in. breadth and 3ft. draft.

Another boat of the same type is 18ft. over all, 18ft. waterline, 4ft. 6in. breadth and 2ft. draft. She has a 5 horsepower engine.

The names of the owners of the following boats have been withheld and as yet no contracts for their construction have been let, although bids are now being taken:

The longest is 77ft. over all, 77ft. waterline, 12ft. breadth, and 3ft. 3in. draft. She will be fitted with an engine of 175 horsepower.

Next in size is a boat 84ft. over all, 75ft. 6in. waterline, 13ft. breadth, 3ft. 6in. draft and an engine of 150 horsepower.

Then comes a craft 77ft. over all, 70ft. waterline, 12ft. breadth and 3ft. draft. The engine has not been settled upon as yet.

Another cruising boat is 69ft. over all, 65ft. 3in. waterline, 12ft. breadth and 3ft. 9in. draft. Her engine will be of 60 horsepower.

The dimensions of a little smaller boat are 67ft. 3in. over all, 59ft. waterline, 12ft. breadth and 3ft. 3in. draft. This boat will also have a 60 horsepower engine.

The next boat is but 1ft. shorter on the waterline. She is 60ft. over all, 58ft. waterline, 12ft. breadth, 3ft. 6in. draft. A 50 horsepower engine will furnish the power.

The largest of the remaining three is of the following dimensions: 51ft. over all, 45ft. waterline, 11ft. breadth and 3ft. draft. Considerable speed is wanted by the owner and an engine of 130 horsepower will be installed.

A boat measuring 38ft. on deck and the same on the waterline comes next. She is 8ft. 6in. wide and her draft is 2ft. 6in. She will have an engine of 15 horsepower.

Last, but not least, comes a boat 25ft. long on deck. She measures the same on the waterline. The breadth is 5ft. and the draft is 2ft. 6in. With a 25 horsepower engine a fair amount of speed is expected.

RECENT SALES.—Mr. Stanley M. Seaman has made the following sales: The sloop Mildred sold by Mr. George E. Edwards, New Rochelle, N. Y., to Mr. John R. Chamberlin, New York city; the catboat Adelaide sold by the Huntington Mfg. Co. to Mrs. E. M. Scott and the launch Gertrude II. for Mr. C. W. Butts, Hoboken, N. J., to Mr. Frank B. Gilbreth, New York city. Gertrude II. was designed by Mr. Henry J. Gielow and built last winter by Mr. Robert Jacob, at City Island. Gertrude II. is 37ft. long and 6ft. breadth. Mr. Gilbreth will have a 30 horsepower DeDietrich engine installed in the boat and a speed of 14 miles is expected. Mr. Gilbreth is a member of the Marblehead-Corinthian and Manhasset Bay Y. C.'s and the New York A. C.

#### THE MANY-USE OIL CO.,

New York City, will send Free Sample. Write now.—Adv.

## A Cruising Steam Launch.

WE present in this issue the complete plans of the cruising steam launch designed by Messrs. Small Bros. for Mr. Harry M. Rubey, of Macon, Mo.

In these days it is rather unusual to see a boat 75ft. long driven by steam engines, but Mr. Rubey's requirements were such that steam answered his purpose rather better than any other power.

The design shows a powerful boat with a pointed stern of the canoe type. The draft was restricted to 3ft. 4in., and she has liberal breadth and a flat floor. The freeboard is ample, and there is a slight break in the sheer line just at the after end of the pilot house.

The cabin house extends well fore and aft, and there is little deck space available. The boat is steered from the top of the cabin house just aft of the pilot house. The portion of the cabin house forward of the funnel is covered with an awning, and this space will be used as a lounging place for the owner and his guests.

The companionway ladder is placed just aft of the cabin house, and anyone coming on board lands on the after deck. From this deck, which is covered with an awning, one enters the main saloon, which is 11ft. 6in. long. On either side of the companionway stairs are transoms. In the forward corner on the starboard side is the sideboard. There is a steam radiator in the center of the forward bulkhead. On the port side are two doors, one leads to the galley and the other to the passageway, which leads forward. Three sliding windows on each side give ample light and ventilation to the main cabin.

The galley is 4ft. long and it is fitted with a large ice-box, coal stove, sink, hot water boiler and folding table. Under the deck are the dish lockers. Another door from the galley leads to the passageway. The engine room is 9ft. long and the coal bunkers are located on either side. The motive power consists of a compound engine  $6\frac{1}{4} \times 13 \times 8$  in., which will give the boat a speed of 7 or 8 miles an hour.

At the forward end of the passageway is a stateroom 8ft. 6in. long and extending the width of the vessel. It is fitted with a brass bed, lounge and bureau. There is a radiator at the after end. Separating this room from another forward is the bathroom, which is 5ft. long. Here there is a porcelain tub, set basin and patent closet. The after stateroom has three windows on each side, while the forward one has but two on either side. Each of these rooms has a large clothes press. The forward room is 8ft. long and fitted very much the same as the other one.

The pilot house, which is 9ft. long, is reached from either the deck or the forward sleeping cabin. Here there is a bookcase, desk, radiator and auxiliary steering gear. On the forward deck is the capstan and a small companionway which leads to the forecabin.

The vessel is heated by steam and lighted by electricity. In the bathroom and galley there is running hot and cold water.

One boat is carried on davits.

The dimensions are as follows:

Length—	
Over all	75ft. 1in.
L.W.L.	72ft.
Overhang—	
Forward	1ft. 8in.
Aft	1ft. 5in.
Breadth—	
Extreme	15ft. 2in.
L.W.L.	14ft. 2in.
Draft—	
Extreme	3ft. 3 $\frac{1}{2}$ in.
To rabbet	3ft.
Freeboard—	
Forward	7ft. 2in.
Aft	4ft.
Least	3ft. 9in.
Displacement	35.84 tons
C. of B. aft of L.W.L.	36.57ft.

## Boston Letter.

CORINTHIAN Y. C. CHAMPIONSHIPS.—One of the most active racing clubs along the coast at the present time is the Corinthian Y. C., of Marblehead, which annually offers championship prizes in several classes in which its enrolled yachts are entitled to enter. It does not make a practice of giving open races, but during the early part of each August there is a series of invitation races, known as the "midsummer" series, winding up with an annual invitation race. While these are not technically open races and are not Y. R. A. races, the Corinthian Y. C. not being a member of that organization, they are for practical purposes open races, and all of the classes of the Y. R. A. of Mass. are generally provided for. It may be said that the attendance at these races is far greater than at the regular club races.

During the season that has just passed the Corinthian Y. C. races, both club and invitation, have been productive of 449 entries, which may be said to be an exceedingly large number for any one club during a season. During the four days of the midsummer series and the annual invitation race the aggregate of entries was 275, or over 60 per cent. of the total number of entries of the club for the whole season. On Aug. 10 the attendance was 79, the largest at any race in Massachusetts Bay during the season. Club championships were offered in seven classes, including four rating classes under the new uniform rule.

Most active of these classes, as in the Y. R. A. circuits, was that of the 22-footers, in which Tyro, owned by Mr. W. H. Joyce, appeared to have little difficulty in capturing the championship. Her record of five firsts and one second in six starts is an enviable one, and is in keeping with her work in other races during the season.

In the 18ft. class Boo Hoo, owned by Mr. Reginald Boardman, took five firsts and one second in nine starts and is winner of the championship. Only four boats

# GAS ENGINES AND LAUNCHES.

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

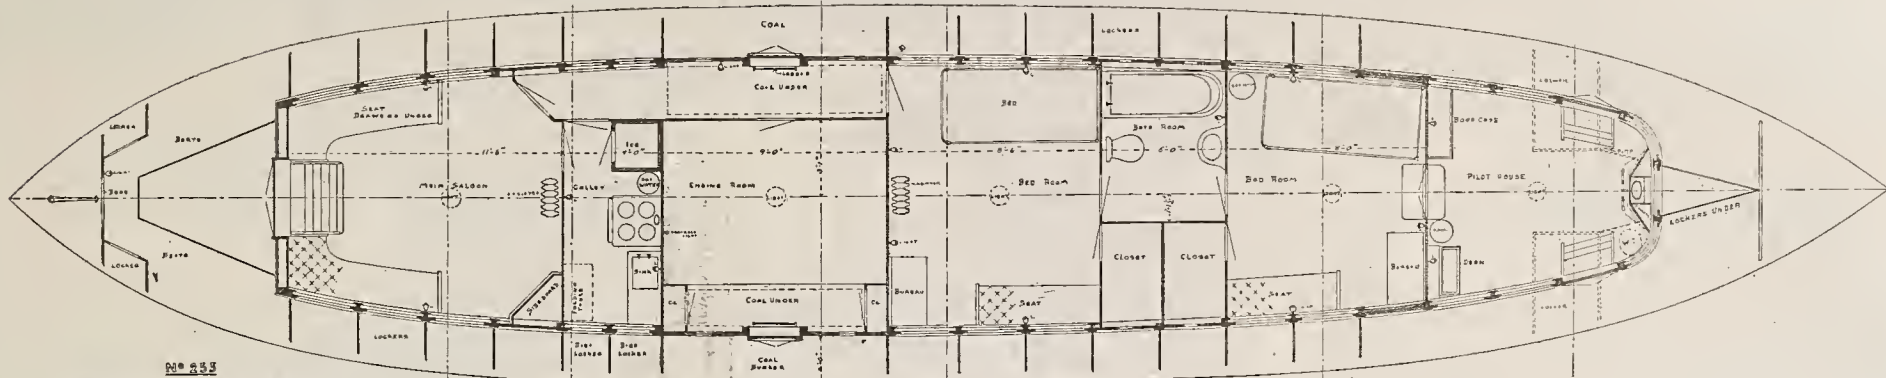

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FRAME PLAN

qualified for the championship in this class out of eleven which competed at some time or other. The reason for not qualifying and also why the average percentage of the second boat in the class and of other boats in this class and other classes appears inconsistent with the total percentage and the number of starts, will be explained further on.

In the 15ft. class Cigarette, owned by Dr. Morton Prince, was the only boat to qualify. She sailed in six races, taking three firsts and one second.

There was greater opportunity for observing the effect of the new rating rule in class M than in any other. In this class five boats competed and in the accompanying table the rating of these boats are given, as they also are in the other rating classes. The boats of longest waterline in class M were Cossack and Louise, nominally 35-footers. Chewink IV. and Sauquoit were 30-footers of the class which was organized in 1904. Seboomook is one of the former Y. R. A. 25-footers. It will be noticed that both of the 30-footers rate higher than the 35-footers, and that there is very little difference between the rating of the 25-footer Seboomook and the 35-footer Louise. Chewink IV. took three firsts and five seconds out of eight starts and got the championship. Cossack's record of three firsts out of three starts may look a little better for averaging up, but it does not go far enough on account of her not sailing the required number of races. Chewink IV. is owned by Mr. F. G. Macomber, Jr.

In class N were two of the original 22-footers, Setsu and Optsah V., each rating at 32.36. Neither qualified for a championship and there was hardly enough racing between them to show what might have been done.

In class P there were the 25-footer Carina II., rating at very nearly her waterline length, two 21-footers and an old-timer, the yawl Sea Fox. Carina II. did about all of the going in this class, taking six firsts and three seconds out of nine starts.

In class Q were two knockabouts, whose rating is given as the limit of the class. Soubrette, owned by Mr. W. B. Moot, is about 19ft. on the waterline, carrying 450 sq. ft. of sail. Carmen is a 21ft. knockabout carrying 500 sq. ft. of sail. Soubrette got four firsts out of four starts.

A number of races were given for the championships, I believe nine. The positions were figured on a percentage basis, the total percentage being divided by the number of starts. It is specified, however, that a yacht must have started in at least six races to qualify for the championship, and consequently the work of those yachts sailing less than the required number goes for nothing, so far as official record or championship is concerned. This applies to Nibelung, in the 15ft. class, whose average percentage is greater than that of the only boat in the class to qualify. In the accompanying table, however, a record is given of all boats competing, for the purpose of reference, it being assumed in dividing the total percentages that a yacht has started at least six times. The table, for which I am indebted to Mr. H. S. Goodwin, chairman of the Regatta Committee of the Corinthian Y. C., follows:

Table with columns for Class, Starts, 1sts, 2ds, 3ds, Total Average, Per Cent. Includes 22-footers, 18-footers, 15-footers, and Class M-33 to 40 feet Rating.

Class N-27 to 33 feet Rating. \*Setsu, Lewis & Talbot... 2000 .333. \*Optsah V., S. H. Foster... 500 .083.

Class P-22 to 27 feet Rating. \*Carina II., H. S. Wheelock... 7500 .833. \*Margaret, S. C. Vaughan... 1833 .305.

Class Q-18 to 22 feet Rating. \*Soubrette, W. B. Moot... 4000 .667. \*Carmen, C. H. Johnson... 2500 .417.

Besides the championship races, there were several of much importance, a brief record being given as follows: Ocean Race, June 17-18—Class A, Cossack; class B, Seboomook; class C, Medric II.; class D, Carina II. winners of first prizes.

NEW BOAT FOR CLASS Q.—Messrs. Burgess & Packard are building at their Marblehead shops, a 22-rater for Mr. Burgess' younger brother. This boat will be used at Marblehead.

NEW LIPTON CUP DEFENDER.—Messrs. Small Brothers have received an order for a 21-footer to be used as a challenger for the Lipton Cup by a syndicate of Toledo yachtsmen. The Lipton Cup is now held by the Country Club, of Detroit.

NEW STEAM YACHT DESIGNED BY WM. GARDNER.—The contract for the steam yacht designed by Mr. William Gardner for Mr. Andrew W. Rose, New York Y. C., has been let to the Pusey & Jones Co., Wilmington, Del. The new vessel will be built of steel. She is 160ft. over all, 130ft. waterline, 21ft. breadth and 9ft. draft. An Almy boiler will be installed and she will have engines of 700 horsepower. The yacht will be lighted by electricity, and when completed she will be one of the finest vessels of her size in the world.

JAMAICA BAY Y. C. OFFICERS.—The annual meeting of the Jamaica Bay Y. C. was held at the club house near Holland's Station on Oct. 29 and the following officers were elected: Com., Benjamin F. Daly; Vice-Com., Henry Lange; Rear Com., William Bjur; Fleet Capt., C. A. Metzger; Treas., James E. Lent; Recording Sec., S. W. Fernald; Fin. Sec., E. B. Palmer; Directors, William E. Stillings, S. Copleston, P. M. Oldner; chairman of House Committee, John Williamson; chairman of Regatta Committee, Walter Reynolds; chairman of Entertainment Committee, E. J. O'Connor; chairman of Membership Committee, C. V. Dykeman. The club now has a membership of 176.

Rifle Range and Gallery.

Zettler Rifle Club.

THE weekly indoor shoot, held Oct. 31, was attended by a dozen regulars and improvement in scores was noticed, William A. Tewes being high man with a total of 1,233 out of the possible 1,250 points in fifty shots at 75ft. offhand, while Charles Zettler, Jr., won the bullseye prize with 16 degrees. The scores follow:

Table of scores for Zettler Rifle Club. Columns include names and scores. \*William A. Tewes 248 246 246 247 246-1233.

Independent New York Schuetzen Corps.

THE first indoor shoot of the season was held at 159 West Twenty-ninth street, Nov. 3. Each member fired two scores of 10 shots each, at 75ft. offhand. Regular shoots will hereafter be held every fortnight, the dates being Nov. 15, Dec. 1 and 15, Jan. 5 and 19, Feb. 2 and 16, and March 2 and 30. The scores follow:

Table of scores for Independent New York Schuetzen Corps. Columns include names and scores. Gus Zimmermann 486, William Soell 449.

Ohio Rifle Notes.

A FEW members of the Twin Valley Rifle Club, of West Alexander, enjoyed themselves on the range Oct. 28. The programme consisted of the regular monthly medal shoot, 4 shots, possible 48; the 20-shot match in five events of 4 shots each, possible aggregate 240, two money prizes, and two 4-shot matches with a pair of live pigeons as first prize and a single pigeon as second. In the medal match Jesse Johnson won with a score of 11, 12, 11, 12-46; J. W. Leshner, 11, 11, 12, 10-44; A. N. Clemmer, 11, 7, 12, 12-42. In the 20-shot match Johnson was also a winner, his score being 43, 45, 46, 43, 44-221; Leshner, 45, 44, 41, 44, 45-219; Clemmer, 43, 44, 46, 39, 42-214. In the first pigeon match Johnson won first with 46; Clemmer and Leshner tied on 45, and the latter won second in the shoot-off. In the second match Johnson and Clemmer tied for first on 46, the former winning in the shoot-off and Clemmer taking second, Leshner 42. All shooting was offhand at 100yds.

Lady Zettler Rifle Club.

THE first business meeting and practice shoot for the winter indoor season was held the evening of Oct. 28 at headquarters, 159 West Twenty-third street, New York city. Miss Fannie Muller was elected treasurer to succeed Miss Scheu, resigned, but no secretary was elected to succeed Miss Katie Zimmermann, whose resignation was tendered but not accepted. The scores shot at 75ft. offhand follow:

Table of scores for Lady Zettler Rifle Club. Columns include names and scores. Miss A. Ludwig 243 247-490, Miss Eusner 237 235-472.

Trapshooting.

Fixtures.

Nov. 16.—Bound Brook, N. J., G. C. shoot, and Fleming-Bissett contest for the individual championship of New Jersey. Nov. 16.—Bound Brook, N. J., G. C., all-day shoot. F. K. Stelle, Sec'y.

Nov. 23.—Edgewater, N. J.—Palisade G. C. A. A. Schoverling, Sec'y. Nov. 23-24.—Kansas City, Mo.—Missouri and Kansas League of Trapshooters' fifth tournament. C. B. Clapp, Sec'y.

DRIVERS AND TWISTERS.

The East Suffolk, Pa., Gun Club began their season on Thursday of this week. Sparrow, pigeon and target shooting will be furnished to the club patrons. The competition is open to all.

FOREST AND STREAM went to press on Monday of this week, Tuesday, Election Day, being a holiday. As a consequence, several communications are necessarily held over till next week.

Dr. C. B. Clapp, Secretary and Treasurer, Moberly, Mo., writes us as follows: "The fifth and last tournament for the year of the Missouri and Kansas League of Trapshooters will be held at Blue River Park, Kansas City, Mo., Nov. 23 and 24."

At Tamaqua, Pa., Nov. 4, Mr. Edward O'Donnell, of Lansford, and Thomas Fredericks, of Tamaqua, shot a match at 13 birds, a very unlucky number for one of the contestants. O'Donnell won with a score of 12 to Frederick's 9. It was a definition for \$200 a side and the gate receipts.

The Laffin & Rand cup, which has been in competition through a long series of contests held by the Rochester, N. Y., Rod and Gun Club, was won at the closing shoot last week by Mr. A. Sterling, of Canandaigua. He scored ten points. His nearest competitor, Mr. J. M. Stoddard, scored 8.

The live-bird season of the Point Breeze Trap Club, Philadelphia, Pa., opened on Saturday of last week. Two men tied in the event at 10 birds, \$2 entrance, optional sweep, \$3; two high guns, handicap. Messrs. Churchill and Felix, Jr., scored 10 each. Messrs. Muller and Martin scored straight in the 5-bird event, high guns, ten entries.

In the first five-man team contest of the Trapshooters' League of Passaic and Bergen Counties, N. J., the Jackson Park Gun Club defeated the Mount Pleasant and North Side gun clubs by a score of 60 to 68 and 66. The event was held on the North Side's grounds, Paterson. Several more clubs are expected to join. The next shoot will be on Nov. 11, at Jackson Park. This activity in club competition is the result of the energetic work, devoted to the formation of a league, by Mr. Wm. Dutcher, of Paterson, N. J.

The programme in connection with the State championship contest under the auspices of the Bound Brook, N. J., Gun Club, Nov. 16, has eight events, at 20 and 25 targets. No. 8, 25 targets, is for an Ithaca hammerless, handicap, \$2.50 entrance. Competition will begin at 11 o'clock. The professional average prize is a loving cup. Amateur high averages: First, gold medal; second, silver medal; third, 200 trap shells. Percentage system will govern purses. Ship shells to J. B. Pardoe, General Manager. Lunch served on grounds. BERNARD WATERS.

New York State Sportsman's Association.

OSSINING, N. Y., Nov. 4.—Editor Forest and Stream! We would like again, through the columns of your valued paper, to call the attention of the gun clubs of New York State to the reorganized New York State Sportsman's Association. Some time ago a notice was sent to the secretary of every gun club in New York State, asking them to bring before a meeting of their clubs the proposition of joining the N. Y. S. Association. While some clubs have responded, the majority are still to be heard from.

A permanent set of officers have been elected: M. R. Bingham, President, Romc, N. Y.; F. D. Kelsey, Vice-President, East Aurora, N. Y.; C. G. Blandford, Secretary and Treasurer, Ossining, N. Y.; Hon. H. L. Gates, Utica, N. Y., and Harvey McMurchy, Fulton, N. Y., Directors. These men are devoted to the sport of trapshooting, and their endeavors to revive the old interest that was taken in the Dean Richmond cup competition and accompanying week's tournament once each year, should meet with the unanimous indorsement and support of N. Y. S. A. clubs.

Dr. McLeod, secretary of the Infallible Gun Club, Buffalo, N. Y., writes me that his club will offer a programme at the forty-eighth annual tournament, to be held in June, 1906, under the auspices of that club, that will set the boys studying railroad maps and time-tables when they receive one. All clubs are required to pay \$5 initiation fee and \$2 yearly dues. If your club has not already joined, please send in the required amount for enrollment, so that your club will do its share in supporting a live association. N. Y. ASSOCIATION, M. R. Bingham, Pres. Chas. G. Blandford, Sec'y.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., Nov. 1.—The Laffin & Rand cup was won by Mr. A. Sterling, of Canandaigua, N. Y., with two points above his nearest competitor.

Table of scores for Rochester Rod and Gun Club. Columns include names and scores. Sterling 13 8 21, Stoddard 21 4 25.

Stoddard withdrew two strings, Hinkson withdrew five strings, Weller withdrew two strings, Donovan withdrew three strings, Miller and Borst each withdrew one string.

Table of scores for Rochester Rod and Gun Club. Columns include names and scores. Rickman 12 7 19, Sterling 15 8 23.

Total points won: A. Sterling 10, J. M. Stoddard 8, J. L. Weller 7, Donovan 6, Rickman, Kershner, Hinkson, Clark and Byer 5, Adkin 4, Bonbright, Borst and Stewart 3.

Palisade Gun Club.

EDGEWATER, N. J.—The scores made at the shoot of the Palisade Gun Club, Oct. 26, are appended. Mr. W. Hopkins made the only straight in the seventh event. Mr. C. Floyd made high average. All events were at 20 targets, a total of 160.

Table of scores for Palisade Gun Club. Columns include names and scores. Events: S. MacDonald 11 17 16 11 10 15 15 110.

Indianapolis Gun Club.

Table of scores for Indianapolis Gun Club. Columns include names and scores. INDIANAPOLIS, Ind., Oct. 28.—Moller won the Peters badge.

## WESTERN TRAP.

### North Aurora Gun Club.

NORTH AURORA, Ill., Oct. 30.—The members of the North Aurora Gun Club with Mr. Stillson as manager and chief high all-round man were assisted by several shooters from Chicago, Morris and Lockport, together with a bunch of good ones from various towns in Indiana in holding a tournament on an island above the town on Oct. 29.

The location was selected on account of the Sunday shoot. The weather was fine. The traps worked well, and all passed off pleasantly after the boys got going. There was a delay in reaching the ground, as after landing from the street cars there was a delay of about an hour awaiting the launch, which was to convey the shooters up the Fox River to the park—said launch went ashore and there remained, owing to the failure of the gasoline engine to give power.

Mr. Stillson got the boys out of the predicament by getting a team and hauling the guns and shells to the grounds and soon all were going nicely. Mr. Stillson again redeemed himself by having a fine lunch served, of which some of the shooters partook to the extent that their scores fell away quite noticeably. The hot coffee, sandwiches and fat doughnuts were a life-saver to many, and therefore much enjoyed. The crowd was so large that after shooting at 175 targets, the pick-ups and all were exhausted and visitors went cross lots to the cars and were off for home.

Now there was an absence of shooters from all the surrounding towns which is hard to explain. Aurora is one of the best towns in the State to reach by either steam or electric cars. Should the Aurora Gun Club awaken from their slumbers and announce a shoot, this item will serve to you individually due notice that all of your friends will be there. The secretary, Mr. Ruse, is a railroad man and busy much of his time, but Mr. Linn, the president, and Mr. Percy Lincoln, the sporting goods dealer, will do the programme work. They are authority for the statement that "Tramp" Irwin will manage the shoot, and that is "nuff said."

As to the shooting, the scores look to you out of order. It is very easy to see that conditions were good. W. D. Stannard, the only professional shooter present, only lost 5 out of 175, then J. S. Young, the good shot from Chicago, made 165; Kinney, also from Chicago, 160; Martin and Henderson, 159. Shepardson, Flynn and Burnham, the noted Indian shooters, were a bit off. Some one said they were shy on sleep.

"Tramp" Irwin was busy every minute, as he was assisting in the cashier's office. Ward Burton was on the ground early.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	Shot	Broke.

### In Other Places.

There is considerable enthusiasm among those who handle the shotgun at Bloomington, Ill. Part of this comes through the choosing of Bloomington for the next place of the State shoot for 1906. The gun club is a "buster," and Dr. McDermant is a pusher; he pushes the shooting so faithfully that the colored people have caught on and have organized a gun club.

There are other shooters in Colorado who like long races as well as John Garrett. W. S. Green, of Central City, challenged A. W. Peterson for the Post trophy, and the match was on at 500 targets. Green won with 407 to 399. There was a high wind and that caused the scores to fall so low.

The Valley Falls, Kan., Gun Club sent out many invitations to the "grasshopper" shooters for their tournament held Nov. 9. D. M. Reese is President and J. L. Renfro is Secretary. Valley Falls has sported a gun club for the past thirty years, even so long ago that the name of the town was that of Grasshopper Falls.

Vietmeyer and Fitzsimmons did not shoot off their much advertised race at the Progressive Gun Club, East St. Louis, Ill. There was such a large crowd present, that it was dark when the regular programme was finished.

H. W. Clay, the runner up in the preliminary at the 1904 G. A. H., won the highest honors at the season shoot given by the Progressive Gun Club, East St. Louis, Ill.

Notice has been received of a shoot at El Paso, Texas, on Nov. 16.

Eastern Illinois trapshooters are invited by the Hoopston Gun Club to join with them in a tournament Nov. 14.

Northern Illinois shooters will do well to remember the shoot to be held at Marseilles, Ill., Nov. 28, 29. The managers and active men in pushing this shoot are "Tramp" Irwin, H. W. Vietmeyer, Fred Lord, Fitzsimmons et al.

"Where there is a will there is a way," then the Will County Gun Club should be a success. This is one of the late clubs and must be a success. The Will County Gun Club, Joliet, Ill., will start in with a shoot Thanksgiving Day. The club have fine grounds, readily reached from Chicago by electric line.

The Twin City Gun Club, which is at the half-way place between Peoria and Pekin, held a shoot last Sunday, Nov. 5. Same was not well attended, and yet there is a fine country sur-

rounding to draw from. Some energetic shooter in that club could get up a tournament that would set the home boys to thinking.

All the Northern, Ill., trapshooters who can forsake the turkey dinner with homefolks would do well to bear in mind the Joliet shoot Nov. 23. For programme and full particulars write to T. F. Pell, Secretary.

One of the newest of gun clubs has lately been organized at Hartford City, Indiana. It is to be known as the Renner Gun Club. The charter members are J. E. Green, Byron Snell, C. H. Townsend, Sheriff Hudson, Fred Townsend, Wm. Hess, Clifford Townsend, Henry Feaster.

And now comes the secretary of the Missouri State League with the announcement that the last shoot for this year will be held at Kansas City, at Bob Elliott's shooting park, on Nov. 23 and 24.

Rolla Heikes was at Marietta, O., on last Friday and was there billed for a fancy shooting exhibition. He was prevented from giving same, owing to the high winds. He shot with the club and made high score.

Capt. O. H. Hardy, the celebrated rifle and pistol shot, was present at the last meeting of the Lead, S. D., Gun Club. He entertained all present with some sensational shooting.

The management of the Baton Range, La., Gun Club has decided to offer the sum of \$10 as a prize for the best score made by any member.

At Coal City, Ill., the new gun club will "sport" the name Dewey Gun Club. The new organization will be officered as follows: President, J. B. Ryan; Secretary, D. Scott; Treasurer, Wm. Greenham.

Mr. Rolla O. Heikes is now touring Ohio, demonstrating what kind of fancy shooting may be accomplished with the use of the new repeating guns.

The closing shoot of the gun club at Owensburg, Ky., was a fitting climax for the season. The club will find it necessary to put up a new club cup next season, as Mr. Ab. Newman won the same at this shooting, it being his third win. At 50 targets for the cup, scores: Ab. Newman 45, N. Duncan 43, U. Alsop 41, Weir Griffith 41, D. Boon 38, John Smith 40, James Lewis 37.

Last week Captain Thomas Marshall was in Dayton, O., as the guest of Rolla Heikes. He was scheduled to take in some of the Ohio shoots.

One of the most unique and enjoyable Hallowe'en parties was given Monday night, Nov. 1, by the Ladies' Shrine Club, the scene of the festivities being the house of the Ogden-Homer, Ill., Gun Club.

Shooting at 200 targets at Great Bend, Kansas, O'Brien 194, Huff 190, Heer 189, Arnold 186, Gano 184, Wilson 181, Gottlieb 180, Hugg 177, Wolf 176, Horton 172, Prose 172, Mahno 171, Logan 168.

The name of the club at Denison, Texas, will hereafter be the Denison Rod and Gun Club. The following officers were elected: G. D. Kingston, President; W. H. Walton, Secretary; L. B. Moore, Treasurer; J. W. Madden, E. E. Davis, E. H. Lingo, B. J. Lindsey, Jesse Whitehurst, C. M. Bryant, H. Tone, H. Brooks, A. H. L. Decker, D. W. Rutledge, E. W. Stewart, Flem Coleman, Directors.

Scatter gun artists will meet at El Paso, Texas, during the American Mining Congress and contest for the cash prizes which will be offered. Sometime a very fine silver trophy will be up for competition.

Last Thursday at Woodstock, Ont., there was the usual shooting tournament. It proved to be attractive and both live and clay birds were used in the various events. Shooting at 7 live birds: Thompson 7, Wright 5, Brind 6, Maynard 7, Barnett 6, Hopkins 7, and Dawson 7.

The cold wintry weather does not stop the enthusiasm of the Houghton, Mich., Gun Club members. A schedule for the winter has been prepared. At each meeting there will be a champion shoot at 15 targets. The one winning the greater number of times will be club champion. There is already a cup contest going on that will close Jan. 1.

C. P. Kinney, D. H. West and R. L. Hibbs were the members of the Wheeling, West Va., Gun Club who went to Martin's Ferry to attend the shoot held there.

A. J. Woodhill, a traveling cartridge expert, gave a shoot at Henderson, Ky., last Thursday. Many local shooters took part, viz., W. S. Alens, J. E. Rankin, Barr, Dade, R. A. Powell, W. W. Howard, J. T. Hopkins, Jr., E. B. Crocket and R. E. Clay.

The Austin, Texas, Gun Club is composed of members having "the sand." It has lately hung up a reward of \$25 for the apprehension of those who shoot quail before November.

The Marietta, Ark., Gun Club has been organized with \$5,000 capital. The club's grounds are two and a half miles north of town.

Chris. Van Der Ahe, the once famous base ball magnate, is now president of the gun club connected with the North St. Louis, Mo., Democratic Association. It is reported that the club lately held a fish-fry at which 700 pounds of fish caught by the members was consumed.

In Hennepin County Minn., there were up to the last day of October, 1,988 big game licenses issued by the auditor. The deer will be kept on the jump during the open season.

At the Marshalltown, Ia., shoot, Oct. 27 and 28, Gilbert was high professional with 388, Budd 381. This calls to mind how well Budd has been shooting of late. H. G. Taylor was the high amateur with 379, Hoon 373, Wallace 365, Cook 363, Russell 362, Burmeister 351, Steege 348, Linell 345.

While the Grayville, Ill., Gun Club is small, yet it gets up and manages a tournament well. At their last tournament Al. Willerding, of Evansville, was high amateur with 179 out of 200; Huddy, of same town, 172; J. L. Scott, of Jacksonville, 169; D. P. Moore, Alney, fourth, 164; LeCompte, 178; Chas. F. Dreihns, 168; Fred Lord, 155. L. A. Cummings and Leslie Standish, besides representing their companies, run the office, and they came in for their share of the congratulations.

One of the gun companies who make only double guns report that it turns out 3,600 guns a month. As this is only one of some dozen in the United States, it is cause for wonder as to what becomes of all the guns.

There is a programme issued now and then for a tournament

where the 90 per cent. shooter is barred. Thus the amateur surely has a golden opportunity.

Shooting at 100 targets at Dayton, O., McConnell, of Osborn, beat Mr. Carr, 75 to 73. In the sweep at 25 targets McConnell 21, Carr 13, R. O. Baughman 9, C. W. Sanders 5.

A. A. Parker, Secretary of the Cañon City, Colo., Gun Club is now ready to take the applications for new members in the gun club. The buildings and traps and all the belongings of a first-class gun are now completed. Representative business men to the extent of forty are now members, and others should join, as there is no healthier nor manlier sport than shooting at "clay saucers," and where the means of recreation are limited, it should be encouraged among all classes of men as well as women.

Ducks are so plentiful in California that many hunters shot the limit by 8 A. M.

The Freeport, Ill., Gun Club held a shoot at Taylor Park last Saturday, in which the prizes were chickens.

At the weekly shoot of the Calcasieu Gun Club, Lake Charles, La., Williamson and Gardner were high with 73 per cent. Gum made 41, Gauthier 60, Merrimce 47, Pearce 48, Barber 36.

Thursday, Nov. 16, is the date of the shoot to be held at El Paso, Texas, by the gun club. A programme has been issued, and there will be twelve events with added money. Shoot open to amateurs from all parts of the southwest. The American Mining Congress being in session, will be the drawing card.

Snow is reported a foot deep in part of the northern peninsula of Michigan, and if that continues, there will be some fine deer shooting. Game is reported plentiful; but in some localities the wolves have got the best of the fleet-footed deer.

Mr. French, with 45 out of 50, won the trophy at the shoot held last Saturday at Des Moines, Ia. The best scores were: French 86, Ungles 83, Patterson 76.

The Conrad, Ind., Gun Club has been organized, the incorporators being Ben Fogli, Howard Doty and Charles Chipman.

Once more our old friend Ed. Voris has come to the front. Again has he won the sparrow championship of the United States. He had a close call, however, as his 86 out of 100 was closely followed by Hugh Clark and E. Pash with 85. If all the shooters the United States over could attend a shoot given at Indianapolis, where the sparrows are trapped, we predict that the sparrow traps would be popular everywhere.

### Cincinnati Gun Club.

The attendance on Nov. 4 was not up to the mark, only fifteen shooting their scores for the Clements trophy. The day was quite pleasant, but a light haze hanging over the traps made somewhat difficult shooting. Maynard has been doing fine work lately, and to-day tied for first with Charles Dreihns on 48. He seems to have found a gun which is just a fit, and he surely can find no excuse to change it.

J. J. Faran will be away a few days, as he goes some time next week to Flora, Ill., on a quail hunt. Williams will attend the tournament of the Hamilton Gun Club next week.

Ackley has returned from Duck Island, and after a short while spent at home, will start for the South to pass the winter. We shall all miss him at the club, and wish him good luck and lots of sport. Gambell has been doing fine shooting since his trigger finger got well. Scores of 49 and 46 out of 50 are not bad. Faran is getting back into shape once more, and will soon be in his usual form. In the practice events, Gambell accounted for 175 out of 205. Maynard broke 169 out of 195, and this included two straight scores of 25 each. Several of the members will attend a shoot at Rylands, Ky., on Nov. 9 as guests of the Kentucky Hunting and Fishing Club on their beautiful preserve.

Several members shot their scores in the second contest of the Ackley trophy series, with the following results: C. O. Le Compte (16yds.) 48, Bleh (19) 48, Gambell (16) 47, Harry (16) 43, Dick (17) 42, Willie (16) 42, B. B. Holliday (16) 42, Durdley (16) 41, Sweeney (16) 40, Jeffries (16) 37, H. Sunderbruch (16) 33, Miles (16) 31. A three-cornered team match was also shot, two men on a team, 50 targets per man; Williams 42, Le Compte 47—89. Gambell 43, Faran 43—86. Ahlers 42, Bleh 39—81. The scores: Clements trophy, 50 targets, distance handicap: Maynard (17) 48, Dreihns (16) 48, Williams (17) 46, Faran (16) 45, Randall (16) 45, Tuttle (16) 42, Roll (16) 41, Bullerdick (16) 41, Ahlers (18) 40, Pohlar (18) 40, Herman (18) 39, Hosea (16) 36, Uhl (16) 33, F. Alther (16) 32, Andrew (16) 31.

Match, 50 targets, two high men out, handicap, Gambell 49, Maynard 46, Bullerdick 46, Uhl 45, Roll 41, Pohlar 40.

Team race, 50 targets:	
Faran	46
Gambell	46
Tuttle	31
Bullerdick	43-166
Ahlers	44
Dreihns	46
Herman	42
Williams	43-175

### Madisonville vs. Superior.

On Nov. 1 the Madisonville Gun Club had another try to whip the Superior team, on their grounds at Madisonville, O. The weather was all that could have been asked for, but the home club was defeated after a close fight, 341 to 339. The match was at 100 targets per man, shot in strings of 20. The Superior boys led in each round until the fourth, when the Madisonville got to work and beat them by 11 targets, 70 to 59. In the last round the visitors lost by 9 targets, 70 to 61, and their lead was cut down to 2. Gambell was high man for the match with 80. Pohlar, of the Superiors, and Settle, of Madisonville, tied for second on 75. The sport lasted until dark, when all started for home, having had a very enjoyable time. The scores:

Superior Team.		Madisonville Team.	
Gambell	80	Settle	75
Pohlar	75	Stirkorb	73
Pfeiffer	66	Heninger	70
Uhl	63	Stevens	62
Deiters	57-341	Patton	59-339

Ohio Notes.

The Cleveland Gun Club held their souvenir shoot on Oct. 28 with twelve members present. The small attendance was due to the dark, cold day. A strong wind was blowing and made the shooting conditions very hard. Tryon was high gun in the souvenir event at 50 targets with 46. Pocock 43, Hogen and Bingham 42 each, Wallace 37, Rowley and Hopkins 34 each, Ong 32, Thie and Hodell 30 each. Scores in this event did not cut much figure, as every one got a prize. For the day, at 90 targets, Pocock was high with 75. Mack a close second with 75. Bingham 72, Hopkins 69, Rowley 67, Hodell 63. The others shot at less than 90.

The Rohrer's Island Gun Club, of Dayton, closed a very successful season with their shoot on Oct. 27. The contests for the club's handicap medal started on March 22 and numbered thirty-two. The winners during the season were: March 22, C. Miller; March 29, R. O. Heikes; April 5, Lee Whitacre; April 12, Gus A. Hodapp; April 19, Ed. Rike; April 26, Ed. Cain; May 3 and 10, Chas. Miller; May 17, Lock; May 24, Wm. Kuntz; May 31, Ed. Cain; June 7, Wm. Oldt; June 14, Buck; June 21, Wm. Oldt; June 28, postponed on account of rain; July 5, Carl Hanauer; July 12, Phil Hanauer; July 19, Wm. Oldt; July 26, H. Oswald; Aug. 2, W. Oldt, Aug. 9, Ed. Cain; Aug. 16, P. Hanauer, Aug. 23, and 30, Gus A. Hodapp; Sept. 6, Ed. Cain; Sept. 13, Ed. Rike; Sept. 20, H. Oswald; Sept. 27, Gus A. Hodapp; Oct. 11, John Schaefer; Oct. 27, four postponed contests were held, P. Hanauer, G. A. Hodapp, M. J. Schwind and Ed. Cain being the winners. Contests were at 25 targets, with handicap of extra targets to shoot at. Scores of 25 or better to shoot off for possession of the medal, the winner holding same until defeated.

The Welfare Gun Club (N. C. R.), of Dayton, entertained a delegation from the Cedar Springs Gun Club at their grounds on Oct. 28. The most interesting part of the day's sport was a team match, fifteen men on a side, 75 targets per man, between the clubs, the visitors losing by a score of 876 to 849. At the close of the first round the Welfares had a lead of 26, with 305 to 279. They gained 10 more in the second round, with 298 to 288, the total score being 693 to 567. In the last round the Cedar Spring boys outshot their opponents, winning by 9 targets, with 282 to 273; but their spurt came too late in the game. For the Welfare club, Rike and Carr scored 70 each. R. Heikes and Cain 67 each, H. Heikes 63, Neff and Watkins 62 each, McConnell 61, Oswald 60, Gross 56, Poole and Foley 63 each, Rayburn 51, Roman 47, Rayburn 34; total 876. Cedar Springs—Young 73 (high score in the match), Reid 63, Clark 63, McCray 65, Noggle 63, McGriff 60, Rayl 59, Dugan 57, D. Reid and Kirk 53 each, Freeman 52, Wilkins and Murray 49 each, Porter 47, Wilt 32; total 849. Before the match three events at 15 and two at 10 targets were shot as practice, Noggle being high with 28 out of 30, Le Compte second with 27 out of 30. The shooting lasted until dark, when the visitors were taken to the Phillips House for dinner, as guests of the Welfare club. During the after-dinner discussion, it was decided to make an effort to start a series of team contests between the clubs of the various cities and towns in this part of Ohio and adjoining territory in Indiana, including Dayton, Cincinnati, Columbus, Springfield, Cedar Springs, Indianapolis and other towns, and the following gentlemen were appointed a committee to push the matter: Rolla O. Heikes and Ed. Cain, of Dayton; Less Reid, of New Paris; Wm. Poole, of Springfield, and M. Murray, of Dublin, Ind.

A new gun club is to be organized at West Alexandria, Dr. Hill, Orion Bear and John Motler being the chief promoters. There was a club here some years ago, but it was disbanded, and its members scattered. During the last year of its existence, Joe Achey won the club medal eleven times, and it is still in his possession. He will offer the medal as a trophy at the first shoot of the new club.

John Stocklein and Joe Larkin, of Dayton, spent a few days with a friend about three miles from Lake View, Lewistown Reservoir, and had some good shooting and fishing, bringing home fourteen ducks and a nice lot of catfish, croppies, perch and sunfish.

A new gun club was organized at Bellevue, Ky., on Nov. 2. The club has leased the Newport Ball Park, and will hold their opening shoot soon. The following are the charter members: Geo. Demaron, Dr. J. P. Gould, Geo. Keefer, Martin Boch, Barney Forstner, Geo. Frost, Martin Rees, Albert Gowling, Chas. Cunningham, Robert Fee, L. Taliaferro, Russell Walker, McKenzie Williams, Geo. Emig, Dr. H. Kattenhorn, H. Riley, Mott Herold, H. B. Beck, Dr. W. D. Richards, Dr. W. L. Young, Dr. Hill, Dr. C. W. Dorsey, John Lehman, Geo. Klein, Albert Carr.

Claude Weaver, of Arcanum, who is hunting with a party of friends in the Maine forests, writes that prospects are good. They had been hunting but a few days, and had killed one deer. He says, however, that moose seem to be scarce, as they had seen but one cow, and that other hunters report no better luck.

Louis Gronewag, of Dayton, who is in Maine with a party of hunters, reports great sport. During the first few days in camp two deer were shot. They have also had good luck with the smaller game.

Dr. N. B. Hartwell and W. D. Linder, of Dayton, left on Nov. 2 for a several weeks' hunting trip in northern Michigan. Dr. O. McCray, William Gamble and T. V. Lyons start on the 6th to join them, and they will bring back a good stock of thrilling stories, as well as a fair amount of game.

David Ankey and Frank Izor, of Germantown, are in camp near Ox Bow, Maine, with a party of hunters. Each of the two named has killed a big buck so far, and other members of the party have killed smaller deer.

The Advance Gun Club, of Dayton, held their final shoot of the season on their grounds east of the city, Nov. 2. A luncheon was served all the afternoon and a good time was enjoyed by all. The members will have a two weeks' rest before the quail season opens. Several practice events were shot, and a 25-target match finished the programme, as follows: Schaefer 17, Middleton 9, H. Engle 8, E. Engle 8, Stackler 7, King 0, Kelly 0. Just as this match was finished Carl Hanauer arrived on the grounds from a snipe hunt, showing a good bag of birds, and a team match between Rohrer's Island and the Advance clubs, at 10 targets per man was proposed. Hanauer and Schaefer represented Rohrer's Island and scored 6 and 3 respectively; total 9. For the Advance club, Stackler scored 4, Engle 3; total 7. In a second match Schaefer scored 8, Hanauer 4; total 12. Advance—Stackler 4, Engle 3; total 7. The Rohrer's Island team won both matches with a total of 21 to 14. This ended the afternoon and season's sport.

William A. Weaver, of New Lebanon, arrived home from his hunting trip in the Canada woods, north of Lake Superior, on Oct. 31. The balance of his party, Messrs. Orth, Brown and Leatherman, got home with their game on Nov. 1. The party had fine sport, Orth killing a big bear and fine moose, and Jonas Leatherman a moose with antlers measuring five feet across. The heads will be mounted and added to the large collection of trophies already owned by Mr. Orth.

Recreation Rod and Gun Club.

MORGANTOWN, W. Va., Oct. 27.—The Recreation Rod and Gun Club of this city held its thirtieth regular weekly shoot at Recreation Park, this afternoon, with eleven guns out. This shoot closed the third successful season of the club since its organization, and we finish the season with thirty-nine members, of whom about one-half are devotees of the trapshooting game.

One of the objects of this club has been rifle shooting, and our management is now negotiating for a suitable room, to be fitted up as an indoor range, for the winter months, and we expect to open up next April with a 200yd. out-door range in connection with our trapshooting grounds at Recreation Park, and to run regular programmes weekly throughout the season of thirty weeks, which will be covered by our trapshooting season.

The winners of the various prizes and trophies offered by the club and various members, for the club's season shooting have been determined from the score books, and are as follows:

1. Club championship solid gold medal: Highest average for entire season's shooting awarded to club champion John M. Cobun, average 81.19 per cent.
2. Handicap event, officers' goblet, silver loving cup, donated by the officers of 1904: Awarded to Bennett S. White, with five wins during season.
3. Class shooting, Stevens target rifle, Class A, greatest gain in this event for season over classification: Awarded to Elmer F. Jacobs, with a gain of 7.43 per cent.
4. New members' prize, sole leather gun case, greatest gain over classification: Awarded to Jas. A. Barthlow, with a gain of 4.37 per cent.
5. Attendance prize, water color floral piece, donated by Elmer F. Jacobs: Awarded to Dr. W. N. Sivey, who attended all of the thirty regular weekly shoots held by the club during the season.
6. Consolation prize, handsome gas-electric drop light, donated by H. L. Moreland, and eligibility limited to members who have not won any of the foregoing prizes: Awarded to Capt. W. Evans Price.

7. Prize for greatest average gain, Savage .22 repeating rifle, donated by John M. Cobun: Awarded to Elmer F. Jacobs, with an average gain for entire season's shooting of 6.29 per cent.

8. Two members only, John M. Cobun and W. N. Dawson, have qualified for this trophy, and the shoot-off of the 100-target race for it has been postponed on account of the recent illness of Mr. Dawson.

This event will probably be shot off during the Christmas holidays.

In addition to the regular programme of 75 targets to-day, the club ran off three extra events, which were won by the following members:

Challenge cup, last qualifying event: Won for the month by John M. Cobun with the clever score of 48 out of 50.

The White prize, a handsome sterling smoking set, donated by Bennett S. White, added target handicap, 20 target base: Tied for by Cobun with 21 out of 24 and Barthlow with 21 out of 33, and in the shoot-off at the same handicap, was won by Barthlow with 25 to Cobun's 22.

The L. C. Smith trophy, a handsome gold medal, donated by the Hunter Arms Company, 20 targets, use of both barrels, and 10 pairs doubles, was tied for by Price and Jacobs with 32 each, and in the shoot-off at 10 singles and 5 pairs double targets, was won by Jacobs with 18 to Price's 12.

In to-day's shoot the club championship gold medal for the week was won by John M. Cobun with an average of 83.31 per cent for entire programme. The scores:

Regular programme for the day:

Events:	1 2	Events:	1 2
Targets:	15 25	Targets:	15 25
Cobun	12 21	Dawson	12 21
S E Taylor	8 10	Miller	10 18
Sivey	7 7	Deusen	11 20
Price	12 18	Christy	11 19
Barthlow	10 20	Kennedy	10 16
Jacobs	10 18		

Event No. 3, handicap:

	Shot at.	Broke.		Shot at.	Broke.
Cobun	22	21	Dawson	20	18
S E Taylor	20	9	Miller	20	14
Sivey	22	13	Deusen	18	15
Price	20	13	Christy	20	15
Barthlow	20	15	Kennedy	20	12
Jacobs	21	13			

Event No. 4, club team race, three men, 15 targets each man:

Barthlow, captain	13	Cobun, captain	14
Sivey	12	Price	10
Jacobs	9-34	Taylor	8-32

Extra events for the day:

Event No. 5, challenge, cup, 50 targets:

Cobun	46	Barthlow	35
Sivey	25	Jacobs	36
Price	40		

Event No. 6, White trophy, handicap:

	Shot at.	Broke.		Shot at.	Broke.
Cobun	24	21	Barthlow	33	21
Sivey	29	19	Jacobs	25	19
Price	25	18	Dawson	26	17

Tie shot off between Cobun and Barthlow, same handicap:

Cobun	24	22	Barthlow	33	25
-------	----	----	----------	----	----

Event No. 7, L. C. Smith trophy, 20 targets, use both barrels, 10 pairs:

	Singles.	Dbles.	Total.		Singles.	Dbles.	Total.
Cobun	17	14	31	Sivey	14	13	27
Price	18	14	32	Jacobs	17	15	32

Tie shot off between Price and Jacobs, 10 targets, use both barrels, 5 pairs:

Price	5	12	Jacobs	9	7	16
-------	---	----	--------	---	---	----

ELMER F. JACOBS, Sec'y-Treas.

Crescent Athletic Club.

BAY RIDGE, L. I., Nov. 4.—The first win in the contest for the November cup, the first of the fall and winter series, was scored by Mr. O. C. Grinnell, Jr., with 23. There were eleven contestants for this much-coveted trophy. Mr. A. G. Southworth, the scratch man of this contest, scored 22.

The Stake trophy had eleven contestants, and the win was scored by Dr. Keyes, with 24 out of 25. Other trophy contests and scores are as follows:

Trophy, 15 targets:

	Hdp.	Brk.	Tot'l.		Hdp.	Brk.	Tot'l.
A G Southworth	0	12	12	C E T Foster	0	11	11

Philadelphia Trapshooters' League.

The remaining schedule of the Philadelphia Trapshooters' League is as follows:

- No. 11—S. S. White at Florists, Lansdale at North Camden, Highland at Clearview, Narberth at Merchantville, Meadow Springs at Media.
- Nov. 25—Media at Narberth, North Camden at Highland, Clearview at S. S. White, Merchantville at Lansdale, Florists at Meadow Springs.
- Dec. 9—North Camden at Merchantville, Lansdale at Clearview, Highland at Meadow Springs, Narberth at Florists, S. S. White at Media.
- Dec. 23—Media at Lansdale, S. S. White at Meadow Springs, Merchantville at Highland, Florists at Clearview, Narberth at North Camden.
- Jan. 6—Lansdale at Florists, North Camden at Media, Highland at S. S. White, Clearview at Merchantville, Meadow Springs at Narberth.
- Jan. 20—Florists at North Camden, Narberth at Highland, S. S. White at Merchantville, Media at Clearview, Lansdale at Meadow Springs.

Feb. 3—Narberth at S. S. White, Merchantville at Meadow Springs, North Camden at Clearview, Lansdale at Highland, Media at Florists.

Feb. 17—Florists at Highland, Media at Merchantville, S. S. White at Lansdale, Meadow Springs at North Camden, Narberth at Clearview.

March 3—Highland at Media, Florists at Merchantville, North Camden at S. S. White, Clearview at Meadow Springs, Lansdale at Narberth.

March 17—Florists at S. S. White, North Camden at Lansdale, Media at Meadow Springs, Clearview at Highland, Merchantville at Narberth.

March 31—Narberth at Media, Highland at North Camden, Lansdale at Merchantville, Meadow Springs at Florists, S. S. White at Clearview.

April 14—Merchantville at North Camden, Clearview at Lansdale, Meadow Springs at Highland, Florists at Narberth, Media at S. S. White.

April 28—Lansdale at Media, Highland at Merchantville, Clearview at Florists, Meadow Springs at S. S. White, North Camden at Narberth.

May 12—Florists at Lansdale, Media at North Camden, S. S. White at Highland, Merchantville at Clearview, Narberth at Meadow Springs.

May 26—North Camden at Florists, Highland at Narberth, Clearview at Media, Merchantville at S. S. White, Meadow Springs at Lansdale.

H. B. Fisher, 7125 Woodland avenue, West Philadelphia, Pa., is the secretary.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Nov. 4.—Several of the regular shooters did not attend, the great football game being a great attraction. However, twelve shooters faced the traps, and competition was good and lively all the afternoon.

The ties for the October cup were shot off, although Mr. Stuart Scott was absent. Dr. Brown broke 12 out of 25 targets, and with a handicap of 8, he scored 20 to the 23 of Mr. Gus Grieff from scratch, the latter winning.

In the regular club shoot for the November cup a new winner, Dr. Held, made high score. Target shooting is a new sport to him, but in years past he had much success on live birds. Mr. E. Huggins also did some very fine shooting, winning a handsome trophy in event 5. Scores:

Event 1, 25 targets:

G E Grieff	25	E Higgins	16
J W Hibbard	16	Dr Held	11

No. 2, 10 targets, walking match:

Grieff	7	Huggins	4
Hibbard	3	Dr Held	1

No. 3, trophy, 15 targets:

	Hdp.	Tot'l.		Hdp.	Tot'l.
Grieff	0	11	F Vilmar	4	12
Hibbard	3	15	Zettel	4	11
Dr Held	4	11	Ehlers	3	13

No. 4, 15 targets:

Grieff	0	14	Zettel	4	10
Hibbard	3	12	Ehlers	3	13
Huggins	4	10	N Jones	4	12
Dr Held	4	13	F Graham	3	13
Vilmar	4	13			

No. 5, November cup, 25 targets:

Huggins	7	22	Kuechler	7	17
Dr Held	7	24	Vilmar	7	14
Grieff	0	23	Zittel	7	11
Hibbard	5	22	Ehlers	5	23
Dr Brown	6	19	Jones	7	21
Dr Williams	0	16	Graham	5	18

No. 6, 25 targets, trophy:

Huggins	7	20	Kuechler	7	12
Held	7	21	Vilmar	7	19
Grieff	0	21	Zittel	7	18
Hibbard	5	18	Ehlers	5	21
Dr Brown	6	18	Jones	7	19
Dr Williams	0	19	Graham	5	21

No. 7, trophy, 25 targets:

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }  
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, NOVEMBER 18, 1905.

VOL. LXV.—No. 21.  
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

**The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.**

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

## "IN THE LODGES OF THE BLACKFEET."

We have in hand a series of chapters entitled "In the Lodges of the Blackfeet," in which is told the life story of a squawman who has lived for many years with the Blackfoot Indians of Montana. The story is autobiographic in form, is related without reserve, and is a most intimate and graphic picturing of wild Indian life on the plains, and—after the wild life was over—of Indian ways on the reservation. The chapters are of sustained interest; the publication will be begun in our next issue.

## BIRDS, CATS AND POISON.

THE destruction of Dr. Hodge's domesticated ruffed grouse by poisoning is a most regrettable incident. While the miscreant who did the deed has not been detected, it is assumed that the act was prompted by revenge; and it may have been done by some one whose cat had been killed by Dr. Hodge. As has been told, trespassing and marauding cats have been the most serious factor Dr. Hodge has had to contend with. Such cats as had owners known to him he captured and returned to their homes; vagrants and strays he trapped and chloroformed. By this course—human nature being what it is—he incurred the enmity of the owners of the destroyed cats; and—human nature being what it is—one may readily conceive that some master of a roving feline, which had been done to death by Dr. Hodge, might regard the doing to death of the birds as a feasible mode of squaring the account.

The detestable deed of the bird poisoner may rightly be denounced in no measured terms; but the denunciation is not likely to affect the bird poisoner. The average owner of a cat or a dog is impervious to protests against the tramp proclivities of his semi-feral animal; he hears of neighbors' chickens destroyed and garden plants devastated without a qualm. Tell him that his cat has killed your canary and he receives the intelligence with a superior sort of commiserative smile. Warn him that you have tame game birds and that he must keep his cats at home, his answer is a sneer. Protect your own birds on your own grounds by killing the trespassing vermin, his recourse is to the arsenic bottle—if his cat may not live to prey on your birds, your birds shall not be left alive. This is the line of reasoning to which the events at Worcester point.

Dr. Hodge's loss of tamed partridges first by cats and then by cats' owners is unusual, extraordinary and noteworthy, only because it is unusual, extraordinary and noteworthy to have live wild game birds in one's possession and as the fruits of successful rearing and keeping. But only in this nature of the bird victims is the case out of the common. The domestic cat belongs in the class of wild animals denominated vermin. It is vermin artificially maintained by mankind. That it is a species of vermin purposely and artificially perpetuated by human society, diminishes in no respect its predatory attributes. So long as there are cats in the community, the creature will prey on the community. Experimenters with game birds must always reckon with the cat. And with the cat owner, which is to say, with poison.

## LOOKING AHEAD.

WE all know something of the difficulties of Christmas shopping and are all subject to the universal strong tendency to put off the purchasing of Christmas gifts until the last moment; when something that might have been done deliberately and comfortably a few days or weeks earlier is done at last—if accomplished at all—in a hurry, among a crowd, and often in a very unsatisfactory way.

In this matter we are speaking two words for ourselves to one for anyone who may wish to purchase any of the FOREST AND STREAM books as Christmas gifts. The last few days before the holidays are commonly crowded with book orders to such an extent that it is difficult to fill them on time. Besides that, the Christmas mails are so crowded, and the post office officials so overworked that everything going through the mails is delayed and packages which, under ordinary conditions, would have had plenty of time for transit, are now thrust aside, delayed and received late.

We can assure those who will number books among the gifts they are to select, that it will be better for them and better for us, if they will send us their orders for Christmas books now instead of one, two or three weeks later.

## BUFFALO FOR THE WICHITA RESERVE.

IT is recognized that efforts to perpetuate the buffalo by maintaining small herds in captivity even in the larger zoological parks and on cattle ranges is doomed to failure by reason of the deterioration due to inbreeding and the stagnation of life in confinement. The only practicable way in which the species may be preserved, if at all, is to restore primitive conditions. This means giving wide ranges in natural wilderness. The adaptability of some of the Forest Preserves to such use has been noted in these columns, and it has been urged that small herds of buffalo should be put on the reserves and there be maintained and protected by the Government. A very practical step in this direction has just been taken by the New York Zoological Society, which has offered to supply to the Government a herd of buffalo gathered together from widely different sources to be liberated on the Wichita Reserve. The offer has been formally made to the Secretary of Agriculture, and the Society has declared its readiness to provide the buffalo whenever the Government shall have fenced a suitable area for them on the Reserve. The action of the Society is generous and patriotic. We trust that we may have the satisfaction of recording the establishment of the Wichita herd.

## BEAVER IN TOWN.

NEW YORK is a wonderful city. Its wonders may be enumerated in millions, if one wish—the population exceeds 4,000,000; the budget for 1906 is nearly \$117,000,000; the Subway carried 106,000,000 passengers in the first year, and there are a thousand or more millionaires living in the city and paying or not paying taxes here. But the wonderful thing to be noted just now is that New York city has a beaver colony "in its midst," a band of live, working, dam-building beavers. The morning papers of Monday related that several hundred visitors in the Bronx Zoological Park last Sunday witnessed a sight altogether novel and marvellous when the place is considered. It was the felling of a large oak tree by the beavers of Beaver Lake, in the course of operations for the provision of winter quarters. The spectators saw the final cuttings by the beavers, the swaying and falling of the tree across the stream, and then the work of the beavers which followed immediately toward the completion of the dam. It was an object lesson one would go far into the woods to see, and it is only one of a multitude of pictures of wild life provided for New Yorkers in the Bronx.

The establishment of the Bronx beaver colony is a restoration of one of original wild species which have been closely identified with New York. If we may trust the history which is told in street names, there must have been beaver in the streams of Manhattan Island in the old days, for Beaver street, a cañon which winds its way amid the towering skyscrapers of the lower part of the city, is reputed to have taken its name from the beaver which frequented the locality; and nearby, on the front of a building at the corner of Wall and Nassau

streets, a cartouche bears the figure of a beaver in commemoration of the ancient denizens of the precincts now populated by bulls and bears. The builders of the Subway have decorated several of the stations with distinctive and appropriate designs for which they have found the motives in the historic associations. In the frieze of the Bowling Green station is shown a game of bowls as played on the green of colonial days, from which the present little park takes its name; at Fulton street, named for Robert Fulton, the motive is the inventor's first steamboat, the Clermont; and in the station at Astor Place, taking its name from Astor, the fur trader, is shown the beaver, significant of the beaver trapping, in which the Astor wealth had its origin.

In the late New York election a State Island candidate announced as his platform plank a proposition that mosquitoes ought to be exterminated from the island, and declared that, if elected, he would drive the insects over into New Jersey. He was not elected, the inference being that the Staten Islanders preferred the rival candidate and mosquitoes to the insect exterminator without them. The opposition press was inclined to make light of the mosquito as a campaign issue, but there is nothing ridiculous about it. We are gradually acquiring a knowledge of the mosquito in its relation to public health which, when the facts shall be fully and popularly appreciated, will give it dignity for campaign platforms. In New Orleans and Havana and other Southern localities to-day no one would dream of making light of the mosquito as a subject of party principle. Only in less degree is it bound to take rank in public administration in all sections cursed by the malaria mosquito. The mosquito is a removable and preventable plague. It is now tolerated and endured only because of popular ignorance, apathy and shiftlessness, all of which attributes of the community are characteristic in a degree possibly criminal, certainly harmful and productive of increased death rates. The candidate for office who proclaims mosquito extermination deserves at least respectful consideration, and the candidate who shall fulfill his mosquito exterminating campaign pledges will deserve gratitude if not a monument.

CAPTAIN EDWARD HERENDEN, who died at Little Compton, R. I., on Nov. 2, in the seventy-fifth year of his age, was a stalwart figure in that class of American masters of whaling ships who have been ranked among the finest practical navigators of the American mercantile marine. He was for many years engaged in whaling on the North Pacific; and was an officer of one of the first ships to winter at the mouth of the Mackenzie. The heroic fiber of the man was shown when he was found among the few who made that perilous expedition into the ice after the great disaster to the whaling fleet in the '80s, and with his small party rescued one of the two vessels which had survived the crush of the floe ice. In 1872-4 Captain Herenden was sailing master of the United States revenue cutter Yukon, and was later a member of the international polar expedition to Point Barrow, and after the return of the expedition spent three years at that isolated outpost. It was Captain Herenden's misfortune, after having acquired a competence, to make losing investments which swept away his modest fortune; and following this he became captain of the watch at the Smithsonian Institution. His personal qualities endeared him to his associates, and his rich store of information on Arctic subjects was freely drawn on. Captain Herenden was a valued contributor to the natural history columns of the FOREST AND STREAM, his communications carrying always the conviction that comes of full knowledge.

OWING to the mistake of his assistant, a conjurer at a Berlin music hall was killed by catching on his forehead a heavy metal ball instead of a light-weight globe which the assistant forgot to substitute. This was clearly a case of didn't-know-it-was-loaded, though the comment may seem flippant and heartless.

MR. RAYMOND S. SPEARS has a reply to our Albany correspondent respecting the disputed Adirondack land sales. The subject is attracting much attention, and one result of the discussion will be to insure a more careful scrutiny of future land transactions in the North Woods.

## THE SPORTSMAN TOURIST

### On Not Getting Lost in the Woods.

WE often see articles in the sporting papers giving people who are lost in the woods instruction as to how to find their way. It is very doubtful whether any of those who are so ready to tell others what to do, ever traveled much in the woods, and it is certain that, if lost there, they could never find their way by any of the so-called helps they offer to others. I have never known of any one writing an article showing insane people how to become sane; but it is just as reasonable as telling those who are lost in the woods how to find their way out, for when a man is really lost he is practically insane and incapable of reasoning as he would at other times, and even when he gets to well-known roads and clearings he does not recognize them. Men will often turn nearly, or quite, squarely around and either go in a circle or sometimes turn back in the opposite direction, all the time thinking they are keeping a straight course. It is as hard to tell why they do this as why life insurance officials can do such crooked things and still think that they are honest.

Sebattis Dana, of the Penobscot Indians, once told me that when he was moose hunting with two other Indians, it came on to snow hard and they started for their camp. All thought that they knew the way and they had traveled some time when they came upon the fresh tracks of three men who were traveling in the same direction as themselves. After following for some time, they came to a place where someone had pulled a piece off a rotten stub in passing. Sebattis recognized it as a place where he had slipped and had broken off the stub in recovering himself. A closer inspection showed that they were following their own tracks. They then started again but soon came round to their tracks the second time. Sebattis felt sure that he could go straight, and took the lead, but shortly they were back again to their own tracks. Finally one of them climbed a tree and could see the lake, near which they camped, close by them; but even then he had to throw a branch toward it to get a right start. Soon after they reached camp it stopped snowing, and they went back to examine their tracks. Sebattis told me that at the time when he was in the lead he had gone straight toward the lake till within plain sight of it and then all three had turned squarely about and gone back in the direction whence they had come.

I have known of a man coming out close to the edge of a good road and then turning and going back. He did not see the road at all but happened to look up and caught sight of a telegraph wire over his head.

An uncle of mine told me that he had lived at a farmhouse in northern New York all summer. Occasionally he had gone through a piece of woods to visit at another farmhouse. One bright day in the fall he started to go there. The way seemed longer than usual, but he had no doubt but that he was going in the right direction until he came out of the woods and found that he had come out at a place which was strange to him. Seeing a house nearby, he went up to it to inquire the way. It was not until he was in the act of knocking on the door that he realized that he had returned to the same house where he had lived all summer. He had got turned around and this caused familiar things to look strange to him. When a man is in such a state of mind that he cannot tell a main road or a clearing when he sees it, it is useless to talk of his being able to follow any of the many ways which some of these Sherlock Holmeses have written of.

Some of these would-be instructors tell us that there are more branches on the south side of trees, while others tell us that there is more moss on the north side of trees and rocks. Trees branch most toward the open spaces, where there is room to spread their branches, whether it is north or south. Firs and spruces branch very nearly symmetrically, no matter what the situation. As to moss, sometimes trees moss more on one side and sometimes on the other. I have carefully tested the matter with a compass in various locations and find that there is no possible way to get any help as to direction by looking at either limbs or moss, though it is a favorite idea of writers to tell of people finding their way by looking at branches and moss; I have never known of any woodsman being guided in that way. Another tells us that the tips of hemlock and cedar point north, while very recently one claims that the tips of hemlock point toward the east. Now the actual fact is, that no one in the woods can see the tops of trees, even in bright days, unless he is upon a hill above them or in some road or open space. In most cases when men are lost it is in dark, rainy, snowy or cloudy days, when there would be no chance to see the treetops; but if they could see them, and it was calm, so that the tops were not bent by the wind, they would find that they bend in all directions. I have walked along in open places and roads testing this by compass, and one might as well rely on which way the leaves fall as on being guided by the treetops.

Another tells us that the gum is softer on the south side. Now, one may travel miles without seeing any gum at all, and to find it upon both sides of a tree, except upon a spotted line, would be a very unusual thing. In our woods I hardly think that a man could average finding one such tree in a day, and even if he did by chance find one, in cold weather the gum on both sides would be hard. In point of fact, the gum

which has recently exuded is soft no matter which side of the tree it is, while the old gum is always hard. Then again, the gum on trees is not confined to the north and south sides of the trees, but is as likely to be found upon the east and west sides if the trees have been wounded on those sides.

Another tells us that by cutting down a tree the rings will be found wider upon the south side. The majority of those out hunting do not carry axes, but if one did, he would find very few cases where the grain of the wood would show any difference. In some cases where a tree stands so its side is fully exposed to the sun there may be a slight difference; but a man might starve to death cutting down trees before he could tell the north from the south. I have traveled the Maine woods in company with as good men as ever traveled these woods, and I never knew any man to be in any way helped by any of these things which so many write of, and those who write so only show their own ignorance of the woods. Some men I have traveled with never used a compass; some always carried one, but very seldom set it, except in stormy weather; while occasionally a woodsman relies entirely on a plan and compass. Some men seem to be born with a compass in their heads, while some can never learn to travel even with a compass in their hands. A good woodsman finds his way just as an animal does, by a certain kind of instinct. He cannot tell you how he does it or teach you how, but he can do it himself, and knowing that he will hunt all day without troubling his head as to where the camp is. Of course, he is guided some by sun and wind and lay of the land; but it is perfectly surprising what some men can do in finding their way in stormy or cloudy days.

I once separated from an Indian on the top of Bald Mountain near Nictor Lake on the Little Tobique in New Brunswick. He belonged north of the St. Lawrence and was an entire stranger in that part of the country. He was going to look for moose, while I was to take the canoe back after I was done hunting, he coming to the camp at the outlet on foot. The day was fine, but at night grew cloudy and threatened rain. As he failed to come in, I grew anxious and at intervals during the evening fired my rifle with heavy charges to try to guide him in. In the morning it was raining hard. At 9 o'clock in the forenoon I heard some one calling, and on going across the stream, found Peol. After he had eaten, he told me that he had followed the track of a moose till 5 P. M., then he had started for camp. He traveled till 9. Then he had spotted three trees in line so as to keep the direction, if the wind should change, had built a fire and stood by it all night until at 5 A. M., when it got light enough for him to see to travel; then he walked until 9 and had struck the stream only a mile below our camp and followed it up. He estimated that he was sixteen miles from camp when he started back, as he had traveled eight hours to get in. He had no compass, in fact, never carried one, although he always carried a watch. He had eaten nothing except a piece of hard bread since the morning before, and had been out all night with no clothing but pants and a red flannel shirt; yet he did not speak of having had a hard time. He remarked that two owls slept at the same house where he did, and that he traveled by the wind. I have hunted with a number of men who, I think, could have done as well.

I once heard Paul B. Du Chaillu, the noted traveler, say: "On the west coast of Africa, if you fall into the water the sharks shall get you sure; consequently you had better never fall in!" And so I would say to those going into the woods, "You had better never get lost."

MANLY HARDY.

### Adirondack Conditions.

Editor *Forest and Stream*:

Your valued paper is fulfilling part of its high calling in giving space to State land affairs in the Adirondacks.

Permit me to add a little testimony as to some other conditions: First—As to the deer supply: I know something about Hamilton county, for I have hunted there for about twenty years, and I know from personal observation that in some sections where lumbering has been going on for three years or so, the deer are perceptibly diminished in number. The old deer trails remain, but the fresh tracks, formerly to be counted by the dozen, are now single or at most two or three. And I do not believe it is a case of the lumbermen driving out the deer, for there has not been a corresponding increase in other sections. The inference is plain.

Second—Many of the residents of the Adirondacks need educating up to a clear and practical recognition of the fact that the preservation of the Adirondack forests, fish and game, is imperatively necessary to their own prosperity.

This should be apparent without argument. But it is not. This is proved by a widespread hostility to the elk and moose liberated in the Adirondack woods in the effort to restock them with this noble game. Many residents argue against the effort, claim the large animals will drive out the deer, and speak complacently of the killing of elk or moose by others.

Again, it is undoubtedly true that the old spirit of setting forest fires in order to create work in fighting

them, still lives and, like a fire smouldering underground, only awaits the opportunity to break out. The past season was so incomparably wet that little opportunity was afforded, but enough was done to show the existence of the spirit. Such work is like a man high up a tree, cutting off the limb on which he sits. Present wages come, but the end is disaster. A campaign of education is needed on both these points. Of course, among the residents are many exceptions, but the need on both points is too prevalent.

Mr. Spears notes the proposed dam at Piseco Lake, and the danger of flooding adjacent lands. In other places also the same danger is at hand. Existing dams are raised to facilitate transportation, and the timber and shrubbery along miles and miles of shore are liable to be killed by the high water.

What that means to the scenery, the beautiful Marion River, made famous by Adirondack Murray, but since flooded and bordered on both sides almost its entire length with dead cedars piercing the air in their unsightliness, illustrates. Some portions of Raquette River and of others, illustrate the same operation of cause and effect. A shame on the mercenary spirit which, to save the work and expense of a little dredging, is willing thus to profane the face of nature! As a health and pleasure resort, the Adirondacks have no equal this side of Colorado—even if there. With their life-giving tonic of the air, with no venomous reptiles nor insects, their unsurpassed opportunities for healthful recreation, their accessibility, and their almost unrivalled beauty, they constitute one of the Creator's choicest gifts—one of the most invaluable possessions of the people. The powers of enlightened and appreciative public sentiment, and of the State should be exerted to prevent the alienation of those lands from the State and of their utility and beauty from the people.

JUVENAL.

### Stories of Some Sea Dogs.

#### IV.—Shakins and the Tough Four.

PERHAPS there are persons who have read some of my previous stories of sea dogs who may think that I never bought a dog but was always picking up homeless ones, but they wrong me, for I have bought several in my life; but after varied experiences with both boughten ones and pick-ups, the latter classes have almost invariably proven to have been the most precious ones, and then again I rather think my fad was for canine waifs and strays.

It was in Liverpool that I picked up Shakins. He looked friendless and as if searching for some one to be good to him, and I called him to me, and patting his head and talking to him, said, "Come along, old fellow," and he was nothing loth to accept my invitation. When we arrived at the dock gate, the policeman on duty said to me, "Are you going to take that dog aboard your ship, Captain? I hope you are, for he deserves a good home. His former master was the mate of a ship that left here a few days ago. The poor mate died and his dog has been watching for his return ever since. He is half starved, but we feed him at times."

That settled it with me, and again patting the poor fellow on the head, I determined that he should have as good a home as he had lost. The dog evidently knew that I was to be his new master, and having been indorsed by the policeman, a future home was as good as assured. He was a collie, and a bright, clean one at that; with a clear, loving eye, and as gentle as a little girl. As soon as we got on deck, the dog was wild with joy. He frisked about the decks and barked and frolicked around as if to say, "Home at last!" When we entered the cabin, he went around peering into every stateroom, perhaps in quest of some trace of his late master, but quite as likely to familiarize himself with his new surroundings; at any rate, he soon made himself quite at home. I told the story of the dog to the two mates, and they at once took kindly to the fellow, and before the day was over he was on excellent terms with all hands fore and aft. The second mate christened him "Shakings," why that name I do not now remember, but it suited me and the dog, and hence that was his name, and one never to be forgotten by anyone who sailed in that ship on that memorable voyage.

Some of my crew that came from New York in the ship got the gold fever and ran away, and I was obliged to ship some new men. Several of these were not to my liking, but they were the best to be had under the circumstances. Four of them the mate christened the "Tough Four," before they had been on board as many days. However, the marked quartette obeyed all orders promptly and gave us no trouble; but they were a forbidding looking lot of chaps, to say the least. Shakins did not like them at all, and while he was fairly familiar with the rest of the crew, he would have nothing to do with these fellows. Several times I was on the point of telling them to come aft and get their wages and go on shore, but I was confronted with the great difficulty of getting men to fill their places, and finally dismissed the matter from my mind.

The afternoon before we sailed several boxes of specie were delivered alongside the ship, to be put on

board. In those days there were no steam lines to Brazil—we were bound to Rio Janeiro—so that specie shipments were of common occurrence on sailing vessels. It so chanced that the four toughs had a hand in putting the boxes on board and, of course, knew from their weight and markings that they contained money. They were put in my stateroom temporarily. Nothing unusual transpired on our outward passage, until we had been out from Liverpool about three weeks, when one night as I was looking into the binnacle to see if the man at the wheel was keeping on his course, he said to me, "Say, Captain, you'll have to excuse me, but most of us fellows forward don't like the four fellows we shipped in Liverpool. They's bad ones, they is. I think they are hatching up some plot to make mischief on board this ship."

I questioned him closely; but he could not make himself quite clear as to what kind of a plot the fellows were hatching, and after cautioning him to be careful, I asked him to ingratiate himself with the suspects, and gather all he could about the supposed plot and let me know.

All the while Shakins was my constant companion; and his marked intelligence bordered on the miraculous at times. Some of the superstitious old sailors said he was possessed of an evil spirit, and was an uncanny dog that was to be respected if not feared. He knew several colors by name, that is so far as the ship's flags were concerned, and if told to bring the ensign, the jack, or the house flag, he would do it every time without making a single mistake. Tell him to bring the quarantine flag—"Q" of the International Code of Signals—and he would pick it out of the nineteen flags of the code. If sent for a ball of cotton sewing twine, he would not bring the hemp twine, although they were in the same locker; in fact, he knew the names of the common things of everyday use on board the ship. He could scent land when we could not see it, and his varying bark—his language—soon became to be as well understood as if he had spoken, as we did, a common language. To the men he was a canine wonder.

We were out just thirty-one days from Liverpool, when Shakins demonstrated his prowess as a life-saver and made himself the hero of the ship. After dinner the passengers, of whom we had several on board, including a family with two little girls, went to their rooms for the customary afternoon nap. I had also lain down for the same bit of comfort, when I was awakened by the cry of "Man overboard!"

Rushing on deck I ordered the main topsail laid to the mast, and a boat lowered, sending a man aloft to keep the man in sight that was overboard. Judge of our surprise when the man aloft sung out:

"It's Shakins that is overboard, sir, and he has got something in his mouth, but I can't just make out what it is yet."

Just at this time little Minnie Foster's mother was hunting for the child, a beautiful flaxen-haired girl of about seven years of age. Several joined in the hunt for Minnie, but she was nowhere to be found. Poor Mrs. Foster was running about crying, "Oh, my poor Minnie, it is she that has fallen overboard! She will be drowned!" And then falling into her husband's arms, went into a faint.

It was not long before the boat was up to where Shakins was calmly holding Minnie by the back of her dress, waiting for the boat's crew to receive them into their keeping. It seemed to me that the men pulled back to the ship even faster than they pulled away from her, for it was but a very short time from the announcement that Shakins had something in his mouth until Minnie and her rescuer were again in safety on our decks. Minnie told her story before her mother recovered from her swoon. She was playing on the transom locker aft and crawled up to one of the stern ports, lost her balance and fell through into the sea. Shakins saw her go and leaped in after her. I have told the rest. When Minnie's mother came to, there was a rejoicing, and Shakins came in for a goodly share of that mother's blessings. The dog was the hero of that ship from that hour until the voyage ended some months later. But before we shall have ended this story, it will be seen he was capable of still greater achievements.

The man at the wheel confessed that the tough four were too deep for him. He was unable to worm himself into their confidence, and must give up the task I had assigned him, and trust to luck to find out what they were up to; for he felt certain that mischief was brewing. I resolved to confide in no one but the mate, whom I could rely upon implicitly, and to him told what the man at the wheel had told me; but we could not between ourselves conjure up just what these four fellows were planning. We watched them closely, but they did their duty well and gave us ait no cause for complaint.

One night the thought came to me that they might be in a conspiracy to seize the ship and attempt to get away with the specie. I acted upon this stray thought, and each hour it weighed heavier on my mind. I loaded the firearms, placed them in a secure place, gave the mate a brace of pistols—there were no revolvers in those days—and began a most careful vigil, especially at night. Shakins now, as I remember, never permitted me to be out of his sight, and he became more adverse to the now to me suspicious four. Most of my sleep I took in the daytime, so that I might be better able to watch by night. I would go to my room as if to take my regular rest, and then when unobserved, come out and sit on the transom, behind the cabin staircase, which led from the quarter deck to the main cabin. After 10 o'clock at night the light was put out in the saloon. Shakins used to lie on the locker by my side or on the floor at my feet.

I had been on deck one night, when the port watch was relieved at 8-bells, midnight, and after passing the time of day with the officers, and cautioning the helmsman to steer a straight course, went below, and, going to my room, struck a match as if going to turn in as usual in my own berth; then silently taking my place on the transom, began my lonely watch. Shakins was by my side. I must have dozed off and been oblivious for some time, when suddenly Shakins rubbed his paw

two or three times quickly over my face. I was up in an instant. There in his bare feet, with a big oaken heaver behind his back, one of the tough four was softly coming down the cabin stairs. Shakins was sitting on his haunches, but never a growl came from him. The fellow made for the door of my room. I permitted him to enter, then before he could do a thing, I whispered to him, "Move, speak, and you die, you villain," at the same time wiping a brass pistol barrel across his face. "Drop that stick, put out your hands." And quick as a flash I had the fellow handcuffed. "Now if you stir or make the least noise so as to alarm your confederates, I will blow your brains out certain. I know your whole plot."

Shutting the door, I turned the key and was just going to call the mate, who was asleep in his room on the opposite side of the cabin, when I saw a shadow in the companionway, gliding along the side of the cabin, was hailed from the deck in a whisper, "Is it all right, shall I come down?" I whispered back, "Yes, come gently." Down he came. As he passed me—for it was so dark that he could not see me—I grabbed him by the arm, and sticking the cold, brass muzzle of the pistol in his face—I should say on his face—said, "Open your mouth, and you are a dead man, or stir, except as I order, and I will kill you." Leading him to the door of my room, I pushed him in, saying to the pair, "If you fellows stir, I will send you to hell in a second, and don't you dare give any alarm."

Then shutting the door, I ran to the mate's room and, rousing him out, sent him with his pistol to my room door to keep guard over my two captives, and to look out for any more of the gang that might come down into the cabin by the companionway. I then went out the forward cabin door, which was always kept locked after 10 o'clock at night; and to my surprise found the second mate bound and gagged at the main fire-rail. It took but an instant to cut his bonds, and telling him to go aft with the capstan bar—he going to the lee side of the house on deck, while I went up on the weather side—I met the third man of the quartette crouched down near the end of the house waiting for the signal to assist his shipmates. I kicked him and ordered him to go aft, and by the time the second mate had reached the wheel, where the fourth man of the gang was, the tough four were all prisoners. The fellow I had secured I marched down the cabin stairs, leaving the second mate to look out for the man at the wheel. All this time Shakins was a silent but much interested spectator, but never opened his mouth. He seemed to know that this was the time for whispering, and he had not learned how to do that as yet.

After sending the second mate down to my room to change places with the chief mate, I told the mate to go forward and summon all hands aft. Not getting any response to his repeated calls, he went forward cautiously and found the watch on deck stupid, and very difficult to awaken; but the watch below were speedily aroused and came aft. My story was quickly told, and in a few minutes the wheel had been relieved and the four mutineers, or rather pirates, were in double irons and securely stowed away in the carpenter's shop. The scoundrels had drugged their watch mates and the four thought it was going to be an easy matter to kill the mate and me; and it would have been, but for Shakins' waking me up at the right moment.

After breakfast I sent for the prisoners one by one and questioned them. Two refused to talk, but one confessed the whole plot, and the other confirmed what the confessing man had told me. They had planned to murder us all, save the second mate, whom they were to compel to navigate the ship near to the land; then put the specie in the boat, kill him, set fire to the ship and make their escape inland and divide the money. It was Shakins that brought their plans to grief. We carried the tough four into Rio, and delivered them to the American Consul. He jailed them until an opportunity presented itself and then shipped them in double irons for trial before a United States Commissioner at New York. Off Hatteras a vessel collided with the ship in a fog, sinking her. The crew were all saved, but the four that were not to be saved from death by law perished as they deserved to perish.

We finished our loading at Rio and went to Cronstadt, thence to London, and back home to New York. Shakins was made an idol of. In every port his deeds were told, both by the men forward and by us in the after part of the ship. Men petted him and women kissed the dear old fellow; but they never took away one whit of his love for me. He made several more voyages with me, but at last his strength began to fail, his eyesight dimmed, and I did not want to see him suffer on shipboard, so I left him on shore with a friend who I knew would care for him tenderly. When I returned some months afterward poor Shakins had gone to the Heaven prepared for dogs. He sleeps now on the banks of the Hudson in a quiet spot where I know he will not be disturbed. I would dearly love to mark his last resting place with a stone on which would be engraved a fitting tribute to his memory, a token of my love and affection for a friend whose equal I have never met. But, alas! I dare not do this, lest some dog-hater would disturb even the dust of dear old Shakins. Can you wonder I love dogs, and that tears will come when I tell of their goodness to me.

B. S. OSBON.

A pleasant little story is told by the Geneva correspondent of the Daily Chronicle about the swallows which have been caught in Switzerland by the cold snap on their way to Italy, and probably en route for Africa. Thousands of the migrants have fallen exhausted and paralyzed by the cold at Lucerne and Zurich, and the kindly folk have been collecting and caring for the little waifs and sending them on by train, when they had recovered, to Chiasso, where they have been set free to continue their flight. We congratulate the swallows, and we also congratulate the good Samaritans who have given such practical assistance to the little creatures.—Westminster Gazette.

## A Day in Massachusetts Covers.

RESPONDING to a growing healthy sentiment, the Solons of the old Bay State have, from time to time, shortened the open season when the game birds may legally be reduced to possession. The older generation of sportsmen can well remember when the shooting of woodcock and upland plover was permitted during the sweltering weather of July, and of ruffed grouse and quail soon after.

The army of sportsmen has been so rapidly recruited in recent times, firearms perfected and rendered more destructive, and the number of bird dogs multiplied and more highly developed, that the more conservative and thoughtful welcome every measure that limits the wholesale destruction and extermination of our game birds and insures their conservation to coming generations.

The heats of summer time have passed; the half-fledged birds that were sought and cruelly slaughtered in former times have now reached maturity, and are strong of wing; the crisp frosts of autumn stimulate renewed energy and impart such a glorious coloring to hillside and landscape as the famed pencil of Rembrandt never equalled; and the sportsmen of the oldest settled State in New England rejoice and are glad that October now marks the opening of the gunning season for upland game birds.

Although this State has been settled nearly three hundred years, and despite the fact that its population to the square mile is greater than that of any other State in the Union, its wooded hillsides and valleys, its sprout lands and white birch and alder runs with overhanging grape vines, the abundance of mast—berries, grapes, nuts, seeds and buds—all combine to make such an ideal home for our native birds that an abundance still remain to generously reward the ambition and skill of the sportsman who is familiar with the haunts and habits of the game.

While upland plover, quail and woodcock are in evidence, the ruffed grouse, here called partridge, are more eagerly sought, and the sportsman who can outwit an old cock partridge, who can follow him through dense shrubbery, spoonwood, blackberry bushes, tangling grape vines and other swampy and woody growths, and finally draw a bead upon him and pull the trigger successfully, when he suddenly breaks cover with a noise like thunder, and with seeming lightning speed, can well feel a pardonable pride in his achievement, and challenge comparison for endurance and skill with the most successful wing shot of other species of feathered game; and in all that goes to stir the blood and send a thrill of triumph throughout the system, the achievement will not suffer by comparison with the deeds of him who successfully stalks big game in gloomy forest and mountain fastness far from the abodes of men.

But, again, the lengthened days of the summer solstice have come and gone, and with them the light and warmth and flowers of summer time. The days of autumn are at hand, and a tempered sun and gentle breezes, mellow and bracing, energize and exhilarate like wine of rarest vintage. In the early morning hours with an old companion, tried and true, and our staunch setter in his accustomed place in the vehicle, and all well bundled up and tucked in to resist the biting air, we are again on our way to old and familiar haunts, a dozen miles away.

Emerging from the smoke of the city, the country looks drowsy at first, but soon the early risers are in evidence, when we encounter teams laden with milk, fruit and vegetables on their way to market.

The eye falls restfully on the dim outline of the hills, and the lifting clouds of mist in the valleys seem like nature's effort to lift the curtains of night and arouse herself from sleep. The deep embrasures of the hills are still hidden in the gloom of morning, and the meadows lie in placid repose. Soon a purple arch is thrown across the sky, which a little later is transfixed and rent asunder by pencillings of gold. Wisps of clouds sail leisurely across the turquoise sky, when the sun soon after rolls above the horizon and dispels the remnant of night and ushers in the new day. Our surroundings were too interesting and impressive for the common-places of conversation, and a community of tastes prompted the tribute of silence.

Arriving at the extensive farm of an old friend, whose covers always abound in game birds, and to which we had always heretofore been welcomed, repulsive signs, "No Trespassing Under Penalty of the Law," greeted our vision and aroused us from our reveries—the first foul blot of the day upon the fairest of pictures—the overthrowing of the ideal and the enthronement of the real.

Arriving at the home of our farmer friend, we found him employed husking corn in his barn. Answering his cheery "good morning" in kind as best we could, we expressed our regret that he had found it necessary to post his farm so as to exclude Italians and other foreigners from the city and the Metropolitan water works, where many hundreds of them were employed.

Much to our surprise, he told us that the Italians and other foreigners had given him no trouble, but that degraded and worthless specimens of humanity from the city, some of whom traced their ancestry way back to the Mayflower, had run over his place Sundays as well as Mondays, cut his barbed-wire fencing, threw down his stone walls, besides doing other damage; that when he remonstrated with them they were saucy, vulgar, profane, and treated him with abuse and contumely. They finally became so obnoxious and unbearable that he threatened them with arrest for violating the Sunday laws of the State, when they departed down through some sprout and pasture land where he heard the discharge of firearms. Missing one of his cows from the herd that night, he sought and found her the next day, in the direction whence the degenerates had taken their departure and from whence came the sound of firearms, shot to death.

Offering the expression of our regrets for such gross improprieties as were dealt out to him, and regrets for his loss, he very warmly, with old-time cordiality, bade us welcome and wished us every pleasure and success. Caring for our team, we decided to try the two-acre

swale, so-called, over the knoll back of the barn. This patch of ground, more marsh than solid earth, lay in a sunshiny hollow between the hills, and was overgrown with a riotous profusion of shrubbery and grape vines. On the further side was arable land flanked with a sugar-loaf knoll rising a few hundred feet in the air, around the base of which, to the woods beyond, flew any birds that were flushed and which were fortunate enough to escape.

My companion took his accustomed position on the outside, when I essayed to work my way through the dense undergrowth. I made but little progress when the tinkling of the bell of Rex ceased and told the story that he was on a point. Being situated where it was impossible for me to shoot, I called out "point"—when, with the noise of muffled thunder, out went a covey of five birds, giving my companion an opportunity to make an easy double, the remainder seeking safety in the woods beyond the hill.

"This is almost too much like butchery," said he, "but being so early in the day, and not knowing what our chances may be later, I was tempted to do it. Now, let me follow the dog and you take the outside."

Thanking him for his courtesy, and assuring him that few places in the State were so sure to hold birds, and that none could be more favorable for their capture, and that we should have to work hard for any more than we might get, I insisted on working the cover and giving him the benefit of the success that was already ours, I ordered Rex on. Faithfully and thoroughly he covered the ground, challenging all likely places, but without avail. Slowly and carefully we worked our way through the dense and tangled undergrowth out toward the further end where it narrowed to a point. Clambering over a lot of small stones at the edge of the cover, that had been gathered in from the adjoining field, I was on their summit when the bell again ceased to tinkle. This my companion announced, when two more partridge broke cover near me with all their startling abruptness, and in a curving flight started like a flash for the woods beyond the hill. Hastily drawing bead upon the foremost, I pulled trigger at the moment a rolling stone gave way beneath my foot, and I scored a clean miss, but the last fell at a very considerable distance to a more careful aim. Crossing over to the woods beyond the hill, the careful and thorough working of the dog not only gave us pleasure, but also numerous shots without adding to the number of birds in our game pockets. For this we found many reasons besides the true one, doubtless—indifferent marksmanship—and consoled ourselves that we did not want all the birds; that we already had a brace, and that

The partridge shot at that flies away  
Lives to be shot at another day.

Returning to the farmhouse at noon to care for our horse and to eat our lunch, we found the animal cared for and a dinner already prepared for us in the house. Accepting the hospitality of our host, two hungry sportsmen did full justice to the ample New England dinner so generously provided.

The shortened autumn day prevented any lengthened interchange of courtesies, and we soon turned our steps toward the birch and alder run beside a well-known trout brook, where woodcock make their home. In less time than it takes to write it, after arriving on the grounds, Rex at command flushed a plump bird that fell an easy shot to my gun. Working carefully down the run some distance, my companion heard an unusual noise and asked me if I did not hear it. Being answered in the negative, we continued our quest a little longer, when, sobbing, intermingled with comforting words, was heard as a note of discord and sadness where all else was harmony and joy.

Following the direction whence came the sound, we were soon near two little girls, one of whom was crying and sobbing as if her heart would break, and her companion vainly endeavoring to assuage her grief and comfort her in her sorrow. This picture of sadness in the early spring time of life touched a responsive chord and emphasized the story of the good Samaritan. We soon learned the story that Mamie's little sister was dead and that they had come to the brookside from neighboring farmhouses to get some wild flowers to put on her coffin.

Just then, woodcock and partridge had little attraction for us, and, touched by the pathos of the scene, we also offered such words of sympathy and comfort as we could command to the afflicted one, coupled with the assurance of co-operation and aid in procuring the floral tribute which was to attest a sister's loss and sorrow.

For a time the tears were dried, but choking sobs too plainly told that the aching heart refused to be comforted. Laying our guns aside, the sportsmen essayed the role of the florist. Making a light framework of the dark twigs of the black alder, we filled the interstices with moss from the brookside, and around the edge, nicely lapped the one over the other, we worked in a row of dark copper-colored leaves from a neighboring beech tree. Upon this, for a foundation, we fashioned a wreath of wild clematis and maiden-hair fern, surmounted by a cross—the emblem of man's salvation—composed of cardinal flowers flanked with blue-fringed gentian.

The children watched the progress of our work with growing interest, and the product they gladly accepted as a burden lifted.

But our shooting for the day was over. Our game bag was not plethoric, to be sure, but sufficient for those who realize that a day spent under autumn skies, along the hillsides clothed in surging billows of color, or beside the purling brook, where the woody odors of lowland growth perfume the air, are not to be measured by the destruction wrought.

When we reached home in the evening the same old stars shone in the firmament, but they seemed brighter.

GEO. MCALEER.

"HUNTING AND FISHING IN THE SOUTH," the pamphlet of information issued by the Southern Railway and advertised on another page, should be in the hands of every person who is looking to an excursion to the South this season.

## Adirondack State Lands.

Editor Forest and Stream:

It would be unnecessary to make a reply to the article written by your special correspondent about "Adirondack State Land Sales," published in your issue of Nov. 11, if the general public was fully acquainted with the question under discussion. The article, as I shall show clearly, carries in it full, exact and perfect substantiation of my contention that "Adirondack land matters ought to be examined by honest, competent and thorough authority"; which means, of course, an investigation by the Legislature.

Your correspondent's itemized reply shows that the titles to 152 parcels, lots or tracts of land were "cancelled." Nowhere in his article does your correspondent explain this save by saying "in many cases the lands were recovered by the owners through an application for a cancellation in the tax title, in which application certain irregularities on the part of the assessors and supervisors were alleged, and which, under the law of the State at that time, rendered the tax sale invalid."

Against this place Commissioner Whipple's statement, quoted in the same article:

"The forest preserve board, immediately after its organization in 1897, made a systematic attempt to recover the lands which were lost through cancellations, their efforts being confined to these, as the redemptions in each case were final and irrevocable under the State tax law. The forest preserve board, through the legal measures adopted, recovered over 100,000 acres of land in the Adirondacks that had been lost through cancellations, but there still remained large tracts to which the State's title was so defective through irregularities [mere technicalities] in the tax sales that it is doubtful whether the State could ever regain those properties."

I showed 117,000 acres the State had lost, and hasn't got now. Mr. Whipple says besides this, 100,000 acres have already been recovered—more than 217,000 acres were taken.

In view of that statement, can anybody deny that there were irregularities in cancellations? That the State ought to get more of that vast acreage it lost?

Of course there was a lawyer behind each cancellation; of course the gloss of "perfectly legal" would be flashed before the public. How many of those 152 tracts of land—say 60,000 acres—were taken from the State illegally? How many of the redemptions were legal and above board?

Chapter 332, laws of 1893, is mentioned by your correspondent. This law excepted all Hamilton county, and numerous towns in Franklin, Lewis, Herkimer and other counties from its provisions. Because the law excepted those towns and Hamilton county, other measures than "sale" were adopted. I quote your correspondent as follows to indicate one instance:

"Jones' Gore: Lots 2, 3, 4, 5, 6, 7, 8, 9, 14, 15.—These lots were stricken from land list per resolution of State Board of Land Commissioners."

In the heart of the Adirondacks, in Hamilton county, in Totten & Crossfield's purchase, where the sale of State lands was forbidden, the State's title to 1,617.9 acres of land was thrown out of the people's domain by a mere "resolution" of the State Land Commissioners. Was it thrown out by the "connivance" of State officials or not? Was it legal? That resolution was worth \$150,000 to the ones who got the land.

"Redemptions" are said to be perfectly legal, irrevocable, etc. Here is your correspondent's statement about the Dr. Webb preserve Lost State lots:

"Township 78 (Totten & Crossfield's purchase), lots 6, 7, 26, 38, 43, 49, 55, 56—redeemed June 24, 1890."

This was nine years after the State first acquired title to them. It also acquired title to them at a subsequent tax sale, but then allowed somebody else to get title at the 1888 tax sale. Mr. Whipple says of these lands:

"At one time, however, years previous to this sale, there were a few lots [three square miles] included in this territory which then belonged to the State of New York; pursuant to the provisions of chapter 475, laws of 1887, these lots were exchanged for other lands which were equally well located and of greater acreage."

Then, to get another statement as to these lands, refer to the Forest Commission's report of 1890:

"June 24, 1890: Hamilton county, Town of Long Lake, Township 38, Northeast corner Sargeant's tract, lots 6, 7, 26, 43, 49, 55 and 56, 2,160 acres.—Redeemed from the tax sale of 1885, under notice, by P. Moynahan, North Creek, N. Y. (The State still holds title to these lands under the sale of 1881)."

Commissioner Whipple says the land was exchanged, the Forest Commission report says "redeemed," and nowhere is it mentioned, save as having been purchased by the State at a tax sale in a Colvin report. A sop was thrown to the public: "The State still holds title to this land under the sale of 1881." This was wiped out later by "exchange" apparently.

Then as to the deal by which the State lost township 20, on Upper Saranac Lake. On lots 4, 5 and 6 were located the ponds and buildings of the Saranac Inn Fish Hatchery, owned, maintained and utilized by the State for the distribution of the fish fry and yearlings. It has been there more than eighteen years, and has been in constant use all that time. In the interval title to this land was "cancelled," squabbled over, and then bought back at the rate of \$6.02 per acre. The State paid \$11,000 in "recovering" those cancelled titles to its fish hatchery and didn't get all of lot 4 at that. The State lost 2,000 acres of choice camp sites around Upper Saranac Lake and paid \$150,088 to get back what it had lost. Moreover, the land-buying commission said the Saranac people paid "about \$50,000" back taxes which the State would have been "obliged to refund." Commissioner Whipple says the Saranac Association had paid "back taxes on the land amounting to \$34,000 or thereabouts." The Association therefore received either \$100,000 and 2,000 acres of State land, or \$116,000 and 2,000 acres of land by reason of this shrewd deal, and the \$50,000 was a lie by \$16,000.

In view of the conflicting statements and in view of the facts that I have pointed out, can there be any doubt that the public has been repeatedly swindled and bamboozled in this matter of Adirondack lands?

Now, then, as to the accusation that I waited twenty years after the transactions to make these facts public.

Most of the redemptions and cancellations about which I complain were made from 1888 to 1893. But how does it happen that a law made in 1900 could give Finch, Pruyn & Co. the State's share in lots 5, 19, 29, 30, 43, 44, 45, 48, 49, 52, 53 and 54, township 33, Totten & Crossfield's purchase? I believe that the State constitution says State land shall not be sold, or conveyed, and yet here, under a law of 1900, a logging company can get the State's share in nearly a thousand acres—960 acres, if one can believe a public document, and your correspondent.

That is conclusive evidence that the old-time land deals are being carried on, "by partitioning." All the pulp companies have got to do is get any old title, claim a "share" in State land, and then by a partition suit, nail a few hundred acres of State land.

That the Adirondack lands are in present danger is also shown by the fact that the State River Commission is going to listen to the cunning arguments of the attorneys and politicians who favor the "power dam" projects in the Adirondacks. The Sacandaga Dam proposition is to erect a dam 1,000 feet long and forty feet high below Lake Piseco. This will overflow nearly fifty square miles (more than is covered by Lake George). Of the 35,000 acres to be covered, upwards of 25,000 acres are State forest preserve land. The timber on that land, which, under provision of the law as regards dams, must be "cleared away," would more than pay for the dam, which is the only expense incurred by the power companies, save the purchase of the private lands that would be overflowed. The State wouldn't get a dollar for its thirty-nine square miles of land.

That dam is going to be built next spring, unless the public stops this power company scheme.

The Adirondack land scandal is not a thing of the past, it is a thing of the present and future, if the land sharks are allowed to have their way.

Your correspondent says that lot 79, Remsenburgh Patent, "100 acres" is "owned by the State now." The secretary of the Forest Commission wrote to me last summer that this land had been sold to the Finch Chemical Company. The State owned 170 acres in that lot in 1901. It was in two patches of 100 acres and 70 acres each. The 70 acres is apparently wiped off the State's list, the 100 acres being the usual sop thrown to the public in such matters as this.

Consider this statement by Commissioner Whipple:

"It seems proper to say here that while various lots have been dropped from the State land list, and are no longer included in the red area of the Adirondack map, other and larger tracts have taken their place—a fact which should always be considered in connection with these particular lands."

Permit me to make this comparison. Suppose that a man is successful in business. He is making \$10,000 a year. A thief picks his pocketbook containing \$100 and an invaluable tress of his dead baby's hair. Because he is making \$10,000 a year should he let the thief escape, when a little run and considerable of a whoop would compel the thief to at least drop the pocketbook? I cannot see any difference between the case cited by Mr. Whipple and the one I cite for comparison.

Your correspondent amply portrays the shameful fact that laws have repeatedly been passed which gave the land sharks repeated opportunities to get at the heart of the wilderness under guise of the law. This, he says, cost the public upwards of 20,000 acres of land in the DeBar and Everton parks (Rockefeller's) alone. The land, "in the judgment of the forest commissioners," wasn't good enough for the public, but it was good enough for William Rockefeller to make into private preserves, to the exclusion of thousands of hunters in that region—some of whom I have heard cursing the land grabbers, and expressing the hope and belief that they would be killed by assassins' bullets. The acts of old-time forest commissions brought Adirondack woodsmen to a frame of mind where they contemplate murder with pleasure. That is the effect of the land swapping proclivities of old-time land dealing forest commissioners—the woodsmen and sportsmen, unjustly treated by their law-makers and having no legal redress, in certain cases, now want to see murder done. The laws cited left matters to the judgment of the forest commission.

The present scheme of Colonel Fox, of the Forest Commission staff, is to have the State constitution amended so that the 125,000 acres and more of State land outside the forest preserve can be swapped for other lands within the preserve. This 125,000 acres is used by the public ten times as much, acre for acre, as any State lands within the forest preserve. It is the best partridge and fox and trout and coon cover in the State, taken by the large, but it is proposed to sell it and thus open the way to further encroachments on the forest domain of the people by private preserves—precisely the same plan as that which cost the public the DeBar Mountain and Everton Park forests and streams.

And because I protest against these legal and illegal land bickerings, these betrayals of the public by its "expert advisers in office," my motives are questioned and my judgment sneered at.

It is a common trick of political gangs to endeavor to put their accusers in as bad a light as possible. I don't know who your special correspondent at Albany is, but I will say this: There isn't a paragraph in his article which does not contain conclusive evidence—as I have shown—that he has accepted without question, the statements of men whose interest it is to hide from the public the exact status of affairs in the Adirondacks as regard State lands, past and present.

I will also say that a comparison of the list of land which are to be sold for taxes by the State Comptroller with the Adirondack preserve land list of 1901 show that hundreds of acres of land bought in 1900 and 1901 by the State were encumbered by back taxes. And also that the State did not receive all the acres it was buying—by some hundreds of acres. I cite the State land purchases in township 2, Totten & Crossfield's purchase, in Hamilton county, as specific instances. Here is a feature of the Adirondack State land scandal which is alone sufficient cause for an investigation by honest and competent authority. This feature is simply this: The State bought 200 acres of water when it got lot 15—for how much I don't know. Possibly the seventeen acres of land was all that was paid for, but in other lots in that vicinity, the Comptroller's tax list and the list of preserv-

lands show that upward of twenty more acres were paid for in some of the lots than the lots are said to contain in the tax list. The State paid for 269 acres and got 240 acres, for instance.

It is alleged there is "nothing doing" around Raquette Lake, and yet not ten weeks ago it was discovered by the State Attorney-General that private individuals were paying taxes on more than 8,000 acres of State land around Raquette Lake, thereby getting a chance to "partition" some more State lands, perhaps.

There isn't a report of the Adirondack Forest Commission that hasn't got a statement of questionable procedure in it, and Mr. Whipple's last statement shows that instead of the State losing a mere 117,000 acres, over 217,000 acres were taken.

This "100,000 acres" mentioned by Mr. Whipple was "recovered" by the State. How much did the State pay to "recover it"? One hundred and sixteen thousand dollars net in the Saranac Association deal. Let us now have a statement giving exactly how much the State has paid to "recover" these lands which had admittedly gone out of the State's possession in a questionable manner.

Let us have the truth about State lands in the Adirondacks.

RAYMOND S. SPEARS.

HUNTINGTON, Long Island, N. Y.

### Raymond S. Spears and Adirondack Lands.

Editor Forest and Stream:

Accept thanks and congratulations for your efforts to get at "the truth, the whole truth and nothing but the truth" in the above matter, but nevertheless I feel indebted to Mr. Spears for his note of alarm, better a false alarm now than no alarm at all, and anyone familiar with the theft of the people's lands by the land barons in this and older countries must have felt thankful for the alarm sounded by Mr. Spears. Do your readers know how the English people were robbed of much of their "commons" by the land hog who, having enough, stole more? Those beautiful common lands of Britain, common to all men and priceless to the poor, where those who were landless and could barely pay the rent of the poorest cottage, could browse a cow and so make both ends meet; also the playground of all the people. When a small boy a good mother sent me, a city child, to the country for a few weeks' summering. One of my chief delights was to drive home at night poor Betsy Sharp's black cow from Sheen-common not many miles from London town. What are the values to-day to the poor of London of Clapham and Wandsworth commons, Highgate Heather and Epping forests with their springy turf, yellow flowering gorse and rolling surface; not to mention the noble trees, acres of ferns and deer of the last mentioned? Only a

few years ago, sir, these were constantly being encroached upon under clever pretenses by the lords of the manor; thanks be that is all stopped now, and warned thereby we should be alert "to hold fast that which is good"; and what is better than the people's playgrounds. We are delighted to hear that Mr. Whipple is so good a commissioner for forest, fish and game, but since he is good, watch the politicians and see them try and turn him out, for we know that Albany crew who, with a few noble exceptions, have ever been willing to help the land hogs, and incidentally themselves to acres and shekels.

It is noteworthy that Commissioner Whipple himself says of the Saranac Inn Association case, "These cancellations undoubtedly should not have been made." \* \* \* "The Forest Preserve Board immediately after its organization in 1897, made a systematic attempt to recover the lands which were lost through cancellations," and seem to have largely succeeded. But it is admitted that what Mr. Spears charged had really happened under previous officials, so there was fire with the smoke after all. Do not be discouraged, Brother Spears, sound your note whenever you think there is cause for alarm. Rogues need watching, and honest men do not mind it.

Yours for the common,

THE DECKHAND.

## NATURAL HISTORY

### Dr. Hodge's Partridges Poisoned.

From the Worcester, Mass., Telegram, Nov. 9.

THE work of Dr. Clifton F. Hodge, head of the biological department of Clark University, in trying to raise partridges in captivity, was brought to a sudden and tragic end Oct. 1 by the dirty act of a coward, actuated, no doubt, by malice, throwing poisoned acorns into the birds' inclosure. The birds ate them and died.

This statement was given out officially by Dr. Hodge yesterday to a Telegram reporter. He made the statement when it was called to his attention there were those in Worcester who have been painstaking in circulating the news that the partridges were no longer in the pen where they had been kept.

But Mr. Hodge would make no statement as to whether he had suspicions or whether there was being anything done to apprehend the person or persons who did the cowardly act.

The birds were poisoned with white arsenic. The arsenic was fed them in acorns. The perpetrator of the crime had taken great pains that his work might not fail of his purpose.

The acorns, a handful of which are now sealed in a bottle at the university, had evidently been carefully prepared for the use. They had been shelled, and then many of them had been split and holes bored in the side and arsenic paste inserted.

Arsenic was used in plentiful quantity, and it is not surprising not one of the four birds that had so long fed on food handed them by their friends in Dr. Hodge's family died in a few hours after they swallowed the poisoned morsels.

Dr. Hodge went to look after the birds about 7 o'clock Sunday, Oct. 1, and found the cock bird, which had been the special pride of Dr. Hodge and the children of the neighborhood, and had been named Ruffer, dead. Shocked at the discovery, Dr. Hodge looked quickly for the other birds, the three females.

He found them all drooping, apparently almost dead. Then he suspected that something had happened to affect them all similarly, and he looked about to see if they had been given anything to eat which had not been in keeping with the customary diet.

He saw several bits of broken acorn, and he knew that it had not been put in the pen by any of his family. He suspected then that possibly the death of Ruffer and the ailment of the other birds was due to poison, and he first gathered all the bits of acorn he could find and arranged to preserve them. Then he went to work to save the life of the rest if possible. But the influence of the drug had too stiff a hold for any hope, and in a few hours all three were dead. The last to die was the hen bird which hatched the young ones in captivity.

The birds were taken to the chemical laboratory and the stomachs removed, and an analysis had to see if there could be arsenic discovered. The task was an easy one. The examination was made by Dr. Benjamin F. Mergold and Dr. C. A. Lyford, and every stomach was found to contain large quantities of white arsenic, exactly like that found in the acorns found in the pen. The conclusion that the death of the birds was due to premeditated and intentional poisoning, the work of a person who wanted to do the man interested in the work a personal spite, is the opinion of all who know the circumstances of the case.

A WORCESTER correspondent sends us these details of events preceding the poisoning of the birds:

The crime was committed on the Sunday morning after Judge Samuel Utley's decision in his court—cited below—that the cat is a wild animal and that a man is justified in protecting his property from wild animals in any way he may see fit. This defeat aroused some venomous fiend to the low-lived trick of poisoning the birds out of revenge, thus setting back the experiment three years. Acorns—about the only food with which the birds could have been caught—were cracked and arsenic pasted over and cut into pieces of the kernels. These were thrown into the partridge cage. A handful of the uneaten fragments was gathered and chemical tests leave no doubt as to the poison used. All the birds, which were in prime feather and health, died

with the same symptoms of arsenic poisoning, and in all were found fragments of the fatal acorns.

The chief difficulty in rearing the ruffed grouse Dr. Hodge found to be the cats which infested the neighborhood. After two of the birds had been caught through the inch-mesh netting of the inclosure, he gave fair warning and began catching the cats in box traps placed near the partridges, chloroforming those that appeared to be strays. Some were sent home, in case the owners happened to be known; and sometimes a neighbor called and got a cat that had been caught. Everything was done in an above-board manner and with entire publicity, with the express purpose of enabling those who valued their cats to keep them at home. Under these conditions it was considered safe to assume that chiefly strays would be caught, and many expressions of encouragement and good will were made to Dr. Hodge for ridding the neighborhood of the pests.

Early in July Dr. Hodge went away for the summer, leaving the care of his grouse to students who occupied his house. Along in September, before his return, a certain yellow cat became very troublesome, haunting the partridge inclosure, climbing about on the wires and even over the top in its attempts to get at the birds. One of the hens died about this time from having burst its crop, probably by flying against the cage when frightened by this cat. The cat had to be chased away, often several times a day; and finally the student in charge threw the usual something in its direction as it was making for the partridge pens, but this time it happened to be a good sized stone and knocked the cat senseless. Supposing he had killed or maimed the animal, he crushed the head with a larger stone and left it for dead.

Some of the neighbors who saw part of the proceeding came over and got the cat; and, claiming that it had not been properly killed, instigated the agent of the Massachusetts S. P. C. A. to bring suit for "cruelty." Judge Utley's decision in discharging the defendant is as follows (Worcester Evening Gazette, Sept. 27, 1905):

"Here is a case where a man found a cat on his premises and was perfectly justified in doing what he did. Whether he meant to strike the cat or not is immaterial. Some time ago in this court I discharged a man for shooting a cat that was stealing his chickens. I see no reason in this case why I should change my opinion. A cat is the most untamed animal in Christendom. You cannot control it. A dog will mind you but a cat is beyond control. A man has a perfect right to protect his property from a person or animal preying upon it."

The merits of the case were thus summed up in the Worcester Telegram the following Sunday morning (Oct. 1, 1905): "The witness for the Government in the Dellinger cat case admitted the only cruelty done the cat was by them in keeping it alive" (for purpose of evidence).

Compare the two pictures. On the one side is a man protecting innocent creatures from beasts of prey; on the other, a cat-like coward throwing poison to innocent birds for revenge. The principle of trespass is fundamental to common law. A man has no right to trespass on the property of his neighbor or the State. Do we live in ancient Egypt or in America? Is the cat the only animal that has the right to live? Who is the merciful man—one who keeps a cat and permits it to kill fifty birds a year (Forbush's estimate); wounding and mangling, killing parents and leaving the young to starve in the nests; or the man who puts an end to this hideous business? By a recent estimate of the U. S. Department of Agriculture we are losing \$795,100,000 worth of property destroyed annually by insects. Which is of more value to the community, a carnivorous cat, or, say, five hundred insectivorous birds? Where is the common sense in fining a man for killing a single bird and at the same time allowing him to keep an inconsequent and uncontrolled cat that kills fifty a year? What is the reason or sense in licensing wild beasts to ravage and kill the property of the State, when the law denies this license to men?

Dr. Hodge's, and with him our own irreparable loss, is but a crisis, an index, a pointer to a large problem which involves the life or miserable death of millions of game and song birds the country over. There are

several million good guns among us. We have every sanction of law, justice, mercy and common sense on our side. Let it be understood that one keeping a cat must keep it on his own premises. We can see to it that this rule is enforced.

And finally, wherever the question is brought up, as it has been and surely will be in the near future, fight the licensing of cats to the last ditch. This would give the animal a properly status and legal protection which it clearly does not deserve.

CHARLES I. RICE.

### The Great State of Texas.

TEXAS, the largest and perhaps the most fertile State in the Union, is also to-day, to a majority of our people, the least known. This condition of things cannot last. For two or three years now population has been pouring into Texas at an extraordinarily rapid rate, and portions of that State which used to be regarded as desert are proving to be wonderfully fertile agricultural land. It seems but a little while since this State was regarded as a vast cattle range which produced only the light-bodied, long-horned steer; but to-day the cattle of Texas equal in quality those of any portion of the West, and the days of the range and of the long trail have passed forever.

A volume which will tend to open the eyes of many people about Texas is No. 25 of North American Fauna, which records the observations of Mr. Vernon Bailey, Chief Field Naturalist of the Biological Survey, and was prepared under the direction of Dr. C. Hart Merriam, its Chief. Naturalists and economists alike will be interested in the volume of 222 pages, with its abundant illustrations and its many maps of great interest. The work describes the various life zones of the State, giving the species of mammals, birds, reptiles and plants which characterize each; enumerates the reptiles of Texas, with notes on their distribution; and the mammals, with notes on their distribution, habits and economic importance. It had been intended to give a list of Texas birds, by Harry C. Oberholser, but the present work proved to be so large that this list has been omitted.

The climate of Texas is wonderfully varied, ranging from abundant humidity to the aridity of the desert; there are low coast swamps and high, rough mountains, dense forests and vast treeless plains. In an enormous territory so diversified we should expect to find a rich and varied fauna and flora, and lying as it does on the borders of the tropics, the State receives many tropical species, while on the tops of its mountains are found other species which belong to the zone of northern climes, known as the Canadian fauna.

The agricultural and commercial interests of the State vary with the climatic conditions on which they depend. In one place the chief industry is stock raising; in another, lumbering; again, cotton, or wheat, or rice, or sugar cane. It is the purpose of the Biological Survey to so study the climate of the State as shown by the plants and animals that are found in its different sections, that it may be able to learn for the agriculturalist where he can and where he cannot raise a certain crop, and what area is best adapted to that crop. This work has been carried on by Dr. Merriam for many years, and his publications on it, especially his "Life Zones and Crop Zones of the United States" have been and are of the greatest value to the farmers of the country.

The country along the Rio Grande is tropical, or almost tropical, in character. Here are found such animals of the South as the armadillo, ocelot, jaguar and red and gray cats, though, to be sure, these animals range beyond this tropical region, and are often found in the next cooler life zone. More than forty species of birds, chiefly confined to the tropics, extend their range into southern Texas. The plants do not appear to show the same tropical character as the birds and mammals, yet a pain is found near Brownsville. The fact that frosts occur from time to time along the Rio Grande is perhaps reason enough for the failure of tropical plants to firmly establish themselves there, since, even if they should spread a little out of their range, they would be killed off at intervals by these brief periods of cold. Thus, while bananas and oranges

thrive near Brownsville during a term of warm years, yet any winter they may be killed by the cold, and must always have artificial protection to insure their living through the winter.

The eastern part of Texas, as far west as the 98th meridian, is similar in climate and in most of its plants and animals to the Mississippi valley; but as we move west the rainfall grows less and less, decreasing from about fifty inches in the eastern part of the State to about ten inches in the west. Near the 98th meridian this rainfall diminishes to about thirty inches, and the country gradually becomes semi-arid. This is the region of the mesquite, and approaches the desert, harsh and forbidding, during the long droughts, but after a heavy rain bursting into verdure, bloom and beauty. The mesquite is one of the most important plants of the region, for it furnishes the wood for fuel, fence posts and building material, while its fruit provides food for man and beast. If the rains come at proper intervals, two crops a year are grown of the beans of the mesquite and screw bean. The gum of the mesquite, now unknown, is probably of commercial value, and will ultimately be gathered and find a market.

In the higher section to the west, and in the Panhandle and on the Staked Plains, is a country characterized by plants and birds and mammals which can endure a greater degree of cold. Here are found some birds of the northern plains, and even of the Rocky Mountains, the southern form of the mountain sheep, the kit fox and the black-footed ferret. In the mountains again occur more and more hardy species, until in the Davis Mountains was found a thicket of quaking aspens, and crossbills, blue snow birds and other northern birds were taken, indicating that here was a little area which belonged to the Canadian fauna.

Mr. Bailey's volume is one of fascinating interest, from the economic as well as from the natural history standpoint, and this is so true that we shall reproduce from time to time in future issues of the FOREST AND STREAM extracts from those papers on the reptiles and on the mammals, which form the remainder of his report. The report on the birds of Texas, by H. C. Oberholser, which is not published here, will no doubt appear later.

## The Biography of a Bear.—IX.

WHILE we were at Summit Spring the fall hegira or exodus of Oregon emigrants was taking place—or rather, going on—for these people do not take any place, but they are mostly going on all the time. They are more inconstant than the cashiers of savings banks. In Oregon they are doubtless called California emigrants, while in California all the responsibility is awarded to Oregon. They spend most of the year on the way to Oregon, or from Oregon to California, just accordingly as they happen to be sidetracked the preceding winter. Of course, they never go clear through to any special destination—whenever they think there is any danger of getting anywhere they turn around and go back. During seven to eight months of the year they can live anywhere along or in the road, and they do that until the rainy season or snows on the mountains make it necessary for them to hole up for the four or five winter months. They are not now as numerous as they were, for many of them have branched off to other roads; but, to use one of their own phrases, "There are quite a few of them yet."

The ordinary outfit of an Oregon emigrant comprises a two or four-horse canvas-covered wagon, with one or two women and all the way from six to thirty-four children in it. Enochs said thirty-three were all the progeny he could count in the longest wagon we saw; but we did not see all of the wagons on the road, and so I say thirty-four. I do not want to swindle them out of any of them. Whenever the national fecundity estimates begin to wane or dwindle, it may be well to look up these Orecalifornigons, for a few families of them will turn the scale—that is, if they can be persuaded to stop in one place long enough to be counted or estimated by the census, which, by the way, is not as active as the centipede, even though it employs more legs. They should be counted if it has to be done by contract.

In the enumeration of Oregon emigrants the length of their wagons is of consequence. As the families increase they lengthen their wagons. The children are stowed mostly crosswise in them, each one being allowed a compartment a foot wide; if the child is wider, or if he grows wider, he has to get in edgewise. Hence, a wagon sixteen feet long implies fourteen children, allowing two feet off for the seat, usually occupied by the parents; if the wagon is twenty feet long, say eighteen children; but after a wagon is extended to twenty-eight or thirty feet, it is as long as can be used on mountain roads, where there are many crooks and turns—so after that length has been reached they add another wagon, which is called a trailer, or back-action.

Of course, the children do not stay in the wagon all the time, so in counting them it would be easier to measure the wagon or wagons. It would be useless to try to count them while they are swarming, and they always swarm when the wagon stops. Besides, there are dogs, horses, mules, cows and goats with the outfit, and they get in the way.

One pleasant evening, when we were eating supper again, a long wagon stopped near us and the couple on the seat climbed down and proceeded to unhook their horses, preparatory to camping. They had four horses in the team, several loose animals and three or four dogs. The wagon was covered with the usual canvas arch, and tow-headed children peered from every loop-hole and aperture. They were in the act of swarming, when the man closed the wagon at the rear and the woman barricaded the front. She shouted in a treble voice to some of them and seemed to be dividing them into squads. It afterward developed that they could not all be permitted to come out at one time as there was only clothing enough—even such as it was—for a dozen or so of them, consequently several squads had to remain in ambush and only the dress corps might deploy. While the woman was in command, the man took the horses away to water them.

It appears that something excited Jack's curiosity, and being fond of children—even dirty ones—he went over to the wagon and climbed into it from the back, just as the strange dogs discovered him and assailed him from the rear. He was somewhat alarmed, and, as we noticed, he shot into the wagon in a hasty, precipitant manner. He only stayed in the wagon a moment, for the spaces were all occupied and one of the fiercest of the dogs followed after him. In fact, the bear almost immediately emerged from the forward end of the wagon very impulsively, sprang down without hesitation and then went up a tree with what alacrity he needed, the dog being a little too late to connect. Incidentally and all about the same time (for I remember looking at my watch) the woman screamed and that wagon went into active eruption like a volcano; or as much like one as anything I can recall at this time. Aside from the distressing nature of the disturbance, it was really wondrous the way young Oregonians of all degrees of size, shape, gender and nudity seemed to shoot out of there. It would seem that they all knew a bear when they saw one in the wagon with them, and, in the absence of any further particulars, they vacated their quarters with spontaneous unanimity.

Meanwhile the emigrant's dogs were after Jack, our own dogs were after the other dogs, the woman ran after the man, the man ran for the wagon, the children were scooting in all directions, some of the horses had broken away, and we thought we had better run for the man to keep him from getting into action with his gun. Taken altogether, there was a great deal going on in that echoing arena in the forest. Enochs often asserted that, considering the suddenness of the insurrection at a calm and peaceful hour, it was an event of historical importance and ought to be chronicled. The only way it was used, however, was by that emigrant who talked about it all the way to Sacramento and back again to Oregon. In fact, he made it pay, for he exaggerated the account in his travels, summing up to the effect that they had been raided by a grizzly and had lost almost all their clothing and provisions in the stampede, thus working upon the sympathy and generosity of every one he could reach—the old scheme of making misfortune or disease a commodity. His story as he told it was doubtless worth a donation.

The truth is, no one was hurt and nothing was lost but a little equanimity, or possibly a few of the children who went into the woods and kept going. We gave the man a quarter of fine venison as some little return for the entertainment he and his outfit had furnished, even if it was not altogether premeditated and voluntary. The venison served to diversify their bill of fare for one meal.

Jack was somewhat disappointed in this adventure, for he began to lose faith in the cordiality of people. He had intended merely to look in upon the children, and would have enjoyed a visit with them, but the attack of the dogs and the resulting hullabaloo he failed to appreciate or comprehend. When he felt like it, he came down from the tree, slapped one or two dogs about as far as they cared to go for awhile, and got around for his supper with his usual infallibility and devotion. I chained him up for the night to prevent possible disturbance, for I was inclined to think that the Oregonian would enjoy getting even with Jack by any good, safe method.

We had decided to move along upon the day following, for we had remained in one place about as long as we could, not because it was cheaper to move than pay rent, but because we were full of ambition and energy.

RANSACKER.

## The Quails of the United States.

BY SYLVESTER D. JUDD, ASSISTANT, BIOLOGICAL SURVEY.

(Continued from page 393.)

### Fruit as Food.

Unlike the catbird and the cedarbird, whose food consists, respectively of 50 to 87 per cent. of fruit, the food of bobwhite for the year includes only 9.57 per cent. of fruit. It is least frugivorous in spring and most so in June and in December and January, taking 20.1 per cent. in the summer month and a little over 18 per cent. during the two winter months. If more birds collected in June had been available for examination, probably the percentage of fruit would have been lower. The December percentage is evidently characteristic, for it was based on the examination of about 200 stomachs.

In early spring wild winter-cured berries, in May strawberries, later the *Rubus* fruits—thimbleberry, dewberry, and highbush blackberry—and in late summer and autumn an endless profusion of the year's harvest yield the bobwhite an accessible and abundant food supply. In late fall and winter, when snow covers the seeds, fruit doubtless keeps it from starving. In December it forms nearly one-fifth of the food for the month. Sumac, wax-myrtle, rose, and bayberry are the main winter supply. Poison-ivy berries are eaten occasionally. Rose hips often project from the snow and furnish timely food. At Falls Church, Va., and at Cabin John Bridge and Marshall Hall, Md., tracks of coveys in deep snow led up to rose shoots to which partly eaten hips were clinging. Sumac and other plants of the genus *Rhus* form 1.60 per cent. of the annual food, and during December the proportion of *Rhus* alone is 10.50 per cent. Of twelve birds shot during December at Porters Landing, S. Dak., near the bobwhite's northern limit, by W. C. Colt, each had eaten from 100 to 300 of the carmine sumac berries, and altogether the sumac had furnished 90 per cent. of the food they contained. Bayberry and wax-myrtle are as important along the coast as sumacs are inland. Berries of wax-myrtle were found in the stomachs of fifteen out of thirty-nine birds collected during November, December and January, 1902 and 1903, in Walton county, Fla. One hundred and twenty bayberries had been eaten by one bird taken in July, 1901, at Shelter Island, N. Y. Both these fruits last through the winter and well into May, affording excellent provision just when it is most needed.

In spite of its frugivorous tastes and constant association with orchard crops, the bobwhite is not often known to injure cultivated fruits. M. B. Waite re-

ports that near Odenton, Md., it sometimes picks ripening berries. Yet birds that were kept in captivity several months refused strawberries when they were hungry. Cultivated cherries were found in a few stomachs, but the bobwhite is not an arboreal feeder and does not damage this crop. During June at Marshall Hall it was repeatedly observed feeding greedily upon the fruit of running dewberry vines. It probably does no serious harm, however, to cultivated bush varieties of *Rubus*, such as the thimbleberry, the raspberry, and the blackberry. It is fond of wild grapes, and a number of crops contained as many as twenty-five frost grapes (*Vitis cordifolia*). Hence it might be expected to injure cultivated varieties, for its relative, the California quail, sometimes plunders vineyards; but, so far as the writer knows, vineyards in the east have sustained no appreciable damage from the bobwhite.

In summing up the frugivorous habits of the bobwhite, it may be said that the present investigation shows no appreciable injury to cultivated fruit, but a marked liking for wild fruit. It may be interesting to note, also, that the bobwhite is not nearly so frugivorous as the ruffed grouse.

### List of Fruits Eaten.

Although the percentage of wild fruits yearly consumed is comparatively small, the variety is great, as shown by the appended list, which includes only those actually ascertained to have been eaten. A few careful observers could easily double the number: Cabbage palmetto, saw palmetto, Solomon's seal, greenbrier, wax myrtle, bayberry, mulberry, sassafras, thimbleberry, high bush blackberry, dewberry, strawberry, rose, haw, apple, cultivated cherry, wild cherry, poison ivy, dwarf sumac, staghorn sumac, smooth scarlet sumac, holly, black alder, climbing bittersweet, frost grape, flowering dogwood, sour gum, wintergreen, huckleberry, blueberry, ground-cherry, nightshade, elder, black haw, honeysuckle, partridge berry, sarsaparilla, woodbine.

### Leaves and Buds as Food.

The bobwhite does not approach the ruffed grouse in destructiveness to leaves, buds and tender shoots, though occasionally it samples them. It eats the leaves of sorrel sometimes, both yellow sorrel (*Oxalis stricta*) and red sorrel (*Rumex acetosella*). It has been known to take the leaves of cinquefoil (*Potentilla*), and is extremely fond of both red and white clover. Captive birds ate grass, lettuce and chickweed.

### Insects as Food.

Notwithstanding statements to the contrary, published and unpublished, the bobwhite eats insects in every month of the year. They form 15.05 per cent. of its entire food for the year. From June to August, inclusive, when insects are most numerous, their proportion in the food is 35.97 per cent. The variety of insect food is large. In the present investigation 116 species have been noted, and further study will doubtless greatly increase the number. Moreover, the large proportion of injurious insects habitually eaten renders the services of this bird more valuable than those of many birds whose percentage of insect food, though greater, includes a smaller proportion of injurious species. Conspicuous among the pests destroyed are the Colorado potato beetle, twelve-spotted cucumber beetle, bean leaf-beetle, squash ladybird, wireworms and their beetle, and May beetles. Its food also includes such weevils as corn billbugs, imbricated snout beetle, clover-leaf weevil, cottonboll weevil; also the striped garden caterpillar, army worm, cottonboll worm, and various species of cutworms; also the corn-louse ants, red-legged grasshopper, Rocky Mountain locust, and chinch bug. The bobwhite does not merely sample these species, as do many other birds; it eats some of them in considerable numbers, for crops examined have contained, respectively, a dozen cutworms, an equal number of army worms, thirty Rocky Mountain locusts and forty-seven cottonboll weevils. This bird also destroys striped cucumber beetles by the score, potato beetles by the hundred and chinch bugs in great numbers. From June to August, inclusive, insects and their allies form, as previously mentioned, about a third of the food. Of this beetles make up nearly half, or 15.37 per cent.; bugs, 8.54 per cent.; caterpillars, 1.37 per cent.; grasshoppers, 6.93 per cent.; miscellaneous insects, 1.33 per cent., and spiders, with other invertebrates, 2.43 per cent.

### Beetles Eaten.

The beetles most largely destroyed are ground beetles, leaf-eating beetles and weevils. Naturally, because of the terrestrial habits of the bobwhite, ground beetles, in spite of their vile odor and irritating secretions, are picked up oftener than the other kinds. Experiments with caged birds prove that even the most pungent forms are relished. Ground beetles are numerous in species and superabundant in individuals. One can form no adequate idea of their numbers except at night. Arc lights kill them by thousands. The writer has known one species (*Harpalus pennsylvanicus*) to enter open windows in the evening in swarms. They have an irritating secretion, which if applied to the skin soon raises a blister. Ground beetles are more or less predaceous, hence the whole family was formerly considered beneficial. Later study has resulted in their division into three classes: The most carnivorous species, possessing sharp, curved jaws for capturing and killing other insects; the least predaceous forms, having blunt jaws and eating considerable vegetable matter; and a class intermediate between these two. The first class contains highly beneficial beetles which destroy great numbers of insect pests, while the blunt-jawed class includes some injurious species that feed on crops. Only a few of the bobwhite stomachs examined contained the useful sharp-jawed beetles, but many contained the blunt-jawed species, especially such forms as *Amara* sp., *Agonoderus pallipes*, *Anisodactylus baltimoricensis*, *Anisodactylus rusticus*, *Harpalus pennsylvanicus* and *Harpalus caliginosus*. At Marshall Hall, in August, 1902, a covey of bobwhites was seen greedily eating beetles of the two species of *Harpalus* named above, which were numerous in wheat stubble overgrown by ragweed. The meadow lark, also, was feeding on them. The liking of the bobwhite for *Harpalus pennsylvanicus* was further proved by experiments with caged birds. It eats

also the larvæ of these beetles, as do the robin and several other birds. Though the genus *Harpalus* as a whole is useful, destruction of these two species is not amiss, for they injure ripening strawberries by eating out the seeds. Through their depredations on a quarter-acre patch a grower at Leesburg, Va., in three nights lost \$350 worth of fruit. The nature of the injury by the beetle has so far made remedial measures impracticable; therefore, the work of the bobwhite and other birds should be estimated at its full value.

Leaf-eating beetles, next in importance after ground beetles in the diet of the bobwhite, include many of the worst beetle pests, and members of the family not already actively injurious are potentially so. These beetles also are provided with protective secretions, more effectively repellent in the larger species, at least, than those of ground beetles, but luckily ineffectual against bobwhite. He eats the most injurious of these insects, such as the potato beetle (*Leptinotarsa decemlineata*), the striped cucumber beetle (*Diabrotica vittata*), the twelve-spotted cucumber beetle (*Diabrotica 12-punctata*), and the squash ladybird (*Epilachna borealis*). The first named is perhaps more correctly termed the Colorado potato beetle. It was a native of the Rocky Mountains originally, feeding on the horse-nettle (*Solanum rostratum*), a plant related to the potato. It began to migrate eastward a year or two before the Civil War, and fifteen or sixteen years later reached the Atlantic coast. Since then, as every one knows, this beetle has threatened the potato crop of the country. Birds, as a rule, avoid it because of its secretions. Therefore the bobwhite's services in destroying it should be highly valued, the more so because the bird's habit of eating the potato bug is not merely occasional nor limited to special localities. Records have come to the Biological Survey from New Jersey, Virginia, Maryland, Iowa, Kansas, Nebraska, Texas and Ontario; and it is believed that more extended observations will show that the habit is general wherever the birds and the beetles inhabit the same district. During the last week of June at Marshall Hall, a pair of birds was observed patrolling rows of badly infested potato vines and diligently picking off the beetles. Writing of the bird's relation to this insect, C. E. Romaine, of Crockett, Tex., says: "Quail have built their nests around my fence and even in my garden, within fifty feet of my house. They have kept my potato patch entirely free from the Colorado potato bug." Three captive bobwhites dispatched fifty potato beetles in five minutes, swallowing them whole, apparently with great zest. No food offered them was eaten with more avidity. Thomas McIlwraith says a recent writer mentions that he examined the crop of one which was killed as it rose from a potato patch and found that it contained seventy-five potato bugs. Lawrence Bruner reports 107 of these beetles found in a single crop. Such wholesale destruction of these pests throughout a large territory is an invaluable aid to agriculture.

The two species of cucumber beetles (*Diabrotica vittata* and *D. 12-punctata*) are highly injurious to cucumbers, squashes, melons and corn, much of the harm being caused by their larvæ, which feed on the roots of infested crops and are difficult to combat successfully with insecticides. The bobwhite eats them freely without ill effect, though examination seldom reveals them in the stomachs of other birds. Indeed, captive birds of all the other species experimented with have refused them, probably because of their offensive secretions.

To some extent the bobwhite feeds also on certain leaf beetles, known, from their jumping powers, as flea beetles. Its favorites appear to be the three-lined potato beetle (*Lema trilineata*), sometimes an ally of the potato beetle in the potato patch, *Edionychus fimbriata*, and several members of the genus *Disonycha*. The golden tortoise beetle (*Coptoclypea bicolor*), an insect that looks like a drop of molten gold and is an enemy of the sweet potato, is also eaten. The locust leaf-mining beetle (*Odonota dorsalis*) is another victim of the bird. Its larvæ tunnel between the surfaces of locust leaves and kill the foliage. In 1895 the ravages of this pest turned the locust-fringed bluffs on the Potomac below Washington as brown as if touched by fire.

The agriculturist finds weevils hard to cope with, on account of their small size, protective coloration, and retiring mode of life. Birds, however, destroy them in large numbers, often a score or two at a meal, and bobwhite does his share of the work. He often eats two common species that feed on clover leaves (*Sitona hispidulus* and *Phytonomus punctatus*), and preys also on the two billbugs (*Sphenophorus parvulus* and *Sphenophorus zea*), the latter injurious to corn. He relishes also that notorious garden pest, the imbricated snout beetle. His most important weevil prey is the Mexican cottonboll weevil (*Anthonomus grandis*). In 1894 this insect first crossed the Mexican border into Texas. During 1903 it caused a loss of \$15,000,000. Though still chiefly confined to Texas, in time it will undoubtedly occupy the whole cotton belt and do a tremendous amount of harm. The bobwhite is fond of this pest. F. M. Howard, of Beeville, Tex., in writing to the Bureau of Entomology, says that the crops of bobwhites shot at Beeville, Tex., were filled with these weevils. H. G. Wood, of Cuero, Tex., in a letter dated Sept. 21, 1901, relating to the weevil scourge, says:

"Several of our business men and farmers are of the opinion that the quail can be made a vehicle for the destruction of the cottonboll weevil. One farmer reports his cotton fields full of quail, and the entire absence of weevils. He found forty-seven weevils in the craw of one bird. \* \* \* I claim quail are the greatest insect destroyers of all birds. \* \* \* We propose to prohibit the killing of quail in this county this season, hoping thereby to save a great portion of the cotton crop next season."

The click beetles, the larvæ of which are the wireworms so inimical to corn and other plants of the grass family; scarabeid beetles, though in smaller numbers; dung beetles, which numerous, and May beetles, parents of the injurious white grub, are eaten by the bobwhite. The May beetle (*Lachnosterna* sp.) and its near relative, *Ligyris gibbosus*, were eagerly eaten by captive birds. The useful ladybirds (*Coccinellidæ*) are sometimes found in the bird's crop, but, judging from experiments with caged birds, do not appear to be highly relished. *Adalia bipunctata* was several times offered and refused, but was finally eaten. The one harmful beetle of the family, the

squash ladybird (*Epilachna borealis*), has been found in stomachs and was relished by captive birds. Certain miscellaneous beetles belonging to different families are occasionally picked up, such as rove beetles, soldier beetles, darkling beetles, hispid beetles, and longicorn beetles.

#### Bugs Eaten.

The bobwhite eats comparatively more bugs than most birds, including both *Heteroptera*, or true bugs, and *Homoptera*, which form 2.77 per cent. of its food. The maximum number of bugs was taken in August and amounted to 21.1 per cent. of the food for that month.

The chinch bug, which in this country has destroyed over \$100,000,000 worth of wheat and other cereals in a season, is preyed upon by the bobwhite throughout the year. C. V. Riley says: "In the winter time, when hard pushed for food, this bird must devour immense numbers of the little pests, which winter in just such situations as are frequented by the quail; and this bird should be protected from the gun of the sportsman in every State where the chinch bug is known to run riot." The data possessed by the Biological Survey concerning this species are scanty, but they show that the quail destroys the pest in Ohio, Indiana, Illinois, Missouri, Kansas and Nebraska. The number of chinch bugs eaten varies, but usually appears to be large. Thus a bird shot Oct. 12, 1901, at Badger, Neb., by W. C. Colt, had picked up 100, and the American Field for Feb. 21, 1903, reports that an observer at Seymour, Ind., found a teaspoonful in a crop. In a letter to the Department of Agriculture, M. A. Page, of Garnett, Kan., says of a bobwhite: "On opening the crop we found about two tablespoonfuls of chinch bugs."

The bobwhite also destroys the false chinch bug (*Nysius angustatus*), which attacks grapes, strawberries, apples, potatoes, turnips, radishes, beets and cabbages. It eats the tarnished plant bug (*Lygus pratensis*), injurious to fruit and truck crops, and stink bugs of more than a dozen species, one (*Euschistus variolarius*) being a pest on many garden vegetables. The noninjurious species, particularly *Thyanta custator*, are often eaten, one bird containing thirty of them. More *Homoptera* (leaf hoppers and other forms) are eaten by bobwhite than by most other birds. The little leaf hopper (*Oncometopia lateralis*) is especially relished.

#### Grasshoppers and Allied Insects Eaten.

Grasshoppers with a few crickets make 3.71 per cent. of the yearly food. In September they contribute 11.9 per cent. The walking stick, singularly like a twig and at times very numerous and injurious to foliage of shade and forest trees, has been found in the stomach of the bobwhite. Locusts and meadow grasshoppers, both highly destructive to vegetation, are favorite articles of diet. The bird grasshopper, so called from its size, is occasionally eaten. The destructive grasshoppers or locusts of the genus *Melanoplus*, such as *M. atlantis*, *M. femurrubrum*, or the red-legged grasshopper, and the Rocky Mountain locust, form the bulk of the orthopteran food of the species. The Rocky Mountain locust is one of the worst of insect pests, and its appearance in large numbers is a calamity. It appears in swarms, clouding the sun and covering the earth, sweeping every green thing before it, and often driving the farmer from home and threatening him with starvation. During a single season it has caused a loss of \$100,000,000.

In 1874-75 Samuel Aughey made a special study of a Nebraska invasion and found that the bobwhites were an active enemy of the locusts. Of twenty-one birds shot between May and October, inclusive, all but five had fed on locusts. The smallest number taken by any bird was twenty and the largest thirty-nine; in all, 539—an average of twenty-five apiece. C. V. Riley ascertained that the bird feeds also on the eggs of the locust, particularly in winter, when they are exposed by the freezing and thawing of the ground. If every covey destroyed as many locusts in a day as the one just referred to, it is hard to overestimate the usefulness of the bobwhite where abundant in infested regions.

#### Caterpillars Eaten.

The bobwhite seems to eat fewer caterpillars than would be expected from its terrestrial habits. The yearly proportion only formed 0.95 per cent., and the maximum quantity eaten in a month was four per cent. in May. This apparent neglect of caterpillars as food is perhaps due to their scarcity where the birds for the present study were shot. Pupæ and adult moths occasionally serve as food. Whatever the list of species of caterpillars eaten by bobwhite lacks in length it makes up in importance, for so great a proportion of serious lepidopterous pests is seldom found in the fare of any bird. As is true of some other birds, the bobwhite includes the army worm in its bill of fare. This pest sometimes exists in legions and moves steadily forward from field to field, devouring corn, oats, forage and other crops. Fortunately it is not often active, and the years of its occurrence are frequently separated by long intervals. Every year, however, the different species of cutworms do serious damage. They cut down germinating grain, often before the plants have fairly sprung above ground. Owing to their mode of feeding, a few worms may lop off many plants in a night. It seems strange that the bobwhites find as many of these nocturnal larvæ as they do. The cotton worm, a pest so destructive that in one year it has caused a loss of \$30,000,000 to the cotton fields, is preyed upon by the bobwhite. Tobacco worms were sparingly eaten by bobwhites at Marshall Hall, but experiments indicated that they may eat them in greater numbers when opportunity offers. Five tobacco worms (*Phlegethontius sexta*), two-thirds grown, placed in a cage with three captive bobwhites, July 8, 1903, were devoured in less than two minutes. Cabbage worms (*Pontia rapæ*) and cutworms also were offered and greedily eaten.

## American Ornithologists' Union.

THE twenty-third annual congress of the American Ornithologists' Union was held this week at the American Museum of Natural History, in New York city. A very large attendance of ornithologists was present, and many papers of great interest were read.

The meeting of the fellows of the Union was held at the American Museum on the evening of Nov. 13, this being the chief business meeting of the session. There were present, among others, C. F. Bachelder, J. H. Sage, Dr. J. H. Allen, William Brewster, Jonathan Dwight, Jr., H. C. Oberholser, W. W. Cook, William Dutcher, Dr. Louis B. Bishop, Dr. A. K. Fisher, Dr. T. S. Palmer, F. A. Lucas, F. M. Chapman, George Bird Grinnell, Dr. T. S. Roberts, Mr. Witmer Stone.

The meeting was called to order shortly after 8 o'clock, and after the presentation of reports by the Secretary, the Treasurer and the Council, the election of officers took place. The choice was as follows: President, C. F. Bachelder; Vice-Presidents, E. W. Nelson and F. M. Chapman; Secretary, J. H. Sage; Treasurer, Jonathan Dwight, Jr.; Council, Ruthven Deane, W. Dutcher, A. K. Fisher, C. W. Richmond, T. S. Roberts, W. Stone, F. A. Lucas. It was determined that three fellows should be elected at the meeting; those chosen were Walter K. Fisher, of Palo Alto, Cal.; Prof. Lynds Jones, of Oberlin, O., and Wilfred H. Osgood, of Washington, D. C. Five members were elected and a large number of associate members.

An active discussion took place looking toward the revision of some of the canons of the A. O. U., and it was decided to appoint a committee to consider the subject and advise about it, the members to be named later.

The Committee on Nomenclature was authorized to prepare for publication a revised check list of N. A. birds.

Mr. William Dutcher, chairman of the Bird Protection Committee of the Union, reported that for a year past the committee had not been active, its work having been passed over to the National Association of Audubon Societies, which was carrying it on with much energy.

The public sessions of the Union, held at the American Museum, began Tuesday, Nov. 14, at 10 o'clock A. M. The papers read were as follows, beginning on Tuesday morning, Nov. 14, at 10 o'clock:

Some Unpublished Letters of Wilson and some Unstudied Works of Audubon. Witmer Stone, Philadelphia, Pa.

The Evolution of Species through Climatic Conditions. J. A. Allen, New York city.

Summer Birds of the Mt. Marcy Region in the Adirondacks. Elon H. Eaton, Canandaigua, N. Y.

Pelican Island Revisited. Illustrated by lantern slides. Frank M. Chapman, New York city.

After a recess the session reconvened on Tuesday afternoon at 2 o'clock.

Some Breeding Warblers of Demarest, N. J. Illustrated by lantern slides. B. S. Bowditch, Demarest, N. J.

Notes on Wing Movements in Bird Flight. Illustrated by lantern slides. William L. Finley, Portland, Oregon.

The Status of Certain Species and Sub-species of North American Birds. J. Dwight, Jr., New York city.

Wildfowl Nurseries of Northwest Canada. Illustrated by lantern slides. Herbert K. Job, Kent, Conn.

On Tuesday evening at 6 a dinner at the Hotel Endicott was attended by members and their friends, and after the dinner there was an informal reception at the American Museum, at which a new projection apparatus was exhibited.

Wednesday and Thursday were devoted to the reading of papers, those of Thursday afternoon being read at the Museum of the Brooklyn Institute of Arts and Sciences, Eastern Parkway, Brooklyn, N. Y.

Wednesday morning, Nov. 15, 10 o'clock: Andreae Hesselius, a Pioneer Delaware Ornithologist. C. J. Pennock, Kennett Square, Pa.

The Probability of Error in Bird Migration Records. Witmer Stone, Philadelphia, Pa.

Some Observations on the Applicability of the Mutation Theory to Birds. Witmer Stone, Philadelphia, Pa.

The Song of the Hermit Thrush. Henry Oldys, Washington, D. C.

Impressions of English Bird-Life. Illustrated by lantern slides. Frank M. Chapman, New York city.

Wednesday afternoon, 2 o'clock: Exhibition of Lantern Slides. William L. Baily, Ardmore, Pa.

A Lapland Longspur Tragedy. Illustrated by lantern slides. Thomas S. Roberts, Minneapolis, Minn.

Similarity of the Birds of the Maine Woods and the Pocono Mountains, Pa. William L. Baily, Ardmore, Pa.

Discontinuous Breeding Ranges. Illustrated by lantern slides. Wells W. Cooke, Washington, D. C.

The Principles of the Disguising Coloration of Animals. Illustrated with experiments and slides. Abbott H. Thayer, Dublin, N. H.

The session of Thursday morning, Nov. 16, began at 10 o'clock.

The Collection of Birds in the New York Zoological Park. C. W. Beebe, New York city.

A Contribution to the Natural History of the English Cuckoo, with a Review of the Literature on the Subject. Dr. Montague R. Levenson, New York city.

Plumages and Status of the White-winged Gulls of the genus *Larus*. Dr. J. Dwight, Jr., New York city.

A Contribution to the Ornithology of South Carolina, pertaining chiefly to the Coast Region. Arthur T. Wayne, Mount Pleasant, S. C.

Should Bird Protection Laws and their Enforcement be in the hands of the National Government? O. Widman, St. Louis, Mo.

Thursday afternoon, 3 o'clock: The Hoatzin and other South American Birds. With Exhibition of Specimens. George K. Cherrie, New York city.

Among the Water Birds of Southern Oregon. Illustrated by lantern slides. William L. Finley, Portland, Ore.

The Congress adjourned on Thursday afternoon, but on Friday morning, Nov. 17, a number of the members visited the New York Zoological Park, where there was much to interest them.

# GAME BAG AND GUN

## Feeding Box for Quail.

WHITINSVILLE, Mass., Nov. 6.—*Editor Forest and Stream:* I send two photos of the winter feeding box for quail which we have used in this section for two winters past with considerable success. One is shown bare so the construction can be readily seen, and the other is shown with the covering of pine boughs as it is set up for the use of the birds. This particular one carried through a covey of seven quail last winter.

I also give herewith the details of our "planting" of quail a year ago, believing that many of your readers will be interested and that a recital of our experience will be helpful to anyone who may want to make a similar try toward restocking depleted covers.

We elected to liberate the birds in the fall, directly after the shooting season closed, and then feed them in the special feeding boxes through the winter.

The year before we tried keeping them in confinement until the weather would allow us to turn them out in the spring, but with the best care we were able to give, more than three-quarters of them died, and those we did finally turn out were in such poor condition that we think some of them died.

The reason we bought the birds in the late fall or early winter rather than in the spring is that it is much easier to get them at that time than later.

The quail, which are the particular subject of this article, were liberated Dec. 17, 1904, twelve dozen of them. There was nearly six inches of snow on the ground at the time. We put them out in bunches of one dozen each generally, but we did make some of the lots eight birds and one or two six birds each. Twelve quail in a lot is small enough, and this number did best. Some are going to die anyway, because they are weak, and some will get caught by foxes, cats and hawks. We found it therefore necessary to start with a good number to each covey so there would be enough left to "make a ring" after losing the inevitable percentage. The most we brought through in any one lot was eight out of twelve. The usual number was five to six. One lot came out with seven, and one lot of twelve only resulted in three birds in the spring. This particular lot we thought had been shot into, as the diminution occurred all at once. Usually they would disappear one at a time.

We liberated each lot directly beside a feeding box. The feeding box illustrated shows a covering of pine boughs, but we used the limbs of shrub oak at times when pine was not easy to get, and they seemed to do very well.

In covering the boxes with boughs they should be placed so that the butts are on the ground, and these butts should be trimmed free of small branches so that the birds can have easy and free access in and out at all times. In case a foe should come up on one side it is quite essential there be a free run left for quick egress on the other.

We had fourteen of these feeding boxes for the twelve dozen birds. We did all the liberating in one day, and as we had a large extent of country to go over, it made a long job. I want to acknowledge here the very efficient help and advice of Mr. A. F. Wood, of this place, in connection with the putting out of these quail and in getting those that scattered back to the feed; also for his persistent and methodical care of the various coveys during the rest of the winter.

This methodical attendance is absolutely necessary, we believe, to get the best results. We found that in the middle of the winter it was necessary that the feed be replenished once a week at least. Everything feeds then, bluejays, sparrows, kinglets, chickadees, squirrels and mice. Crows take some feed, but they are rather shy of the closed-up appearance of things. Bluejays are a pest, as they carry off more grain than they eat. We could find no way, however, to stop their thieving and we had to make good the loss.

The feed we used is what is sold at the poultry stores as "scratching food." It is composed of a number of grains and seeds of small size and seemed to fill the needs of the case very nicely.

The second day after liberating we visited every feeding box and found that one-half of the coveys were using the shelter and food provided, the rest were scattered. We found them, however, close by in every instance and we toled them all back to the feed by laying a line of hay chaff on top of the snow from the feed to the place where we found them. We also sprinkled a little grain in the chaff. This plan worked splendidly, and when we again visited the birds we found that they had all followed the line of chaff and were all using the feed. We had no more trouble on this account, as when the quail once got the grain fairly located they visited it regularly thereafter.

We found it of advantage to clear away the snow after a heavy fall so the sun would melt a bare place. The birds seemed to like to get on this little bare ground and sun themselves. We often saw them so.

We placed all the boxes so that they would have a sunny exposure, and we looked for spots where the snow did not naturally lie as deep as it did in others. The south side of a thick pine tree was as good as any, particularly if the tree grew on the south bank of a hill. We also tried to get the feeding boxes near "quick cover," like a thick swamp or a brushy hillside, so the birds could come and go without exposing themselves very much, and a cover they could drop into quickly in case an enemy got after them at the feed.

We liked to have the box near water also, but this we do not think is so essential as some of the other things. Of the twelve dozen that we liberated and cared for in this manner we were able to count sixty birds in March after the snows were gone—about forty per cent.—and these birds were all strong, vigorous individuals,

practically acclimated, and we believe they bred early and raised good-sized broods. We think that we lost more hens than cocks, so we did not get the number of broods we would have if the sixty had been exactly mated. We are well satisfied, however, and intend to try the same thing again this coming winter and we think we can save a larger percentage this time.

We think the best way to liberate is to provide as many boxes with cloth top and drop trap door as there

QUAIL FEEDING TROUGH.

are to be coveys. Transfer the birds from the shipping crate according to number wanted. Place the liberating box on the ground with the trap door under the edge of the roof of the feeding box; put a few branches over the whole so the quail will not fly as soon as they leave the box; quietly drop the trap door and step quickly away. It is better if the birds come out when no one is in sight; they are more quiet then and will notice the feed, which is what is wanted. If the liberating box is wanted for use again it can be secured the following day. There is no harm then if the covey is flushed, they have had a chance to locate the feed and will return to it again.

In attending to the birds we bought we also fed a number of native coveys. The native quail did the best. They were stronger and also more wary. Practically all the natives lived after they found the feed. We used lines of chaff to tole these to the feed the same as for the others. I have in mind one covey of eleven quail that

THE TROUGH COVERED.

we got to feeding the middle of January, 1905, that apparently came through intact.

We began to look for the native coveys with a view of feeding them on the first light snows, and we found three coveys. Two other native coveys we found after the snows got deep and forced them into the highway. They were then seen and reported and we easily got them to feed; they were so hungry they met our efforts more than half way.

Our experience, so far, leads us to believe that quail will stand any amount of cold if they can get something to eat, as pointed out in a former sketch which was published in your issue of Oct. 15, 1904; also, that they can successfully be led to feeding places by a little study and perseverance.

The food should be placed in a sheltered location where it will not be covered up with snow or washed away by rains; it needs to be replenished at times. When the snow is deep all over the country more grain is required than at any other time.

We have this fall a good many quail in our section, as many or more than there were two years ago, when the birds were most plentiful. This condition is due, without the shadow of a doubt, to the work we have done in restocking and winter-feeding. CYRUS A. TAPP.

## Telescope Sights for the Squirrel Hunter.

TELESCOPE sights have been employed on rifles for a great many years, but their use in target shooting and in hunting was not at all general prior to five years ago. Since then they have been adopted by rifle shooters in all parts of the country, and the demand for them is increasing steadily. Whatever may be in their favor, one thing alone shows that their use is no mere fad. It is this: That few men who adopt telescope sights discard them for those that do not magnify. Instead, they purchase better glasses until they find the one that seems best adapted to their needs, then stick to that one and learn all its peculiarities, so that they can use it with the utmost precision.

The telescope sight is well adapted to use on all game wearing fur, and on some varieties that fly, though not all. And as sportsmen quite generally concede that squirrels should be shot with rifles instead of shotguns, the telescope is at its best for squirrel hunting, to which these remarks will be confined.

If the average squirrel shooter failed to observe the many interesting traits of these little animals closely while hunting them in the old way, he cannot fail to give them the closest attention while using the telescope as a spy-glass. I hold that he will in time come to shoot less frequently and to devote more of his time to using the glass as he would a field glass, the pastime taking stronger and stronger hold on him. The logical result will be greater endeavor to kill cleanly or to miss entirely. Here is an advantage the advocates of rifle telescopes do not always use in their arguments. "To miss is mystery," so 'tis said; but in squirrel shooting with telescope sighted rifles a miss can generally be accounted for, since rifles and ammunition are so perfect that the personal error can be found without difficulty. In other words, the location of the cross-hairs at the moment the trigger is touched will show the error plainly if it exists, and a miss is explained as plainly as though it were pointed out by means of a diagram.

It is aggravating to miss an easy shot through shooting too high or too low, but one who uses the glass will soon come to be glad when the miss is entirely clean, just as he will take pride in placing his shot in an instantly vital spot, with the satisfying result of seeing the game drop to the ground and lie there without a quiver. There is little mystery, since he can see just where his error lay and rate himself soundly for his carelessness or haste, resolving to be more careful in future. There is no dead reckoning with him. He knows just where he is at fault and makes every effort to improve and does improve if his heart is in the thing.

To me there is nothing connected with my favorite sport of squirrel shooting so completely satisfying as to return to camp, after an hour spent in the woods between daybreak and breakfast time on an autumn morning, with three or four squirrels, each one of which was shot cleanly in the head. Perhaps one may be justified in detailing to his companion how the shots were made, for the satisfaction begins when the first squirrel drops, increases as each one is added to the string carried on a bit of latigo leather at the belt, and culminates with the arrival at camp with a squirrel for each empty shell. There is no haunting belief or certainty that any squirrel shot at may be crawling about to die miserably in its high nest or hollow limb. The use of the telescope is worth while.

If one happens to miss through some unavoidable agency, as he may often do, the glass aids him in the search he immediately takes up for the crippled squirrel, which may be hiding on some high limb or lying among wild grape vines or dead leaves perfectly concealed from the unaided eye. One using plain sights must either conceal himself and watch for a long time for some movement that will show him the location of the cripple, or go away and leave it in its misery—both unsatisfactory in the extreme; but with the glass every limb and hole is brought under close inspection, and if the least part of the squirrel's head is visible it may be put out of misery by a carefully aimed shot.

With those benighted old ladies of both sexes who work themselves up into a frenzy over "the cruelty of shooting squirrels," I have nothing to do. If they would take the trouble to write to some farmer in the West or South, whose lands are bordered with forests alive with squirrels, they would obtain some information that would compel them to agree with him that but for the moderate shooting permitted in the autumn months he would find it merely a waste of time to plant corn for the squirrels to destroy, leaving nothing of any value whatever save the stalks. They multiply too rapidly, whenever given the free opportunity; and protection all of the time can never be thought of for a moment. There is no other way, and the person who would attempt to stop the sportsman from enjoying the sport of shooting them with the rifle needs enlightenment and needs it very badly. Take the squirrels of Central Park, for example. If they were permitted to multiply freely they would overrun the park in a very short time, despite the prowling cats and the vicious boys who maim or kill them at every opportunity with slingshots and stones. Even these squirrels have to be thinned out frequently.

If any cruelty is practiced in the woods it consists in shooting at squirrels with shotguns. Evidences of this may be obtained by any person who shoots squirrels in woods frequented by men with guns. I have dressed scores of squirrels whose skins and hams contained from one to a half dozen shot that must have caused painful

wounds. On the other hand, I have never found a bullet in any squirrel, nor any wounds showing conclusively that bullets had caused them.

Opinions as to the style of glass to use for squirrel shooting are almost as numerous as the men who use the telescope. It is often argued that the full length glass is best for hunting. Theoretically it may be, just as the best rod in theory should be one piece; but we have our fishing rods made in several pieces, for convenience in carrying, and while we must admit they may be somewhat inferior to one-piece rods, we find them quite satisfactory in fishing as well as in dodging crowds at the ferries and railway stations. So it is with the short telescope; it is not much in the way after its owner has become accustomed to the different balance it imparts to the rifle, and while he must take better care of it than open sights, in time he does not notice the change, and handles his rifle somewhat roughly, after all, being careful not to drop it or lean it against any smooth surface, so that it might fall to the ground and possibly disarrange the alignment. But whether the long glass is better or not, the manufacturers are turning out thousands of short telescopes to-day, and these give the best of satisfaction.

The diameter of the telescope tube is much discussed, it being generally conceded that a large tube is better than a small one; but here, again, the convenience and compactness of a small, short tube offsets, to a limited extent, the advantages of a wider field of view and better definition in dark places. I will not attempt to say the glass I prefer is even as good as larger and longer ones for the average squirrel shooter, for it is only four-teen inches long and five-eighths-inch in diameter, its power being six. It has given complete satisfaction, however, but it should be explained that it is placed on the left-hand side of the rifle, as near as possible level with the open sights on top the barrel, so that if there is not light enough for the telescope, the merest shifting of the eye brings the open sights into correct alignment. It is true that the placing of the tube on the side of the barrel is objected to by some, but my experience proves that if only one set of sights is to be placed on the squirrel rifle, that set should not be in a tube; in other words, there are always times when the telescope is useless and at others almost so. In my own experience I could contradict myself on this point, for I have hunted in tall timber for ten days or more at a time without firing a single shot aimed through the open sights. Still, I would not be without them. With a rifle equipped thus one will often find himself trying the telescope, and thinking he can do better with the open sights, shift to them, only to return to the glass before firing. This if the shot is deliberate. Mine generally are.

Growing tired of telescopes with fancy adjustable mountings that were so easily changed that anyone who happened to examine the rifle could shift the tube equal to a foot or more at 100 yards; and proceeding on the fact that exceedingly few shots are fired at squirrels distant more than forty yards, I obtained a set of mountings which, when fixed on the rifle and the tube aligned to center a tiny spot at thirty to fifty yards, could only be shifted with a screwdriver or a hammer. The focus, when adjusted for one person's use, is absolutely fixed, and can only be altered with a screw driver. The cross-wires are also fixed. Windage can only be obtained by raising a set-screw in the forward mounting and hammering the latter to right or left. Elevation can be changed by turning the thumbscrew of the rear mounting, but as this is set with a steel pin—and the pin lost—there is no fear in that respect. To make assurance double sure, there is a white mark on both mountings to show that the latter have not shifted by accident. As a general proposition, if the cross-hairs are held on a squirrel's eye at the moment the trigger is touched the bullet mark will be found pretty close to the eye; but if elevation or windage is needed, holding the merest distance away from the eye will insure a head shot, provided always one does not wobble. Should one get a shot at a fox or crow, even at 200 yards, holding the cross-hairs for either wind or elevation is as exact as guessing how much to turn an adjusting screw—and one never suffers through forgetting to restore the sight to its proper place after firing a shot. On such a tube there are no knobs, hooks, points or other protuberances to catch on limbs or in one's clothing, and altogether it gives good satisfaction.

There is something altogether fascinating about squirrel shooting with a telescope-sighted rifle of small caliber. This is particularly true of the present time, for ammunition has been improved greatly of late, and it is now possible to purchase a .22 caliber rifle taking one of the more powerful rim-fire cartridges loaded with smokeless powder, which will give good satisfaction on squirrels, while one has no bother over reloading ammunition. In this way he can purchase a box or two of fresh ammunition before going away for a few days in the woods, and the better cartridges are clean to carry and handle, all of their lubrication being within the finished cartridge, so that they can be carried in the pocket until needed. These little cartridges shoot very flat at all squirrel-shooting distances, so that a slight error in holding will not always result in a miss; and make so little noise that the game is not frightened clean out of the woods when one fires a few shots.

While the big game must be followed further and further away from civilization, there are squirrels to be found in almost every patch of woods within a few miles of one's home; permission to shoot on private land is not difficult to obtain if one is known to be careful, and the sport is one that may be enjoyed during a single afternoon as well as when one can command several days of leisure.

PERRY D. FRAZER.

### Third Rail Kills Rabbits.

THE third rail, recently introduced by the Long Island Railroad as a transmitter of motive power for its trains to the new Jamaica race track, kills more small game than all the sportsmen. Rabbits and squirrels suffer in greatest numbers, and quail and other game are occasionally found. The rabbits are found along the track every morning, having been shocked to death by the rail—New York Times.

## Concerning Bears.

Editor Forest and Stream:

The editor of Our Dumb Animals, George T. Angell, and a correspondent of the Springfield Republican, are responsible for a controversy "in the matter of shooting bears." At least, I judge so from the annotations made by Mr. Angell to the reprint of an article from the Springfield Republican in Our Dumb Animals. Mr. Angell is engaged in a laudable enterprise, that of engaging humane sympathy for the brute animal, but to a "man up a tree" it would appear that neither Angell nor the correspondent know very much about bears. The correspondent says "the bear is a specially inappropriate animal to select for killing in mere sport. He is largely a vegetarian, is timid and clumsy, and rarely attacks man except in self-defense." I wonder where that correspondent took his lessons in zoology, especially as it relates to "b'ar"? Certainly not in the native habitat of bruin. From what I have seen and heard the bear is peculiarly the animal above all other quadrupeds to test the courage of man, in a hunt, even when man is well armed.

Not long ago I was reading of an Englishman who had hunted in all parts of the world, saying that, on the whole, the bear was a gamier animal to hunt than either the lion or tiger of Asia or Africa; that he would rather face any lion or tiger than the average grizzly bear; that the latter was the fiercest and most indomitable of all quadrupeds in battle, whether it be with brute or human animal.

In my intercourse with Western men I have met many who had killed their "b'ar" in their day, and none but attested to its bravery and ferocity. The man who has fought his bear is a hero. Before me lies a work by Francis Fuller Victor, telling of the "Wild West" as it was fifty to seventy-five years ago. He relates some of the experiences of the famous Joe Meek as a bear-killer, bearing testimony as to the aggressiveness of the bear. Indeed, in this country—in northeastern California—it is generally deemed foolhardy for a person to attack a bear single-handed, or unassisted by dogs, no matter how well armed. A bear will stand a great deal of punishment, and a large amount of lead before he will succumb, unless struck in the beginning of the attack in a vital spot. Bruin has been known to continue a fight for some considerable time after his heart had been shot to pieces. As a rule, he is of wonderful vitality, strength, activity and quickness. Some species of bears are less aggressive than others, and there are those who will run to hiding at the sight of man, but even these when brought to bay are dangerous game to the hunter. Hunting bear with firearms is at all times precarious adventure.

It is said in California that even the grizzly is changing his character; that he has lost his aggressiveness, and will seek covert on the approach of man, whereas formerly he would voluntarily give battle, and at times had been known to charge a company of men when he had not been even provoked to battle.

Grizzlies are not as plentiful as they once were in the Sierra Nevada Mountains. What few that are met with nowadays are shy of man. Instinct has taught them that man with a modern rifle is an invincible foe. Nevertheless, hunters are very chary of the grizzly and will seldom attack him unless with the aid of good dogs, or with a companion who also has courage and is endowed with coolness.

Bear are yet very abundant in this region of California—embracing the mountainous portion of Sierra, Plumas, Butte, Yuba and Nevada counties. I hear they are plentiful also in other portions of the Sierra Nevada Mountains, but I speak now of the region in the five counties of which I have personal knowledge, and which I have traversed in the past eighteen months to more or less of an extent as a prospector hunting for gold ledges, or deposits of auriferous gravel. My trips have led me among the high lava-capped ridges and to the volcanic peaks which attain altitudes of 7,000 to 8,000 feet above the level of the sea, and whose slopes are covered with a dense growth of pine, fir and spruce. The deep ravines between the ridges make suitable haunts for bruin, and I have ample evidence that the latter exists in great numbers. The bears of hereabouts are mostly black and brown. They make great havoc with the young stock of the isolated mountain ranches, and some of the farmers have to wage constant warfare against bears.

The creatures seem to have an unappeasable appetite for pork on the hoof, and hang about the ranches at all times of the year, except when they are in hibernation, ready to pounce upon and carry off any pig that is not too heavy and bulky. They will also go so far as to enter a sty when pressed by hunger, and select any choice little porker that they may fancy.

A boar or full-grown sow will not hesitate to fight a bear, but the bear will avoid encounters with such, and resort to cunning to gain his prey. The depredations of bear upon some of the ranches are a constant loss to the ranchmen. There is but little or no corn raised, and it is too expensive to haul in for feed, so the swine are turned into a meadow to feed on grass, and later into the woods to fatten on acorns. It is then that bruin gets after piggy with success.

In this region the ridges and ravines are so thickly covered with manzanita, chaparral and a variety of other brush that it is almost a physical impossibility for man to go through the same, it being necessary even constantly to keep pruning shears at work to keep trails and wagon roads open, brush growing almost spontaneously. This brush makes perfect cover for bear and other like "varmint." It gives immunity to bruin from the two-legged hunter with a gun. The ranchmen have recourse mostly to the Newhouse steel trap. Bruin, when caught, is ignominiously knocked in the head with an ax, and his carcass thrown to the very hogs he himself would have devoured. I know many ranchmen who number their bear killings by the score.

Nor does bruin stop in his raids on domestic stock at pigs, calves and colts often fall prey to him. And he just dotes on sheep. Flock masters find it necessary every year, in some of the summer mountain ranges, to hire professional bear hunters to clean out the varmint. The grizzly is especially fond of mutton and will in a fortnight do much havoc to a flock. Furthermore,

he will, for a change of diet, help himself to a full-grown cow or steer when he can't get a pig, calf or colt. The lonely prospector has difficulty, too, in keeping his pack and riding animals with him in the mountain solitudes, when bear are around. As soon as burro, mule or horse get sight or scent of bruin they will start for the valleys unless kept tethered close to prospector's camp, and even that is no safeguard, as the bear will frequently raid the prospector's camp and loot his cache, larder, meat safe, or smokehouse, whichever it may be that he has his provisions stored in. Bear are really so numerous and troublesome in this part of California that they are a nuisance.

That "the bear is largely a vegetarian," as asserted by the correspondent of the Springfield Republican, is an assertion of no material importance in this discussion, but the statement might be qualified by saying that the bear is preferably a flesh-eater if he can get it. He will eat anything and everything that a man will eat, except a few specialties to which he singularly objects, but it is not flesh. As to his liking for variety, the bears in the national parks that frequent the garbage cans of the hotels do not show any partiality to vegetable matter over flesh, as the offals of the table and kitchen. And when it comes to fish, bear of all kinds seem inordinately fond of them, and it is a common sight, in the headwaters of the streams in the Northwest, that are tributary to the Pacific Ocean, to see bruin industriously fishing for salmon.

As a matter of fact, the bear family is omnivorous. In captivity, I know, though, bears have been exclusively fed upon vegetable matter, and they thrived upon it. There is a man in Pennsylvania who raises bears as an industry, and I believe he feeds them nearly altogether, if not quite, upon vegetable stuff, the two principal items being sweet corn and watermelon. The polar bear, perforce, must, because of his habitat, subsist upon fish, etc., exclusively the greater portion of the year.

But take the dog. Most dogs are fed or like meat of any and all kinds. Yet, the dog can be trained, after he is weaned from his mother milk, to subsist entirely upon vegetable matter. Shepherd dogs and collies, very often never get any other food than oatmeal mush. These dogs are brainy, industrious and at once both gentle and brave. I have also seen an ugly pet pug fed upon delicatessen ranging from sauerkraut to ice cream and angel's food. Excuse me, however, and I will give an essay on dogs some other day. I just wanted to show that animals, notorious flesh-eaters, may become, by necessity or training, habitual vegetarians, and to demonstrate by these facts that the correspondent of the Springfield Republican don't know so much about bears after all.

I could, furthermore, go on and tell a whole lot of things about bear that he and Mr. Angell seem never to have heard or read, but just at present I simply want to resent the imputation that our worthy President was engaged in child's play when he went hunting bear in Colorado.

I agree, however, with the statement that there is "danger of having whole species exterminated, which, to the zoologist, the evolutionist and the lover of nature, as well as sometimes to the agriculturist, are of the utmost 'sympathetic interest.'" No true sportsman will deny this, and FOREST AND STREAM and other journals published in the interest of venatic sports, are as zealous in their advocacy in the preserving and perpetuation of species of animals, wild, rare or otherwise, as is Our Dumb Animals and its humanitarian publisher, George T. Angell and his contributing correspondents. The hunter, trapper and fisherman may be no less humane than the farmer.

There is another thought in connection with this matter of shooting bears. In an annotation to the article "No Sympathy with Bear Killing," Mr. Angell says: "We have read, first and last, a good deal advocating the belief that the smaller animals suffer very little when attacked and destroyed by the larger." Mr. Angell inferentially making this a plea for the salvation of bruin from an untimely death by gunshot at the hands of man. This on the proposition that the bear or any of the other large carnivori might be intended as the instrument, provided by a Divine Providence, to mercifully destroy the smaller wild animals when they become old and sick and liable to die of starvation.

I rather think, apropos to the paragraph immediately foregoing, that Mr. Angell's early education in natural history has been sadly neglected. There is no library available to me at this moment—I am writing in a cabin in the wilderness—or, I think, I could give the names of books and authors that would enlighten Mr. Angell in those matters that he seems so deficient in. To the best of my knowledge and belief the smaller wild animals are usually eaten literally alive by those carnivori of which they are the "legitimate" or "natural" prey. If they suffer at all, they certainly must suffer then. Carnivori seldom select "sick" animals for their prey, but will, of course, quickly pounce upon a wounded animal. Some species of animals will promptly kill their own kind when the latter take sick; they will also kill those born deformed, but the reason is only surmise to me. Again, weasels and wolves will often kill out of pure wantonness, purely for the sake of killing, and not because of necessity. A weasel will often kill more poultry in one night than he could consume in a month. Coyotes and wolves frequently hold high carnival in attacking a band of sheep and wantonly destroy large numbers in excess of their needs for the present or immediate future.

"The poor creatures out in Colorado preying on berries, and at the worst only now and then on some other wild beast!" Forsooth! The bears and other "poor creatures" may be of that kind "out in Colorado," but they are of a different kind here in California. At least the bear are. They eat berries in season, also roots, large fruits and any and all kinds of garden produce, when the ranchman and his dogs are away to town, but just the same his ursine majesty does not disdain a hog or two now and then by way of variety. The bear is no epicure, but he is a gourmand, and were it not for his valor, strength and ferocity, would be held in contempt, even as is the coyote by the cowboy of the plains.

California has, however, placed the bear upon a high pedestal of respect by making the animal the chief figure in its coat of arms and seal. Bruin also had a place on the flag once. Notwithstanding all this, the bear is

no more of a saint or innocent than is the wolverine, which has been honored by Michigan as the symbol of the Peninsular State. And what is the wolverine? The glutton; the mysterious corcajo.

But I will have to cut this short. Editor Angell is doing good work in promulgating consideration and kindly treatment for the dumb brutes, but I think he should go easy on nimrod—the nimrod is not so "fierce" as Mr. Angell in his innocence would unjustly paint him.

If any Bible authority is needed as to the ferocity of bruin in olden times, I would refer to Kings II., chapter 2. The children of Beth-el for no more of an offense than mocking the prophet Elisha and calling him a "baldhead," were set upon by two she bears out of the wood, which tore forty and two children of them.

WM. FITZMUGGINS.

SIERRA CITY, Cal.

## The Massachusetts Association.

BOSTON, Mass., Nov. 11.—*Editor Forest and Stream:* On Thursday afternoon the executive committee of the Massachusetts Central Committee for the Protection of Fish and Game met at the Copley Square Hotel to consider legislation for the coming winter. The question whether it would be wise to make an effort to secure the repeal of the law which allows the farmer to snare on his own premises was discussed, and the subject of seeking to secure a law imposing a license on non-resident hunters was briefly considered. No definite decision on either proposition was reached, but the committee voted to hold another meeting about the middle of next month, and to invite the newly-formed clubs to be represented at that meeting.

The board of government held a meeting at 5:30 and voted that a committee be appointed to arrange for a proper participation in the meeting of the North American Fish and Game Protective Association, to be held in Boston early in January, 1906. Ex-presidents G. W. Wiggin and B. C. Clark, Dr. Payne and A. D. Thayer were appointed, and the name of the president was added, he being also president of the North American Association.

At the Association dinner Prof. William Brewster, of Cambridge, said, in watching the destruction of birds by foxes on his 300-acre place in Concord, Mass., for several years, only two cases had come under his observation in which foxes had killed ruffed grouse. In his opinion, the fox is more blamed than he deserves.

Prof. Edwin De Merritte, of the De Merritte School, another of our members, related experiences of his boyhood and later days with rod and gun, and, although a man somewhat beyond the middle period of life, declared his ability to make long tramps and his fondness for field sports not in the least upon the wane. Many topics suggested by the members present were elucidated by these gentlemen, the meeting becoming a sort of round-table conference, and every one pronounced it one of the most profitable ever held by the Association.

The president announced the required committee of seven to nominate officers for the ensuing year, Dr. B. V. Howe being first named and consequently chairman. The next meeting will occur about the middle of December, at least three weeks prior to the annual, which is the second Wednesday of January.

Your correspondent had the pleasure one evening of witnessing an exhibition of motion pictures of hunting and fishing scenes that are to be one of the features of the coming sportsman's show, to be given at Christmas time in Mechanics' Building. They are sure to please, and will be a great addition to the other exhibits. All those now engaged in preliminary preparations for the show are making their headquarters at the Copley Square Hotel.

The Pine Tree State is making a great game record this year if all reports are true. Considering the long spell of dry weather last month, the receipts at Bangor have been surprising.

The long-looked-for snow, however, has succeeded copious rains, and recently hunting conditions have been prime. For every returning hunter more than one goes into the woods. In a couple of weeks the season will have reached the zenith. Shipments from Bangor the past week were 524 deer and 21 moose, as against 496 deer and 19 moose in the corresponding week of last year. Shipments for the season thus far up to last Friday were 2,327 deer, as against 2,229 last year.

On Monday last, the biggest day of the year, there were shipped 167 deer and 5 moose.

Two large bucks were secured by W. L. Bonney, of Waterville, weighing 215 and 195 pounds, and each had exceptionally fine antlers. These were obtained in the Patten region, where the snow is now 6 inches in depth.

It is reported that deer are being hunted with dogs in the vicinity of Pushaw Lake.

Fifty Ohioans are in the Oxbow country and will return about Nov. 20.

A few of the Boston hunters returning with deer are J. S. Wilcox, W. R. Woodward, E. S. Farnsworth, Fred L. Taft, W. H. Moody, E. S. Gifford, H. C. Pickering and B. W. and A. S. Stark. Messrs. Pickering and A. S. Stark secured moose, as also did A. H. Locke, of Salem.

Two Newtonville men, C. M. Howell and Henry B. Morse, brought out a remarkable kill—a 700-pound moose, two bears weighing 200 pounds each, four deer, a fox and twelve partridges. Most of these were found in the Roach River country.

Dr. G. G. Furnell, of Waverly, Mass., has secured a large buck in the Dead River country.

Another hunter who had remarkable success is H. E. Newell, of Haverhill, who has brought back a moose, two buck deer and a bear.

A 14-point buck was shipped at Bigelow station by C. C. Fisher, of Union City, Ind.

Mr. and Mrs. J. K. Halson and son, of Boston, secured a moose, two deer and a fox.

Sixty deer and five moose were shipped from Patten the past week.

It is reported that in the herd of caribou at the foot of Katahdin are a young bull, two cows and a calf.

A. O. Claffin, of Newton Center, and twelve other Bay State sportsmen are at Patten.

A. H. Shumway, of Taunton, while making a stay at Billy Hobb's camps, secured a moose.

B. R., E. T. and H. R. Symonds, of Reading, got two deer each. There is luck for hunters in New Hampshire these days.

J. T. Hall, of Boston, got a deer in Holderness and Amos Merrill, of Warren, shot his third bear for the season the past week.

Bert Cook, of Tilton, has captured his tenth fox for the season. Selectman E. J. Young of the same town has captured four mink this fall, and at Thornton H. E. Colby secured two deer.

I should have mentioned that in Massachusetts several sportsmen have had good days on woodcock. A hunter from Hopkinton told me he got sixteen one day, and Prof. Brewster expressed the opinion at the meeting, that native woodcock have been on the increase for a few years. The anti-sale law is bearing fruit apparently. In Massachusetts, it is no longer one of the two "vanishing game birds" in the Professor's opinion.

H. H. KIMBALL.

## Woodcock in China.

In certain parts of central and southern China, the woodcock is a constant and frequent visitor and is found occasionally in sufficient numbers to repay one for a day spent in quest of this greatly prized spoil of the gunner's sport. In the districts more remote from habitations there still remain occasional woods of fair-sized pine trees that have been allowed to come to maturity without interference. These exist chiefly in ravines and near the summits of the hills, in places more inaccessible to the wandering wood cutter, to which fact they owe their safety. It is in such spots that the woodcock are most numerous, being found, however, invariably close to water, either stream or pool. At the same time in some of the higher valleys or nullahs where no pine are found, but only low bushes and heather, cock may be occasionally flushed; and indeed it is in such places where they are most likely to be seen and brought to bag, as the thickly wooded nullahs are difficult for dogs to work and not less difficult for the sportsman to get a shot in, or to retrieve his bird if dropped. In fact, in spite of its name the woodcock is by no means so partial to forest or heavy woodland, although no doubt he seeks shade during the daytime. In China, at least, this appears to be sufficiently afforded by a few low shrubs or even by patches of high grass.

A curious trait may be mentioned, moreover, namely, that woodcock are not averse to the near neighborhood of human habitation, for on more than one occasion they have been flushed just outside the inclosing wall of the small walled hamlets that dot the plains of China. This wall is nearly always supplemented by a broad moat, which together form a means of resistance to robbers and pirates. Along the edges of these moats where the people of the hamlet are constantly passing and where children and cattle are often straying about, woodcock may constantly be found in the low bushes that usually fringe the margin; but without dogs it is often impossible to find them, so close will they lie. Once flushed, however, they go right away to the nearest woods unless shot, which they usually are, as they offer an easy chance in these circumstances. The vicinity of these moats is generally then a sure draw for a cock, and even a couple may sometimes be found in the same place or near to each other.

In the neighborhood of the coast ports, where there is a sprinkling of foreign residents, the woodcock is found in the local markets, being trapped or shot in fair numbers by the Chinese, as they fetch a good price when they can be disposed of to Europeans. But further inland the wandering Chinese gunner would probably not waste a charge of powder on one, his mode of procedure being in general to "brown" a flock of anything (magpies as often as not, which are sometimes seen forty and fifty together). The bird, then, is in such districts very seldom molested and possibly returns from year to year to the same districts if not to the same spot. While on the subject of Chinese shootists, however, it is not to be supposed that they are indifferent shots. Far from it, as anyone who has seen them shooting snipe in southern China or pheasants in the north can testify. The Chinaman for the most part fires only from the hip too, not from the shoulder, when shooting game; and in spite of this fact and also that the best of their arms are old rusty, converted matchlocks, they make marvellously good shooting at times.

The writer has seen them more than once, out after snipe, when these birds were wild, as they indeed can be in the bitter north winds of mid-China in winter, following the flight of the bird while the complicated arrangement that ignites the charge was in process of combustion, a second or two only perhaps, but sufficient in the way of a "hang-fire" to considerably nonplus a foreign sportsman. The barrel is a very long one which possibly accounts for these old weapons making at times the most astounding long shots, and the kick is such as to inflict a severe blow, which is primarily the reason that the hip-shot is so universal.

B. O. BAY.

## Pennsylvania's Army.

HARRISBURG, Pa., Nov. 10.—There never before has been so many hunters in this State as this fall, and the number of serious accidents is appalling. The opening of the rabbit season last week was the cause of so much ravel that on some of the railroads special cars carried ten with dogs and guns notwithstanding the short season and heavy dog tax in this State. The interest in outdoor sport and recreation is increasing rather than decreasing. I hope to send you a more complete report soon.

H. A. SURFACE,  
Economic Zoologist.

## THE MANY-USE OIL

Cleans out powder residue. Lubricates, never-gums; 2oz. bottle 10c. —Adv.

## Munchausen Only.

*Editor Forest and Stream:*

Will not the readers of your candid and always trustworthy journal sympathize with me in a protest against the degradation of our sporting literature in the following fashion:

"BEST GAME SHOT IN THE WORLD.

"LONDON, Oct. 31.—Though fifty-three years old, Earl de Grey, upon whose estate at Dagowill the Prince of Wales has recently been shooting, still ranks as the finest game shot in England. Indeed, it is the general opinion here that he is the best in the world.

"Anyhow, he has killed more game than any other living sportsman. Ten years ago it had amounted to 316,699 head. Comprised in this list were 111,900 pheasants, 84,400 partridges, 45,500 grouse, 26,500 hares and about as many rabbits. In one year alone his 'bag' amounted to over 19,000 head.

"In Yorkshire he once shot 500 grouse in a single day and on another occasion brought down 750 pheasants. In Wales, between sunrise and sunset, he once disposed of 950 rabbits.

"In America many people would regard feats of this kind as mere slaughter rather than sport, but English folk do not so consider them, and Earl de Grey is English in everything. His wonderful knack of bringing down birds completely dazes strangers who go away and explain to their friends their firm belief that he 'simply can't miss.'

Now, what is the use of publishing such impossible rot as this? Is anybody expected to believe it? One moment of mental arithmetic will suffice to show that all statements made are inordinately outside of the limit of credence or physical accomplishment. Beginning at the age of ten years only the sum total of 316,699 head of game would require an average of 736 units for every day of the Earl's life, while the phenomenal bag of 19,000 head for one single year would require the killing of fifty per day for the year round, close seasons and all; and any man who would attempt to kill 950 rabbits in a day, one at a time, no matter how, would drop from exhaustion. The exertion would require the slaughter of two rabbits per minute for eight consecutive hours—a test of physical endurance seldom paralleled in glass-ball shooting thirty years ago.

Does the concoctor of this "astonisher" fancy that he is doing a smart thing? And why will editors persistently decline good matter as "not available" and print such stuff as this? For certain it is that it is almost impossible to market anything but sensational, abstruse or hyper scientific stuff in any magazine to-day, no matter how reputable its past record.

The hardship of it all is that such literature finds a ready market in reputable newspapers and magazines, and most of it is concocted by young people who have never had any field experience, but merely read up enough to post themselves on sporting events and sporting vernacular, so as to give an air of plausibility to what they write.

I have seen them in the libraries myself, cramming. Such impostors are driving honest and experienced raconteurs out of the magazine field. Even the most careful of them continually make blunders which anyone who knows the ground can readily detect. For example, I recently read a very well put up sketch of a Kiowa home, but the baby cradle was Ojibwa! Of course the ordinary reader would not detect the misfit; yet, he would be apt to prefer a correct statement to a substitute for truth.

Isn't it time that the press took up this matter for the sake of purity in sporting literature, as well prevent our gentlemen from being made fools of?

CHARLES HALLOCK.

## How to Cook Coots.

*Editor Forest and Stream:*

To sportsmen who at the end of a day's duck shooting find themselves proud possessors of a pair of coots, sheldrake or old squaw in place of the black ducks they had hoped to bring home, I send this word of hope. The fishy taste of any of those birds may be removed, but the game flavor retained, by following these directions, which I have recently obtained from the well known game cook, Mary Walsh:

"Pluck and draw the birds immediately; don't allow them to hang with the entrails in. Wash thoroughly with cold water, both outside and in. Cut off the tail for about one inch with the fatty tissue at the base. Sprinkle with pungent white pepper both inside and out, using two teaspoonfuls to each bird. Place in the ice-box but not touching the ice, and keep for at least one week, better ten days. Then wash with salt water (hardful to the pint), dry and roast for twenty minutes with an apple placed in each bird. Then serve, removing the apple before placing on the table."

I would add that a friend and myself have just had the pleasure of eating a pair of white-winged coots cooked in this manner, and not only was there no taste of fish, but the game flavor of the birds was preserved, which is not so when the old method of par-boiling is used.

HENRY H. THORP.

## Cleaning Rifles.

OPELOUSAS, La., Nov. 1.—*Editor Forest and Stream:* Through the FOREST AND STREAM I would like to hear from some of the readers on the following subject, how to keep clean and bright the barrels of rifles using the very highest power smokeless powder? I use the .30-40 U. S. box magazine carbine, the .303 Savage and the Luger automatic pistol. Even though I keep my firearms in good shape, always clean, I can never keep the barrels of these rifles free or clean. The powder seems to leave a residue, a kind of gum, that I find impossible to remove. In using the black and the low-pressure powder it is always a simple matter to clean the barrel of a rifle, but using the kind that is used in the .30-40 and the .30 U. S. G. rimless or the .303 I have never been able to keep my rifle barrel shining, even though I have used this kind of arm for a number of years and have tried every means that I could think of.

JOHN P. BOAGNI.

## Black Bass Fishing in Pennsylvania.

If ever the fishermen in Pennsylvania had a problem to match the famous 15 puzzle, it is to be found in the small-mouth black bass. An introduced fish, it has made itself at home in the waters of the Keystone State, and keeps the angler and the Department of Fisheries guessing what it will do next. About the time either or both imagine they have solved the problem of its habits, movements and general behavior, it starts off on some new vagary, and human wits have to be set to work again.

There is probably no fish living in the waters of Pennsylvania which has had such a varied standing with the fishermen of the State. When first introduced through the medium of a locomotive water tank in 1870, it was welcomed warmly, and when the members of the family could be fished for legally, they were sought with eagerness by anglers, but to their disgust, in vain. Prior to their advent, the principal baits for Pennsylvania river fishes were worms, dough and similar primitive lures. The fishermen became disgusted at the failure of the newcomers to bite, and as the fish multiplied and were still uncatchable, curses took the place of blessings.

It was freely declared that black bass would not bite upon a hook, and to this crime was added the greater one of devouring the valuable food and high class game chub. Like the fox in the case of the grapes, the fishermen consoled themselves by declaring the chub was a far superior fish to the black bass anyhow. Then heavier anathemas than ever were hurled at the new introduction. By and by the anglers discovered that the bass loved a minnow, a helgramite, a frog and other living creatures and abhorred dead or still bait, and immediately the stock of the bass once more went above par. Soon, in the estimation of many, it became the greatest game fish that swims. It was declared to be far superior to the brook trout both in game and food qualities, and the consensus of opinion was that no man should waste his time on such an insignificant game and poor table fish as the river chub. Some people even went so far as to compare it favorably with the lordly Atlantic salmon.

It is due to the black bass to say that it still holds a high place in the hearts of thousands of Pennsylvania anglers, and even the devotees of trout admire its magnificent game qualities; but there are signs that it has nearly reached the zenith of its popularity, and that sentiment will veer to some native fish. Once more the chub is rising in favor.

The bass is loved perhaps because of its vagaries; because one day it will take minnows and the next day refuse anything but helgramites; the day after demand nothing but frogs, and perhaps the day after scorn everything but stone catfish. Perhaps the succeeding day rise to nothing but the artificial fly, and then again possibly make all the changes of foods in a single day. Very few men dare to say they know all about the black bass, and the few who did are often jeered at. Indeed the majority of anglers rather plume themselves of their lack of knowledge of the habits and requirements of the fish.

Everything went well with the fish and the angler until the year 1900, and then complaints were heard, first from the Delaware, then from the Susquehanna that there was a decrease in the catch of bass, and the wail—for wail it was—increased in volume and extent with each succeeding year until it spread to the fishermen in nearly all the waters in Pennsylvania. There were some streams by 1904 which previously had yielded heavy catches that gave up scarcely a fish to an angler in a week. Naturally everybody wanted to know why, and every one began to reason out a cause. At last many of them found the Jonah, as they believed, and the Jonah was the German carp. People had always hated and despised the German carp, and with reason, as an inferior and nearly worthless food fish without any game qualities.

Consequently, it is not surprising that when the German carp was suggested as the fish which was causing a rapid decrease in the number of bass, nearly everybody, including the Commissioner of Fisheries, concluded that they had the offender. It was asserted and believed that carp destroyed the spawn of the bass; that they destroyed the water plants which contained minute life necessary to the existence of the young fish, the shelter which the plants afforded the little creatures from being devoured by other fish.

But this spring the anglers and the Commissioner of Fisheries received a shock. The bass reappeared in great numbers in nearly all the waters of the Commonwealth in which they had previously been. There were little fish, medium size, and some large fish. The catches were nearly equal to those of ten years ago. A curious feature was that in many of the streams in which the catches were most abundant, the carp were still plentiful. Notably the Susquehanna River.

In some streams young bass were said to outnumber minnows. Hence it was concluded that while the German carp may have been a factor in the decrease of the number of bass in the streams, it was not the chief factor. Something else evidently caused their temporary disappearance, and with the removal of that something they have reappeared once more, and the black bass has emphasized its right to the title of "mysterious fish."

It is a well-known fact with the great majority of fishermen, the higher the character of the surrounding scenery the greater zest there is given to the general art of angling. Hence, those who fish for black bass in Pennsylvania waters are favored beyond those who angle in most of the States. The greatest rivers and their largest tributaries flow tortuously through moun-

tain ranges. From the center to the west are the huge crests of the Alleghenies. From the northeast to the southwest in the eastern part of the Blue Ridge and South Mountains, with their royal spurs, some of which, like the Welch Hills, extend into the southeastern part of Pennsylvania.

None of these waters have great depths, excepting in occasional spots in the Susquehanna. As a rule, they rush and tumble over rocky beds, froth in shallow places over rocks and boulders, and spring into quiet, dark pools for rest, making long streaks of eddies or swifts in which the bass and wall-eyed pike congregate.

Because of the diversified character of the water in Pennsylvania rivers and large creeks, there are probably few States which can show, within a given space, so many methods of bass fishing. While thousands sit quietly on the bank or in an anchored boat waiting patiently for the bite, which comes or not, as the case may be, there are thousands who hunt for bass on their favorite stream as the hunter hunts for a rabbit or a bird. Such men will sometimes cover five or six miles of water in a day with a boat, or wade two or three. It is the hunter of the black bass who secures the greatest enjoyment from his day's outing, and who generally has the best basket when the sun has gone down.

The bass is the people's fish more than any other game fish. He stands among fish for the fishermen as baseball does among field athletic sports. As he is the people's fish, so all sorts and conditions of lines and baits are used to lure him from his watery home. There is a regular gradation, from the fine enameled or braided silk line to the common cotton cord, generally called the "clothes line." Fine drawn gut, the best silk gut, twisted double gut, all are used. Hooks, from No. 2 to 3 and 4-0, from the plebian ringed hook, three for 5 cents, to the beautifully snelled, highest grade hooks made. Cheap flies and expensive flies, cheap machine rods and the most expensive hand-made article, eane angles and a pole cut from the woods; even hand-lines are not disdained by some, and so there are artificial baits of all kinds and descriptions, deadly and otherwise.

The still-fishing, bait-casting, skittering, drifting, trolling, both with artificial, live and dead bait, float-fishing, bottom fishing, spinning the swifts, and fly-casting—all of them may be found sometimes within five or six miles on any given river.

It is noteworthy, nevertheless, that as the rivers are of different characters, so a certain form of fishing is apt to predominate in these particular streams. Float fishing is not as often met with in the Susquehanna as bottom fishing and spinning a swift, while float fishing is the method usually pursued in the Delaware. Of the methods used in the Susquehanna, spinning an eddy is the most exciting and pleasurable and more apt to give best results. It should be said here that on the Susquehanna River and its branches, there are hundreds and hundreds of men whose chief means of livelihood are to row or pole a boat for an angler and sell him bait.

The boats used on the Susquehanna for bass fishing are very long and very narrow, with square ends. They are just wide enough for one man to sit in comfortably. These boats are poled with wonderful skill among the dangerous rocks and up or down raging rifts. Seeking the head of a swift, the bow or one end of the boat is thrust upon a rock in back water, and so held steady and firm while the angler fishes.

The angler baits his hook with, we will say, a stone catfish, and the line, without any float or sinker whatever, is cast overboard into the swift flowing water. The line is then drawn from the reel, five or six inches at a time, and in that manner the bait is allowed to float down perhaps for a distance of fifty or seventy-five feet, or to the end of the swift, when, if there has been no strike, the line is slowly reeled in. Before each take, the rod is raised suddenly till in an upright position, then lowered quickly, and the slack is then quickly taken up by the reel. When the bait is drawn to the boat side, it is cast a little to the right or the left, and the paying out of the line is done over again; and this is repeated time and time again, until every foot of water embraced in the swift and for two or three feet on each side has been thoroughly fished. The angler then takes in his line, the boatman draws his craft from the rock and drops down to the next swift, and so the fishing goes on all day.

If while the line is being paid out the angler notices or feels a slight twitch, he knows a bass is at work, but he does not strike. He draws from his reel perhaps two or three feet of line, and as the bass lightly pulls, he allows the line to slip through his fingers and then gives more, and so perhaps until twenty-five or thirty feet has thus been paid out. Then comes a sudden rush, a tremendous strike on the tip of the rod, followed by a leaping bass.

It is idle to describe the contest which ensues. It is seldom that two are exactly alike. Every fisherman who has tried to catch black bass knows how it feels much better than any writer can describe it. Every angler knows that he is in an agony from the first leap until the fish is in his net lest the bass should tear himself loose, cut the line on a rock or smash his rod when the butt is given.

Drifting in the Delaware with a float line is conducted almost exactly the same as spinning the swift, excepting that, the water being deeper and the fall less, the streaks through the pools run more slowly, and there a sinker is used to keep the bait well beneath the surface.

A good catch of bass in Pennsylvania waters is twenty-five. The usual weight is from a pound to a

pound and a half. When a six-pounder is landed the fact gets into the newspapers, and the lucky man hailed by his companions, the editors, as a great angler.

W. E. MEEHAN.

## Fish at \$70 a Pound.

"Yes, sir. Had a great time," said the returned fisherman, wiping his blistered brow, "and I brought back with me two of the most expensive fish I ever handled."

"Here's an honest fisherman," burst from the crowd in the office. "He acknowledges that he bought his fish."

"Well, not exactly that," the fisherman returned, "for these fish were thrust upon me. They cost me over \$70 a pound, and I guess they were cheap at the price. At any rate, I felt cheap when I paid it."

"Come now, old man, don't dispel our illusion. Here we have granted that you are an honest fisherman—the first we have ever seen—and instead of telling us the old yarn you start in on a new one that is just as bad. Seventy dollars a pound for fish!" And there was no mistaking the look of disgust that accompanied the remark.

"Friends," the fisherman expostulated, "give me leave to tell my fish story. 'Tis not so long as a railroad ticket nor so deep as an editorial, but 'tis tough. A plague o' both your fish, say I." He paused in Shakespearean fashion for a reply; but there was none.

"The first thing you learn when you go fishing on the Gunnison River out in Colorado is that you must not keep any fish you catch that is under seven inches in length. The game warden will get you if you don't watch out. And as I was catching from seventy-five to a hundred fish a day of particularly enormous size, I threw back the little ones without compunction. The fights I had with some of those 40-pound trout—"

Of course he was interrupted here, but luckily was not assaulted.

"Well, any way," he continued, after taking his arm down from shielding his face against threatened blows, "I caught a lot of fish. I also made the acquaintance of two very nice young ladies who were stopping at the same so-called hotel. They fished, too, and I don't think they were as particular of the game as the rest of us were, for they seemed to slide their catch past the game warden without examination. I told them a lot of funny stories and sang some snatches from comic operas as the moon was disappearing over the mountains, and did all those agreeable little things that you can do, don't you know, and I really believe they were quite cut up when I announced I was going to leave for home.

"The last day I saved only about forty pounds of the fish I caught, and as I took the train that evening I carried the basket with me, preferring to keep my eye on it instead of checking it through. I can see those girls now waving their good-bye from the little platform of a station.

"When the train reached a small town near the boundary of the State some game wardens got on, and seeing my basket, declared their intention of looking over my catch. I willingly agreed and they lost no time in tumbling my fish about until they discovered near the bottom two tiny fish that were quite under seven inches in length and probably weighed less than a pound together.

"Why, I wonder where those little ones came from," said I. And I was genuinely surprised.

"You'll have to get off here," the game warden said. I protested that the fish were not mine, they they were perfectly welcome to them, and in the meantime I thought the whole thing over and could reach only one conclusion—those girls had played a little joke on me by putting those little fish in my basket. I told that to the wardens and they laughingly gave me the credit for having invented a new excuse for having prohibited fish in my possession.

"You better tell that to the judge," they suggested as we walked up the street, and I did when we reached the courtroom. But the judge only smiled and read enough of the law to fine me \$50, that was \$25 each for the little fish, and the costs made my bill come to \$70. You see the State gives the game warden a good share of the fine for his trouble, and, so there will be a little left for the State, they hit you pretty hard. They also took my whole basket of fish, saying the law would not permit me to take them out of the State.

"Gosh, judge," I said, "can't you let me have the fish? I've paid a good price for them. It seems to me you ought to let me take them along."

"He thought for a little while and then he said: 'Well, you can have the two little ones. I guess the law will be satisfied in these larger ones here.'

"So I brought home the two little \$70 fish."

"Did you ever hear anything from the young women?" asked the stenographer.

"Not directly," the fisherman returned sadly, "but after I had described them to a man on the train leaving Denver, he told me that he thought they were the daughters of a game warden he knew."—Kansas City Star.

## Fishy.

MOTHER (reproachfully, to her small son): "Jamie, where have you been all afternoon?" Jamie uncasily—"At Sunday school, mamma." Mother—"Then how is it you are wet and smell so of fish?" Jamie (in desperation)—"Well, you see, I've been studying about Jonah, and the whale, and—well—I guess it came off on my clothes."—Harper's Weekly.

## Fish and Fishing.

### The Recent Dynamiting of Salmon.

DESPITE the precautions taken for the prevention of poaching in the salmon waters of the Restigouche and its tributaries, there is reason to fear that many more fish were secured this autumn out of these rivers by illicit means than were killed by the anglers who lease or own the fishing of them, during the whole of the last season. Several residents of the neighborhood are believed to have taken fish out of these waters since the end of the open season, and in some few cases evidence sufficient to convict was readily obtained. Apart altogether from the fishing during the close season, it has transpired that the diabolical practice of dynamiting the salmon pools has been resorted to in some instances, the guilty parties in this matter being men employed in erecting poles for a telegraph or telephone line in the Causapsal country. In one instance, it is said, upon good authority, that thirty-six salmon were killed at one time by an explosion of dynamite in one of the pools of either the Causapsal or the Metapedia River.

### How the Poachers Evade the Law.

Not even in the entertaining pages of the recently issued "Autobiography of a Poacher," in which are related some of the most rascally offenses against the fish and game laws of half a century ago in the country of Lorna Doone, will the reader find anything to compare with the desperate strategy of the Restigouche country poachers, in their efforts to escape punishment for their recent crimes. I have the entire story from the lips of the Quebec judge who was sent by the provincial government to hear the prosecutions taken against the accused parties by the officials of the Riparian Association of the Restigouche, Causapsal and Metapedia rivers. Four criminal prosecutions had been taken in the name of the club against parties accused of using dynamite to kill fish in the said river, and two against parties accused of the illegal fishing of salmon during the close season. The six defendants appeared before the judge from Quebec, at Causapsal, and pleaded *autrefois convict* of the same offense, with evidence at the same time of having been convicted by a local magistrate or justice of the peace, who is at the same time the government fish and game warden. In support of this plea they produced receipts for the payment of different fines to which they had been condemned. It transpired from the evidence in question, that is from the receipts produced in court, that each one of the accused had been informed against by one of the others, who had received the amount of the condemnation and had given a receipt therefor; so that it is evident that none of them paid over any sum of money at all, since each was supposed to have received from another, the sum to which he himself was condemned.

The lawyer for the prosecution, Mr. Kelly, who is the representative of the county of Bonaventure in the local Legislature, applied to the court for leave to proceed without taking any consideration of any of the judgments rendered by the local magistrate, on the ground that he must have been in collusion with the accused to interfere with the proper course of the administration of justice. It was actually shown that some of the convictions had been rendered by the local magistrate during the very night of the arrival of the Quebec judge at Causapsal. After hearing argument on all these pleas, the judge took *en delibere*, the question whether he had any jurisdiction to proceed any further with the charges of offenses already adjudicated upon, even though such adjudication may have been by collusion. The further hearing of the case was postponed till Nov. 25, and in the meantime the judge declared that he would fully report all the circumstances of them to the Attorney-General, which he lost no time in doing, immediately upon his return to Quebec. What the action of the government will be in the case is not yet officially known, but in all probability there will be a careful investigation into all the charges of collusion made in connection with this shameful business.

### Do Fish and Ang'le Worms Ever Rain Down?

This is one of the curious questions which has been submitted for me to grapple with by an angling friend who sends me a cutting on the subject from a Canadian newspaper. The editor of this paper had expressed his opinion, which was that the worms, at least, do not come down with the rain. He received, in reply, a letter from a ship captain in St. John, N. B., who insists that angleworms do rain down, since he has seen them fall on the deck of a vessel by hundreds when she was sailing. This captain wants to know whether frogs or toads ever rain down. Another correspondent asks for an explanation of where the worms come from that are sometimes found during a rain storm on roofs, and in eaves and water-barrels for catching rain water. As to how they reach the air when their home is in the ground, it is asked whether they may not be taken up in a whirlwind, water-spout or cyclone.

In this connection I have before me a letter from the town of Tyndall, South Dakota, in which the writer says: "Some twenty years ago, while living in the town of Menno, South Dakota, a very heavy shower came on suddenly one warm afternoon. In consequence, a stream of water, perhaps eighteen inches across, ran down the street. I noticed some small boys excitedly catching something in their hands, and, on going to them, found they were catching numbers of small fish, say from an inch to two inches long. There was no body of water containing fish, nearer than five miles, the town being situated on a high, dry prairie."

Though there are more things in heaven and earth than are dreamt of in our philosophy, it would require a considerable stretch of the imagination to believe that either the heaven above or the waters which are above the firmament are inhabited by fish and by the angleworms upon which they feed, and it is up to the students of meteorological science to explain whether whirlwinds, waterspouts or cyclones are responsible for the

temporary appearance of such phenomena as the apparent raining down of little fish and worms.

### A Sportsmen's Convention.

The new Minister of Colonization, Mines and Fisheries of the Province of Quebec, the Hon. Jean Prevost, has fixed upon the month of December for holding the proposed convention of sportsmen in Montreal, to discuss various matters affecting the fish and game interests of the Province of Quebec. The Minister believes that the protection of our fish and game is not what it ought to be, and that the government does not make the most of its opportunities in this direction. Both American and Canadian sportsmen are to be invited to this convention, and all who are interested in fish and game protection and in the relations between the government and sportsmen will be gladly welcomed, especially if they have suggestions to offer for the improvement of existing conditions.

### Smelt Plentyful.

Smelt are particularly abundant at present in the St. Lawrence from Three Rivers to the Gulf. While these delicious little pan fish are taken in immense numbers in nets in the Gulf of St. Lawrence and the Baie des Chaleurs, and are being shipped away in large quantities, the catching of them by rod and line angling is quite the vogue at present here. At certain phases of the tide the whole of the docks and wharves on both sides of the river are crowded with fishermen, both young and old, enjoying the sport of catching smelt. At times they take the bait very freely, and it is no uncommon occurrence to see several anglers landing from one to three of the little fish at the same time. It is cold work at this time of the year standing for hours at a time at the river front holding a rod, baiting hooks and taking off fish, but it is gladly braved by quite an army of fishermen for the sport which the catching of the little silver beauties affords.

E. T. D. CHAMBERS.

## Northern Michigan Notes.

Editor Forest and Stream:

As usual, the first week of August found me at the Conway Inn on Crooked Lake in northern Michigan, content to rest from office duties, and to enjoy an outing of ten weeks in boating and fishing in the limpid waters of the famous "Inland Route," and exploring the woods and hills and trout streams that are contiguous. The weather proved all that could be desired, as there were but three days during my sojourn that I was not on the water with my little eleven-foot canvas boat Wanderer, rowing or paddling from five to twelve miles per day and walking more or less as a change.

The three days of rainy weather were pleasantly passed indoors with reading correspondence and games at cards or checkers with the genial little party of summer guests who make this their home. A new structure is to be erected to supersede the present Conway Inn that will accommodate about fifty people, and as the location is the most charming one on the lake, the venture will undoubtedly prove a success. Petoskey, only seven miles south, was literally overcrowded this season with summer guests, and many were turned away from its hotels. At Round Lake, one mile from Conway, a new attraction, consisting of a camp of Ojibway Indians from Canada on a pretty point, where they daily gave a representation of the principal scenes from Longfellow's Hiawatha, drew large crowds who were comfortably seated in a large pavilion with open front, and had a good view of the performance, which included aquatic sports, canoe racing, diving and swimming, and the departure of Hiawatha across the bay. The Indian dances and their weird songs gave a variety of interesting incidents, and upon the whole it was quite a unique show. I having seen the Sioux, Winnebago and Menomonic Indians in the west in an early day before they were sent to their reservations, and having visited their villages on the occasion of some of their festivals, it was not so new to me as to the great majority, nevertheless I enjoyed the spectacle very much.

From the highest of the conical sand dunes at the upper end of Round Lake a very pretty view may be obtained that well pays the labor of the ascent, for Little Traverse Bay and Lake Michigan, Round Lake, Mud Lake, Crooked Lake, Pickerel Lake and a vast scope of country are spread out to the observer.

The fishing has been fairly good, but not quite up to last season, probably on account of nets that are said to have been stretched across Crooked River in the spring when fish were on their migration from the Great Lakes, still some fairly good catches of bass, pike perch and pickerel were made, and many good strings of the smaller fish, such as perch, bluegills, rock bass and sunfish, were brought in. Many from Crooked Lake go by launches to Burt Lake for a day or so at fishing, and, as a rule, have been quite successful.

One of my most delightful trips of the season was taken with H. Milton Foss and his son, Earl D., who have a neat lodge on a retired spot on the shore of Crooked Lake, and invited the Wanderer and crew to accompany them. We got an early start, and with the Malissa and Wanderer in tow, made a quick run to the foot of the lake, thence through the devious course of Crooked River until having passed so-called Grass Lake, we reached the Devil's Elbow, and then having an idea that we could probably pick up a few bass before the daily run of steamer and launches through the river took place. Mr. Foss and myself took to our small boats, and drifting down ahead of the launch, cast with minnow and frog in every likely spot all the way down to Burt Lake, but without much success. Mr. F. and Earl then went with the launch on up to Maple Bay and I followed in the Wanderer, trolling with spoon around the most likely places near the shore; but caught but one fair-sized pickerel. Arriving at Maple Bay, I found them anchored and picking up a fine string of perch that would run from  $\frac{3}{4}$  to 1 pound in weight each.

We went ashore at a favorable spot on the old Indian Point and prepared for an al fresco dinner. While Mr. F. and I got sufficient fish in readiness, Earl had a fire in shape, coffee boiling, bacon fried, potatoes boiled, apple sauce made; and while he was frying the fish, we built an impromptu table and seats and were soon enjoying an excellent dinner with ravenous appetites. As we were about at the finish a cow approached closely and solicited a share, and we gave bread and fish bones, both of which were eaten with a relish; and finally we put down saucepan and fryingpan and tin plates, all of which she seemed to appreciate highly, as she licked them clean and wanted more. A snap-shot of the incident would have been very much prized.

After a rest we again resumed fishing, with fair success, until after sundown, and finally boarded the launch and started back. The trip by moonlight through the river and lake was not the least feature of the outing. On arriving at the lodge at 9:30 P. M., we soon were warming up by a good fire, and Earl shortly surprised us with a fine supper. We had a most enjoyable day, in which we had taken a half-dozen fair-sized pickerel and about sixty perch. While we were in Maple Bay, we noticed a number of fishing parties, one of whom had been fortunate enough to capture a maskinogé of about 16 pounds.

The largest pickerel that I saw this season was taken by Mr. James J. Faran, of the Cincinnati Point Club, who spent a day at Carp Lake, Emmett county, and besides a number of lesser size, caught one weighing about 15 pounds. While called by local fishermen a pickerel, it is really the great northern pike.

The weather continued fine until about the middle of October. Ducks were then beginning to come in, and there were many coveys of ruffed grouse in the woods, and the promise fair for a good hunting season.

E. S. WHITAKER.

## Ways of the Salmon.

By Prof. C. W. Greene, "Physiological Studies of the Chinook Salmon." From Bulletin of the Bureau of Fisheries.

THE salmon is an anadromous fish. Its natural spawning beds are in the cold waters of the mountain streams. When the eggs are hatched and the young are able to swim, they proceed down the streams and out into the open ocean, where they feed and grow for a period of two to four years. On the approach of maturity they re-enter the mouths of the rivers and make the long journey back to the spawning grounds in the mountain waters, a distance sometimes of hundreds of miles. The mature salmon as they approach the mouths of the rivers are strong and vigorous and in the very prime of condition. They have been feeding voraciously on the abundant ocean fauna and their tissues are loaded with the supply of fats and oils and other constituents which make the flesh so much sought after because of its delicious flavor and nutritious excellence.

The fact which presents so peculiar and interesting a problem, or series of problems, in fact, to the physiologist is this: The salmon takes no food after it leaves the ocean and enters fresh water.\* The journey, it may be of hundreds of miles, is made against the swift currents, rapids and waterfalls of the mountain streams. It matters not how long the distance nor how great the exertion that is required, all the energy must be supplied from the store of material accumulated while the fish is feeding in the ocean, material present in its body when it enters the fresh water stream.

A prolonged fast is always of especial physiological interest. The winter sleep or hibernation of the bats, dormice and the bears, while it is a period of fasting, is also a period of inactivity. All the vital processes are reduced to a minimum and little energy is liberated. In the salmon, on the contrary, the fasting period is the period of the greatest activity of the fish's life. The changes and reactions within the body of an animal that is giving off daily a large amount of energy, and at the same time is taking in no food to renew its vitality, present peculiar physiological phenomena. Nature herself performs the experiment of inanition in the salmon and it remains for science to unravel the details. The main question is how long and through what stages this one-sided process can advance before disintegration reaches the point at which the organized life of the individual animal must come to an end.

The numerous investigations of the United States Bureau of Fisheries into the natural history of the salmon—especially the migration, feeding and spawning habits—have firmly established the facts upon which the general statements made above are based. Of the numerous workers we may especially mention the recent investigations of Mr. Cloudsley Rutter, late naturalist of the Bureau's steamer Albatross, who was one of the best informed men on all scientific questions that pertain to the Pacific salmon. It is to his energy and skilled insight that we are indebted for the more accurate details of the conditions under which the young make the journey from the headwaters of the rivers to the sea, also for details as to the progress of the adults to the spawning grounds, as well as for saving improvements in the methods of propagation. Mr. Rutter was at the time of his death in the midst of an exhaustive study of the embryology of the salmon.

\*This statement is borne out by the researches of the Bureau of Fisheries, and investigations by Miescher-Ruesch and Noel Paton on the Atlantic salmon in Europe show the same to be true of that species also.

### A Carp Story.

CHARLOTTESVILLE, Va., Nov. 5.—Editor Forest and Stream: Norris in his American Anglers Book says: "It is an established fact that on draining carp ponds in Germany, to cultivate the soil, which had been flooded and made a fishpond of, for the purpose of enriching it, that the spawn of the carp left after drawing off the water, does not lose its vitality, though exposed for two or three years to the heat of summer and frost of winter; and that when the field is again converted into a pond there is no necessity for restocking it with carp, but the ova remaining beneath the surface of the ground produces a stock of carp, thus keeping up an alternation of crops—fish and vegetables." Verily, the carp is here to stay.

W. O. WATSON.

## Ouananiche in Lake St. John.

## Editor Forest and Stream:

Regarding Mr. E. T. D. Chambers and his correspondent who desires information about the ouananiche fishing in Lake St. John, I would like to add my mite for what it is worth. I believe there is no better authority on fishing than Mr. Chambers, and I have a number of times availed myself of his generous offer to furnish any information in his power.

The early part of last September, with my wife and a couple of gentlemen, I went to Lake St. John, expecting some rare sport with the landlocked, but the trip was a decided failure and disappointment, as we never saw a single fish. One reason was that they seemed very scarce, or would not bite; that the water was so low it was impossible to get to the grounds; the hotels were closed and men were unprocurable. The worst part of all this was that we did not know of these facts until on the ground, information which, I think, should have been sent us before we started, as accommodations and men were engaged ahead of time. Even at the Hudson Bay post, Pointe Bleue, we could get no guides. From these circumstances and from talking with the natives I have formed the conclusion that the ouananiche of Lake St. John are not as plentiful as supposed, or in other words, that the place is fished out. The drain has been very great in the last few years, and even the hatchery could not stand it. I understand that hatching ouananiche has been discontinued and salmon has taken its place.

I believe there are fine rivers comparatively easy of access in the Labrador peninsula, where the ouananiche can be found, and it is my desire to find some next season. Let me say, that when we found it impossible to fish the Grand Discharge or elsewhere at that time we retraced our steps somewhat and at Lake Edward, on the Quebec & Lake St. John Railroad, had the best brook trout fishing that the most enthusiastic could wish for, and the camps, men and food as furnished by Mr. Rowley, who conducts them, were the best. The charges were reasonable and the fishing fine. For one wanting large trout and comfortable accommodations where a woman can enjoy it, I know of no better place. The members of our party were far from expert, but caught all we could use and, more, sending the surplus to the hotel at the station. One fish weighed 4 pounds, a few at 3 and from that down, and we would have had larger fish, the guides told us, had we gone earlier or later, September being spawning time, and most of the fish consequently indispensed. This is written for no other purpose than to tell fishermen the truth and facts as we found them.

STEPHEN P. M. TASKER.

PHILADELPHIA, Pa.

## Keeping Fish Alive.

CONSUL-GENERAL GUENTHER, of Frankfurt, Germany, writes: "It is reported that the French naturalists, Billard and Bruyant, have made a discovery with reference to keeping fish alive, which may be of practical importance.

"The reported discovery concerns a tiny alga, by itself not visible to the naked eye, which possesses the remarkable property to preserve the water in which it exists in a state of great purity for an almost unlimited period. The little plant possesses also the advantage of multiplying rapidly, and thrives in almost all kinds of fresh water. To the naked eye the presence of these algae is noticeable through the brilliantly green color of the water, provided it contains a large number of them. The two scientists have succeeded in keeping brook trout alive in a large-sized vessel for six weeks, so that their taste at the end of this period did not appear to be impaired in the least. This is all the more remarkable as it is well known that otherwise brook trout can only be kept alive in running water. Leeches have been kept alive by the same process one and one-half years without change of the water. Experiments have already been made to make practical use of the discovery for the transportation of live fish.

"Live brook trout, for instance, were shipped by rail, the journey consuming seven hours, at a temperature of 25 degrees, in vessels filled with water to which these algae had been added. The trout were all fresh upon arrival, while of others, shipped at the same time in pure water not containing these algae, not a single trout arrived alive. The explanation of this phenomenon is probably that these algae, like other green plants, decompose the carbonic acid exhaled by the fish, and so reoxidize the water. The two scientists are also of the opinion that the algae also render the poison, which may have been secreted by the fish, harmless."

## A Tame Eel.

## Editor Forest and Stream:

A recent article on this interested me much. In the rotunda of a hospital in Cincinnati is a large granite basin supplied with clear and cold well water from a bronze figure of a boy standing on top of a large granite block and holding in an uplifted hand a leaking boot. About the base of the large block, which is supported by iron standards, so that it is about six inches above the bottom of the basin, are piled loose fragments of granite, with interstices for the passage of fish. In the basin are a number of bass, sunfish, small carp, minnows and gold fish. There were also two eels, one very large, and two turtles. I fed them two to three times a week on meat finely cut, bread crumbs, etc., and during the summer occasional grasshoppers and moths from about the arc lights. They became quite tame, and would come with a rush to take their food, and many of the bass and sunfish would take it from the hand, as would one turtle and the larger eel. This eel grew remarkable tame. It would not only take meat from the hand, but allow rubbing with a stick or the hand, and would seem to enjoy it and turn over on its side for more, and finally could be lifted out of the water and would not attempt to get away. Many of the fish seemed to have regular habitats in some nook among the rocks. It was an interesting study.

E. S. WHITAKER.

## Codfish Taken with the Fly.

## Editor Forest and Stream:

There is a long narrow inlet of the ocean running from Halifax Harbor to the northwest, called North-west Arm, in which during May and June there is good fly-fishing for pollock. At the junction of the arm and harbor is an extensive shoal, Point Pleasant Shoal, on which at low tide there is about three to six feet of water. This is good ground for trailing. Last June I was casting for pollock and getting none, but to my great surprise I raised and killed six codfish, ranging from two to six pounds. This is the first time anything of the kind has occurred here, at least as far as I can find out.

Will your piscatorial experts kindly say if the occurrence is known to any of them.

G. I. MILLER.

## International Fisheries Conference.

SEATTLE, Wash., Nov. 11.—The International Fisheries Conference, after adopting a resolution requesting the fish commissioners of Washington and British Columbia to prepare complete data on the run and pack of sock-eye salmon for a number of years past, adjourned yesterday. This was the only recommendation made by the commission, the Canadian members refusing to take up the question of a close year. Both fish commissioners were present at the conference, and stated that the work of preparing the requested data would be commenced at once.

## The Kennel

## Telegony.

## Editor Forest and Stream:

The paper on "The Transmission of Acquirements" in your Oct. 28 issue, while strong throughout, and to a layman convincing in general, is very far wrong in dealing with telegony.

The fact seems to be that this phenomenon, while exceedingly rare, does occur but only in a very small percentage of cases of mesalliances. Some years since, I collected statistics very carefully and thoroughly, extending my inquiries for about two years, and as you, Mr. Editor are aware, I knew lots and lots of dog men in those days, and I got but one case that was thoroughly established, and one more that seemed possibly to be a case of telegony, but there were several chances of superfetation; and, as I remember, this one case was offset by over 200 cases of mesalliances, where telegony did not show. And while the percentage of occurrences of telegony in my statistical effort was only one-half of one per cent., it must further be remembered that instances where it does show are remembered, from the very fact of their unusual nature, while where it is not shown the matter is forgotten as just the usual rule.

Mr. Reid is eminently correct in saying that the mother is not changed by a mongrel alliance; that precious bit of rot has been championed, but only by "changes in cell structure" and "all the formulas and phrases that oppress her" (Science).

It is probably twenty years since Dr. Jonathan Hutchinson (I think he was President of the British Medical Society; anyhow, he was a highly distinguished man) set forth the theory that explains telegony, and does not lug in "changes in cell structure," etc., ad nauseam. In the words of a layman, it is about this: At the time of the mongrel union, the stroma is abnormally thin, a sperm penetrates it, and reaches an ovum only developed to the extent of the outer layer, from which the skin is evolved, and fertilizes that ovum to the extent of giving life to that layer (I wish I could remember the name of that layer; it is a "blast" of some kind, but I forget whether it is the "epiblast" or another one); at the next union, with a sire of her own breed, or race, that partially fertilized ovum is ripe, is fertilized, and in all other "blasts" but this outer one, takes the form and type due to the last mated pair.

This fact thoroughly accounts for the fact that telegony is invariably shown *only in the skin* (or the hair, an appanage of the skin). The pug bitch who underwent a "change in cell structure" through a rough-haired terrier's assistance; at her next litter, got by a pug, had one puppy with the coat to be expected of a terrier-pug; but all conformation was that of the pug.

I thoroughly believe that Mr. Reid is entirely correct in scouting that moonshine nonsense of "maternal impressions" affecting the progeny. I have never seen or heard of a case where that was alleged, that it was not self-evidently the plain results of a mongrel union, if facts were at all fully given. Somebody may cite Herbert Spencer in support of telegony, and Charles Darwin as affirming "mental impressions." But Mr. Spencer stated that they accepted statements of others, whom he supposed knew what they were talking about, and when Mr. Everett Millais and some more got after those sources of "information" they shut up like clams, and "did not wish to be involved in any controversy" (wise that), and Mr. Darwin's instance of a greyhound bitch, in heat, following her master riding along the public road, teased by a mongrel on the way, and although served by a thoroughbred greyhound, threw a litter of mongrels, would cause a dog man to ask whether that bitch was ever five minutes out of her master's sight?

WM. WADE.

OAKMONT, Pa., Nov. 4.

## The Mecklenburg Meet.

CHASE CITY, Va., Nov. 9.—The sportsmen accustomed to the finest fall fields sport of the Mecklenburg are here with the first flushes and have not missed a day's shooting since the opening of the season, Nov. 1, and are bagging daily from one to three dozen birds.

The weather, fields and roads are in perfect condition, and the sport could not be better. The hotel game preserves are 18,000 acres. The Mecklenburg hounds are famous and have had field practice all the season, for the Mecklenburg meet of the Virginia-Carolina Fox Hunters'

Association, which was held at headquarters, Oct. 23 to 28, with a recorded grandest week's sport that ever took place in this State, there being some six States represented in famous sportsmen and packs, and 125 riders, with no blanks in a week's chase, but from one to three foxes caught every chase, and yet without a least serious accident to man or horse. The hotel also owns kennels of fine dogs, which are ready for the guests when needed, also guides are provided.

During the Christmas holidays there will be another rather informal fox chase meet here, owing to the popular demand generated during the October hunt, when there were some 125 hunters and other guests. The next annual meet will be Nov. 1 of next year. Col. W. T. Hughes is president of the Virginia-Carolina Fox Hunters' Association, and Mr. E. W. Overbey, of Boydton, Va., the famous fox hunter and foxhound breeder, is secretary and treasurer.

W. E. D.

## Points and Flushes.

THE Imperial Bloodhound Kennels, Danbury, Conn. (Dr. Knox, proprietor), advertises puppies in our business columns, and for this stock Dr. Knox gives assurance of character and breeding, and of excellence for bench show or trailing.

## "Only a Dog."

THE New York Times says: "A three-masted bark (who ever heard of a bark with only one or even two masts) believed to be the Orion," and then goes on to tell that she was passed in midocean by the White Star Liner Teutonic. "The officers leveled their glasses on the craft but not a sign of life was seen unless a black object that some thought was a dog; was, in fact, the Orion's mascot."

We should like to know, and others would like to know also, how those officers who "leveled their glasses," the steamer being "within five miles of the derelict," could have definitely settled in their minds whether that "black object" was not the colored cook, and if it was only "a dog," why they did not rescue the dog, it would not have cut down the steamer's "record" more than half an hour to have learned definitely if there was any human or animal life on board.

The Teutonic must be provided with very powerful binoculars to solve such an important problem to the satisfaction of conscience and the dictates of humanity at a distance of "five miles." Many a small boat has been sent from a ship to rescue a dog from a derelict, because the captain of the ship loved dogs and would not permit one to perish at sea, when it could be saved by a few minutes' delay in the voyage.

Many's the dog that has saved a ship, because God had given it an intelligence superior to the man who commanded the ship upon which he made his home. We have records to prove this statement. There may not have been a dog on the Orion, but it would have rebounded to the credit of the captain of the Teutonic if he had been sure that there was not, when it was thought that there was one on her lonely decks and deserted, "whence all but him had fled."—American Shipbuilder.

## Canoeing

## Officers of A. C. A., 1906.

(Assumed office Oct. 1, 1905.)

Commodore—H. Lansing Quick, Youkers, N. Y.  
Secretary—William W. Crosby, Brighton Mills, Passaic, N. J.  
Treasurer—Frederic G. Mather, 164 Fairfield Ave., Stamford, Conn.

## ATLANTIC DIVISION.

Vice-Commodore—Woolsey Carmalt, 82 Beaver St., New York.  
Rear-Commodore—Matthias Ohlmeyer, Francis H. Leggett & Co., 128 Franklin St., New York.  
Purser—George S. Morrissey, 73 Mercer St., New York.  
Executive Committee—William A. Furman, 846 Berkeley Ave., Trenton, N. J.; Louis C. Kretzmer, Schepp Building, New York; Clifton T. Mitchell, 46 E. Sedgwick St., Germantown, Pa.  
Board of Governors—Robert J. Wilkin, 211 Clinton St., Brooklyn.  
Racing Board—Daniel B. Goodsell, 36 Washington Sq., New York.

## CENTRAL DIVISION.

Vice-Commodore—Henry R. Ford, 45 N. Division St., Buffalo, N. Y.  
Rear-Commodore—Edward H. Demmler, 526 Smithfield St., Pittsburgh, Pa.  
Purser—B. Irving Rouse, 981 Lake Ave., Rochester, N. Y.  
Executive Committee—John S. Wright, 519 West Ave., Rochester, N. Y.; Lyman T. Coppins, 691 Main St., Buffalo, N. Y.; Jesse J. Armstrong, Rome, N. Y.  
Board of Governors—Charles P. Forbush, 164 Crescent Ave., Buffalo, N. Y.  
Racing Board—Harry M. Stewart, 85 Main St., E. Rochester, N. Y.

## EASTERN DIVISION.

Vice-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.  
Rear-Commodore—Frank S. Chase, Manchester, N. H.  
Purser—Edgar Ward, 112 Highland St., West Newton, Mass.  
Executive Committee—Daniel S. Pratt, Jr., 178 Devonshire St., Boston, Mass.; Arthur G. Mather, 84 South St., Medford, Mass.; H. L. Backus, 472 Lowell St., Lawrence, Mass.  
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; Herman D. Murphy, alternate.

## NORTHERN DIVISION.

Vice-Commodore—J. McDonald Mowat, Kingston, Ont., Canada.  
Rear-Commodore—James W. Sparrow, Toronto, Canada.  
Purser—Russell H. Britton, Gananoque, Ont., Canada.  
Executive Committee—Charles E. Britton, Gananoque, Ont., Canada.  
Board of Governors—John N. MacKendrick, Galt, Ont., Canada.  
Racing Board—J. McDonald Mowat, Kingston, Ont., Canada.

## WESTERN DIVISION.

Vice-Commodore—John A. Berkey, St. Paul, Minn.  
Rear-Commodore—Lucien Wulsin, The Baldwin Co., 142 West Fourth St., Cincinnati, O.  
Purser—Wade Hampton Yardley, 49 Pioneer Press Bldg., St. Paul, Minn.  
Executive Committee—George H. Gardner, 149 Kennard St., Cleveland, O.; Augustus W. Friese, The Journal, Chicago, Ill.  
Board of Governors—Henry C. Morse, Peoria, Ill.  
Racing Board—Frank B. Huntington, 90 Sheboygan St., Fond-du-Lac, Wis.

## How to Join the A. C. A.

"Application for membership shall be made to the Treasurer, F. G. Mather, 164 Fairfield Ave., Stamford, Conn., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

# YACHTING

## A Singlehand Cruising Yawl.

COMPARATIVELY few men cruise singlehanded in these days, although there are many who prefer boats that can be handled by one man if necessary. The advantages of the craft that can be handled singlehanded at all times are manifold, and anyone owning such a craft is never deprived of a sail through being short of a crew. Singlehand cruising has been on the wane for many years, and it is quite a rare thing now to encounter a man who does all his cruising alone. While many men enjoy the solitude of singlehand cruising, the dangers which sometimes arise from sudden sickness, accidents and other unexpected contingencies are so great that some do not think the game worth the candle. But the real enthusiast, however, is not deterred by any of these things and enjoys every season what some would term his lonely voyages.

The singlehander, with accommodations sufficiently roomy to make two comfortable, is the ideal vessel for the man of reasonable means, for he can then take a friend or his wife or his son with him for a cruise if he so desires, yet he need never miss an afternoon sail just because he is shorthanded, for he can manage his little ship alone, no matter what the wind and weather may be.

Such a vessel as we have described is the one illustrated in our columns this week. The plans come from the board of one of our younger designers, Mr. John G. Alden, of Boston. All of Mr. Alden's work that we have seen has been of a high order, and if he keeps up the pace he has already set he may be reckoned as one of this country's coming yacht designers. His designs all show some originality and beside being a practical boatman he has had the advantage of scientific education. He has an eye to form and beauty, and this, together with a good knowledge of practical construction, equips him well for the profession that he is to follow. Mr. Alden has been associated with Mr. B. B. Crowninshield for some time, and his drawings are all up to the high standard exacted in Mr. Crowninshield's office. The designs that come from Mr. Crowninshield's boards are invariably well executed and carefully lettered. We mention this because it is rather a remarkable thing in these days when speed is the consideration in all business and professions and many essentials are consequently slighted. With one or two exceptions the standard of the work on the drawings that come from the English designers are vastly superior to anything done here. There is little reason for this, and while drawings need not be complicated or loaded down with unnecessary lettering or data, everything that does appear should bear witness to the efficiency and accurateness of the draughtsman.

The singlehand yawl was designed for Mr. C. H. Smith, of Boston, and Mr. Alden has given much time to the working out and perfecting of the design. Mr. Smith wanted a boat that would be as comfortable as a little boat can be in rough water and one that would not pound in a chop. The body plan shows sections favored by Mr. A. Cary Smith. The boat has a flaring side and she is over a foot wider on deck than she is at the waterline at the point of greatest breadth. The under-body is not cut away much and her overhangs are sufficiently long to give her a shippy appearance and carry out the lines to good advantage.

We would criticize two things in the construction, and while they are not of great moment they would add to the strength of the boat itself and the comfort of those on board. A deck beam carried athwartship at the after end of the cabin house would stiffen the boat somewhat, and while it would make access to the cabin a little more difficult it would also prevent any water from getting below should the cockpit fill.

The floor of the cockpit should be made to drain toward the after end. As shown in the drawing, the lowest point is at the forward end, and if the scupper were stopped up the water would soon get below. Then, again, anyone passing to and from the cockpit to the cabin would have to step or stand in a puddle of water.

By having the lowest point of the cockpit floor aft, what water gets into the boat would drain aft out of the way, and if the scuppers are open she frees herself much more readily.

The cabin house is 9ft. 3in. long and 4ft. 11in. greatest width. In the forward end of the cabin house on either side are screw ports. The cabin is 6ft. 10<sup>3</sup>/<sub>4</sub>in. long and on each side there are wide transoms 6ft. 2in. long. There is 1ft. 8in. floor room between the bunks. On each side at the after end are lockers. On the starboard side forward is a chest of drawers with a shelf on top. Opposite is the galley space, and there are shelves and lockers for stores, china and cooking utensils.

There is 4ft. 4<sup>1</sup>/<sub>2</sub>in. head room under the carlins of the cabin house. Good storage space is found beneath the cockpit and under the forward deck.

The materials of which the boat is built are clearly shown on the construction plans.

The rig has been carefully worked out and the boat can be made to balance under almost any combination of sail.

The dimensions are as follows:

Length—		
Over all .....	27ft.	10in.
L.W.L. ....	18ft.	
Overhang—		
Forward .....	4ft.	7in.
Aft .....	5ft.	3in.
Breadth—		
Extreme .....	7ft.	10 <sup>1</sup> / <sub>4</sub> in.
L.W.L. ....	6ft.	10in.

Draft—		
To rabbet .....	2ft.	7in.
Extreme .....	4ft.	6in.
Freeboard—		
Forward .....	2ft.	6in.
Aft .....	1ft.	9in.
Least .....	1ft.	7in.
Sail area—		
Jib .....	104 sq. ft.	
Mainsail .....	283 sq. ft.	
Mizzen .....	85 sq. ft.	
Total .....	472 sq. ft.	
Displacement .....	5,516 lbs.	
Ballast (iron, all outside) .....	2,400 lbs.	
Ratio sail area to wetted surface .....	3.29	

## Boston Letter.

PROGRESS ON SCHOONERS.—Two new 55-rating schooners are now in process of construction in the Lawley shops at South Boston. One of these is for Rear Commodore Alfred Douglas, of the Boston Y. C., and was designed by Mr. Fred D. Lawley. Her construction is well advanced, the cabin joiner work being now under way, and it is expected that she will be hauled out of the shop some time next month. She is a wholesome looking craft, with good cabin accommodations.

The second boat under construction is for Vice-Commodore H. A. Morss, of the Corinthian Y. C., of Marblehead, and was designed by Messrs. Tams, Lemoine & Crane. This schooner is 84ft. over all, 55 ft. 6in. waterline, 17ft. 9in. beam and 10ft. 5in. draft. Her sail plan is quite moderate. Although this boat is intended by her owner to be raced as often as circumstances will permit, nothing has been sacrificed in the cruising accommodations, as the spirit of the new uniform rule might imply. She is well divided below decks, the interior finish being in mahogany. The owner's quarters are reached by the main companionway, situated some distance forward of the cockpit. The companionway ends in a passage on the port side of the boat, which leads aft to a double stateroom extending the full beam of the boat. There is a berth on each side, with transoms. The room contains a bureau, and a toilet room leads from the after end. Forward of this stateroom is another stateroom and a chart locker on the port side. On the starboard side is the owner's stateroom, abaft which is a toilet room. The passageway leads forward to the main saloon, which takes in the full beam of the ship. Here there are generous transoms, plenty of shelf and locker room and there are two sideboards, one on each side. There is also a stove with mantle above. Forward of the main saloon is the galley, off of which is the captain's stateroom. The galley contains all the modern inventions for comfortable cruising. There is also situated here an acetylene tank, by which the yacht will be lighted. There are accommodations for seven men forward. It is expected that a third 55-rater will be built for a Boston man, but nothing definite can be announced at present.

NEW BURGESS & PACKARD BOATS.—Messrs. Burgess & Packard have orders for a 22-rater for Mr. Charles Burgess, a 30ft. cruiser for Mr. C. J. Field, of Seattle, a 32ft.

sloop for Cape Cod and a 21-footer whose owner's name is withheld. They also have an order for a 100ft. passenger boat for Southern waters, the motive power for which will be two gasolene engines of 100 horsepower each. They also have orders for the following power boats: A 35ft. cabin launch, with 25 horsepower engine, for Mr. Vertress, of Nashville; 28ft. launch, with 10 horsepower, for Mr. E. L. Rose; two twin-screw 80ft. power yachts, each to have 100 horsepower, and a 55ft. launch with 50 horsepower.

NEW SKENE LAUNCH.—Mr. Norman L. Skene has an order for a 32ft. launch for Mr. R. H. Curry, of Melrose Highlands, Mass. This boat will be moored at City Point.

WIDOW III. SOLD.—Mr. Herman W. Friend, of the Boston Y. C., has sold his auxiliary cruiser Widow III. through the agency of Mr. Norman L. Skene to Mr. James B. Ely, of New York, who will use her at York, Me. Widow III. is 36ft. over all, 24ft. waterline, and 9ft. breadth. She is equipped with a Sagamore engine of 4 horsepower.

NEW 42FT. SCHOONER.—Mr. Isaac B. Mills has an order for a 42ft. waterline schooner to be 56ft. over all and 14ft. breadth, for a member of the Eastern Y. C.

JOHN B. KILLEEN.

## British Letter.

THE DECLINE OF YACHT RACING.—Following on Mr. Burton's letter on this subject, which appeared in the Field of Oct. 14, and which I commented on in my last letter, there has appeared in the same paper one from Mr. Charles MacIver, a well-known Clyde yachtsman. Mr. MacIver indorses what Mr. Burton says, but goes even further and says that "The first backward step was taken many years ago, when we accepted the principle of pandering to inefficiency by making special concessions for inferiority of rig." By this Mr. MacIver means, of course, the allowance made for schooners and yawls. With all due deference to Mr. MacIver as a practical yachtsman, I have no hesitation in saying, that the vast majority of people will entirely differ from him. It is clearly in the interests of yachting, and therefore the duty of the Yacht Racing Association and the yacht clubs to cater for the classes which exist, and if they followed the advice of these two gentlemen, there would be little or no racing at all, excepting in the 52ft. class and some of the small classes. In their partiality for class racing these gentlemen appear to forget that something must become of the outclassed rater, and they also seem unaware that there are many yachtsmen who do not care to go through the strenuous work of class racing, which means being on the go all the season, and sailing several days in each week, although they like to have an occasional race. Then there is the question of expense. Many people who like to have a race when one comes their way cannot afford the large crew and heavy expenses necessary in class racing and are perforce obliged to indulge in cruiser matches. It is quite apparent that the Y. R. A. and the leading yacht clubs should do all they possibly can to encourage class racing as being the highest form of the sport; but they can never hope to drive people into it, and they must proceed on common sense lines.

SINGLE-HAND CRUISING YAWL—SAIL PLAN—DESIGNED BY JOHN G. ALDEN FOR C. H. SMITH, 1905.

There will always be men who prefer class racing pure and simple to any other form, but there will always be others—and plenty of them—who, either from necessity or choice, will stick to handicaps, and they must not be neglected. Into their hands will come the ex-racers for which a market must be found, or else class racing could not go on, for owners would be left with their outclassed boats on their hands. So long as there is yacht racing, so long there will be handicap classes. The remedy for the revival of class racing is not in the abolition of the handicap classes, but in a proper system of construction, whereby racing yachts may be turned out strong and substantial. The Y. R. A. can do a lot to foster class racing, but they will always have to look forward to the encouragement of the handicap classes as an essential part of our sport.

**A NEW CLASS-RACER.**—Mr. R. Young, who last year raced the 100-ton cutter *Merrymaid*, has given an order to Camper & Nicholson, of Gosport, for a first-class racing cutter of 80-rating. It is stated that the new boat will be built to Lloyds highest class, so that in one respect at any rate she will not be what is commonly called a thoroughbred, for classification at Lloyds requires stout scantlings, but is unfortunately ill-adapted for racing yachts with heavy lead keels, as most of the strength is in the wrong place. The probability is that Mr. Young's new boat will be much after the style of *White Heather*, *Valdora* and the other more recent boats in the handicap class, and an attempt will be made to form a class with these vessels, including also *Bona* and *Navahoe*, and race them under Y. R. A. rules and time allowances. This is the nearest approach that one can hope to get to a bona fide rater class until the question of an international rating and scantlings are fixed on. It will be rather a mixed lot, for *Navahoe* will be running her fourteenth season and *Bona* her tenth; yet these two boats will be the pick of the class unless the new Gosport craft turns out a flier. If owners are really so tired of handicap racing, such a class as mentioned above would be a distinct novelty and an interesting experiment, and it will be one step in the right direction—namely, that of getting back to the real racing. E. H. KELLY.

## Designer of the Swampscott Dory.

From the Boston Globe.

"THEN if you are looking for the designer of the Swampscott dory, you are looking at him now," said Capt. Theophilus W. Brackett, who had just landed at Fishermen's Beach with a catch.

"It was in the 40s that I concluded that there could be an improvement made on the old flat-bottom, straight-side dory, and after a good deal of drawing I hit upon what I thought it ought to be, and then I carried my plans into James A. Knowlton's shop and asked him if he could build me a dory after the plans. He said he could, and he went to work on it. The old fishermen dropped in while he was building it and made all sorts of fun of it; they all declared it wouldn't be a boat when it got done, but after a while she was ready to launch and I rowed away from everything on the bay. That was the start of the Swampscott dory."

The evolution of this now famous little boat seems to have begun with the primitive forms in various quarters of the globe. Influences of climate and peculiarities of race have had much to do with deciding the type in use in each locality. But the starting point was evidently the single log of buoyant wood made pointed at both ends, and not hollowed out. These may be seen yet in places along the Australian coast.

The catamaran, which is made by lashing three logs together, the two side logs being larger than the one in the center, were used in Ceylon and India for fishing and for landing goods. These are also found on the east coast of South America and the West Indies.

Catamarans navigated by sail were found in use on the coast of Peru, but the dugout canoe is traceable to the stone age, while the American Indian is the author of the bark canoe, Napoleon caused to be constructed a flat-bottom boat for use in his proposed invasion of England, which was called *Catamaran*; but its precise form and outline are not given. It is believed to have been of flat-bottom, slanting up to square ends.

According to Capt. Brackett, who has spent his life in fishing boat at Swampscott and the Cape, the three boats which have been used by fishermen in American waters are the punt, the straight and sloping dory. The punt has a round bottom, with straight, broad stern. The old dory has a broad, flat bottom, straight up sides and broad V-shaped stern, while the Swampscott dory has a narrow flat bottom with sides rounding up, and

a very narrow V-shaped stern. It is claimed and conceded that the Swampscott dory is safe on the water, easier of propulsion, hence speedier, and more sightly than any other boat.

"When I came here from the cape," continued Capt. Brackett, "there was no boat building at Swampscott; all our dories were built at Salisbury with straight sides and broad bottoms. But pretty soon a few small shops were in operation, and carpenters would spend their spare time building dories."

The fame of the Swampscott dories spread, and a demand for them sprang up everywhere. They are even shipped to Australia, that country in the remote parts of which is still found the single log with sharpened ends, the true primitive forebear of the craft which they are seeking in Swampscott to-day.

Capt. Brackett's idea, which amounts to a discovery of more than 60 years ago, enters into the construction of all power dories, launches and light sailing boats of the present time. But, alas! the discoverer, at 86, is forced to brave the hardships and dangers of weather and sea in order to sustain himself in his declining years.

## New Orleans Notes.

**CAPT. ROBERT GALLOWAY**, of Memphis, Tenn., has sold the 85ft. auxiliary yawl *Daisy*, one of Gielow's last year's designs, which is enrolled in the Southern Y. C., to the Hon. Joseph Sibley, of Franklin, Pa., who will continue to use the craft in Gulf waters. Captain Galloway has placed an order for a larger yawl to take the place of *Daisy*, which in turn replaced the 60ft. yawl *Coon*, which he also brought South. *Daisy* made the memorable voyage from New York to the Great Lakes, via the St. Lawrence River and down through the small lakes of the State of Wisconsin to the Mississippi River and the Gulf to New Orleans.

Mr. H. U. Hayden, of the Southern Y. C., is having built by Messrs. Burgess & Packard, of Boston, a 200 horsepower twin-screw power boat of 103ft. length over all, 93ft. waterline, 16ft. breadth and 3ft. 9in. draft, with a guaranteed speed of over 18 miles an hour. This craft will have two 100 horsepower Standard engines. She is something of a departure in boats of this size. Her pilot house is unusually well forward. Mr. Hayden has just recently sold his 50ft. motor launch *Zora* to Mr. E. M. Toby, also of the Southern Y. C.

The 35ft. yawl *Whim*, recently purchased at Cottage City, L. I., by Drs. S. S. Grosjean and W. C. Richardson, of New Orleans, has created quite a favorable impression on Lake Pontchartrain. Since getting here *Whim* has been fitted with a 5 horsepower Wolverine engine. A large power yacht, purchased at New York by Dr. J. R. M. Dillon, just arrived, is a welcome addition to the fleet, as will be the 20-knot autoboat designed by Mr. Henry J. Gielow for Mr. A. F. Jay, of New Orleans.

The owners of the sloop *Country Girl*, of LaPort, Tex., are out with a challenge to race any of the New Orleans yachts for \$1,000 a side. Mr. S. F. Heaslip, owner of the ex-champion of the Great Lakes, *Cadillac*, enrolled in the fleet of the Southern Y. C., has responded that he would accept the challenge with *Cadillac* and race for any sum up to \$5,000, and the Southern Y. C. has notified the Texas yachtsmen that they will give them \$250 toward their expenses to have the race here. L. D. SAMPSELL.

**BRONZE SLOOP FOR F. M. SMITH.**—The bronze sloop designed by Mr. Henry J. Gielow and mentioned in these columns last week, is for Mr. F. M. Smith, owner of the steam yacht *Hanoli*. Mr. Smith has owned two racing craft, namely, *Effort I.* and *Effort II.*, and while these boats flew his pennant they were raced constantly. The new boat is larger than anything Mr. Smith has attempted, and she will meet *Neola* and *Weetamoc*. Mr. Smith is a member of the New York, Larchmont and Shelter Island Y. C.'s.

**BRITISH DELEGATES AT RATING RULE CONFERENCE.**—On Oct. 24 a meeting of the council of the Y. R. A. of Great Britain was held and delegates were elected to represent England at the conference to consider the advisability of an international measurement rule for racing yachts. Messrs. W. P. Burton and R. E. Froude, F.R.S., were the delegates elected. It was decided that the first meeting of the conference, at which Great Britain, France, Germany, the United States, Denmark, Sweden, Spain, Italy, Portugal and Switzerland are expected to be represented, will take place at the Langham Hotel, London, on Monday, Jan. 15.

## Rifle Range and Gallery.

### The Individual Championship Match.

THE twelfth annual individual rifle championship match was shot on Election Day over the 200yd. ranges in Greenville Shooting Park, New Jersey. The winner was Dr. Walter G. Hudson, president of the Manhattan Rifle and Revolver Association of New York city, who scored 2268 points out of the possible 2500, while second man, W. H. French, of Newark, N. J., was only 3 points behind, but tied the Doctor shot after shot during the last half of the match, and evidently could not stand the strain of such a long contest, which lasted from 9 o'clock in the morning until dark. Harry M. Pope, of Springfield, Mass., won the ten-shot trophy with the great score of 237 out of the possible 250 points.

The interest displayed in this affair is ever keen, for, while it was originally intended as a sort of farewell shoot at the end of the outdoor season among the riflemen who take part in all the important matches in and about New York city, and was therefore more or less of a local character, it came to be watched with keen interest by all the riflemen of the United States, and those who could find time to come to New York on Election Day came to consider it quite an honor to take part in the match and were glad to meet the famous riflemen who always congregate to watch if they do not take part in this affair. To-day it is by no means a local match, but those who stand behind the committee of arrangements have carefully avoided calling it by any high-sounding name, yet it is considered a very high honor to win the old medal originally presented by William Hayes, the veteran rifleman of Newark, but now attached to eleven gold bars, each bearing the name of the winner and the year in which he won the trophy. And it is also an honor to capture the trophy given the contestant who has the highest 10-shot score, for when so many expert riflemen meet to fire 100 shots in competition, it is reasonable to expect that very high scores will be made, although the winner of the 100-shot match cannot take the 10-shot trophy, too. The lowest score that has ever won this 10-shot match was 229, in itself a score of no mean order. The records which follow in their proper place prove that riflemen have shown steady advancement during the past dozen years, and it is only fair to say that rifle-makers and ammunition makers are entitled to a share of the credit, since vast improvement has taken place in rifles, sights and ammunition. This affair has also brought to light the real value of telescope sights, which until a few years ago were barred from important competitions. Most of the high men in this match used telescope sights, and several of them shot smokeless powder with satisfactory results. Improvements show steadily, but surely.

Election Day was a glorious one on which to be outdoors, but from the rifleman's point of view it was not of the best for fine shooting. At one time the sun shone brightly, but at another the sky was overcast, and again light clouds hid the sun momentarily. The result was an almost constant changing of the light, with a corresponding changing of elevations. The wind was fresh, but not an important factor in this match, as the Greenville range is enclosed by high fences that prevent the wind from sweeping across with much force. The best light conditions prevailed during the early morning, and after 3 o'clock in the afternoon.

The number of contestants this year was about the average, although fewer took part than last year. This time twenty-two men finished their scores, and out of this number eight had totals of 2200 points or more. There were perhaps one hundred riflemen in the shooting house during the exciting finish of the match, and almost as many sat down to the dinner which followed, when the trophies were presented, notes compared and stories handed round concerning Election Day matches in other years. Within recent years the old Zettler Rifle Club has taken charge of the affair, and its officers have done everything they could to make it a success. So smoothly did everything pass off that there was no hitch of any kind, yet there was a scarcity of rules and conditions.

Nearly one-half of the contestants used telescope sights (French, Pope, Dorrier, Hubalek, Tewes, Ross, Barker, Buss, Schlicht, Smith and Barning), and it was noticeable that those to whom the use of these sights is still somewhat new showed remarkable improvement in their holding. Dr. Hudson had a telescope with him, but did not put it on his rifle, and Mr. Barning, who used a glass, had trouble with its shifting from the recoil of the rifle, and lost his chance before he discovered what was wrong, then could not remedy the fault with the few tools available in the shooting house, and his scores suffered badly in consequence. Mr. French was the only contestant who used a full length telescope, something that is not so popular to-day as formerly. Mr. Dorrier's fine work with a telescope of only three power shows that improvement in sighting lies not so much in great magnification as in rendering the target clear enough so that it may be seen distinctly. Harry Pope used a five power glass, which he thinks is best for his eyes.

George Schlicht is another of the riflemen who have taken up the telescope recently, and while he admits that it aids him, also admits that he has not yet mastered its peculiarities, and finds it quite a different proposition to the old pinhead sight. He is a veteran target shot, who seldom misses a shoot of importance.

Louis Maurer can always be found shooting in the big matches, just as he has done for more years than most of us can remember. He is seventy-three years of age, but is full of vigor and activity, and after firing his 100 shots showed less fatigue than some of the youngsters. He has been a rifleman ever since 1844, and says he has taken a deep interest in all the improvements to firearms and shooting during those sixty-one years, both in Germany, his native land, and in the United States, where he has spent nearly all his life.

The match was scheduled to begin at 9 o'clock, but all the latitude possible was given the contestants as they arrived. Some came in as late as 11 o'clock, but each one was permitted to fire his 10 sighting shots, if he chose, and as some shot faster than others, the scores were not finished simultaneously, and it was almost dark when the last shot was fired, and the contest finished beyond all doubt.

The contest in detail follows: At the end of the first score French and Hubalek were tied with 229 each, third and fourth being Hudson and Dorrier, tied with 225, while Pope and Ross were tied with 219. Hubalek forged ahead in the second round and finished with a total of 458 for the 20 shots. Hudson was second with 456, and French third with 449. Pope forgot to put a bullet in his rifle on his fifth shot in this score, and this cut his total down to 424. The third round closed with Hudson leading, with 688 for the 30

# GAS ENGINES AND LAUNCHES.

Their Principles, Types, and Management. A Complete and Practical Manual.

BY F. K. GRAIN, M. E.

Bound in cloth, with 123 pages and 20 illustrations. Sent, postpaid, for \$1.25.

THIS compact and comprehensive handbook contains all the information essential to users of the marine gasoline engines, and will be welcomed by the thousands of men now owning and running power boats. Laymen and experts will alike find the book invaluable. It treats of the various types of marine gasoline engines, points out the good in each, and tells how to run them. A knowledge of the contents of this book will help to overcome difficulties and avoid accidents. The most complete book of its kind ever published.

FOREST AND STREAM PUBLISHING CO., NEW YORK.

shots; French 680, Hubalek 676, Dorrlor and Ross tied with 658.

The fourth score was finished with French leading Hudson by 4 points, his total being 911; Hudson 907, Hubalek 902, and with a good chance to improve.

When 50 shots had been fired French was the favorite with a total of 1141, seven points higher than Hudson's 1134.

The fact that he was behind spurred Hudson to greater efforts, and he finished his sixth score with a total of 230, which gave him the lead by one point, or 1364 points to French's 1363.

In the seventh score Hudson had 1595 points, all told, while French had 1583; Hubalek had 1563, but Pope was gaining and but 3 points below him.

French cut down Hudson's lead materially in the eighth round, finishing with 1812 points, still 4 behind the Doctor.

The ninth closed with French and Hudson tied on 2044 points. The atmosphere of the old shooting house began to warm up.

Pope was third, and the old war horse, Mike Dorrlor, had begun to see things through his telescope, and had a total of 2005 for fourth place.

The tenth and last round was remarkable because Harry Pope scored 237 points and settled all doubts about who should take the Armbruster trophy for the best 10-shot string.

Up to that time the matter was undecided, as both he and Dorrlor had scored 235. His score equalled the highest one ever made in these championships—that of Dr. Hudson, who won the Armbruster trophy last year.

But Pope's total for his last 50 shots was 1157 points, an average of 231.4 per score. This great work was for the moment forgotten, however, in the interest over the fight between French and Hudson for first place in the championship.

They tied on the 91st shot. Hudson gained 3 points on the next shot, but French tied him on the 93d.

French gained 5 points in the next round, but lost one in the 95th, his score standing 112 to 108 for the medicine man.

On the 96th shot French had 134 points to Hudson's 132, but they tied again in the 97th round, while in the 98th round Hudson forged ahead with 181 to French's 179.

In the 99th the latter made a 24 to the Doctor's 22, and again they tied. The excitement was intense. Fancy what these men had to face, with one shot to fire and the issue nip and tuck during its last half.

But Dr. Hudson has been in many close matches and is well known for his ability to surprise his shooting friends, hence it was only what many of them looked for when the marker signalled a 24 for him.

The strain was too much for Mr. French, who fell down and made an 18, losing the match by 3 points, but receiving the congratulations of all hands for the plucky fight he had put up.

This gave Dr. Hudson the famous old Hayes trophy, with its eleven bars bearing the names of its various winners.

Mr. French won the Keller trophy, given for the best 100-shot score, but as the Doctor was not under the conditions of the match entitled to two prizes, it went to second man.

Harry Pope had to be content with the Armbruster trophy for the best 10-shot score, and the bullet he failed to shoot.

It was not much consolation when he knew that an average shot, in his case a 23, would have landed him in first place with a good margin to spare.

But such things are all in the game, and he did not show his disappointment by any outward signs.

The contestants were permitted to fire 10 sighting shots before beginning the match, but after signifying their intention to begin, every shot counted, bullet or no bullet.

Nothing but high power ammunition was barred, and any rifleman could enter. The 25-ring target was used. It has a 12-inch black and rings 3/4-inch apart, the center, 25, being 1 1/2 inch in diameter.

The distance was 200 yards, and the firing position, offhand. The scores follow:

Table of scores for various shooters including Dr. W G Hudson, W H French, Harry M Pope, Michael Dorrlor, Arthur Hubalek, William A Tewes, Fred C Ross, W A Barker, Charles Bischoff, L C Buss, George Schlicht, J Kaufman, Louis P Hansen, O Smith, Aug Begerow, B Zettler, P Andassy, H L Seckel, T Maurer, G T Conti, G Bernius, H F Barning.

The records show that the long score of this year was lower than in 1904 and 1903, while Mr. Pope's score of 237 ties the best previous one, made by Dr. Hudson last year.

These records are given below for purposes of comparison:

Table of 100-shot and 10-shot scores for various years (1893-1904) and shooters (F C Ross, M Dorrlor, H M Spencer, J E Kelly, Dr W G Hudson).

seconds; arm, any military revolver or any military magazine pistol, with full charge service ammunition; no re-entries:

Table of scores for Thomas Le Boutillier, Merrit H. Smith, R. H. Sayre, C. L. Burlingham, and Wm G Kreig.

United States Revolver Association.

NEW YORK, N. Y.—Inclosed herewith is matter of the official scores in the annual championship contest of the United States Revolver Association.

This information will be published in a small booklet and mailed to all the members of the Association within a few days.

Inclosed also is a copy of the Constitution, rules and regulations governing contests, etc., of the Association.

The success and rapid growth of this organization is without doubt a matter of much interest to every one interested in the development of skill in shooting the pistol and revolver.

From a membership of forty in 1900, the Association has grown to a total membership at the present time of about 600, scattered through thirty-eight States and Territories.

From a dozen entries in the national contests in 1900, the number of contestants has increased, until this year they number thirty-four.

By comparing the scores made in 1900 with those made the present year, under the same conditions, it will be noted that a marked advance has been made and that vastly greater skill has been developed by these contests.

This organization has negotiated and conducted two international matches with France, one in 1900 and the second in 1903, both of which were won by the United States.

The annual championship matches prove that no one section of the country has all the best shots.

In 1903, the Any Revolver Match A was won by J. E. Gorman, of San Francisco; last year the same match was won by Dr. I. R. Calkins, of Springfield, Mass., while this year the same match was won by John A. Dietz, Jr., of New York City.

Similarly, the Any Pistol or Match B was won in 1903 by Thos. Anderton, of Boston, Mass.; last year it was won by Dr. E. H. Kessler, of St. Louis, Mo., and this year it was won by John A. Dietz, Jr., of New York City.

Valuable and appropriate trophies and medals are provided by the Association as prizes in these contests.

Some of these are held by the winners from one contest until the next succeeding one, while others become the property of the winners after they have been won a limited number of times by the same person.

The Association is more than self-supporting, and is in excellent financial condition.

One of the definite things that the Association plans to accomplish in the near future is to establish a team match and provide a suitable trophy for teams of five men.

A. L. A. HIMMELWRIGHT.

Annual Outdoor Tournament of the U. S. Revolver Ass'n.

Held contemporaneously at New York, Chicago, St. Louis, Pine Bluffs, Arkansas and San Francisco.

Match A—Revolver Championship.—Open to everybody, distance 50yds., 50 shots on the Standard American target, 8in. bullseye, 10-ring, 3.36in.; arm, any revolver; ammunition, any; the score to be completed in one hour or less from the time of firing the first shot; no re-entries:

Table of scores for Match A participants including J A Dietz, R H Sayre, F V Kington, Wm G Kreig, Edwin Sturtevant, Sidney E. Sears, A L A Himmelwright, Albert Sorenson, T M Borcur, Dr M R Moore, John Doe, William T Clark, Mrs C C Crossman, Moses Summerfield, C C Crossman.

Match B—Pistol Championship.—Open to everybody, distance 50yds., 50 shots on same target as Match A; arm, any pistol; ammunition, any; score to be completed in one hour or less from the time of firing the first shot; no re-entries:

The score of the winner is better by one point than has ever before been made in this contest.

Table of scores for Match B participants including J A Dietz, G W Waterhouse, R H Sayre.

Match C—Military Championship.—Open to everybody, distance 50yds., 75 shots, fired in strings of 5 shots each; same target as Match A; each string must be shot within the time limit of 15

In order to stimulate interest in revolver and pistol shooting, and to ascertain the degree of skill of the revolver and pistol shooters of the United States, the United States Revolver Association has decided to offer an attractive series of medals.

The medals will be awarded to any member of the Association making the requisite scores, as follows:

- For 10 targets, counting 80 or better, a bronze medal. For 10 targets, counting 85 or better, a bronze and silver medal. For 10 targets, counting 90 or better, a bronze and gold medal. For 10 targets, counting 95 or better, a silver and gold medal. For 10 targets, counting 95 or better, a gold medal.

The rules governing the shooting for medals are as follows: Targets.—The target is the regular Standard American, with the bullseye 8in. in diameter (containing 10, 9 and 8 rings), for 50yds., and the same target reduced so that the bullseye is 2 3/4in. in diameter for 20yds.

These targets, numbered and signed, will be supplied by the United States Revolver Association at ten cents each; ten shots on each target constitute a score. The ten targets submitted for any medal need not be consecutive.

Position.—The shooter must stand free from any artificial support, and hold the revolver or pistol in one hand.

Arms.—Any revolver not to exceed 2 3/4lbs. in weight; maximum length of barrel, exclusive of cylinder, 8in.; trigger-pull, not less than 2 1/2lbs.; sights open, in front of hammer, and not over 10in. apart; any ammunition.

Military revolvers with plain, open, fixed sights, and trigger-pull not less than 4lbs., will be allowed 5 points.

Any pistol, length of barrel and distance between sights not to exceed 10in.; trigger-pull not less than 2lbs.; open sights; any ammunition.

The shooting for medals must in all cases be done on the grounds or in a gallery of a regularly organized shooting association or club, in the presence of at least two witnesses, one of whom must be an officer of the club.

After shooting, the scores and distance must be certified to by the club officer over his signature. The targets are then to be forwarded to the United States Revolver Association, addressed to the Secretary-Treasurer.

If the stipulated conditions are complied with and the scoring correct, the medals will be awarded and the shooter rated accordingly in the record book of the Association.

An illustration of the medals issued by the Association will be found on the last page of this folder.

It is hoped that all the revolver and pistol shooters of the United States will avail themselves of this opportunity to secure a rating in the records of the Association.

This will enable the Association to ascertain the degree of skill of the various shooters and to assemble strong teams from different parts of the country when necessary for important matches.

New York Schuetzen Corps.

THE regular shoot was held Nov. 10 on the Zettler ranges in West Twenty-third street. The attendance was large, over seventy men finishing their two 10-shot scores.

C. Meyer and F. von Renn tied for high score on the ring target, the former ranking the latter, who had the lower 10-shot score. On the bullseye target G. Ludwig was the winner.

The full results at 75ft., offhand, with .22cal. rifles:

Table of scores for New York Schuetzen Corps participants including H Hoensch, D Ficken, C Schmitz, H Nordbruch, F Lankenau, W J Behrens, C Brinkama, A Beckman, C Meyer, F Von Ronn, G Ludwig, J C Bonn, O Schwanemann, B Zettler, Phil Heidelberger, J Facklman, J N F Seibs, N C L Beversten, J Hainhorst, H C Hainhorst, H Haase, G Thomas, C Plump, R Ohms, F Facompre, W Dahl, H Offerman, J H Hainhorst, D Peper, A W Lemcke, J G Thoeke, H D Meyer, H B Michaelson, C Sievers, H Quenten, J N Herrmann, H W Messloh.

Bullseye target, degrees: Ludwig 17 1/2, C Brinkama 23 1/2, N W Haaren 43, Charles Meyer 45, H Haase 47, Aug. Jantzen 48, J Hate 50, Meinschien 52, Otto Schwanemann 52, F Gobber 54, G Fixsen 56.

Von Dwingelo 65, H Offermann 65 1/2, A P Fegert 72 1/2, Henry Quaal 72, J H Hainhorst 73, W J Behrens 83, Phil Heideberger 86, Henry Decker 88, J G Thoeke 95, Fred Muller 95 1/2.

Zettler Rifle Club.

THE 100-shot match at Greenville cut down the attendance at the club's indoor shoot, held Nov. 7. Henry D. Muller won the honors on the bullseye target, and young Charles Zettler on the ring target.

The results at 75ft., offhand, follow: Ring target: C Zettler, Jr. 246, 241, 244, 244, 242—1217; Henry D. Muller 235, 237, 239, 242, 244—1197; C G Zettler 236, 242, 235, 232, 240—1185; T H Keller 225, 231, 232, 237, 231—1156.

Bullseye target: Henry D. Muller, 50 degrees.

Rifle at Walnut Hill.

WALNUT HILL, Mass., Nov. 11.—The Massachusetts Rifle Association shoot to-day had a fair attendance. The weather conditions were fine, though a strong fitful wind tested the judgment of the shooters constantly.

In the annual 100-shot election week match four competitors completed their scores. R. L. Dale was high man with a total of 2155 points. Early in the shooting his rifle became badly leaded, and was given various treatments at times during the day, without wholly removing the trouble. This, with the poor conditions, very materially reduced his total, causing a loss of at least 75 points.

The effect of the wind was, as usual, most apparent at the 1000yd. range, where the experts shot until nearly dark, with only fair success. The scores:

Table of rifle match scores for Walnut Hill. Includes sections for 'Election week offhand match', 'A Niedner', 'J E Lynch', 'F H West', 'Offhand practice match', 'Ring target', 'Military medal match', 'Medal rest match', 'Long range rifle match, 1000yds.', 'Pistol and revolver match', and 'Pistol medal match'.

Providence, R. I., Revolver Club.

THE outdoor season was practically closed at our Cranston range by a special shoot on Nov. 4, which was one of the most enjoyable events of the season. A strong wind bothered the men, but some good scores were made.

Almy was high man all around with revolver, and Luther struck a gait on the reduced ring target which made it interesting.

A. B. Coulters, our president, spent most of his time with the Krag rifle at 200yds., and several of the members had an opportunity to try their hand with this weapon, with the result that we expect to take up military rifle shooting next spring in earnest. We had hoped to push this plan the past season, but our endeavors were sidetracked somewhere, and we have had to content ourselves with an occasional try. We are ready to take up the work when we have a show at 200, 300 and 500yds. range, and the use of the required weapon.

We are now busy pushing plans for the winter's indoor work. The following scores were recorded:

Table of revolver match scores for Providence, R. I. Includes 'Rifle, German ring target, 200yds.', 'Rifle, Standard target, 50yds.', 'Revolver, Standard target, 20yds.', and 'Revolver, military count, 50yds.'.

Cashion Gun Club.

CASHION, Okla., Nov. 4.—The Cashion Gun Club held a very successful shoot to-day, in honor of Mr. M. J. S. Day, of Fort Worth, Texas, a trade representative of a powder company. A large number of local men were out of town, but the club members present gave a shoot just the same.

The weather was beautiful, with no wind, so good scores were made. Henry Donnelly made the high average. The scores at 100 targets tell the story:

Table of revolver match scores for Cashion Gun Club. Includes 'J H Donnelly', 'J S Day', 'K L Eagan', 'Euens', 'Bryant', 'Smith', 'A L Houseworth', 'T Clark', and 'J L Houseworth'.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Nov. 16.—Bound Brook, N. J., G. C. shoot, and Fleming-Bissett contest for the individual championship of New Jersey.
Nov. 23.—Edgewater, N. J.—Palisade G. C. A. A. Schoverling, Sec'y.
Nov. 23-24.—Kansas City, Mo.—Missouri and Kansas League of Trapshooters' fifth tournament. C. B. Clapp, Sec'y.
Nov. 28-29.—Marsailles, Ill., G. C. R. E. Loring, Sec'y.
Nov. 30.—Utica, N. Y.—Riverside G. C., all-day target tournament. E. J. Loughlin, Sec'y.
Dec. 2.—Lowell, Mass., R. and G. C. all day shoot. E. J. Burns, Sec'y.
Dec. 12-13.—Omaha, Neb.—Interstate team race, between teams of Nebraska, Iowa, Missouri and Kansas. W. D. Townsend, Sec'y. 1906.
Jan. 16-19.—Hamilton, Ont., G. C. annual winter tournament. Ralph C. Ripley, Sec'y.
May 24-25.—Montreal, Can.—Canadian Indians' first annual tournament. Thomas A. Duff, High Scribe.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Riverside Gun Club, of Utica, N. Y., through the Secretary, E. J. Loughlin, announce an all-day target tournament for Nov. 30.

Secretary W. D. Townsend writes us that the Omaha, Neb., Gun Club shoot will be held on Dec. 12 and 13, instead of on Dec. 5 and 6, as at first announced.

A Lafin & Rand trophy to high gun, and cash prizes to second and third high guns, are features of the Lowell, Mass., Rod and Gun Club all-day shoot, Dec. 2. Mr. E. J. Burns is the Secretary.

In the contests of the Philadelphia Trapshooters' League, last Saturday, the Highlands defeated Clearview, 194 to 185; Lansdale defeated Camden, 184 to 153. Narberth defeated Merchantville, 180 to 161; Meadow Springs defeated Media, 172 to 158.

Secretary W. D. Townsend writes us that the Omaha, Neb., Gun Club will hold a tournament, and interstate team race between teams of Nebraska, Iowa, Missouri and Kansas, on Dec. 12 and 13. A day and a half will be devoted to trapshooting, after which, on the afternoon of the second day the team race will take place. The lowest team is to pay for the targets and for a dinner for the winners.

In the contest for the November cup, at the weekly shoot of the Crescent Athletic Club, Bay Ridge, L. I., Nov. 11, Mr. Frank B. Stephenson scored a win, making the excellent score of 24 out of 25 from scratch. Mr. A. G. Southworth, scratch, won in the Stake trophy contest, with a score of 22. The first contest of the team series was won by Messrs. Lewis C. Hopkins and Lowell M. Palmer, Jr., with 48 out of a possible 50.

At the shoot of the New York Athletic Club, of which he is a member, Mr. Gus Grieff scored an average of over 95 per cent. for the programme of the afternoon, Nov. 11. He won event 4, 25 targets with a full score from scratch, the trophy being awarded to him under the rule of the club, which recognizes a straight score as the winning score even if there be handicap scores of equal value to it, an excellent provision, by the way.

At the Point Breeze track, Philadelphia, Nov. 11, there were three open events and a special \$10 miss-and-out contest between Messrs. Churchill and Miller, the former at 30, the latter at 28yds. Churchill won in the twelfth round. The first sweepstake was at 10 birds, and Messrs. Muller and Staley made straight scores. In the second event at 5 birds, Messrs. Muller, Churchill and Wilson were high with 3 each. In the next event, same conditions, Messrs. Muller and Churchill were high with scores of 4.

The programme of the Missouri and Kansas League of Trapshooters may be obtained on application to the Secretary, Dr. C. E. Clapp, Moberly, Mo. On the first day, Nov. 23, twelve events are provided, of which the ninth is the L. C. Smith badge contest, 25 targets, \$2.50 entrance, use of both barrels. The other events are at 10, 15 and 20 targets, entrance \$1, \$1.50 and \$2. On the second day, there are eight 15 and four 20-target events, \$1.50 and \$2 entrance. Experts and paid men may shoot for targets only.

A correspondent writes us that "The shooting season of the Magic City Gun Club, of Muncie, Ind., for 1905, closed with the events of Nov. 2. The first prize, a 16-gauge Marlin repeating shotgun, was won by G. G. Williamson, who shot from the 19yd. mark. The second prize, a handsome watch charm, donated by the Hunter Arms Co., was won by J. R. Johnson, who stood at the 14yd. line. Johnson had his prize won outright, but Williamson, was tied with A. C. Spencer. In the shoot-off Williamson broke 22, and won."

The manager, Mr. L. H. Schortemeier, writes us that "The Bergen Beach Gun Club, Brooklyn, L. I., will hold their second annual merchandise prize shoot at targets on New Year's Day, Monday, Jan. 1, 1906, for from fifteen to twenty merchandise prizes; distance handicap, 16 to 21yds. rise; 50 targets, entrance \$2.50, including targets. Handicaps by the President, Mr. Harry Bergen; the Treasurer, Mr. H. W. Dreyer, and the Manager, Mr. L. H. Schortemeier. The shoot of Jan. 2, 1905, was a great success. Programme of other events later."

The Palisade Gun Club, Edgewater, N. J., offers a programme of eight 20-target events for their tournament, to be held on Nov. 23. Entrance, \$1.40. Added money total, \$20. Events 3 to 7 will be a 100-target race, \$5 entrance, for a \$100 Ithaca hammerless; ten entries to fill. A number of merchandise prizes, medals, etc., will be given for different averages. Guns, and ammunition, prepaid, sent to Wm. Benison, Edgewater, N. J., will be delivered on the grounds free. A sliding handicap will govern. A. A. Schoverling, Secretary, 2 Murray street, New York.

The Hudson Gun Club, of Jersey City, N. J., has again suffered from the malicious depredations of vandals, the last destruction being much worse than the first. Traps, targets, furniture, dishes, stove, etc., were smashed with painstaking thoroughness. Nevertheless, the club, with admirable pluck, resolved to continue, and at a meeting held in Jersey City, Nov. 6, appointed two committees, a House Committee and a Shooting Committee, each having full power to act. The Shooting Committee will arrange for the December tournament, and will provide suitable prizes, and will earnestly endeavor to complete all the details of an enjoyable competition. Such perseverance in the face of calamity should be appreciated by giving the tournament generous support. The dates, etc., will be determined in the near future, and will be then promptly announced.

BERNARD WATERS.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Nov. 11.—Lively sport was the feature of the afternoon at the shoot of the New York Athletic Club to-day. The weather was perfect for trapshooting, although the wind blew with sufficient force to make the flights very irregular. Nevertheless, very good scores were made by several members. Event 4 was won by Mr. Gus Grieff with a full score from scratch. The club rule gives any one breaking a straight in a handicap the trophy without a shoot-off. Event 8 was won under the same conditions by Mr. E. O. McMurtry, who broke 25 straight.

The club event for the November cup caused more of a struggle, as Dr. De Wolf, J. W. Hibbard and Dr. Brown tied on 24 out of 25 with their handicaps added. In the shoot-off, Mr. Hibbard won out.

A number of other trophies were contested for during the afternoon.

Mr. Dickerson, a new-comer in the trapshooting world, presented the club with a handsome trophy, the conditions of which in competition will be announced later.

Mr. Gus Grieff made the highest average ever made at the Travers Island trap shoots, scoring a fraction over 95 per cent. for the afternoon. Scores:

Table of trapshooting scores for New York Athletic Club. Includes 'Event 1, 10 targets', 'Event 2, 15 targets', 'Event 3, 10 targets', 'Event 4, trophy, 25 targets, handicap', 'Event 6, 25 targets, handicap', and 'November cup, 25 targets, handicap'.

Shoot-off, 25 targets: Hibbard ..... 23 De Wolf ..... 21 Brown ..... 22

Table of trapshooting scores for New York Athletic Club. Includes 'Event 7, 25 targets, was won by Vilmar', 'Event 8, 25 targets, handicap', and 'Event 9, trophy, 25 targets'.

Ridge Gun Club.

REDDING RIDGE, Conn., Oct. 28.—No. 1 was a special event at 100 targets. Mr. H. S. Welles was high with 89. He also was professional high average for the day, and made the only straight score of the events, in event 7. Mr. J. S. Fanning was second high professional average. Mr. C. W. Stevens won the gold medal in the 100-target race and was first amateur. Mr. R. L. Hall won the field glass and was second amateur. Mr. W. A. Gregory won the cigar box, and was third amateur. The professional average prize was \$5; amateur high averages were \$5 and \$3.

Table of trapshooting scores for Ridge Gun Club. Includes 'Targets', 'C W Stevens', 'W A Gregory', 'J S Fanning', 'H Sanford', 'R C Hall', 'E H Bailey', 'E Madden', 'H S Welles', and 'Bigelow'.

On the Bill.

A hungry-looking man hurried into a lower Grand street restaurant the other day, and climbing upon one of the high stools at the lunch counter, reached for one of the well-worn and much-thumbed bills of fare. He read it all through two or three times, called a waiter and gave his order: "I guess I'll begin with a couple of plates of fly specks." "Fly specks!" exclaimed the astonished waiter. "Why, we don't serve fly specks." "Well, then, why don't you take them off the bill of fare?" The waiter's reply is not recorded.

# V. S. Government Ammunition Test.

Accuracy test of Krag-Jorgensen .30-Caliber Cartridges held at Springfield Armory by order of the Ordnance Department, United States Army.

TESTED—Ammunition of all the American Manufacturers.

CONDITIONS—10 and 20 shot targets, muzzle rest.  
10 and 20 shot targets, fixed rest.

DISTANCE—1,000 yards.

RESULT and OFFICIAL REPORT: **U. S. Cartridges excelled all others.**

MANUFACTURED BY

## UNITED STATES CARTRIDGE CO., LOWELL, MASS., U. S. A.

Agencies: 497-503 Pearl St., 35-43 Park St., New York.

### WESTERN TRAP.

#### Cincinnati Gun Club.

Nov. 11 was a fine day for sport—not cold, and with a bright sun. Nineteen members shot their scores in the Ackley trophy contest this week. Maynard was high with 45. R. L. Trimble was on hand for the first time in many weeks, and tied with Williams for second place on 44. John Falk has been under the weather for two or three weeks, but was out to-day and landed in third place with Ahlers on 43. Barker has been rather out of the game lately, and his score shows a lack of practice. L. Ahlers, H. Jergens and Maynard are going to southern Illinois for a little quail shooting. John Falk and son, W. Smith and Frank Kenickie are going to Utopia, O., on the 14th, and will put in several days among the quail. Ackley shot in a few practice events to-day. In a match race Gambell broke a straight 50, Ahlers second with 48. The scores:

Maynard, 19	45	Tuttle, 17	36
Trimble, 19	44	Roll, 18	35
Williams, 18	44	Keplinger, 17	35
Ahlers, 19	43	Myers, 16	34
Falk, 16	43	F Althers, 16	34
Pohlar, 19	39	Herman, 18	33
Barker, 19	39	Bullerdick, 17	33
Randall, 17	39	Miles, 16	30
Hosea, 16	38	Lytle, 16	33
French, 16	33		

Match, 50 targets, three low men pay for targets:

Gambell	50	Bullerdick	42
Ahlers	48	Roll	42
Pohlar	43	Barker	35

#### Kentucky Hunting and Fishing Club.

Rylands, Ky.—The Kentucky Hunting and Fishing Club held a live-bird shoot on their preserves at Rylands, about fifteen miles from Cincinnati, on Nov. 9. The day was dark and cold, with a stormy north wind, which aided the birds greatly. As a rule the birds were strong ones, and good fliers, only a few poor ones in the lot. In the regular contests at a total of 42 birds, Peters was high with 39, Ahlers 37, Willie 36, Gambell 35.

Refreshments were served all day and a good time was enjoyed by all. The scores:

Event No. 1, 5 birds, \$2.50 entrance, 60 and 40 per cent.:

McMorris, 30	2222-5	Ahlers, 30	2202-4
Settle, 30	2221-5	Steinkorb, 30	2101-4
Gambell, 30	2221-5	Herman, 30	1110-4
Peters, 30	2222-5	*G Osterfeld, 30	02121-4
H Osterfeld, 30	2211-5	Mingess, 30	10011-3
Willie, 30	2122-5	*Roanoke, 30	21010-3
*Boch, 30	2222-5	*Payne, 30	01011-3
*Hake, 30	2221-5		

\*For birds only.

Event No. 2, 10 birds, \$7 entrance, money divided 50, 30 and 20 per cent.:

#### Ohio Notes.

At the regular shoot of the Cleveland, O., Gun Club on Nov. 4 nine members took part. The programme consisted of four events at 15, two at 10, one at 20 and one at 25 targets, a total of 125 targets. Events 5, 6 and 7, at a total of 50 targets, were the regular club contest. Tryon and Allen tied for first in Class A on 46. MacMeans was first in Class B with 48. MacMeans was high for the day with 107 out of 115. Tryon broke 93 out of 100. Boardman 99 out of 125 and Hopkins 98. Allen 81 out of 90. The club will hold a tournament on Thanksgiving Day, at which cash prizes will be awarded.

Farmers in the vicinity of Wopakoneta report a scarcity of game in the county, and many of them have forbidden hunting on their

farms. Quail are said to be very scarce and rabbits are not as plenty as usual.

Henry Price, of Brookville, and W. Hapner, of Lewisburg, who are hunting with a party in upper Michigan, have each killed a moose. Linkhart and other hunters from Green and Clinton counties have returned from a month's hunt in Canada. Several deer were killed, and each one of the hunters got a moose. Their camp was located in the midst of a fine game country, and they found birds plenty as well as large game.

A party of hunters from Hamilton has just left for a deer hunt in Price county, Wisconsin. Deer are reported to be plentiful and the hunters will be gone a month.

The tournament of the Hamilton, O., Gun Club, announced for Nov. 9 and 10, proved to be a failure, as so few shooters were present that it was called off. Even the local shots failed to turn out. This club seems to have dropped out of sight, or to have buried itself intentionally, as for many months nothing has been heard concerning it.

Uncle Joe Wilson, of Lewisburg, has returned from his hunt with deer and moose antlers. He killed two bull moose while away.

Mason Benier, of Dayton; Alpheus Hawker, East of Dayton, together with H. H. Conklin, H. H. Hawkins, L. N. Clevenger and Otis Swigart, of Greene county, are in camp in the forests near Worthington, Can., and will stay until December. They have killed six deer and will hunt for moose still further north.

M. E. Wild, J. F. Heck, Laurence Fry, Claude Weaver and M. L. Weisenbarger, of Arcanum, are camped on the Eagle Lake road, north of Patten, Me. On the first day they killed three deer, and at the latest reports had added four more to that number. They are expected home on Nov. 23, and their friends are expecting plenty of venison.

O. N. Harshman, a farmer living north of Eaton, was brought before Squire L. T. Stephen on Nov. 7 and fined \$25 and costs for hunting out of season.

William Butler, Robert Moses, B. D. Moses, Thos. Leach and Ed. Wysong, of Eaton, left on Nov. 7, for Prentiss, Wis., where they will hunt for several weeks.

E. C. Dyer, George Kraft and Al Wurstner spent two days at the Lewistown reservoir last week and killed 145 ducks, the largest number killed by one party so far this season.

Rike's score of 97 out of 100 at the N. C. R. grounds on Nov. 4 shows that he is getting confirmed in the target smashing habit.

E. W. Holding, winner of the individual inter-county championship trophy, has been awarded the handsome gun offered to the Ohio trapshooter making the best score during the season. He had ten scores of 50 straight.

Less Reid is another Ohio shooter who has been making a reputation for himself, and has a record of 97 per cent. for the season.

Wm. Clark, of New Paris, is a crackerjack, and makes a good showing on any grounds he may happen to visit.

#### At Watson's Park.

Chicago, Ill., Nov. 6.—Yesterday at Watson's Park was inaugurated the first of a series of weekly shoots which will run throughout the winter months. These shoots are gotten up to interest the shooters of the city, and all visitors who may be in the vicinity and who desire an outing at the traps.

That all may shoot without making it very expensive the management has provided that each target broken shall pay 7 cents, and the remaining money shall be divided into three moneys on the per cent. plan, 50, 30 and 20.

This time of the year there is the attraction of duck shooting and the quail shooting to open this week, and that takes many of the shooters to the fields; hence the attendance was limited.

Barkley made high score, 97 out of 105, with Steenberg close up, with 96, while Hutchinson was third.

Shooting conditions are so good at Watson's old park that a strong bid will be made for the next G. A. H. Scores:

Events:	1	2	3	4	5	6	7	Shot	Broke.
Targets:	15	15	15	15	15	15	15	at.	
Lovell	15	12	14	14	12	11	11	105	89
Galusha	11	12	11	12	14	12	12	105	84
Hutchinson	14	14	14	12	13	13	13	105	93
Morehouse	13	12	12	13	11	12	12	105	85

Barkley	15	12	14	14	13	14	15	105	97
Shogren	10	15	11	15	13	12	12	105	89
Kinney	11	12	14	13	14	13	12	105	89
Walsh	13	12	..	..	..	..	..	30	25
Myrick	14	11	13	15	..	..	..	60	53
Barribal	..	11	12	11	12	13	..	75	59

#### In Other Places.

Recently there was a shoot at Carlisle, Pa. W. H. Sheffer, of Steelton won first prize, William Thompson second and R. E. Shear, of Carlisle, third.

Robert Dunner won the first prize at the Whittaker, Pa., Gun Club by killing 7 live birds straight.

J. A. Lane, of Brooklyn, Ia., visited his old stamping ground, Marshalltown, Ia., during the tournament.

The Manistique, Mich., Rod and Gun Club, now has a membership of sixty-five. The members who own launches have arranged to sow wild rice throughout the swampy district adjacent to Smith Creek.

A. J. Anderson, of Chicago Heights, Ill., is doing the proper thing in publishing notices of future meetings and inviting all to participate. All traveling men are invited to meet with the club and show off their wares, and thus increase the local interest.

The Brenham, Tex., Rod and Gun Club while active in the special line of trapshooting, find time to improve the lake so that fishing may be a favorite pastime.

Occasionally, although he has all the work connected with the gun club on his hands, there is a secretary who can outshoot the "bunch." As for instance, W. W. Wohlwend, of the Akron, O., Gun Club, at the shoot held Wednesday, won the handicap cup with a score of 22 out of 25. On Thanksgiving Day there will be a good shoot held, as the prizes will include turkeys, chickens and ducks.

A meeting was held at Navasota, Texas, for the purpose of organizing a shooting and fishing club. Chas. J. Kirk was chosen chairman, and Ed. F. Blackshear secretary. Committee on constitution, Governor George D. Neal, Ewing Norwood, C. J.

Kirk, P. H. Leary, R. A. Horlick and W. L. Steelc. On membership, J. E. Cuthrell, Ward Templeton and Edgar Jones. On grounds, J. T. Evans, Ben Ahrenbeck and O. Geisecke.

Quite a number of the Butte, Mont., Gun Club members met Sunday and tried out the new handicaps that will be used when the trophy is being shot for. Some good scores were made.

Several members of the Widgeon Gun Club, of Visalia, Cal., were out duck shooting recently. One shot fifty, the limit, and all the shooters averaged a bag of forty.

The officers of the Progressive Gun Club, East St. Louis, Ill., are: President, Eugene Delcine; Secretary, N. R. Haff; Treasurer, William L. Baggerman; and they are the proper fellows when it comes to conducting a tournament.

Ben Reismeyer, of Princeton, Ill., was lately tried and fined at Hennepin, Ill., for shooting on the Swan Lake Gun Club grounds without permission.

A recent decision of the Supreme Court of Illinois, makes the owners and lessees of shooting preserves secure in the premises; and all others who encroach on the grounds of same are trespassers. This makes the shooting preserves along the Illinois River very valuable and secure for all time to come.

The Mishawaka, Ind., Gun Club has held a meeting, and the members are very enthusiastic. The members will hold a shoot on Thanksgiving Day, as well as the day previous, at which time all will have an opportunity to win a bird for their dinner.

When Howard Knauff, a member of the Brighton, Pa., Gun Club, was married several of the members caught him with a rope in cowboy style and marched him about town. Just to show how very popular he was with the club members.

There were thirty-nine shooters at a tournament recently given at St. Charles, Mo. Many of the old-time shooters were present. Thence there was a pair of good ones present in Chas. Spicer and Charles Spencer. The scores were low, indicating hard conditions, as Mr. Spicer made 59 out of 65 for a sample.

Last Sunday the Chicago Heights, Ill., Gun Club made a good showing at the traps. At 75 targets, P. Castor broke 63, H. Tuets 57, E. Oglesby 56, A. Anderson 52, R. Durig 49, C. Fritz 43, H. Gehrs 34. This club will hold weekly shoots during the winter months.

The Hamilton, Ill., Gun Club held a meeting Wednesday evening last and elected the following officers: President, William Waggoner; Secretary, Joseph Lefler. Committee, Leon Sangier, Wm. Wooster. The members have decided upon a Thanksgiving shoot, and shooters from the neighboring cities will be invited to participate.

The North End Gun Club, Port Huron, Mich., held a shoot Tuesday. Scores, at 25 targets: Frank Vanderburg 20, Wm. Pilkey 14, Capt. Kimball 14, John Hazlewood 12, Heil Buckridge 11.

At the tournament of the Baton Rouge, La., Gun Club, held Thursday last, the best score was made by Robert Raymond by getting 67 out of 75. This puts him in the lead for the monthly trophy. This is how the scores stood at the end of the day: R. Raymond 67, H. L. Fuqua 57, C. D. Raymond 56, A. Klempeter 55, S. J. Powell 55, F. Klempeter 54, Banks Powell 54, B. Hochenedel 52, W. C. Whittaker 37, B. S. Parks 26, T. P. Singleton 16.

The twentieth and final contest for the club trophy was held last week at the grounds of St. Marys, West Va., Gun Club. Two prominent citizens were out and shot for the first time this season. The day was good and scores large. At 100 targets, J. D. Dinsmore 85, E. R. Smith 71; Cole broke 67 out of 75, C. J. Mowry 56 out of 70, O. C. Ogden 32 out of 50, Dr. Watson 22 out of 50, and R. A. Flesher 16 out of 50.

J. A. McKee won the third shoot of the series held by the Billings, Okla., Gun Club with 23 out of 25. Other scores were: Carson 16, Huddleston 12, Neil 17, Groff 14, Carpenter 18, McClusky 8. Carson and Carpenter are now a tie with 51 points.

At the shoot of the Crescent Gun Club, Connerville, Ind., Thursday last, the scores were good. With the allowance in broken targets, Huddy, Beard, Hill and Vaughan made 50; Fuchs 49½, Ruhl 47½.

Members of the New Haven, Ind., Rod and Gun Club held a dance last Thursday evening. As their best girls were present why of course the evening was well spent. The social part should be cultivated by the members of all gun clubs if they wish to hold the club together.

The scores made at the Anna, Ill., shoot were: At 110 targets, Spencer 103, Riehl 98, Steenberg 89, L. Fisher, Middleport, O., 99; R. S. McMullan 96, W. C. Marigold 93, Lou Watson 86.

Members of the Soo Gun Club, Sioux City, Ia., after a wait of two weeks, were rewarded by a light of ducks and Canada geese that amply paid them for their patience. J. H. Gray and M. F. Duncan, prominent members, were among the successful ones.

A successful shoot was held at Woodstock, Ont., live birds being trapped. At 10 pigeons, Thompson killed 7, Wright 5, Maynard 7, Bonnett 6, Hopkins 7, Davison 7, Gurnett 9.

The Youngstown, O., Gun Club is holding regular practice events, and the interest seems never to lag.

The Stanley Gun Club, Toronto, Can., has rented land, and will soon erect a club house that will accommodate the club and its friends.

The Newport and the Knoxville, Tenn., gun clubs are having some friendly club shoots. Newport won the first shoot with 8 points.

The Trenton, O., Gun Club was out for their regular shoot Saturday last. Shooting at 50 targets, G. H. Harvey broke 42, I. Heckman 41, Chas. Kerr 41, Leslie Baker 39, J. H. Kerr 34, Dr. Schoenfeld 25. H. Richter was the official scorer.

George Premo, of Amasa, one of the famous hunters of the Northwest, and prominent member of the Menominee, Mich., Gun Club, was seen in Menominee last Thursday, and a delightful time had he while meeting and shaking hands with all the old club members.

There is a league of clubs about to be formed in the towns of Indiana and Ohio, with Centerville, Ind., as the instigator. It is thought that Denver and New Paris, O., will be selected as the prominent Ohio clubs.

The feature of the season for the Magic City Gun Club, Muncie, Ind., which came to an end Thursday, was the contest of A. C. Spencer and G. C. Williamson. For the eighth time this season these gentlemen have tied, and on the shoot-off Williamson won and was awarded the gun. J. R. Johnson won the gold badge which was donated by a manufacturer of guns. The secretary reports that his books show the shooting to have been much above the average. The season has been the most successful during the history of the club.

IN NEW JERSEY.

North New Jersey Shooting League.

The final match of the season's team races was held Thursday afternoon Nov. 2, at Morristown, Montclair's team being pitted against Morris, and resulted in the defeat of Montclair. Scores:

Table with 2 columns: Team Name and Score. Includes Morris and Montclair teams with individual player scores.

This gives the Newtown club first place, she having won seven matches and lost one, while Montclair takes second place, having won six and lost two matches. Morris finished in third place, Orange in fourth, and Dover in fifth place.

In addition to the team race, some ten events were run off, some twenty-nine marksmen participating.

At the close of the shoot the contestants adjourned to Day's, where they sat down to a most enjoyable dinner. After dinner President Brickner called the members of the League to order. The minutes of the last annual meeting were read and approved, the various prizes were distributed, and the annual election was proceeded with, and the following officers were elected for the ensuing year: President, Mr. A. B. Brickner, of Newton; Secretary, Mr. F. A. Trowbridge, of Morristown; Treasurer, Mr. Charles R. Whitehead, of Morristown.

Montclair Gun Club.

Saturday, Nov. 4.—The regular weekly shoot to-day brought out but seven shooters. The only good score was made by Babcock, in event 1, he breaking 24. This was all the more remarkable as the wind was blowing a gale at the time.

Events 4 and 5 were for the silver cup, at 50 targets, handicap. The event went to Boxall, he breaking 40; this with his handicap of 4 giving him a score of 44. All the scores recorded are net breaks, the handicaps as indicated being added targets for events 4 and 5 only.

Table with 2 columns: Events and Targets. Lists scores for various events and target counts.

Nov. 7.—Some sixteen men faced the traps at the Election Day shoot of the Montclair Gun Club to-day. Some five regular events for silver prizes were run off.

Howard and Allan tied for first prize in event 1, Howard winning first place in the shoot-off, Bush taking second prize.

In event 2, Howard and Clickner tied for first place, Howard again winning in the shoot-off. Four men tied for second prize, Allan winning out in the shoot-off.

In event 3, Bush, Allan and Hartshorn tied for first prize, Allan winning in the shoot-off.

In event 4, miss-and-out, Wallace easily won first prize.

Table with 2 columns: Events and Targets. Lists scores for various events and target counts.

Nov. 11.—But nine men faced the traps this afternoon, although it was the regular monthly shoot for the Chas. Daly Gun.

Events Nos. 1, 2, 3 and 6 were for practice. Event No. 4, 15 targets, was won by Clickner, he taking home a box of cigars.

Event No. 5, 50 targets, handicap, added targets, for the Daly gun, was won by Boxall, he breaking 37 targets; this with 4 added, gave him a score of 41, and event for the month, the lowest winning score in the event to date.

Handicaps apply only in event 5 as added targets.

Table with 2 columns: Events and Targets. Lists scores for various events and target counts.

E. WINSLOW, Sec'y.

North Side Gun Club.

PATERSON, N. J.—The main feature of the North Side Gun Club shoot on Nov. 4 was the team contest of the Trapshooters' League of Passaic and Bergen counties. The arrangements were that the Jackson Park Gun Club should shoot at the Oradell Gun Club's grounds. A telegram was received by Secretary G. A. Hopper on Friday, asking for a postponement, as the Oradell grounds were not in shape at present. The Oradell Club should have come to Paterson and shot at the Jackson Park Club's grounds instead of postponing their date. The Jacksons were then compelled to go to the North Side's grounds, where they were to shoot with the Mount Pleasant and North Side clubs, making a three-cornered match to start with.

Messrs. Jack Fanning and William Nichols, trade representatives, were present, and acted as referees with Mr. Dutcher. They gave every encouragement that a Dupont cup would be presented for competition in the League series.

The weather was windy, and affected the scores unfavorably. Many who claim credit for the starting of the League, but the man who did all the work and who has been working nearly two years to get the clubs into a league is William H. Dutcher, of the Jackson Park Gun Club. He has never ceased his efforts. Now that he has succeeded, it is only right to let the trapshooters and followers of the pastime know to whom the honors belong. He also brought the professionals here on Saturday, as a step toward a trophy.

The Jackson Park Gun Club defeated both of their opponents in the team shoot. The scores were as follows:

Table with 2 columns: Team Name and Score. Lists scores for Jackson Park Gun Club and Mt. Pleasant Gun Club.

North Side Gun Club.

Table with 2 columns: Team Name and Score. Lists scores for North Side Gun Club and Mount Pleasant.

These matches will count in the League and make the positions of the teams to date as follows:

Table with 4 columns: Team Name, Won, Lost, P. C. Lists league standings.

In addition to the team matches the following events were held:

Table with 2 columns: Events and Targets. Lists scores for various events and target counts.

Bound Brook Gun Club.

Bound Brook, N. J., Nov. 7.—Two squads of shooters attended the membership shoot of the Bound Brook Gun Club on Election Day. The attractions at this meet of the club were two events of 5 targets each for loving cups, and three events for medals. These five were handicap events, and were won after several shoot-offs.

The two for cups were won by Brampton and Fisher. The three medal events were won by Dunning, Prugh and Stelle.

The last event, which proved the greatest attraction, was for free

prizes and targets. The best man had first choice. Following are winners, scores and prizes: F. K. Stelle, 9, book; F. C. Bissette, 8, scarfpin; Byron Prugh, 7, stein; S. W. Dunning, 7, three pictures; A. K. Smith, 5, pipe; Martin, 4, cut-glass cruet; C. Fisher, 3, tobacco jar; Leon Da Four, 3, scarfpin; Leon Walters, 3, picture, and Stanley Brampton, picture.

Table with 2 columns: Events and Targets. Lists scores for various events and target counts.

F. K. STELLE.

Crescent Athletic Club.

BAY RIDGE, L. I.—The Election Day shoot of the Crescent Athletic Club had the holiday cup as the chief object of competition. Thirteen shooters contested for it, and Mr. L. C. Hopkins, one of the most steadfast of the Crescent shooters, won it with a full score, 25. Mr. J. N. Teeter won the Stake trophy; he scored the limit, 25. There were eleven other trophy contests, so that the holiday shoot was one of keen activity. The scores follow:

Trophy shoot, 15 targets: W. W. Marshall 15, Jere Scott 14, E. W. Snyder 12, O. C. Grinnell, Jr., 12, F. Stephenson 11, J. Teeter 10, L. C. Hopkins 9.

Trophy shoot, 15 targets: F. Stephenson 15, O. C. Grinnell, Jr., 13, L. C. Hopkins 12, S. P. Hopkins 10, H. B. Vanderveer 6.

Trophy shoot, 15 targets: F. B. Stephenson 15, O. C. Grinnell, Jr., 13, L. M. Palmer, Jr., 12, H. B. Vanderveer 10.

Trophy shoot, 25 targets: Jere Lott 25, D. C. Bennett 25, F. B. Stephenson 20, O. C. Grinnell, Jr., 18.

Shoot-off, same conditions: Jere Lott 25, D. C. Bennett 22.

Trophy shoot, 15 targets: Jere Lott 14, L. M. Palmer, Jr., 13, F. B. Stephenson 13, D. C. Bennett 13, O. C. Grinnell, Jr., 9.

Trophy shoot, 15 targets: F. B. Stephenson 15, O. C. Grinnell, Jr., 12, L. C. Hopkins 11, S. P. Hopkins 7.

Holiday cup, 25 targets: L. C. Hopkins 25, F. B. Stephenson 24, W. W. Marshall 24, Jere Lott 23, C. A. Lockwood 23, D. C. Bennett 21, O. C. Grinnell, Jr., 19, S. P. Hopkins 18, J. Teeter 17, C. E. Foster 16, E. A. Cruikshank 16, C. W. Hickling 16, E. W. Snyder 15.

Trophy shoot, 25 targets: Jere Lott 25, W. W. Marshall 23, D. C. Bennett 22, O. C. Grinnell, Jr., 20, F. B. Stephenson 19.

Stake trophy, 25 targets: J. N. Teeter 25, L. C. Hopkins 24, F. B. Stephenson 22, E. W. Snyder 21, W. W. Marshall 20, O. C. Grinnell, Jr., 19, C. A. Lockwood 18, C. E. Foster 18, S. P. Hopkins 18.

Trophy shoot, 15 targets: W. W. Marshall 13, S. P. Hopkins 12, C. A. Lockwood 12, C. E. Foster 10, L. C. Hopkins 10, O. C. Grinnell, Jr., 8, J. N. Teeter 8.

Trophy shoot, 15 targets: C. A. Lockwood 15, E. W. Snyder 12, L. C. Hopkins 10, W. W. Marshall 10, C. E. Foster 8, E. A. Cruikshank 7.

Trophy shoot, 15 targets: L. C. Hopkins 14, C. A. Lockwood 14, W. W. Marshall 14, O. C. Grinnell, Jr., 13, S. P. Hopkins 13, J. N. Teeter 11, E. W. Snyder 8, C. E. Foster 8.

Shoot-off, same conditions: C. A. Lockwood 15, W. W. Marshall 10, L. C. Hopkins 10.

Trophy shoot, 15 targets: L. C. Hopkins 14, W. W. Marshall 13, C. A. Lockwood 11, S. P. Hopkins 11, C. E. Foster 9.

Nov. 11.—The weather was of autumn's most delightful kind, with a light wind. There was a good attendance of shooters to participate in the eleven trophy contests of the afternoon.

The team series was begun, and Messrs. Lewis C. Hopkins and Lowell C. Palmer, Jr., scored the first win with a total of 48 out of 50.

In the November cup contest, Mr. Frank B. Stevenson, from scratch, scored a win with the excellent score of 24 out of 25, while two other scratch contestants, Messrs. Lowell M. Palmer, Jr., and A. G. Southworth, were close up with 23 and 22 respectively.

November cup, 25 targets, handicap:

Table with 4 columns: Name, Hdp., Brk., Tot'l. Lists scores for November cup.

Stake trophy, 25 targets, handicap:

Trophy shoot, 15 targets, handicap: Stephenson 15, Hopkins 15, Palmer 14, McConville 14, Foster 13, Southworth 12, Marshall 12, Damron 11.

Shoot-off, same conditions: Hopkins 14, Stephenson 13.

Trophy shoot, 15 targets, handicap: Foster 15, Hopkins 14, Palmer 13, Southworth 13, Stephenson 13, Damron 13, Marshall 12, McConville 10, Vanderveer 9, Grinnell 7.

Team shoot, 25 targets, handicap: Southworth 22, Marshall 15; total 37. Stephenson 17, Grinnell 16; total 33. Palmer 24, Hopkins 24; total 48.

Trophy shoot, 15 targets, handicap: McConville 15, Foster 13, Southworth 12, Damron 12, Keyes 10, Hopkins 9, Marshall 8, Palmer 8, Vanderveer 4.

Trophy shoot, 15 targets, handicap: Palmer 14, Foster 14, Grinnell 13, Southworth 12, Hopkins 12, Stephenson 11, Keyes 10, Marshall 8, McConville 7, Damron 8.

Shoot-off, same conditions: Foster 14, Palmer 11.

Trophy shoot, 15 targets, handicap: Palmer 13, Hopkins 13, Grinnell 13, Marshall 12, Keyes 12, Foster 12, Southworth 9, Damron 9.

Shoot-off, same conditions: Palmer 14, Grinnell 14, Hopkins 13.

Shoot-off, same conditions: Palmer 12, Grinnell 9.

Trophy shoot, 15 targets, handicap: Palmer 14, Southworth 14, Grinnell 14, Foster 13, Hopkins 13, Marshall 10, Damron 10, Keyes 6.

Shoot-off, same conditions: Southworth 13, Palmer 12, Grinnell 11.

Trophy shoot, 15 targets, handicap: Foster 14, Hopkins 14, Southworth 13, Grinnell 13, Palmer 11, Marshall 9, Damron 7.

Shoot-off, same conditions: Hopkins 13, Foster 11.

Trophy shoot, 15 targets, handicap: Foster 14, Hopkins 14, Grinnell 13, Southworth 13, Palmer 11, Marshall 10, Damron 8, Keyes 8.

Shoot-off, same conditions: Foster 14, Hopkins 14.

Shoot-off, same conditions: Foster 13, Hopkins 12.

Hudson Gun Club.

THE regular meeting of the Hudson Gun Club was held at the club's headquarters, 357 Newark avenue, Jersey City, N. J., Nov. 6, and called to order promptly at 8 o'clock by President Whitley.

After disposing of the minutes of the previous meeting, and "thrashing out the general affairs," New Business brought about much of interest to the large number of members present, many of whom had not attended previous meeting, at which very important matters concerning the welfare of the club had been discussed.

President Whitley and Secretary Hughes, in a most impressive manner told of "the wreck." They described in detail how some "loafers, hoodlums, thieves," or what not, had wantonly smashed everything but the house itself—traps, pulls, indicators, the stove, thousands of targets, chairs, pictures, wash-stand and all the dishes—and how these scoundrels had evidently finished up their job by planting the hammer in a cake of soap.

held, windows or no windows, dishes or no dishes. I will appoint two special committees for this occasion; one to be known as the Shooting Committee, as follows: J. Hughes, Dr. Sergeant (Carl Von Lengerke), Joe Dohran and E. Heritage.

The other, the House Committee: W. O'Brien, E. Brewer, Chas. Banta and J. Whitley. Both with full power to act."

The President then continued: "Now, gentlemen, we have been confronted with adverse conditions before, just prior to holding a big shoot; but our shoots and outings have always been successful, and everybody who has favored us with their presence on such occasions went home happy. I look to you to make the coming shoot and entertainment an equally successful event. Don't come back to me for advice, but go ahead and act. Call on me for assistance, if need be, and I'll help you."

After the meeting adjourned the Shooting Committee arranged to meet Monday, Nov. 13, to settle on a date for the shoot.

It goes without saying that the House Committee will have the house and grounds in order in time, and that the dinner they will serve to the club's guests on that day will be long remembered.

The Shooting Committee will buy suitable prizes to be shot for, and knowing the members of this committee, as I do, I can assure your readers that every one who attends that shoot at the Hudson Gun Club in December will not regret it, and will go home happy. The committee will leave no stone unturned to make this another of those memorial shoots and outings of that club.

The date will be announced next week in the columns of FOREST AND STREAM. Further information may be had by addressing James H. Hughes, care the N. Y. Tribune, Park Row, New York city, or Carl Von Lengerke, 1263 Broadway, New York city.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Nov. 4.—The Peters badge was won by Parry, who was shooting in good form.

The English Hotel cup was won by Nelson Wise, of Noblesville, Ind., defeating Silas W. Trout, of Franklin, Ind., by scores as follows:

Table with 2 columns: Name and Score. Lists scores for English Hotel cup.

The visitors were J. W. Bell, St. Louis, Mo.; J. F. Trout, Franklin, Ind.; Wm. Burgett.

Table with 2 columns: Events and Targets. Lists scores for various events and target counts.

Nov. 11.—Scott won the Peters badge. The quail shooting season is on in Indiana, which accounts for the small attendance.

The Indianapolis Gun Club is receiving many inquiries from shooters in different parts of the country as to whether we were an applicant for the G. A. H. for 1906. In answer we would say we are, and should we be successful in securing the honor again, we will have some surprises for the boys when they arrive.

Table with 2 columns: Events and Targets. Lists scores for various events and target counts.

Wm. ARMSTRONG, Sec'y.

New England Kennel Club.

BRAINTREE, Mass., Nov. 11.—The special autumn shoot was attended by some of the most skillful shots of the New England Kennel Club to-day.

The three classes, A, B, and C, performed well in the 50-target double-barrel event. Each class was allowed a handicap. The prize for Class A was a copper and brass Russian pitcher. It was won by Mr. Wm. F. Beal, with a score of 44. The prize in Class B, an antique pewter bowl, was won by Mr. R. O. Harding, with a score of 44. The Russian copper cup, prize for Class C, was won by Mr. J. C. R. Peabody. Scores:

Table with 4 columns: Name, Brk., Hdp., Tot'l. Lists scores for Class B.

Table with 4 columns: Name, Brk., Hdp., Tot'l. Lists scores for Class C.

In the regular double-barreled contest William F. Beal, Thos. Silsbee, Dr. C. G. Weld and J. C. R. Peabody were tied for first place with scores of 21, and in the shoot-off, which followed, Mr. Beal won the leg. The scores:

The weekly cup shoot was omitted.

Sheepshead Bay Gun Club.

SHEEPSHEAD BAY, L. I., Nov. 7.—There was some wind, but the weather was pleasant. On account of being short of targets, the prize events were called off.

# FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }  
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, NOVEMBER 25, 1903.

VOL. LXV.—No. 22.  
No. 346 BROADWAY, NEW YORK.

*The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.*

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

## IN THE LODGES OF THE BLACKFEET.

We begin to-day the publication of a series of chapters descriptive of life with a wild people on the Western plains. It is a graphic and intimate picture, such as perhaps has never before been written; and its interest will prove to be well sustained to the end.

## PRIZES FOR GAME HEADS.

THE FOREST AND STREAM offers three prizes of \$20, \$10 and \$5 respectively for the best moose heads secured in the year 1905 in the hunting grounds of the United States and Canada.

It offers also three prizes of \$15, \$10 and \$5 respectively for the best white-tail deer heads taken in the hunting season of 1905 in the United States or Canada.

The heads will be judged from photographs submitted to the FOREST AND STREAM. In estimating their merits the two qualities of size and symmetry will be taken into consideration. With the photograph of each head must be sent a memorandum of the place and the time of its taking and the name of the person taking it. The competition will be open to amateur hunters only; and with this single restriction it will be open to the world. There are no entrance fees. The photographs submitted will be the property of FOREST AND STREAM. Entries for the competition must be made not later than Jan. 15, 1906. The awards will be determined by a committee of representative sportsmen to be announced later.

## DRUMMING OF THE RUFFED GROUSE.

Few subjects have been so much discussed by sportsmen as the whistle of the woodcock and the drumming of the ruffed grouse. To the latter sound much mystery has always attached. The dull roll of thunder comes out of the air, from a distance, in the depth of the forest, and excites the wonder of the listener, but its direction and its distance seem so uncertain that he is not likely to try to find it. Few persons have seen the bird in the act of drumming, and of those few, a still smaller number have been trained to observe the ways of nature or to draw just conclusions from what they may have seen. Nevertheless, many people—some observers and some mere theorists—have expounded their views on the subject. It has been declared that the grouse drums by beating his wings against the object on which he stands, against his own body, or against each other above the back; but none of these have satisfied all the conditions and all are to be rejected. The best descriptions of the drumming ever given is that by Mr. William Brewster, printed in the old American Sportsman, in 1874, and the still earlier one of Audubon in his "Birds of America."

In this year of 1905, however, Prof. C. F. Hodge, of Clarke University, carried on a series of observations on his domesticated ruffed grouse which point to another explanation, and which, illustrated by a multitude of photographs, appear to show that the sound is made by the rapidly repeated blows of the stiff wing quills against the erected and expanded feathers of the side, which thus form a feather cushion. Professor Hodge says: "In fact, the sound, so far as quality goes, can be best imitated by striking with a wing properly stretched or even a concave fan on an extremely light eiderdown cushion." Professor Hodge conjectures, too, that the bird while drumming fills the air sac of the breast and abdomen. "In this way the contour surfaces of the strong wing supports along the sides are made to inclose a large cavity filled with air and this acts like the resonance chamber of a drum, and yields the booming throb to the air."

Many ornithologists, judging by analogy from the habits of other grouse, have conjectured that the air

sac at the sides of the neck had some—as yet entirely undetermined—relation to the drumming of the grouse. This, of course, remains to be proved.

Certainly no one has ever had such ample opportunity for studying and recording by photography the drumming of the ruffed grouse as had Professor Hodge, who, in two days, took no less than forty photographs of the bird in action, and his account, illustrated by these pictures in the Country Calendar, must be regarded as the most important contribution ever made to the subject.

Professor Hodge believes, as has long been agreed, that the drumming of the ruffed grouse is a mating call. The fact that the bird drums in autumn is no valid objection to this conclusion, since many birds produce in autumn sounds which we are accustomed to regard as peculiar to the breeding season, though such sounds are often or usually made by young birds.

## THE BOTTLE JOKE.

TO CONSTRUCT a joke which shall be piquant, pointed, pertinent and merry, is a matter of no small mental activity and endowment. Such witty brightness is far above the intellectual compass of the average jokesmith of business, who, with calm premeditation to earn his wages and support his family by the sweat of his brow, valiantly attempts to yank mental glistenings from his foggy sensorium. Thus come many pointless jokes.

The joke-maker has unlimited commercial incentive to joke to the limit of his capacity. The trade demand, even for fourth-rate wit or humor, far exceeds the supply, or the capacity to manufacture it.

The raw material, unfortunately, is long since second-handed, so far as it is available, inasmuch as it has been worked over and over from time immemorial. Even at that, it is limited in quantity, hence the trade demand, even for fourth-rate jokes, far exceeds the supply. This is an encouragement to him who produces the imitation or bogus product, and affords opportunity for malice to disport itself as humor.

Of the malicious jokes, none is more flagrant and false than the "bottle joke," that moss-grown play of the fat-witted which portrays the sportsman afield with a bottle around which man, dog and gun revolve. This has been served up from time immemorial in all its combinations, recasts, variants and attenuations, till a certain part of the non-sporting public would be justified in believing that a well-filled bottle was the essential part of a sportsman's equipment, and that sport itself was a mere pretext to betake oneself to the woods where, in seclusion, all constraint would be abolished.

No baser libel could be perpetuated on sportsmanship than that which seriously implies that the bottle is an integral part of the sportsman's outfit. The effervescent, mirthful joke, full of fun and merriment without malice, brightens the moments and benefits mankind; but the malicious joke, which leaves hurt and false opinion, is deserving of condemnation. A sportsman may be a total abstainer or he may not, precisely as other men in other vocations or avocations may be. Indeed, the sportsman of to-day is one and the same man in business and sport. In other words, the business men of America are all sportsmen, following sport in some one or all of its different forms of shooting, fishing, yachting, camping, etc.

However, in this matter, one's judgment should be fully tempered with charity, for the reason that the jokesmiths, earning their bread by a racking mental anguish, compared to which the sweat of the brow is as naught, are not unworthy of commiseration, not forgetting a kind thought for the public also. They are an ancient, venerable guild, of whom more was expected than their treasury contained. There are but few elementary jokes, the most honored of which are the mother-in-law joke and its attenuations, the doctor and his patients, etc., with the bottle joke, in all its variants of snakebites, lost key-hole, swaying lamp-posts, etc. With this dearth of rough joke material on the one hand, and the antiques of thought pervading the gray matter of the average jokesmith on the other, the true spirit is without doubt to feel thankful that the joking conditions have long since reached bed rock, and cannot become worse.

The bottle joke will probably survive, and bounce up in due season in the spring when the young man's mind of the old man's mind lightly turns to thoughts of fishing.

and in the fall, when their mind turns to dog and gun, and perchance between time, when the days wax hottest, or the bleak, chilling winds sweep from the north, for a good thirst is not a matter of labor or sport, nor is the knowledge of what will best assuage it confined to guilds or classes.

## AMERICAN AND ENGLISH FOXHOUNDS.

THE recent contest between a pack of American hounds, the Grafton pack, of Massachusetts, Mr. Harry W. Smith, master, and the Middlesex pack, English hounds, of Virginia, resulted in a victory for the American hounds. With this victory there were associated the honors of which the Townsend trophy was the emblem, and the \$2,000 stake. The official award, after two weeks of sport and critical observance of the packs' doings by the expert judges, was rendered as follows:

We award the match and stake, together with the Townsend cup, to the Grafton pack, which, in our estimation, did the better work with the object of killing the fox in view.

The decision was signed by Mr. Charles McEachern, of Montreal, and Mr. James K. Maddux, of Warrenton, Va. The kill was an essential consideration in the match as contemplated, but as neither pack had killed within the official knowledge of the judges, that circumstance was necessarily omitted in consideration of the award.

There was a large gathering of fox hunters, gentlemen and ladies, who rode pluckily across country regardless of walls, ditches and rough going. Several hard falls occurred, but fortunately no one was seriously injured.

The race between the two packs, one American the other English, has much more of importance than appears on the face of it. For many years past, the American foxhound has been sneered at as a frivolity of the hunting field, by English fox hunters and by some American fox hunters who had seen the English hounds hunt in England, or who formed their opinions and derived their knowledge from hearsay. Some packs of pure English hounds were established in this country; but the rivalry between the respective supporters of the two kinds of hounds was uncompromisingly distinct. Some informal races were run in the past to determine which of the breeds was the better, but apart from establishing a general belief in the superiority of the American hounds, they were indeterminate. This race between the Grafton pack and the Middlesex pack, was run under all the formal conditions essential to an authoritative decision.

For the English hound, nearly all or quite all the attributes of excellence were claimed. In particular it was asserted that he was much faster, much more enduring and much more of a true foxhound than was his lighter-built, taller and less robust confrere of the States. On the other hand, the American fox hunter held that the heavy-boned, heavy-bodied and comparatively short-legged English hound was physically incapable of competing with the American foxhound, however much satisfaction he may give to English sportsmen on English fields.

This match will accomplish much in officially establishing the long mooted question of superiority, although many more matches may be necessary before the matter is settled acceptably to all. One match can hardly be said to be absolute in its scope over all. The more matches there are the better for the sport. Nevertheless, up to the present the American foxhound has proved himself to be other than the frivolity of sport at which he was estimated by some who now know him better.

COMMISSIONER JAMES S. WHIPPLE has appointed Mr. John B. Burnham, of Essex, a district game protector. Mr. Burnham has been strongly supported as a candidate for the office of chief protector, and it is assumed that Commissioner Whipple has made him a district protector in order to qualify him for the larger office, the law requiring that the chief protector shall be named from the list of district protectors. If this assumption shall prove correct the appointment will be received with unbounded satisfaction by all the friends of the forest, game and fish who are cognizant of Mr. Burnham's qualifications for the office.

WHEN a man says that he prefers dogs to human beings it will probably be found that human beings prefer a dog to him.

## THE SPORTSMAN TOURIST

### In the Lodges of the Blackfeet.

#### I.—Fort Benton.

WIDE brown plains, distant, slender, flat-topped buttes; still more distant giant mountains, blue-sided, sharp-peaked, snow-capped; odor of sage and smoke of camp fire; thunder of ten thousand buffalo hoofs over the hard dry ground; long-drawn, melancholy howl of wolves breaking the silence of night, how I loved you all.

I am in the serene and yellow leaf, dried and shrivelled, about to fall and become one with my millions of predecessors. Here I sit, by the fireplace in winter, and out on the veranda when the days are warm, unable to do anything except live over in memory those stirring years I passed upon the frontier. My thoughts are always of those days; days before the accursed railroads and the hordes of settlers they brought swept us all, Indians and frontiersmen and buffalo, from the face of the earth, so to speak.

The love of wild life and adventure was born in me, yet I must have inherited it from some remote ancestor, for all my near ones were staid, devout people. How I hated the amenities and conventions of society; from my earliest youth I was happy only when out in the great forest which lay to the north of my home, far beyond the sound of church and school bell, and the whistling locomotives. My visits to those grand old woods were necessarily brief, only during summer and winter vacations. But the day came when I could go where and when I chose, and one warm April morning in the long ago I left St. Louis on a Missouri River steamboat, bound for the Far West.

The Far West! Land of my dreams and aspirations! I had read and reread Lewis and Clark's "Journal," Catlin's "Eight Years," "The Oregon Trail," Fremont's expeditions; at last I was to see some of the land and the tribes of which they told. The sturdy flat-bottom, shallow-draft, stern-wheel boat was tied to the shore every evening at dusk, resuming her way at daylight in the morning, so I saw every foot of the Missouri's shores, 2,600 miles, which lay between the Mississippi and our destination, Fort Benton, at the head of navigation. I saw the beautiful groves and rolling green slopes of the lower river, the weird bad lands above them, and the picturesque cliffs and walls of sand stone, carved into all sorts of fantastic shapes and form by wind and storm, which are the feature of the upper portion of the navigable part of the river. Also I saw various tribes of Indians encamped upon the banks of the stream, and I saw more game than I had thought ever existed. Great herds of buffalo swimming the river often impeded the progress of the boat. Numberless elk and deer inhabited the groves and slopes of the valley. On the open bottoms grazed bands of antelope, and there were bighorn on nearly every butte and cliff of the upper river. We also saw a great many grizzly bears, and wolves, and coyotes; and evenings, when all was still aboard, the beavers played and splashed alongside the boat. What seemed to me most remarkable of all, was the vast numbers of buffalo we passed. All through Dacotah, and through Montana clear to Fort Benton, they were daily in evidence on the hills, in the bottoms, swimming the river. Hundreds and hundreds of them, drowned, swollen, in all stages of decomposition, lay on the shallow bars where the current had east them, or drifted by us down the stream. I am inclined to believe that the treacherous river and its quicksands, its unevenly frozen surface in winter, played as great havoc with the herds as did the Indian tribes living along its course. Many and many a luckless animal, sometimes a dozen or more in a place, we passed, standing under some cut bluff which they had vainly endeavored to climb, and there they were, slowly but surely sinking down, down into the tenacious black mud or sands, until finally the turbid water would flow smoothly on over their lifeless forms. One would naturally think that animals crossing a stream, and finding themselves under a high cut bank would turn out again into the stream and swim down until they found a good landing place; but this is just what the buffalo, in many cases, did not do. Having once determined to go to a certain place, they made a bee-line for it; and, as in the case of those we saw dead and dying under the cut banks, it seemed as if they chose to die rather than to make a detour in order to reach their destination.

There were many places after we entered the buffalo country which I passed with regret; I wanted to stop off and explore them. But the captain of the boat would say: "Don't get impatient; you must keep on to Fort Benton: that's the place for you, for there you'll meet traders and trappers from all over the northwest, men you can rely upon and travel with, and be reasonably safe. Good God, boy, suppose I should set you ashore here? Why, you wouldn't in all likelihood keep your scalp two days. These here breaks and groves shelter many a prowlin' war party. Oh, of course, you don't see 'em, but they're here all the same."

Foolish "tenderfoot," innocent "pilgrim" that I was, I could not bring myself to believe that I, I who thought so much of the Indians, would live with them, would learn their ways, would be a friend to them, could possibly receive any harm at their hands. But one day, somewhere between the Round Butte and the mouth of the Musselshell River, we came upon a ghastly sight. On a shelving, sandy slope of shore, by a still smoldering fire of which their half-burned skiff formed a part, lay the remains of three white men. I say remains advisedly, for they had been scalped and literally cut to pieces, their heads crushed and frightfully battered, hands and feet severed and thrown promiscuously about. We stopped and buried them, and it is needless to say that I did not again ask to be set ashore.

Ours was the first boat to arrive at Fort Benton that spring. Long before we came in sight of the place the inhabitants had seen the smoke of our craft and made preparations to receive us. When we turned the bend and neared the levee, cannon boomed, flags waved, and the entire population assembled on the shore to greet us. Foremost in the throng were the two traders who had some time before bought out the American Fur Company, fort and all. They wore suits of blue broadcloth, their long-tailed, high-collared coats bright with brass buttons; they wore white shirts and stocks, and black cravats; their long hair, neatly combed, hung down to their shoulders. Beside them were their skilled employes—clerks, tailor, carpenter—and they wore suits of black fustian, also brass buttoned, and likewise their hair was long, and these latter, almost without exception, wore parfleche-soled moccasins, gay with intricate and flowery designs of cut beads. Behind these prominent personages the group was most picturesque; here were the French employes, mostly creoles from St. Louis and the lower Mississippi, men who had passed their lives in the employ of the American Fur Company, and had cordelled many a boat up the vast distances of the winding Missouri. Without exception these men wore the black fustian capotes, or hooded coats, fustian or buckskin trousers held in place by a bright-hued sash. Then there were bullwhackers, and mule-skinners, and independent traders and trappers, most of them attired in suits of plain or fringed and beaded buckskin, and nearly all of them had knives and Colt's powder and ball sixshooters stuck in their belts; and their headgear, especially that of the traders and trappers, was home-made, being generally the skin of a kit fox roughly sewn in circular form, head in front and tail hanging down behind. Back of the whites were a number of Indians, men and youths from a nearby camp, and women married to the resident and visiting whites. I had already learned from what I had seen of the various tribes on our way up the river; that the everyday Indian of the plains is not the gorgeously attired, eagle plume bedecked creature various prints and written descriptions had led me to believe he was. Of course, they had, all of them, such fancy attire, but it was worn only on state occasions. Those I now saw wore blanket or cow (buffalo) leather leggings, plain or beaded moccasins, calico shirts, and either blanket or cow leather toga. Most of them were bareheaded, their hair neatly braided, and their faces were painted with reddish brown ochre or Chinese vermilion. Some of them carried a bow and quiver of arrows; some had flint-lock fukes, a few the more modern cap-lock rifle. The women wore dresses of calico; a few "wives" of the traders and clerks and skilled laborers even wore silk, and gold chains and watches, and all had the inevitable gorgeously hued and fringed shawl thrown over their shoulders.

With one glance the eye could take in the whole town, as it was at that time. There was the great rectangular adobe fort, with bastions mounting cannon at each cor-

ner. A short distance above it were a few cabins, built of logs or adobe. Back of these, scattered out in the long, wide flat bottom, was camp after camp of trader and trapper, string after string of canvas covered freighters' wagons, and down at the lower end of the flat were several hundred lodges of Piegans. All this motley crowd had been assembling for days and weeks, impatiently awaiting the arrival of the steamboats. The supply of provisions and things brought up by the boats the previous year had fallen far short of the demand. There was no tobacco to be had at any price. Keno Bill, who ran a saloon and gambling house, was the only one who had any liquor, and that was alcohol diluted with water, four to one. He sold it for a dollar a drink. There was no flour, no sugar, no bacon in the town, but that didn't matter, for there was plenty of buffalo and antelope meat. What all craved, Indians and whites, was the fragrant weed and the flowing bowl. And here it was, a whole steamboat load, together with a certain amount of groceries; no wonder cannon boomed and flags waved, and the population cheered when the boat hove in sight.

I went ashore and put up at the Overland Hotel, which was a fair-sized log cabin with a number of log walled additions. For dinner we had boiled buffalo boss ribs, bacon and beans, "yeast powder" biscuit, coffee with sugar, molasses and stewed dried apples. The regular guests scarcely touched the meat, but the quantities of bread, syrup and dried apples they stowed away was something surprising.

That was a day to me, a pilgrim fresh from the effete East, from the "States," as these frontiersmen called it, full of interest. After dinner I went back to the boat to see about my luggage. There was a gray-bearded, long-haired old trapper standing on the shore looking absently out over the water. His buckskin trousers were so bagged at the knees that he seemed to be in the attitude of one about to jump out into the stream. To him approached a fellow passenger, a hair-brained, windy, conceited young fellow bound for the mining country, and said, looking intently at the aforesaid baggy knees: "Well, old man, if you're going to jump, why don't you jump, instead of meditating over it so long?"

He of the buckskins did not at first comprehend, but following the questioner's intent stare he quickly saw what was meant. "Why, you pilgrim," he replied, "jump yourself." And instantly grasping the youth by the legs below the knees he heaved him out into about three feet of water. What a shout of laughter and derision arose from the bystanders when the ducked one reappeared and came gasping, spluttering, dripping, ashore. He looked neither to the right nor the left, but hurried on board to the seclusion of his cabin, and we saw him no more until he pulled out on the stage the next morning.

I had letters of introduction to the firm which had bought out the American Fur Company. They received me kindly and one of them took me around introducing me to the various employes, residents of the town and to several visiting traders and trappers. Of the latter I met one, a man only a few years older than myself, whom I was told was the most successful and daring of all the traders of the plains. He spoke a number of Indian languages perfectly, and was at home in the camp of any of the surrounding tribes. We somehow took to each other at once, and I passed the balance of the afternoon in his company; we eventually became great friends. He still lives; therefore, as I may in the course of this story tell some of the things we did together, for which we are now both truly sorry, I will not give his right name. The Indians called him the Berry; and as Berry he shall be known in these chronicles of the old plains life. Tall, lean, long-armed and slightly stoop-shouldered, he was not a fine looking man, but what splendidly clear, fearless dark brown eyes he had; eyes that could beam with the kindly good nature of those of a child, or fairly flash fire when he was aroused to anger.

It was not half an hour after the arrival of the steamboat, before whisky dropped to the normal price of "two bits" per drink, and tobacco to \$2 per pound. The white men, with few exceptions, hied to the saloons to drink, and smoke, and gamble. A few hurried to load their wagons with sundry kegs and make for the Indian camp at the lower end of the bottom, and another, still larger, ran out on the Teton as fast as their horses could run.

The Indians had hundreds and hundreds of prime buffalo robes, and they wanted whisky. They got it. By the time night closed in the single street was full of them charging up and down on their pinto ponies, singing, yelling, recklessly firing their guns, and vociferously calling, so I was told, for more liquor. There was a brisk trade that night at the rear doors of the saloons. An Indian would pass in a good head and tail buffalo robe and receive for it two and even three bottles of liquor. He might just as well have walked boldly in at the front door and traded for it over the bar, I thought, but I learned that there was a United States marshal somewhere in the Territory and that there was no telling when he would turn up.

In the brightly lighted saloons the tables were crowded by the resident and temporary population, playing stud and draw poker, and the more popular game of faro. I will say for the games as played in those wide open and lawless days that they were perfectly fair. Many and many a time I have seen the faro bank broken, cleaned out of its last dollar by lucky players. You never hear of that being done in the "clubs," the exclusive gambling dens of to-day. The men who ran games on the frontier were satisfied with their legitimate percentage, and they did well. The professionals of to-day, be it in any town or city where gambling is prohibited, with marked cards, false-bottom faro boxes and various other devices take the players' all.

I never gambled; not that I was too good to do so, but somehow I never could see any fun in games of chance. Fairly as they were conducted there was always more or less quarreling over them. Men a half or two-thirds full of liquor are prone to imagine things and do things they would recoil from when sober; and, if you take notice, you will find that, as a rule, those who gamble are generally pretty heavy drinkers. Somehow the two run together. The professional may drink also, but seldom when he is playing. That is why he wears broad-cloth and diamonds and massive gold watch chains; he keeps cool and rakes in the drunken plunger's coin. In Keno Bill's place that evening I was looking on at a game of faro; one of those bucking it was a tall, rough, be-whiskered bullwhacker, full of whisky and quarrelsome, and he was steadily losing. He placed a blue chip, \$2.50, on the nine spot, and copped it; that is, he placed a small marker upon it to signify that it would lose; but when the card came it won, and the dealer flicked off the marker and took in the chip.

"Here, you," cried the bullwhacker. "What you doin'? Give me back that chip an' another one with it. Don't you see that the nine won?"

"Of course it won," the dealer replied, "but you had your bet copped."

"You're a liar!" shouted the bullwhacker, reaching for his revolver and starting to rise from his seat.

I saw the dealer raising his weapon, at the same instant Berry, crying out, "Down! Down!" dragged me with him to the floor, everyone else in the room who could not immediately get out of the door also dropped prone to the floor. There were some shots, fired so quickly that one could not count them; then there was a short intense silence, broken by a gasping, gurgling groan. Men shuffled to their feet and hurried over to the smoke enveloped corner. The bullwhacker, with three bullet holes in his bosom, lay back in the chair from which he had attempted to arise, quite dead; the faro dealer, white, but apparently calm, stood on the opposite side of the table staunching with his handkerchief the blood from the nasty furrow a bullet had plowed in his right cheek.

"Close call for you, Tom," said some one.

"He sure branded me," the dealer grimly replied.

"Who was he? What outfit was he with?" was asked.

"Don't know what his name was," said Keno Bill, "but I believe he rolled in with Missouri Jeff's bull train. Let's pack him into the back room, boys, and I'll get word to his friends to come an' plant him."

This was done; the blood-stained chair was also removed, ashes were scattered on some dark spots staining the floor, and after all hands had taken a drink on the house, the games were resumed. Berry and I strolled out of the place. I felt queer; rather shaky in the legs and sick at the stomach. I had never before seen a man killed; for that matter, I had never even seen two men in a fist fight. I could not forget that terrible death gurgle, nor the sight of the dead man's distorted face and staring eyes.

"Awful, wasn't it?" I remarked.

"Oh, I don't know," Berry replied, "the fish got what he was looking for; these bad men always do, sooner or later. He started first to pull his gun, but he was a little too slow."

"And what next?" I asked. "Will not the dealer be arrested? Will we not be subpoenaed as witnesses in the case?"

"Who will arrest him?" my friend queried in turn. "There are no police, nor officers of the law here of any description."

"Why—why, how, then, with so many desperate characters as you evidently have here, how do you manage

to preserve any form of law and order?"

"Seven—eleven—seventy-seven," Berry stentimentously replied.

"Seven—eleven—seventy-seven," I mechanically repeated. "What is that?"

"That means the Vigilance Committee. You don't know exactly who they are, but you may be sure that they are representative men who stand for law and order; they are more feared by criminals than are the courts and prisons of the East, for they always hang a murderer or robber. Another thing, do not think that the men you saw sitting at the tables in Keno Bill's place are, as you termed them, desperate characters. True, they gamble some, and drink some, but on the whole they are honest, fearless, kind-hearted fellows, ready to stay with a friend to the end in a just cause, and to give their last dollar to one in need. But come. I see this little shooting affair has sort of unnerved you. I'll show you something a little more cheerful."

We went on up the "street" to a fair-sized adobe cabin. Through the open doors and windows came the strains of a violin and concertina, and the air was about as lively a one as I ever had heard. Many and many a time I heard it in after years, that and its companion dance pieces, music that had crossed the seas in the ships of Louis XV., and, taught by father to son for generations, by ear, had been played by the voyageurs up the immense length of the Mississippi and the Missouri, to at last become the popular music of the American in the Far Northwest.

We arrived at the open doorway and looked in. "Hello, Berry, come in, old boy," and "Bon soir, Mons. Berri, bon soir; entrez! entrez!" some of the dancers shouted; we went in and took seats on a bench against the wall. All of the females in the place were Indians, and for that matter they were the only women at that time in all Montana, barring a few white hurdy-gurdy girls in the mines of Helena and Virginia City, and of the latter the less said the better.

These Indian women, as I had remarked in the morning when I saw some of them on the levee, were very comely, of good figure and height, and neatly dressed, even if they were corsetless and wore moccasins, far different indeed from the squat, broad, dark natives of the eastern forests I had seen. And they were of much pride and dignity; that one could see at a glance. And yet they were what might be termed jolly, chattering and laughing like so many white women. That surprised me. I had read that Indians were a taciturn, a gloomy, silent people, seldom smiling, to say nothing of laughing and joking with the freedom and abandon of so many children.

"This," Berry told me, "is a traders' and trappers' dance. The owner of the house is not at home, or I would introduce you to him. As to the others"—with a sweep of his hand—"they're too busy just now for any introduction ceremony. I can't introduce you to the women, for they do not speak English. However, you must dance with some of them."

"But, if they do not speak our language how am I to ask them to dance with me?"

"You will walk up to one of them, the one you choose, and say: 'Ki-tak-stai pes-ka'—will you dance?"

I never was what you may call bashful or diffident. A quadrille had just ended. I boldly walked up to the nearest woman, repeating the words over and over that I might not forget them, bowed politely, and said "Ki-tak-stai peska?"

The woman laughed, nodded her head, replied "Ah," which I later learned was yes, and extended her hand; I took it and led her to a place for another quadrille just forming. While we were waiting she spoke to me several times, but I could only shake my head and say: "I do not understand." Whereupon she would laugh merrily and say a lot more in her language to her neighbor, another comely young woman, who would also laugh and look at me with amusement in her eyes. I began to feel embarrassed; I'm not sure that I did not blush.

The music struck up and I found that my partner was a light and graceful dancer. I forgot my embarrassment and enjoyed the quadrille, my strange partner, the strange music and strange surroundings immensely. And how those long-haired, buckskin-clad, moccasined plainsmen did caper and cut pigeon wings, and double shuffle, and leap and swing in the air! I wondered if I could ever, since that seemed to be the style, learn to do likewise. I determined to try it anyhow, but privately at first.

The quadrille ended I started to lead my partner to a seat, but instead she led me over to Berry, who had also been dancing, and spoke rapidly to him for a moment.

"This," said he to me, "is Mrs. Sorrel Horse. (Her husband's Indian name.) She invites us to accompany her and her husband home and have a little feast."

Of course we gladly accepted and after a few more dances departed. I had been introduced to Sorrel Horse. He was a very tall, slender man, sorrel haired, sorrel whiskered, blue eyed, a man as I afterward learned of extremely happy temperament under the most adverse conditions, a sincere and self-sacrificing friend to those he liked, but a terror to those who attempted to wrong him. Sorrel Horse's home was a fine large Indian lodge of

eighteen skins, set up beside his two canvas covered wagons near the river's bank. His wife built a little fire, made some tea, and presently set before us the steaming beverage with some Dutch oven baked biscuits, broiled buffalo tongue, and stewed bull berries. We heartily enjoyed the meal, and I was especially taken with the luxurious comfort of the lodge; the soft buffalo robe couch upon which we sat, the sloping willow back rests at each end of it, the cheerful little fire in the center, the oddly shaped, fringed and painted parfleches in which Madam Sorrel kept her provisions and her various belongings. It was all very new and very delightful to me, and when after a smoke and a chat, Sorrel Horse said: "You had better camp here for the night, boys," my happiness was complete. We went to sleep on the soft couch covered with soft blankets and listening to the soft murmur of the river's current. This, my first day on the plains had been, I thought, truly eventful.

WALTER B. ANDERSON.

### The Free Trappers.

MR. JOHN HEALEY, of early Montana and early Alaska days, writes to Mr. Tappan Adney, who had sent him a copy of Hamilton's "My Sixty Years on the Plains": "I thank you for 'Wild Cat's' book. I received it last night at 9 o'clock, and finished reading it before going to sleep. I like Bill, and he is all he claims for himself. The story of his life is good. I knew him very well, and have always admired the man. That he is still living seems wonderful, for Bill was an old man when I knew him forty years ago. I mean he was an old mountaineer.

It was give-and-take in those days, and life was cheap. A man had to take care of himself. The free trappers were all independent men, who would not work for any company. They got credit for their hunting, paid their bills and dissipated their money racing horses and outfitting their women. I have outfitted many of these men, and a better lot never lived. In the Whoop country they were known as wolfers—Belly River wolfers. They were without any doubt the bravest and best men I ever knew. I can't say enough for them. All rivalry ceased when one or more was missing, and whenever volunteers were called for to go in search of the missing ones, the trouble was to keep too many from going. Many of these men have seen the passing of the buffalo, the wolf and the Indian; and now they are riding the plains with buggies and autos just the same as you are doing in the East. I can't help taking off my hat to some of my comrades; they have developed into some of the finest specimens of the Western citizen."

Capt. Luther S. Kelly, better known as Yellowstone Kelly, and now agent of the San Carlos Apaches, writes of the author of "My Sixty Years on the Plains":

"Bill Hamilton was the best sign talker in the Northwest. He talked so fast the Indians had to pay close attention to him."

The author's observations upon the habits and customs of the Indians, the ways of wild beasts and their characteristics, and his accounts of the hardships and hazards of the trapper's life—"one day all calm and peaceful, the next surrounded by hostile Indians"—are very interesting. They describe a phase of our development that has all but passed away. The very simplicity of the story, the absence of any endeavor after "style" or effect, make it the more entertaining.—Detroit Free Press.

### Surgery in the Camp.

NOTRE DAME BAY, Newfoundland, Nov. 7.—*Editor Forest and Stream:* I read the letter in your issue of Nov. 4 from R. S. Spears on a "Bit of Camp Surgery." Something like Mr. Spears' case happened to me. In the fall of 1903 I was in camp at Patrick's Marsh, one of the best caribou haunts in Newfoundland. Before leaving home I had cut off the top of the second finger of my left hand. It was so sore that I let no one know of it, fearing that its state would prevent my going on the trip. The first day in camp I struck the sore so badly that the wound was opened and it bled. During the night it pained so much that no rest could be had. One of the party, a man from the Bay and used to nature's remedies, inquired the cause of my trouble. When he saw the finger he said he would fix it up all right. He procured some turpentine, or little lumps of the fir tree. This he burnt in an iron spoon to take off the spirits or to reduce its strength. The cut was then well covered with the salve and bound up lightly. That night sweet was the sleep, and three days after the cut was clean and the flesh filling up. Within a week the finger was sound. BETHICK.

### Brazilian Woods.

ACCORDING to Handel and Industrie Brazilian forests are furnishing a good field for the investment of foreign capital. Cabinet woods of many kinds abound, are easy to get at and fairly easy to get out. Only small quantities have been exported. This is due to a lack of enterprise on the part of Brazilians. A German consular officer, writing to his government, points out the enormous possibilities of Brazil's forests and calls attention to the fact that an American company, with \$5,000,000, is beginning to exploit some of the best regions. He assigns as a reason for the backward state of the lumber trade the fact that communication with the woods was bad, freights and wages high. The new company hopes to overcome all these by the application of modern transportation and milling methods. For example, an elevated swinging railroad will take the logs out of the woods to the mills and the mills will be near or on good roads.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

# NATURAL HISTORY

## Papers at the A. O. U. Congress.

THE twenty-third annual congress of the American Ornithologists' Union was held at the American Museum of Natural History, New York city, with the exception of the final session, which was at the Brooklyn Institute of Arts and Sciences. Meetings open to the public were held forenoon and afternoon, Nov. 14, 15 and 16, the programmes being made up of the reading, illustration and discussion of papers by members. Luncheon was served at noon on each of the three days by the Linnæan Society of New York, and on the evening of the 18th the members met at the Hotel Endicott at an informal dinner.

At the opening session "Some Unpublished Letters of Wilson and Some Unstudied Works of Audubon," by Witmer Stone, Philadelphia, Pa., was the first paper. It was received with the interest always shown by bird students for the works of these pioneer American ornithologists. In "The Evolution of Species through Climatic Conditions," Dr. J. A. Allen, New York city, spoke of the manner in which our present geographic races illustrated the differentiation of species whose distribution covered a wide area, including very diverse climatic conditions, which in time affected the plumage and appearance of the birds. In a paper on "Summer Birds of the Mt. Marcy Region in the Adirondacks," Elon H. Eaton, Canandaigua, N. Y., enumerated many birds, and recounted interesting facts regarding them in their northern forest home. The final paper of the morning was "Pelican Island Revisited," by Frank M. Chapman, New York city. Mr. Chapman illustrated his paper by a beautiful series of views of the home life of these interesting birds on their own exclusive island in the Indian River region of Florida. This island is now a Government reservation, set apart especially for these birds, and is the only place on our coasts where they breed. The slides showed old birds and young, or varying sizes, nests, eggs and method of feeding, in which the young bird puts its head well into the throat of the parent.

The first paper on the afternoon programme was "Some Breeding Warblers of Demarest, N. J.," by B. S. Bowditch, Demarest, N. J., illustrated by lantern slides. Ten species were enumerated as known to breed as follows: Black and white, blue-winged, yellow, chestnut-sided, black-throated green, oven bird, northern yellowthroat, yellow-breasted chat, hooded, redstart and the Louisiana water thrush, and several others were spoken of as probably breeding, though nests had not been found by the author. Thirty slides of birds, nests, eggs, young and nesting sites illustrated the paper. The second paper was "Notes on Wing Movements in Bird Flight," illustrated by lantern slides, by William L. Finlay, Portland, Oregon. Mr. Finlay has accomplished the most remarkable results in certain branches of bird photography, notably birds on the wing, probably, of any living photographer and nature student, and the series of slides shown on this occasion were a wonderful revelation of his success along this line. The possibilities of bringing out the principles of wing movement in flight were strongly indicated, though Mr. Finlay regards his work as only a step in this direction. In a paper on "The Status of Certain Species and Sub-species of North American Birds," J. Dwight, Jr., New York city, following a line of reasoning which he adopted several years ago, regarding the procedure of the American Ornithologists' Union in the matter of nomenclature, argued against the hair-splitting methods of differentiation that has led to such confusion in the case of certain geographical forms. The case was discussed from the opposite side by Mr. Oberholser, impartially by Dr. Allen, and very strongly in favor of a more simple and less complicated method by Mr. D. G. Elliot. The last paper of this session was "Wildfowl Nurseries of Northwest Canada," by Herbert K. Job, Kent, Conn. Mr. Job is one of the pioneer bird photographers, and his work is among the best. His slides illustrated the home life of the waterfowl, which are still to be found in great colonies in this wild northern country.

After the dinner of that evening the members returned to the Museum for an informal reception, at which there was a demonstration of a new projection apparatus. This apparatus not only projects slides, but a magnified and beautifully clear colored reflection of any small object, introduced into the objective, is thrown in color on the screen.

The first paper of the morning session of the second day, "Andreas Hesselius, a Pioneer Delaware Ornithologist," by C. J. Pennock, Kennett Square, Pa., dealt principally with extracts from the note books of this Swedish missionary, whose observations were made some 200 years ago. At that time ornithological observations were few, and those included in these notes were extremely interesting, and couched as they were, in the quaint style of the time, often very amusing. Witmer Stone, of Philadelphia, Pa., discussed "The Probability of Error in Bird Migration Records." Mr. Stone spoke of the conditions that tend to admit error in the records as gathered by single isolated observers and recorded the methods he has adopted, of grouping observers in parties of three or four, who practically cover the same ground, thus affording the opportunity of checking and averaging the observations of each by those of the others. Mr. Stone followed this paper by one on "Some Observations on the Applicability of the Mutation Theory to Birds." The discussion which followed by Dr. Allen and others showed a disinclination to admit the applicability of this theory to birds. Henry Oldys, of Washington, D. C., followed with a discussion of "The Song of the Hermit Thrush." Mr. Oldys has for some time devoted himself to the study of bird song, and gave an interesting account of his experience in securing an opportunity to study the hermit's song, of his impressions regarding it, and its comparison to the song of the wood thrush. He

gave some pleasing imitations of a variety of songs of each of these two species, and concluded by rendering a little song, the words of which he had composed, to the air he had recorded from the most accomplished of the hermit songsters to whom he had listened.

Mr. Chapman concluded the forenoon session with "Impressions of English Bird-Life," illustrated by lantern slides. Besides giving a number of views of English birds, the author gave views of the home and town surrounding of Gilbert White, as well as other characteristic English country scenes, and contrasted the conditions of bird-life in England and this country. England being described as possessed of fewer species but many more individuals.

The afternoon meeting opened with an exhibition of lantern slides and "Similarity of the Birds of the Maine Woods, and the Pocono Mountains of Pennsylvania," by William L. Bailey, Ardmore, Pa. The Pocono Mountain region has been but little worked as ornithological territory, and the author enumerated many species included as normally more northern breeding birds, some of them not having been previously recorded as breeding in Pennsylvania. Prof. Wells W. Cook, of the United States Department of Agriculture, Washington, D. C., followed with a paper on "Discontinuous Breeding Ranges." The author cited instances of birds found breeding in the southern extremity of the southern hemisphere, and the northern extremity of the northern hemisphere, while between the two extended a vast area over which they were not found during the breeding season. He also mentioned other instances, of species having restricted breeding ranges, separated by extensive longitudinal gaps. The final speaker of the session was Abbott H. Thayer, Dublin, N. H., who demonstrated his claims regarding protective coloration in animals, which, as he explained and abundantly convinced his audience, are not theories but facts. First regarding the views hitherto held of the efficacy of coloration harmonizing with surroundings, Mr. Thayer explained that this was dependent on the nature and effect of the light that the creature was seen in. His contention was that as the prevailing light conditions have the tendency to bring the upper parts into strongest relief, blending into least conspicuousness on the under parts. To counteract this tendency nature has colored her creatures darkest above, shading to lightest beneath. The speaker gave a demonstration of his contention by exhibiting an imitation of a leopard, ground color shaded as in nature, from darkest above to lightest beneath, also with the spots shown, and with a background painted in the same color as the animal. By alternately lighting from above and below the creature was made to disappear when seen in the normal, top light, and to stand out sharply, despite the exact similarity of color to background, when seen in a bottom light. Secondly, the speaker contended that the white upper markings on many creatures cannot be guiding signals for others of the same species, because from the pursuing creature's range of vision these markings would usually come against the skyline and therefore disappear against the sky. They are, therefore, of importance in reducing the creature's silhouette against the sky by subtracting the area of the part that thus blends into the sky. Mr. Thayer also gave a number of other demonstrations. The title of his paper was "The Principles of the Disguising Coloration of Animals."

The opening paper for the forenoon session of the final day was "The Collection of Birds in the New York Zoological Park," C. W. Beebe, New York city. Mr. Beebe gave many interesting experiences in connection with the various experiments that he has such an excellent opportunity of conducting at the Zoological Park, among others mentioning an experiment with two young white-throated sparrows hatched in the Park. These birds were fed in the same manner on the same kind of food, but one was kept in a cage out in the light and air under fairly normal conditions, while the other was kept indoors, in a rather dark place, and subjected to a moisture-laden atmosphere. At the first molt the two birds showed no perceptible change, but soon after the second molt Mr. Beebe found that the bird kept indoors had become an almost uniform dusky color, and with no trace to indicate the identity of the specimen. The skins of the two birds were exhibited. The second paper was "A Contribution to the Natural History of the English Cuckoo, with a Review of the Literature on the Subject," by Dr. Montague R. Levenson, New York city. Dr. Levenson corrected the erroneous statements that the young of the English cuckoo ejected the eggs and young of the bird in whose nest they were hatched, before the young cuckoo was twenty-four hours old, and that they had, at this period, a depression in the anterior portion of the back to enable them the more easily to effect this ejection. He illustrated his paper by drawings and photos, and apparently abundantly proved his contention. Dr. Dwight gave a paper on "Plumages and Status of the White-winged Gulls of the Genus *Larus*," illustrating his remarks with a considerable series of skins. He contended for the elimination of one recognized form, and for the recognition of another new form. A paper by Arthur T. Wayne, Mount Pleasant, S. C., on "A Contribution to the Ornithology of South Carolina, pertaining chiefly to the Coast Region," in the absence of the author, was read by Mr. Brewster. The list of species covered was a quite lengthy one, and was fully annotated. Mr. T. S. Palmer, in the absence of the author, read a paper by O. Widman, St. Louis, Mo., on "Should Bird Protection Laws be in the hands of the National Government?" The author contended that inasmuch as the birds were the guests of the nation, rather than of any one State, the National Government should have the supervision of their protection, thereby securing a uniform law, which otherwise could not be secured. Mr. Thomas S. Roberts, Minneapolis, Minn., related "A Lapland Longspur Tragedy," illustrated by lantern slides. On the night of March 13,

1904, during a heavy migration flight of these birds southern Minnesota, and northern Idaho, a severe snow storm occurred in this region during which thousands of these birds struck the buildings, telegraph poles, wires and the ice on lakes, many being instantly killed and others injured, some of the latter being revived in the houses and afterward liberated. Mr. Thomas stated that a conservative computation of the number which were killed was 750,000, but that he fully believed that 1,000,000 would be a more nearly correct estimate.

The afternoon session was held at the Brooklyn Institute of Arts and Sciences. Mr. F. A. Lucas, in behalf of the Institute, welcomed the Union to the Institute. Mr. Lucas was elected chairman of the meeting. Mr. George K. Cherrie, New York city, spoke on "The Hoatzin and other South American Birds." The exhibition of specimens to illustrate this paper were viewed later. Mr. Cherrie spoke of the habits of this interesting bird, which while young, has claws on the wings, used like the hook on the wings of bats, to assist in climbing. They are lost before the bird reaches maturity. The species nest where the structure will be over water when the eggs are laid, and the eggs are not laid until the river rises sufficiently to inundate the lower part of the tree in which the nest is built. The last paper of the Congress was "Among the Water Birds of Southern Oregon," by William L. Finley, of Portland, Oregon. This paper was illustrated by a very large series of beautiful slides, showing the bird life in the great rookeries of this still wild region. The congress was then adjourned. The members were served with refreshments by Mr. and Mrs. Lucas and the exhibitions of specimens in the museum were afterward viewed.

On the morning of the 17th the members visited the New York Aquarium and then went to the New York Zoological Park, where they were entertained by Mr. Beebe, who served refreshments. B. S. BOWDITCH.

## Daring Deeds of Dogs.

### Malty in the Moccasin's Den.

BLACK, heavy, boiling clouds were massing in the southwest. The soft, sweet, voluptuous breeze had been succeeded by an ominous calm. The gay music of most of the birds had died away; even the noisy, irrepressible yellow chat which here renders day and night hideous with his incessant screechings (which may seem most entrancing music to his kin) was awed into comparative silence. It was evident that "a clash of the elements was impending; and that, in the Ozarks, means something dreadful; for though we seldom get a visit from a dangerous wind, the lightning and thunder are as terrible as any region of the earth can produce. Sometime the thunder is so loud that a timid being wonders the very globe is not split open—and the concussion cause even the firmest substances to shake and rattle; while the power of the lightning does not need to be merely guessed at, but leaves evidences "susceptible to ocular demonstration."

I have seen a round ball of red, white or blue lightning apparently twenty inches in diameter, crush an oak of at least equal thickness into cord wood and kindling wood, and scatter the fragments in every direction more than 100 feet—that is, they were distributed about the site of the tree in a circle over 200 feet wide. I have known it to break off the upper half of a tall pine—about eighteen inches thick at that part—and hurl the great heavy top sixty feet from the stump. Last summer five or six trees from fifty feet to 200 yards apart, and most of the poles of a rural telephone line parallel with them for a distance of about a furlong, between Hot Springs and the Ouachita, were struck simultaneously, it is thought, by one and the same discharge. The awful crash was heard at my home on the west side of the Ouachita, about three miles distant—indeed, it sounded as if it had burst a mountain at our very ears.

This much I have said about the lightning terrors of the region to impress more fully upon the reader the desperate nature of the canine adventure I desire to try to narrate; which, though it may read like a chapter from a "blood and thunder" novel, will, nevertheless, be as literally true as my memory and judgment can make it.

Malty, my faithful friend and well-nigh inseparable companion, had called me forth—perhaps the "red gods" had something to do with it, too—and I was following her anxiously, for her excited manner—bristling and growling—indicated the proximity of something more formidable than a rabbit. What it was I never found out, for soon we came to the brook, and on the shore we were distracted by a new enemy, a good-sized water moccasin.

Now, Malty was not an invincible snake dog as Coallie now is. On the contrary she had been, up to this time, always so rattled at the sight of a snake that I did not consider it safe to allow her to attack one, even of the less venomous sort. Once she had poked her nose right into the jaws of a moccasin while I was pulling at her tail trying to prevent her, and the foe fastened his rough teeth into her so firmly that she drew him backward about a yard before tearing loose from him. Her body soon swelled to nearly twice its proper size, in spite of all I could do, and she was sick with the poison for about two weeks, during which time she refused all food and drink, and kept her head covered up in a dark corner of her room. When anyone uncovered her for examination of her wound she looked and behaved like one ashamed, and immediately hid her head if permitted to do so.

So I now reminded her of her former indiscretion and checked her rashness, while I cast my eyes about for a club, clod or any sort of weapon. Although the snake was surrounded with driftwood, I could not pick up

## The Deer Park on the Farm.

SIERRA CITY, Cal.—*Editor Forest and Stream:* The literature of venatic sports and pursuits is ever most interesting to me, and I presume it is so also to the generality of disciples of St. Hubertus, as is the fish story to the worshippers at the shrine of Izaak Walton. I turn almost instinctively to any yarn spun by a hunter, when I see it in print, particularly when I need diversion from the thoughts of my regular vocation. Furthermore, I desire "to get en rapport," as the spiritualists would say, with my surroundings if in a game country, and nothing seems so effective to that result as a periodical like FOREST AND STREAM, for perusal, or any story on hunting and game no matter what its source. Sometimes the story may be found in publications not of the class. Recently I picked up a copy of the Farm and Home Sentinel, of Indianapolis, and found an article by the editor in regard to the American deer and its association with man. Thinking it might be entertaining to others, I take the liberty of submitting it. WM. FITZMUGGINS.

Less than half a century ago it was very common in some parts of this country to see a certain portion of the larger farms permanently devoted to game—especially the native white-tail deer. The "deer park" was an important part of such farms, particularly to those of the old-fashioned gentlemen who settled the "military scrip lands" of midland and southwestern Ohio. These people brought with them the customs of their fathers from Virginia and the Carolinas. It seems hardly possible now to consider the small expense attending the founding and maintaining of a deer park in the earlier days of what once was the "Northwestern Territory."

Land, of course, was much cheaper then than now and the animals themselves could almost be had for the asking. To-day the "deer park" among farmers and even among country gentlemen is almost unknown in the Central West. In the old days the deer were no more of a luxury than are the farmers' flock of turkeys to-day. A herd of deer increases rapidly, are not costly to feed, are easily kept in flesh and furnish venison for a large family, besides leaving plenty of it for market.

One of the staff writers of the National Stockman and Farmer, of Pittsburg, while on a visit to Washingtonville, Montour county, Pa., was invited to drive out to a farm one mile away to see some deer fed. In relating the story of his trip he says:

"I was surprised to find that a plain Pennsylvania farmer was keeping more than one hundred deer in a grove by his home. I spent a night in the home of this farmer, and when I awoke in the morning three deer were at their feed troughs near the house awaiting breakfast. During the next hour I counted seventy-five more as they moved out of the dense grove, making their way toward the feeding ground. As they approached with light step and grace of motion some fawns playing and some older deer watchful, I was sure that no prettier farm scene existed in America.

"A few weeks before this time I had visited the new Zoo, up in the Bronx Park, New York city, where the deer is a specialty, and there was nothing there to compare with the sight upon which this Pennsylvania farmer feasted his eyes twice a day when his deer came out in the open for their grain." This herd belongs to the Hon. Alexander Billmeyer, of Washingtonville, Pa.

The personal experiences of the owner with deer is full of dramatic contrasts. Mr. Billmeyer's original start was five does and a buck. In six years his herd had increased to one hundred head. Every doe usually has twins each June. In order to reduce the herd and keep it "within due bounds" Mr. Billmeyer sold a large number of the animals and prepared traps for taking them. This proved unfortunate. On account of the wild and timid nature the deer became panic-stricken and in their terror only twelve were caught in the traps, while twenty-two were killed in the effort. In addition to the twenty-two mentioned, a large number of others in their frenzy dashed themselves against trees and fences, many of them were killed outright and others were so crippled as to necessitate their being shot. Those left became so restless and troubled that both appetite and digestion were impaired, and when winter came on they were low in flesh and in no condition to bear its rigors. In spite, therefore, of the greatest care, several of the remaining herd perished from the cold.

Mr. Billmeyer also has a little herd of elk. The elk are much less numerous and less liable to panic than the deer. While the latter always seek shelter from the weather in heavy forest and thickets and even in sheds and shelters of man's construction, the elk remain out in the open in the very coldest of weather. Nature, as with other animals, has provided in a wonderful manner for the care and preservation of the young deer. There is nothing in the animal kingdom so beautiful and graceful, so timid and yet so trustful as the spotted fawns. They are easily "raised on the bottle" and adapt themselves readily to any new surroundings or circumstances.

The writer went out early one summer morning some years ago to kill a "black-tail" deer or two for venison. The particular hunting ground was at the base of the Sangre-de-Cristo Mountains, in Colorado, on the San Luis Park side. A fat doe was killed. The hunter discovered when too late that she had a fawn hidden somewhere in the mountain oak thickets. When carrying the quarters to the pack-horse the feeble cry of a human infant was repeatedly heard. As there was no house or road, nor even an Indian trail, within eight or ten miles, the presence of a baby was impossible, but the writer did not think of it then as the cry of a fawn. The piteous wail ceased and as the horses hidden in the ravine were approached something touched the hunter's boot leg, and looking down he found a most beautiful fawn two or three weeks old trotting contentedly between his feet. The heart of the hunter smote him as the little creature so trustfully followed, for the cruel fate of the mother was fresh in his mind. Taking it in his arms he mounted his horse and carried it home. There the tender-hearted housekeeper fed it on rich cow's milk. It took to the food and ways of the white

folks from the first and grew amazingly. How it did thrive! The kind foster mother allowed it always to eat at the "first table." In a few months it drank coffee and tea like others and soon concluded that everything tasted better if shared with the housekeeper. From that on it drank from her cup and ate from her plate. It was inordinately fond of pickles and was so impolite as to clear the pickle dish at every meal. It followed those whom it loved constantly about like a dog.

At the end of a year "Jennie," as the doe was named, had grown to be several inches higher than the dining table and so strong that soldiers and cowboys alike dared not start any "rough house" games with her as formerly. Then her troubles began.

A large party of ladies and gentlemen came from Denver on a camping expedition through the mountains. The railroads had not then climbed the Sangre-de-Cristo passes. This party, with a just regard for the convenience of having numerous saddle horses at hand, camped for a week near the place bossed by the orphaned "Jennie." The third evening of their sojourn the party were guests at a formal dinner in the ranch dining room. The splendid doe, not being in possession of any "company manners," was ignominiously locked up in the private blacksmith shop of the place.

The soup had been served and the dinner was going off with all the smoothness and precision possible to a table presided over by a tactful woman, assisted by a detail of half a dozen men as waiters, when a tremendous racket was heard in the direction of the stables, followed by a crash of breaking wood and falling glass. The dismayed housekeeper barely had time to say, "Oh! it's Jennie," when around the corner of a building she came. With a squeal of anger, the long hairs on her back standing out straight, blood streaming from cuts on her face and a piece of window sash around her neck, she came leaping high in the air and striking the ground on all four feet; her eyes blazing with anger, she looked dangerous. Bounding into the dining room at one leap, she struck the table with a crash, breaking a stack of plates and throwing soup in every direction. The gowns of several ladies were ruined and the neatly pressed scissors-tail of the male guests had a disreputable look ever after.

This settled it. Jennie was to be turned into venison, but woman's influence came to the rescue. The patient housekeeper "put her foot down," so to speak, and declared that Jennie was practically one of the family and there should be no cannibalism in that mess room while she had anything to do with it. The next winter, however, the passes were piled deep with snow and toward spring a tobacco famine raged in the valley. In the ranch store room was tobacco enough to give the fifty men on the place a quarter ration for several weeks. But the door was left open and the deer who was passionately fond of the weed, had an hour to herself in that forbidden precinct. The result was the last tobacco in San Luis Park was eaten, trampled under foot and otherwise destroyed. The next morning Jennie was treacherous beguiled into "taking a walk" with the foreman. They entered the cottonwood thicket, where the town of Villa Grove now stands, and there poor Jennie died. On the banks of Kirber Creek she was buried and there she has reposed for these many years. It was believed by some that, like the educated Indian, she tired of civilized life, put on the blanket of the barbarian and returned to her native pastures on the sides of the Sangre-de-Cristos.

In the childhood of the writer ninety-four acres of the farm on which he was born were used for a "deer park." There were many such at that time, some larger, some smaller. In this enclosure were between thirty and forty deer. These were fed as carefully as any animals on the farm and were used for food or sold as the welfare of the herd or the circumstances of their owner dictated. A few of them leaped the fence and were killed by hunters. The Civil War turned the attention of men into new channels.

A small bunch finally remained in the park, led by an enormous stag. One day a lady undertook to walk through the deer park in spite of warnings. She was attacked by the stag, knocked down and her life was only saved by laborers who fought the brute with ax and pitchfork until so crippled that he had to be shot. The owner sold the remaining deer, turned the "park" into cultivated fields and from that on no deer have been held in captivity on that land or in that township. Thus the disappearance of deer parks in the Middle West is accounted for. One by one they were abandoned for various reasons until practically none are left.

Even considered as a luxury, a deer herd is not so expensive, and except for the increased value of land could be easily made to pay expenses. In the case of the herd spoken of by The Farm and Home Sentinel, something over a hundred deer and elk altogether, there is but 2,000 bushels of corn, oats and wheat screenings fed each year.

## The Goose Came Back.

THE writer was informed by Capt. Handen B. Nicholas that his father, the late Robert C. Nicholas, of Buckingham county, Va., once caught a young wild gander, which he tamed, and for a long time it remained quietly and contentedly in the yard with the other tame geese. However, it disappeared in the spring after it was a year old. The following fall Mr. Nicholas heard in the air far above him what seemed to him a familiar "honk." Taking out of his pocket a large bandana handkerchief, with which he was accustomed to call together the geese by waving it when he fed them, he held it up in the air and waved it, and to his surprise the gander came to the ground with some young geese and a mate he had taken in the Arctic regions. They never left their home again, but remained all their lives perfectly tame and contented. This is not fiction but an established fact, and will be corroborated by Captain Nicholas if anyone wishes to verify it. It appears to the writer to be strong, steady proof of the fact that wild animals reason and are far more intelligent than they are generally believed to be.

BUCKINGHAM,

even a rotten stick before he tried to escape. Somehow all snakes seem afraid of me, and I must look one steadily in the eyes from the first if I would strike it ere it rushes away. Malty leaped after him in a fearful rage. He fell into the swift water, now-so muddy that nothing could be seen an inch below the surface, for the rain had been literally pouring down for several minutes, and the sky was aflame with blinding lightning. "Great Jove" hurled his mighty thunderbolts, right and left with such apparent recklessness that we couldn't imagine whether he favored our side or the snake's, or was against us all. A great pine was so near me that I ran on to another which had fallen long before and bridged the creek (a standing pine is not a safe companion in a thunder storm). Not that I felt much safer there, the pine was still too near; but I could not desert Malty now—poor little "fuss-and-trouble," she had always heretofore been so nervous about thunder. But on this occasion she seemed to defy everything to capture that snake. Perhaps she had made solemn vows of vengeance during her long illness.

As the snake struck the water another and larger one appeared at its side with wideopen mouth. This was more than Malty could forgive. She rushed out on the log beside me and instantly hurled herself down upon them, and all disappeared in the torrent.

Now comes the wonderful, the amazing, the incredible part of the story. I can't say how it was. I can't explain it. I only know it really happened, and was no dream.

Of course I expected her to reappear in a moment, and my mind worked very rapidly. I wondered if she would be bitten under water; if, under such circumstances, the bite would be harmful, if she could find or catch a snake under water, etc. But she did not come up; neither did any snake. I searched the water from bank to bank with my eyes; down stream, up stream, carefully scrutinized the shores. No dog. No snake. No living thing. I was alone with the flood, the ear-splitting thunder, the blinding lightning, the roaring tempest. Had I lost that faithful, loving, thinking, passionate dumb brute forever? Had some large aquatic monster actually swallowed her? Or, had she caught in a network of roots. Ah! that was it! The only likely thing. I had read of such a fate overtaking land animals.

I was tempted to plunge in—I was wet as could be already. But I believed I could search the bottom more quickly with a pole, and every second was most precious now. She might be struggling in awful agony on the bottom, might be drowning, might already be past help. I am not ashamed to say that I prayed for that little dog, while mentally recalling instances wherein I had been unkind and unjust to her. Never had she seemed so precious to me.

Sentimental? Silly? Yet, I believe all true sportsmen capable of so loving any really worthy dumb companion, only some would not admit it, even to their dearest friends. I certainly would not confess this "weakness" in FOREST AND STREAM if I believed its readers, in the main, held the contempt for animals that some do. I quickly found a long pole, with which I rapidly but carefully prodded the bottom all about. It did not come in contact with anything that felt at all like any animal. I was in despair.

Suddenly I heard a sound very different from the noise of the elements. I could not decide what nor whence it came. It seemed faint and far away. I soon decided, however, that it was near, and moved about to get the direction; whereat I noticed that it became more distinct as I neared the south shore, so I crossed over. Then I noted that it came from the ground. I kept on until I stood directly over the spot. The sound now became a furious, though muffled, barking, and the ground shook like the deck of a boat in a storm.

"Is it possible? Is Malty here, under this ground? How did she get here? There must be an outlet under the water! Humph! too much like a novel!" I mentally exclaimed.

"Malty! Malty!" I called aloud, and began tearing at the sticks and roots that were in part exposed, for I discovered that this was a drift thinly and irregularly covered with earth, although a space of two or three yards between it and the creek appeared solid ground.

I soon had her uncovered, but she was so eager after the snakes that she paid no attention to me, but kept on digging, barking and growling. The passages among the sticks were so narrow and tortuous, however, that the snakes kept eluding us for a long while, and I do not now recollect whether we got any of the snakes or not. My joy at her exploit made me comparatively indifferent to all that happened afterward for the remainder of the day.

This adventure suggests several interesting questions for naturalists and sportsmen to wrestle with, and I would be much gratified to see the subject discussed in FOREST AND STREAM by its well informed readers, especially by men of such wide experience as Cobia Blanco, Hardy, Captain Kelly and Jaques. Can a dog trail anything on or under water? Does a dog open and use his eyes under water very commonly? Can a dog use his teeth effectively under water without strangling? I have myself received evidences that say "yes" to all the foregoing, but want better proof if possible. How many of you have known dogs to perform really useful or interesting feats under water? Please speak up! What more widely interesting subject could you suggest to lovers of adventure or students of natural history?

Water and dogs. The sportsman's chief delights.

Since writing the foregoing I have noticed with sincere sorrow that our beloved fellow-contributor, Cobia Blanco, has passed on to the happy hunting grounds, and even at this late date I must ask to be permitted to declare my admiration and respect for him. So much has been said in his praise that I might seem simply following popular opinion were I to indulge in an extended laudation, so I will offer but one special tribute:

He was truthful, he was true to nature. My own comparatively limited experiences convince me of that, but instead of praising his style—it was too brief, too tantalizing; I often wished for details. There was never a word too much, nothing tiresome. L. R. MORPHEW.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## Vagaries of the Ruffed Grouse.

BEAUMARIS, NOV. 12.—*Editor Forest and Stream:* Recent notes on the peculiar freaks of ruffed grouse at certain seasons of the year, particularly the fall, bring to my recollection several instances where these birds have flown against buildings and other obstructions. The object of this letter is to tell of something which occurred only a few moments ago.

I was walking along the shore of Lake Muskoka, and was just passing a summer residence when I heard a whirr of wings, saw a ruffed grouse fly and then heard a loud, dull thud. On going down to the boat house, which is situated about twenty yards from where the bird rose, I found a ruffed grouse lying on the ground at the side of the boat house, with one of its wings extended, as though hurt. On going toward it, and when within two yards or so, it fluttered under the boat house, and must have escaped between some of the logs of the crib-work, as I did not get another glimpse of it.

On another occasion, in the fall of the year, I was estimating some pine timber on an island, and took my gun with me; I did not see any birds, but on arriving at the hotel about dusk, as I was standing on the outer edge of the verandah, a ruffed grouse coolly walked out from under the verandah with its usual jerky strut, directly under where I was standing. Needless to say I did not shoot it, and nothing would have induced me to do so under the circumstances.

I do not think these freaks are confined to the ruffed grouse, as I remember when a boy—we lived in the suburbs of a town in England, and several miles from any place where game birds were likely to be found—I was in the garden, and an English partridge flew up from under an apple tree. A boy friend of mine also shot an English hen pheasant a few hundred yards from my home. I regret not having any means of ascertaining the season of the year of the latter occurrences, but am convinced that these birds were possessed by a craze similar to that shown by our ruffed grouse.

Can it be that these birds have received a pellet of shot, which, although not proving fatal, has been sufficient to craze them to a certain extent? This solution has occurred to me because so many of these peculiar events happen in the fall, and therefore in the open season.

I may mention that there is a scarcity of ruffed grouse in most parts of our northern country this fall. On the first and second days of the open season a friend and myself drove about sixty miles on unfrequented bush roads, and although we had good dogs, we only bagged twenty-six birds, most of these being old birds and singles; we came across very few coveys. Last year my friend bagged between sixty and seventy birds, going over the same ground. This number, I must acknowledge, I consider far too many for any single individual to shoot. If a little moderation was exercised, we would have game for all time to come, and I have no sympathy with those who do not know when they have enough. J. H. W.

## The Quails of the United States.

BY SYLVESTER D. JUDD, ASSISTANT, BIOLOGICAL SURVEY.

(Continued from page 411.)

### Miscellaneous Animal Food.

INSECTS of several orders not previously mentioned make up 0.70 per cent. of the food of the bobwhite. They include hymenopterous insects, such as ants, (*Lasius* sp., *Tetramorium caspium*, *Camponotus pennsylvanicus*); gall flies (*Synipidae*), which produce bladder-like growths on plants; in rare instances parasitic wasps (*Tiphia inornata* and *Proctotrypes rufipes*); crane flies, May flies, and sometimes true flies, like the green fly (*Lucilia caesar*) and the robber fly (*Asilidae*). The animal food of the bird includes other orders besides insects. The greater part of this is spiders, chiefly ground spiders, with a few harvest-spiders (*Phalangidae*). The common thousand-leg (*Julus* sp.) sometimes contributes to the food, as it often does to that of many species of song birds. Snails are more often taken. Among these *Pupa armifera* and the pond snail (*Succinea ovata*) have been identified. The little fresh water lobster called crayfish (*Cambarus*) had furnished the major course for four out of fifteen birds shot by collectors for S. A. Forbes in Illinois. Manipulation of these biting crustaceans would appear to be difficult for a bird no larger than bobwhite. The queerest food eaten is the toad. B. H. Warren reported Florida birds as feeding on small batrachians (probably young toads), and laboratory examination of Florida birds showed in one case a tiny toad. It is fortunate that this habit of bobwhite is not general, since the toad is useful and destroys great numbers of insects.

### Food of the Young.

During the breeding season a third of the food of adult bobwhites consists of insects, while their young, like those of practically all other land birds, consume a much greater proportion of insect food than do their parents. At Marshall Hall, July 24, nineteen droppings collected from two broods of downy chicks—one but a few hours out of the shell and the other probably several days old—consisted wholly of the remains of insects. Their fragmentary condition made the species almost unrecognizable, but the following were identified: Minute green leaf-eating beetles (*Chrysomelidae*), at least two species; leaf-eating beetle (*Colaspis brunnea*); small scarabæid beetles (*Scarabæidae*), two species; longicorn beetle (*Cerambycidae*), one species; ground beetles (*Carabidae*), five species; weevils (*Rhynchophora*); grasshopper (*Acrididae*); caterpillars (*Lepidoptera*); ants (*Formicidae*); stink bug (*Euschistus?*); spiders (*Arachnida*); thousand-legs (*Julus* sp.).

### Masked Bobwhite.

(*Colinus ridgwayi*.)

The masked bobwhite is slightly smaller than the bobwhite of the Eastern States, and the male differs strikingly, having the chin, throat, and sides of the head black, and the underside of the body usually uniform

rusty reddish. Since the discovery of the bird little has been added to our knowledge of its life history beyond some notes on its distribution, and the fact of its probable extinction within our borders. It lived on grassy plains covering a limited area in southern Arizona, south and southwest of Tucson, and ranged into northern Sonora, Mexico. In regard to the causes leading to the disappearance of the masked bobwhite, Herbert Brown writes as follows:

"The causes leading to the extermination of the Arizona masked bobwhite (*Colinus ridgwayi*) are due to the overstocking of the country with cattle, supplemented by several rainless years. This combination practically stripped the country bare of vegetation. Of their range the *Colinus* occupied only certain restricted portions, and when their food and shelter had been trodden out of existence by thousands of hunger-dying stock, there was nothing left for poor little bobwhite to do but go out with them. As the conditions in Sonora were similar to those in Arizona, birds and cattle suffered in common. The Arizona bobwhite would have thriven well in an agricultural country, in brushy fence corners, tangled thickets, and weed-covered fields, but such things were not to be had in their habitat. Unless a few can still be found on the Upper Santa Cruz we can, in truth, bid them a final good-by."\*

Recent information received by the Biological Survey from Sonora is to the effect that these interesting birds still survive in parts of that region, and efforts are being made by a game association to obtain living birds from there to introduce into California. The natural home of the masked bobwhite, in the hot and arid desert of southern Arizona and northern Sonora, is sufficient guaranty that the birds would thrive in cultivated sections anywhere in southern California and the arid Southwest. It would be deplorable if so handsome and useful a bird should be allowed to become extinct, and a determined effort should be made to introduce it into suitable localities before it is too late.

Beyond what Herbert Brown has stated we have practically nothing on this bird's habits. He has told us that, like all the birds of the genus *Colinus*, the males give the well-known "bobwhite" call, and he translates their rallying note as "hoo-we." He examined the stomachs of three birds. The first contained mustard seed, chaparral berries, six or eight beetles, and other insects; the second only a single grasshopper an inch long, and the third contained twenty ants, several crescent-shaped seeds, and a large number of small, fleshy green leaves.

It is stated by Bendire that in Sonora Benson found these birds only in fields where wheat and barley had been grown. Probably then the bird's general habits may be safely assumed to be similar to those of its relative, bobwhite.

### California Quail.

(*Lophortyx californicus*.)†

The California quail is generally dispersed over California below an altitude of 8,000 feet and extends into southern Oregon and western Nevada. It has been introduced into Washington and British Columbia, and efforts to introduce it into the Hawaiian Islands also have proved very successful, although of late years its numbers there have been much reduced by the mongoose, by which in time it is likely to be exterminated. Two geographic forms of the bird are recognized, a dark form and a light one, but as they do not differ in habits they are not distinguished in the following account. It is a beautiful bird with a most pleasing combination of colors and markings, its head being adorned by a glossy black crest, narrow at the base and gradually widening into gracefully recurring plumes, and the markings on the underparts resembling scales. It frequents brush-covered hillsides, cañons, thickets along water courses and the borders of roads, as well as vineyards and other cultivated fields. The nesting time of the species varies considerably according to locality and conditions. According to E. A. Mearns it nests in March and April in Ventura County, Cal. Nests containing eggs were found during the last week of May in Tulare County, Cal., by J. E. McLellan. The eggs usually number 12 to 15, and are white or buff with spots.

These birds take kindly to civilization, and flocks are not rarely seen in the suburbs of large towns, where they range through the gardens and orchards. They often nest close to farm buildings, and W. Otto Emerson states that a pair nested within a rod of his front door, though nearly every hour people and vehicles were passing within four feet of the nest.

Instead of spending the night in a circle on the ground, like the bobwhite, the California quail chooses much safer places and roosts in bushes or low thickly foliated trees. This quail is even more confiding than the bobwhite, and frequently comes about farm buildings to eat with the chickens. It has been known to lay in confinement, and appears to yield readily to semi-domestication.

The valley quail has acquired the interesting habit of posting sentinels when feeding, which is described in detail by John J. Williams. Mr. Williams observed a flock enter a field and begin to feed, while a sentinel took his station in a peach tree and scanned the country round about for danger. Presently he was relieved by a second bird, who took up a position on a brush pile and a little later was relieved by a third, who kept guard while the other two fed with the flock.

Writing in 1891 Clark P. Streater says that about 100,000 are sold each year in the San Francisco market. It is not a perfect game bird, for it does not lie well to a dog, and when once flushed has a habit of running that is exasperating to the sportsman. The best way to hunt these quail is to keep the dog at heel and to run down the birds. This is likely to make them take wing and to break up the covey. The same result may be accomplished also by discharging the gun in the air. When a covey has been scattered in suitable cover they will lie well enough to a trained dog to give the hunter

\*Auk, XXI, p. 213, April, 1904.

†This name is used here to cover both the typical California quail (*Lophortyx californicus*), and the paler, more southerly form, called the valley quail (*L. c. vallicola*).

considerable sport, though it is poor in comparison with that afforded by the bobwhite. The beauty of this quail, its pleasant call notes, and its confidence in man make it a favorite, except where it damages the grape crop. In fall and winter where it is abundant hundreds of birds unite in great packs. Bendire, writing in 182, says that within a decade packs of 500 were often found, but that at that time coveys even of 50 were rare in most places. In the fall of 1891 they were still very abundant on the west side of the San Joaquin Valley, where E. W. Nelson, of the Biological Survey, records their slaughter by pot-hunters. The hunters stationed themselves behind a brush blind near the one spring where the birds came to drink. Thousands of them flocked thither for water during the day, and by waiting until many birds were bunched the hunters killed at least a score at each discharge of the gun. In a week of this butchery 8,400 quails were killed. A record of 525 birds to four guns in a day in February, 1903, near San Diego, Cal., shows that birds are still abundant there, though far less numerous in most places than formerly.

The California quail, though not a large consumer of insects, is a useful bird, since weed seeds constitute more than half of its food. In some regions these birds suffer from the curtailment of their food supply by droughts, and in the northern part of their range many are killed by severe winters. Bendire states that during the excessively cold winter of 1887-88, when the mercury dropped to 28 below zero in the northeastern corner of California, these quail perished in great numbers.

The California quail might be introduced successfully in many sections between California and Texas where it does not occur at present. It already has been introduced into Colorado, where it will be protected by law at all seasons until 1920. Laws to prevent trapping and to limit the day's bag, together with absolute protection in sections where necessary, should suffice to preserve this beautiful species.

### Food Habits.

The general food habits of this quail have been ascertained by the examination of 601 stomachs, and it proves to be one of the most largely vegetarian of game birds. The material for investigation was collected in California, and represents every month of the year except May. Insects furnished but 2.15 per cent. of the food, and leaves, seeds, and fruit 97.85 per cent.

### Insect and Other Animal Food.

The 2.15 per cent. of animal food eaten by this quail is distributed as follows: Spiders, 0.03 per cent.; beetles, 0.22 per cent.; grasshoppers and crickets, 0.24 per cent.; ants and other Hymenoptera, 0.67 per cent.; miscellaneous insects, 0.99 per cent. The beetles are both adults and larvæ. Like the eastern bobwhite, the California quail feeds on ants of the families *Formicidae* and *Myrmicidae*. Sometimes twenty to thirty-five ants are taken at a meal. Of the other Hymenoptera, gall insects and their galls make a significant proportion. Caterpillars and their pupæ are eaten. Cutworms, measuring worms, sphinx, caterpillars, and the cotton bollworm make up the greater part of this food. Like the bobwhite again, this bird shows a relish for bugs. It eats leaf bugs, bugs of the chinch bug family, and stink bugs, assassin bugs, flat bugs, burrower bugs, leaf hoppers, tree hoppers, plant lice, and bugs of the genus *Scolops*. The miscellaneous animal matter taken includes flies, spiders and snails.

### Fruit.

The vegetable food of this quail amounts to 97.85 per cent. of its diet. The bird has an unsavory reputation among fruit growers, especially the owners of vineyards. Relative to this subject, Miss Florence A. Merriam, writing from San Diego county, Cal., says:

"In fact, the quail were so abundant as to be a pest. For several years great flocks of them came down the cañons to Major Merriam's vineyard, where they destroyed annually from twenty to thirty tons of fruit. In one season—July to October, 1881—one hundred and thirty dozen (1,560) were trapped on his ranch. The result of this wholesale destruction was manifest when I returned to the valley in 1894. The birds were then rarely seen on the roads and seldom flushed in riding about the valley."

When this species becomes superabundant and plays havoc with crops it is well to remember that it can be so easily checked. W. H. Osgood, of the Biological Survey, has furnished the writer data on the frugivorous habits of the quail in central California. In one vineyard he saw a flock of about a thousand eating zinfandel grapes. The birds do much damage in September, when the young are molting and they have collected in packs, as before described.

Walter E. Bryant, writing of the damage to fruit, offers testimony on the other side:

"In some parts of California there is a strong prejudice against the quail, owing to alleged damage to the grape. The evidence which I have thus far gathered shows that the quail do pick at the bunches of grapes, and not alone those bunches which are near or on the ground; but the damage which they cause seems over-estimated. Too often mutilated bunches are supposed to be due to the presence of quail in the vineyard; but there are other birds and mammals, also which vary their diet with grapes. I have examined a number of quail's crops and gizzards without finding the presence of grapes, although the birds had been shot near and in vineyards. A quail's crop sent to me from Los Gatos, by Mr. A. H. Hawley, contained twenty-five small grapes; others had a few grapes, seeds and poison-oak berries."

In the 601 stomachs of the valley quail examined by the Biological Survey grapes formed only 0.01 per cent. of the annual food. This small quantity is due, no doubt, to the fact that many of the birds were shot in regions remote from vineyards and many of them during the time when grapes were not in fruit. The total proportion of all kinds of fruit was only 7.60 per cent., an amount so insignificant as to preclude the idea of serious damage. Where the birds are over-abundant

and the consequent damage, great, trapping or advertising the conditions in sporting papers will probably result in reducing the numbers to normal. Of the 7.60 per cent. of fruit, grapes, as before stated, contribute 0.01 per cent.; plants of the genus *Rhus*, mainly *Rhus diversiloba*, 4.74 per cent., and miscellaneous fruit, prunes and vaccinium, 2.85 per cent. The maximum quantity of fruit, amounting to 32.40 per cent. for the month, was taken in December, after the grapes had been picked.

#### Grain.

The relations of the California quail to grain are of considerable economic importance. W. T. Craig, of San Francisco, writes to the Department of Agriculture: "I have observed the quail enter a field of wheat to the number of thousands, and had they not been driven away they would have destroyed the whole crop." No other reports to the Biological Survey show the danger to grain from this quail to be so serious, but data at hand show that it does more or less damage to germinating grain. Two quail shot by Walter E. Bryant on a newly-sown grain field had eaten, respectively, 185 kernels and 210 kernels of barley. Barley is important in California, where it is grown for hay, for grain feed, and for beer making. There is, however, much volunteer barley, which many species of birds feed on and thus do good rather than harm. It is probable that quail do little or no harm to barley at harvest time, and the waste grain that they subsequently gather in stubble fields has no positive value. Of the yearly food of the 601 quail examined 6.18 per cent. was grain, divided as follows: Barley, 4.58 per cent.; wheat, 0.44 per cent.; corn and oats, 1.16 per cent.

#### Leaves.

In its habit of feeding on foliage the California quail differs from the bobwhite and resembles the ruffed grouse. Such food forms 22.73 per cent. of the vegetable matter eaten. In February, when the bobwhite is weathering blizzards, the California quail is enjoying balmy weather and feeding on browse to the extent of eighty per cent. of its food. Most of this browse consists of leaves of leguminous plants, principally clovers. Bur clover (*Medicago denticulata*), a weed that grows in cultivated land and along irrigation ditches, appears to supply most of the forage. Alfalfa and clovers of the genus alfalfa form most of the remaining leguminous green food. Next to legumes the finely divided leaves of alfilaria, or "filaree" (*Erodium*), are important. Grass, chickweed (*Alsine media*), the leaves of fern, geranium, exalis, and groundsel-bush (*Baccharis*) also furnish forage for the quail. W. W. Cooke reports that near Grand Junction, Colo., where the California coast quail has been introduced and thrives wonderfully, market gardeners regard it as a nuisance.

#### Weed Seeds.

Different seeds, largely of weeds, furnish the California quail 59.77 per cent. of its year's diet. Legumes contribute 17.87 per cent.; alfilaria, 13.38 per cent.; composite, 5.55 per cent.; the spurge family, 5.85 per cent., and miscellaneous plants 17.12 per cent. Leguminous seeds are liked best by the bird, and make up 17.87 per cent. of the seed diet for the year and 46.1 per cent. of its food for June. Bur clover yields abundance of seeds as well as forage. Its seed pod is peculiar, much elongated, beset with long, sharp spines, and spirally coiled into a roundish bar. The quail swallows it whole, regardless of spines. This food is highly nutritious and is relished by stock as well as by birds and wild mammals. Seeds of closely allied plants, such as alfalfa, vetch, cassias, cultivated beans and peas, and clovers of the genera *Trifolium*, *Lespedeza* and *Melilotus* also are in the quail's list, as well as of locust and lupines, the latter taken in large quantities. They include the seeds of *Lupinus nanus*, *L. micranthus* and *L. sparsiflorus*. Other leguminous seeds are eaten in great numbers, including a small bean-like seed, *Lotus glaber*, which looks much like a miniature Frankfurt sausage, and an unidentified, almost microscopic square seed, with a notch in its edge, possibly some species of birdsfoot trefoil. Nearly all of the leguminous plants that furnish the quail with seeds belong in the category of weeds.

Seeds of weeds from other families of plants make up no less than 41.89 per cent. of the annual food. Seeds of composite yield 5.55 per cent., such injurious weeds as thistles making up the largest part of this percentage. *M. mariniana* has the largest seeds. Ninety of these had been eaten by a quail shot by F. E. L. Beal at Haywards, Cal., Aug. 15, 1903. The seeds of the bur thistle are smaller and have a hook at one end and a set of spines like a paint brush at the other. They are, perhaps, most liked of all composite seeds. From 500 to 800 are often eaten at a meal. The destruction of this seed is highly beneficial, for the bur thistle is troublesome to farmers. Wild carrot, tar weed, wild lettuce, mayweed and marsh elder furnish most of the remaining seeds of composite plants. Tar weed is a favorite source of food, and one stomach, collected at Watsonville, Cal., by J. S. Hunter, contained 700 of these seeds. Another stomach, from the same place, held 2,000 tiny seeds of dog fennel, or mayweed.

From seeds of plants belonging to the spurge family come 5.85 per cent. of the annual food. Spurges, particularly *Croton setigerus*, commonly known as turkey mullein, are a staple with the California quail as with most other seed-eating birds. So fond are the quail of turkey mullein that their crops are often completely distended with the seeds, sometimes from 500 to 900 to a bird. Turkey mullein is a prostrate plant covered with a whitish, woolly pubescence, and often used by the Indians to poison fish. Seeds of alfilaria, which is both a weed and a forage plant, are eagerly sought. They are lance-shaped, furnished with a long, elaborate, corkscrew awn ending in a thin spine. They burrow into sheep's wool and even pierce the skin. The alfilaria is one of the few seeds of the West that all seed-eating birds consume. The plant is very abundant in California, and the quail often eats from 1,000 to 1,600 of the little corkscrew seeds at a meal. It affords 13.38 per cent. of the year's food, and 26.70 per cent. of the June diet.

Seeds of miscellaneous weeds comprise 17.11 per cent. of the annual food. Among the species included are pig-

weed, rough pigweed and black mustard—especially obnoxious in grain fields—and the closely related weed, wild radish. Seeds of shepherd's purse and of other cruciferous plants are included in common with *silene* and the chickweeds. Geranium seeds are so much relished that often 300 to 400 are eaten at a time. Two closely related plants, miner's lettuce (*Montia perfoliata*) and red maids (*Calandrinia menziesii*), bear minute shiny black seeds that often are eaten by the thousand. The little seeds of red sorrel and curled dock are occasionally taken in almost as large numbers. Seeds of chess, a serious grain pest, are relished, and hundreds of the grain-like seeds of the grass known as "poison darnel" appear in crops examined. Macoun, quoting Spreadborough, states that in British Columbia, where it winters successfully, the quail finds shelter in severe weather under the broom, which in places grows abundantly and yields seed for subsistence.

The quail feeds also at times on mast. A. K. Fisher, in the western foothills of the Sierra Nevada, the last of July, found both young and adult quail eating young acorns. Small quantities of sedge seeds and of dodder are eaten, the latter plant being a destructive parasite on leguminous forage crops. The miscellaneous seed list includes also stick seeds, buttercup, bind weed, plantain, ribgrass, painted cup, mountain lilac and black wattle. In the mountains of Lower California the food supply determines the breeding time of birds. If there is not enough rain for a good supply of seeds the coveys of quail do not break up into nesting pairs but remain in coveys throughout the summer. If the season is wet and the winter rains promise abundant food the birds mate in March and begin nesting immediately.

#### Food of the Young.

The food of young birds differs from that of the parents, as has already been remarked of the bobwhite, but the difference is less marked with the California quail. Stomachs of thirty-two young of the western birds, from one-fourth to one-half grown, have been examined. They were collected from the middle of July to the middle of September. The food was composed of 3.4 per cent. of animal matter and 96.6 per cent. of vegetable matter. Thirty-nine adult birds shot in the same period had eaten almost entirely vegetable food, since only 0.6 per cent. of animal food appeared in analysis. Had the young birds been collected when newly hatched, undoubtedly a larger proportion of insect food would have been found. The 3.4 per cent. of insect food mentioned consisted of beetles, 0.1 per cent.; bugs, 0.2 per cent.; grasshoppers, 1.3 per cent., and ants, 1.8 per cent.

The vegetable food of the young is much like that of the adult. In this case it consisted of leguminous seeds, 18.1 per cent.; alfilaria seeds, 18.5 per cent.; miscellaneous seeds, 54.4 per cent.; browse, 6.6 per cent.; grain, 0.6 per cent.; and miscellaneous vegetable matter, 0.4 per cent.

## The Biography of a Bear.—X.

LATE in the evening we reached an ideal camping ground, one of the most attractive nooks in the mountains that I have ever seen. This was the eastern boundary of the tamarack wilderness and the furthest extremity of the "dry lake." Almost encircling us was a series of high peaks, their northern and western slopes covered with dense and tall forests. Between the summits, the main forest and the open, level land there was a belt of tamarack about half a mile wide in its narrowest place, while a wandering, sluggish little stream, as clear as crystal, and ice cold, drained the meadows and swales, upon which waved grass waist high. Here would be another chance for our horses.

To make the place superlatively fascinating to us, we saw no evidences of its having been recently explored. There were deer tracks everywhere in the soft, wet ground; and they were the tracks of very large deer. We were in the range of the western species, known as the mule deer, which sometimes approaches the elk in size. Later, we found some bear tracks that were so large that we were not altogether certain that we cared for them particularly. We were of the opinion that some of these tracks, which looked to be about fourteen inches in length, had been made too recently to be things for unrestrained delight, for the animals making them had evidently become too old and too tough for any peaceable use. We weren't out after bears especially, having one with us that kept us very well supplied in a way. As for the meat of these old fellows, a carcass would have been too much of a supply; besides, at this season the fur would be of little value; even if we had been after bears, I do not think either of us wanted them in such an out-of-the-way place and with such unreasonably large feet. Why, some of the fore-foot tracks were about the size of a plate, and the claws that impressed patterns in the mud must have been as long as our fingers and top sharp for any conceivable use we had for them. There were some other vital reasons for considering them unavailable. It is true Enochs frequently announced his intention to go out and bring one of these large bears into camp, but we had learned to make allowances for his proclamations. Enochs was too deferential to Jack at certain times to impress us with anxiety as to his voluntarily disturbing any of the wild ones. There were some rocky gorges in our vicinity, where we satisfied ourselves that these ponderous animals had private apartments, and though Enochs was always upon the eve of calling in upon them, several years elapsed, and he omitted doing it until the incident was apparently closed. It is really astonishing how some of the opportunities we long for lose their fascination when they do present themselves. Later along we even moved camp to restrain ourselves from disturbing a bear that came to us in the night time.

At the head of the little stream, where the water oozed from springs that were almost geysers, we found an abandoned dairy. There were two or three log houses tumbling to decay, with racks and tables in some of them that had apparently been used as milk shelves, while several parts of a cheese-making contrivance were falling to pieces in a corner. As the place was fifty miles or so from more than four or five people, this

location could never have been a good one from which to peddle milk—not even over such roads as we traveled. The milk would have churned itself to butter and the butter would have melted into oil, and even if the oil could have been saved, the scheme would have failed. Evidently butter and cheese had been made here as the staple product.

At this time there was not the tinkling of a cowbell, the lowing of steer, nor the tracks of man or domestic animal in the region about us. All the signs of the wilderness indicated that the intrusion of man hereabouts was a rare event. Such birds, squirrels and wild creatures as we saw were at first overpowered with astonishment and curiosity, and then they scurried away panic-stricken, to remain hidden and silent for a long time. The behavior of these wild creatures is a fairly accurate declaration of the status of a wilderness, but it requires no little experience and observation to interpret them correctly, for there are many stages of fright and alarm, and they manifest these in a variety of ways. The bird that makes the greatest outcry, or the animal that hurries out of sight with the greatest signs of panic are not those least familiar with the sight of man. In fact, the lizards of the rocks, the watersnakes, and fish themselves, all testify to the extent with which they have been favored with human interference.

One of the log huts mentioned was comparatively intact, and in it there was a rough stone fireplace; but the hut was so small that a table, a bench and a rough pole bunk about filled it. Moreover, it was too much occupied by chipmunks, mice and possibly by snakes, to be inviting. We utilized it, however, for a cook house, and stored our provisions in it, after carefully boxing them up. A few rods away we selected a little knoll of dry ground and set up our tent there for our sleeping quarters. We found plenty of dry swamp grass to make splendid mattresses, and carpeted the ground in and about the tent. Arranging a camp implies a great deal of fussy work, and by the time we had ours done to our fancy, we were a little beyond comfortable exhaustion, but felt better after supper.

From our tent we had an entrancing view of the mountains and forest, as well as of the upper end of the dry lake, which in reality was more or less wet and swampy, enough so to remain green and fresh throughout summer. As we sprawled about upon our well upholstered bedding, watching the last gilding of the purple summits, the sky colors, the shadows of approaching night settling lower and deeper and darker in the cañons and hollows, and when we could faintly see distant things in the tall grass at the edge of the meadow which we believed to be deer—possibly bear here and there—we smoked our pipes and felt about as well pleased and optimistic as people ever feel. Here was a field for sport, adventure, and for all the spice we were likely to need in the way of danger, if we sought it sincerely. Suddenly it occurred to me that this must be the floating meadow; that this was not a dry lake, but a lake blanketed over with prostrate forest and swamp growth, the accumulation of centuries. As I gazed at it, I saw, or imagined I saw, that it undulated with long, almost imperceptible, swells and subsidences! This was surely a lake.

With the first rays of the sun the next morning, I found myself exploring that part of the meadow which seemed most accessible. I had provided myself with a tamarack pole twenty feet in length and sharpened at one end. I went out upon the layers of matted swamp grass and sounded about until I found a yielding spot, and I sank the pole, point first, by continued prodding. After getting it down through the matted growth of reeds and grass several feet, the pole suddenly slipped through my hands and sank to its full length without further resistance; it was in water, and there was no bottom within its reach! I barely succeeded in recovering the pole, and when withdrawn, it was as cold as a huge icicle; but I was too much excited to notice that. I ran for the camp, and after a hasty breakfast, during which I aroused Enochs and Dick to enthusiasm, we all set out with an ax and a shovel for my discovery.

We set to work immediately, chopped the sod away and dug a hole with the shovel about four feet square. After getting through the sod, we found a tangle of water-soaked poles and logs, which we had considerable difficulty in getting through. At last we uncovered a patch of water which proved as clear as glass, but to look down into it it had the bluish tinge that indicated great depth. We sank the pole down, down as far as we could reach by lying down and reaching to our shoulders in the water—there was no bottom! As we lifted the pole out again we laid it crosswise over the hole, and bending down close to the water, I tried to see to the bottom. I could see downward many feet, but no bottom was visible—nothing but the reflection of our own faces and forms, of which our wide hats were the main feature.

We next walked about, and jumping up and down, we could feel the yielding and heaving undulation distinctly. We realized that here, sure enough, was a covered lake, perhaps miles in extent and of unknown depth. We had begun to get excited, and when we returned to the hole we had made and saw the swirl of a big fish break the surface of the water, we set off at a run for tackle and bait. We could find no grasshoppers, so we hastily sliced some small strips of venison, got our tackle and hurried back to the skylight we had cut in the roof of our lake. Our continued tramping about the edge of the hole had caused the sod to sink into the water, and it was now submerged, so that to get near enough for satisfactory operations we had to collect more poles and make a crib platform over the hole.

We worked like beavers, and it was wonderful how much we accomplished and the size of the poles that we managed in our enthusiasm and excitement to get into that crib, carrying many of them a considerable distance. When all was ready, we dropped in our baited trout lines, with great expectations. For a moment or two there was no response from the depths below; then, almost at the same instant, each of us received the thrilling shock of a strong strike. I twitched my line sharply and felt the unmistakable sensation of being fast to a big one. It sulked an instant, and then shot away and downward, and the snell snapped from the

shank of the hook at the first strain. Enochs and Dick each drew up his line, to find the hooks had been nipped from them as cleanly as mine had been.

We were now all trembling with excitement and anticipation, while we got out our largest ringed hooks, of which we happened to have four, and hastily attaching these to our lines, we baited and lowered them, this time putting on bait proportioned to the size of the hooks. Our lines had scarcely sunk ten feet when we were all very busy, and our lines were hissing through the water and sawing into the edge of the turf and sod. "Easy, boys! Easy! Tire 'em out. We can't raise them with these lines; the lines 'll snap sure!" I exclaimed. Enochs said "d—n," and drew up his line minus hook and sinker. Dick, more patient, was still playing his fish, and at last I could feel that mine was yielding stubbornly, but surely, little by little. When I had worked him almost to the surface, I got down flat and reached for him under the water. I was fortunate enough to get my fingers into his gills and lift him out just as he was about to lunge away in a final effort. Dick followed my methods, and lifted his fish out also. Big trout? Why, these fish were patriarchs—six, possibly eight-pounders, and looking more like salmon than trout.

Certainly we were baited and in after them again with more speed and celerity than is common to probate courts; but in our excitement we got our lines almost as much tangled as legal phraseology, and in our struggles with the tackle, one of us—I think it was me—got into the water. I was wet to the middle, but was too game a fisherman to admit that I nearly froze to death. But I wonder to this moment how it is that such icy water remains liquid. However, we got our tackle straight and were at once busy with fish again, for a few instants, and then each of us swore a word or two as we pulled up our limp lines all minus bait, hooks and sinkers. This was serious, as we had no more hooks, other than brook trout fly-hooks, which were utterly useless here.

Remembering a collection of pothooks made from heavy wire that were in the old stone chimney, we hurried away to the hut and spent the balance of a valuable forenoon fashioning them into fish hooks. While Enochs and I were engaged fixing hooks and tackle, I told Dick to dig another hole down to water at a distance of about a hundred feet from the one we had made. I figured that this would enable us to see down into the water.

In making the hooks we got the most of them ranging in size from a large trout-hook to some large enough for sturgeon; but I determined to have at least one that would stand the strain that anything likely to be lurking in our subterranean lake would put it to; so I made a hook about the size and form of a shark hook. I then got the stay chains from the wagon and linked them together, making a chain about ten feet long, to which I attached the shark hook with a sort of swivel coupling. I next got the lash ropes and our picket ropes of three-quarter inch manila, and after getting these all spliced together, I had a line a hundred yards long. It looked like mighty stiff tackle for trout fishing, but I like to be prepared for emergencies.

After bolting a lunch, no incident of which I can now remember, we again hurried to our promising fishing ground and went into the business for all there was in it. Dick had not completed his hole, but he could not resist the temptation to take part in the fishing, and so we postponed that project.

We baited the smaller of our improvised hooks first and lowered these attached to our heaviest trout lines and such pack thread and cordage as we found about our blankets, the tent and various parcels in our outfit. We had no sooner lowered these lines below the surface than we had begun to participate in some of the liveliest fishing I ever heard of. It would seem that our experiments of a few hours had aroused the fish in that underground realm until they were ravenous, if not crazy. We began to pull them up—trout, salmon-trout, fish that seemed to be salmon, and others that belonged to no fish family with which we were familiar. About every third fish we hooked, however, either straightened out our hooks, which were not stiffly

enough tempered, or our lines parted, and we lost most of our improvised tackle. Every little while we hooked fast to something that carried away bait, hook and sinker without seeming to notice any impediment in the process whatever.

In the meantime we had hoisted out a collection of big fish that were now floundering about us in the water holes and upon the grass, and several had been carried away by Jack. Most of the fish seemed to be of the salmon family, while others looked like mackerel, cod-fish, pickerel, and one had a mouth like he might belong to the sturgeon or shark division. When the smaller tackle was exhausted, I resolved to put the shark tackle into commission. As I arranged the pile of chain and rope I was joshed by Enochs and Dick, but neither of them could do it with much sincerity. I simply asserted that if there was anything too large in that hole for the outfit I now had, some one had to go for more rope and competent tackle. Telling Dick to finish the second hole, so that it would give us some chance to see in the depths below, I put on about two pounds of meat and let down the line yard by yard, until I had paid out at least a hundred feet of it, and no bottom sounded. I let down more and more, until I thought it wise to reserve enough to make fast to something, and to allow a little to play out with.

Some time passed without anything more than nibbles at the big bait. Once in a while there was a jerk that pulled out a foot or more of the rope, but I judged from the feel of it that it was fish of not more than twenty or forty pounds—possibly salmon. Enochs had been examining the fish we had landed, and he was about half persuaded of the correctness of my theory, that this buried lake of ours might be connected with the sea by some subterranean river or channel. It is true we were about two hundred miles from the coast; but not many miles north of us there was at least one river that had no known outlet, but sank and lost itself in the earth. These fish were certainly different from any known inland fish and—

About that time there was a tug at the rope that nearly took my breath, and I barely escaped getting a leg fouled in the coils of rope that now rapidly ran out. Enochs and I both grasped it, gave it the strongest jerk we were capable of, and then we immediately had our hands blistered for our pains. The rope ran out like it was either foul of a whale or a freight train. I got a half-hitch around the end of the largest pole, and as the rope ran out, it fairly burned a collar on the pole. It smoked and sparks flew, so that I cast the coil loose in the water, while Enochs made the extreme end fast to a cross-pole.

As soon as the slack rope had paid out a little it stopped, and as far as we could see our fish—or whatever we had hooked—had apparently pulled loose or got off the hook. We began to take in rope, and kept coiling it on the pole platform until we had it about two-thirds in; then we felt something to which we were fast. It felt like a log or fouled line, and we gave it a good jerk, for which we were immediately paid by more blisters upon our hands. I again hastily dumped the coils of slack rope into the water, while it kept us busy to keep from going along with it, as it now fairly whizzed and sizzled as it cut down into the water.

"We've got to make fast to something with spring to it," I said. "If it rushes the rope all out like that, something has to give way. Carry the end out as far as it will go. There's a small tree over there near our wagon. If it will reach the tree, tie it as high up as you can, so the tree will answer for a springpole. Be lively!"

Enochs ran with the rope out to the edge of the wet ground, while the slack was coming in nicely. Dick ran to his assistance, while I steadily reeled in. They had almost reached the tree, when I felt the old dead weight, there was a sudden strain on the rope below, and away she started. The boys reached for the tree, failed, felt the rope slipping from them, and in desperation they ran the end around the wagon tongue, and made it fast. They had barely accomplished this, when the line went taught and the wagon started forward with the ready speed of an automobile. The wagon was

empty, and ran comparatively easy, so I shouted to Dick and Enochs to get in, while I ran for it myself. We all clambered in, for a novel ride indeed. As the speed increased I put on the brake, but as the wheels had reached wet ground the wagon slid along like a sled.

We went right along, notwithstanding the brake, and we could see the rope smoke where it paid over a pole at the brink of the hole. As we approached the opening in the sod Enochs and Dick began to climb back out of the seat and crowd me further toward the rear end of the wagon. It looked as though we might develop into a submarine affair, and we had begun to mutiny and desert the ship, when the rope again slackened, just in time to save us from thinking we were scared.

We all got out of the wagon with a great deal of anxiety that had been steadily accumulating. This kind of fishing was getting laborious. The rope was slacking again, and I reefed it in, while I urged the boys to run the wagon back. This they did until they had the wagon back to the old stand. They were trying to get it to a position opposite the tree, when I again felt the old ominous strain. I was going to be more cautious now, so I signalled the boys to hold fast, and let a little slack.

I hurried to the wagon and explained that we were at the danger point, and we would now let the fish take the initiative a little. We all got into the wagon again, and Jack's attention having been attracted, he, too, came and clambered in. He seemed to have about all the fish he could hoist on board. We had just fairly got comfortably settled, when there was a tightening of the line, and then we started forward, but with very respectable moderation. I again manned the brake, which answered very well as a sort of drag, while our wagon wasn't such a bad substitute for a reel, or, at least, for a sort of capstan in effect—that is, in its effect upon the rope.

We started forward, as I say, with respectable moderation, but we presently began to scorch a little. I applied the brake until it locked the wheels, and then we struck the wet ground and went forward as though we had lost respect for ourselves entirely. The next thing I remember we had collided with the crib about the hole, and as the wagon pole went down the momentum we had attained flipped us over endwise into the surrounding swamp without any remorse whatsoever.

RANSACKER.

### Squirrels and Glass.

In a shop window were confined two full-grown gray squirrels. A section of tree-trunk perhaps five feet in height, had been placed upright in this window, and the gray squirrels would playfully skip up and down its surface, and would occasionally jump from it on to the smooth polished and perpendicular glass, perhaps a foot or a foot and a half distant, and glide rapidly, and sometimes slowly, over it. Again they would stop and remain stationary on the glass for a short time. This was a common feat performed by these little animals and many onlookers observed it.

These squirrels seemed to glide over the smooth surface and apparently did not lift their feet. All my life I have known and studied the habits of the gray and other species of squirrels in various portions of the United States, but never, except in the two cases mentioned, have I observed or known of these little animals possessing such a power.

### How Do Hares Act When Attacked?

MONADNOCK, N. H., Nov. 18.—*Editor Forest and Stream:* May I advertise through your paper for information as to how hares behave when attacked by birds of prey? Whether they commonly squat, on the appearance of such an enemy and generally continue to do so to the last, rather than betray motion, even when already seen by the hawk or owl; or, in short, under what circumstances do they resort to running to save themselves from birds of prey?

ABBOTT H. THAYER.

## GAME BAG AND GUN

### Field Notes from Old Sullivan.

HAVING passed several months in Sullivan and Ulster counties this season I should say that game is as abundant as any time within the last ten or fifteen years. The stock of ruffed grouse is large and the birds usually wild and well able to take care of themselves. The man who wishes to succeed with these grouse must use straight powder and not allow himself to be easily discouraged. Long tramps over a very rough country are the rule, and none but the most thoroughly broken dogs are of much service. A wild, heedless pointer or setter is a nuisance, as nine times out of ten the birds are flushed far out of shot. An experienced animal who knows his game and works carefully will establish his point in many cases, and is simply invaluable. In the absence of such a dog two or three men will do better and get closer shots by themselves.

The flight of woodcock began in the first moon in October and the last birds passed through on the 31st of the month. In many of the covers the soil is too sandy for these birds, as there is very little feeding ground. In a few places, where the ground was really suitable, fair bags were made. Personally, I was quite satisfied to pick up a couple of woodcock when grouse shooting, and only accounted for about a dozen, all told. I found good covers but poor feed.

Quail have been practically exterminated by the extremely severe weather of the last two winters. I have

heard of a few birds but have seen none. Without restocking it will require several years to re-establish quail in this part of the State, and conditions are much the same further south.

The deer season opened Nov. 1 for fifteen days in Sullivan county, but I can hear of very few of these animals in this section. In the southern part of the county they are said to be quite plentiful. They are abundant in Ulster county, where, as yet, there has been no open season. A very large bear was shot near Willowemoc on the 2d of the month. She had two cubs with her, one of which was killed at the same time. The men had only two bullets, I am told, when they came upon this family of bears, or they would have bagged both cubs.

A kingfisher has been hard at work upon the spawning beds of the trout for some time, and it was only on Election Day, Nov. 7, that I was able to bring him to book. This is the latest date known, I believe, for this bird to be found on the Neversink, but he had too good a thing to leave, i. e., great numbers of small trout in the shallow tributaries of the main stream. On several occasions I had seen this kingfisher with trout six or seven inches long in his bill, but he was too smart for me until this particular afternoon. He was intent upon selecting a victim, and I crept up within thirty yards. Even then I was ashamed to pot him as he sat, and he was making his escape when the shot overtook him. Such scruples are foolish when one remembers the enormous damage done by this one bird during the past month. All his

companions migrated southward long ago. These birds were unusually numerous on the trout streams of Ulster and Sullivan counties this summer. Probably the low water, caused by the long drouth, was quite to their taste. At one large trout hatchery I was told that nearly fifty had been killed. They are handsome birds, and I would no care to have them exterminated; yet, their numbers should be kept within bounds.

A few of those beautiful birds, the osprey, or fishing eagle, are seen every summer on the Neversink. This river is still at its old tricks, and frequently does great damage when on the rampage. Meadows and banks are washed away and many of the pools are far shallower than a few years ago; indeed, some of the smaller ones had disappeared altogether, and the stream has changed its course entirely.

As far as I can learn only two deer were killed in the first week of the season in the northern part of Sullivan county, one near Mongaup Pond and one in the neighborhood of Sundown. What has become of the many deer known to inhabit this section it is hard to say, unless they were killed in the deep snow of last winter.

Many complaints were made of the damage done by these animals to crops and garden patches. As long ago as seven years last June I remember seeing the high wide inclosures placed around vegetable gardens to protect them from the deer at night. This was far up in the West Branch in Ulster county. If a tracking snow should fall before the expiration of the fifteen days open season

more deer would be shot. No dogs are allowed and still-unting on a carpet of dry leaves is an unprofitable pursuit.

The ruffed grouse is certainly a hard bird to bring to bag at this season of the year. It can fly at top speed through the thickest covers and in more open woods rises at long range or entirely out of shot. One sees only a brown streak against a brown background and is apt to toss up the gun and fire without proper aim or allowance for speed on cross, quartering or rapidly rising shots. The difference between a good and a bad shot is something less than one second, but that makes all the difference between a kill and a clean miss. Deliberate promptness is the word.

Woodcock seem an easy mark when found in grouse hooting unless you compare them with the occasional bird, which rises close at hand and crosses an open space. In dense thickets the woodcock prefers to climb like a kyrocket to get above the alders and small timber, and in the first flight seldom does his level best. He has been enjoying a siesta, and probably feels tired and lazy. If he has been shot at and badgered before he will show you what he can do. Then, indeed, he whistles through the air as if on a special mission, and if missed on the first rise may never be seen again. Woodcock have a large brain which they use to good effect if wide awake. I have marked woodcock down to a yard and waited with my eyes upon the spot until the dogs could be brought up. The dogs made game and trailed but could not find the birds. The reason being that the woodcock had run it once on striking ground and then had quietly taken wing again when at a safe distance. I have proved this to my own satisfaction. The strange part of it is that these birds are never found again on the same day.

What a charm there is about this bird and how hard we work to find it if we only hear that well known whistle. Do you know how this sound is made? I do not know that I ever heard it mentioned. Examine the next woodcock you kill; turn up the wings and note the primary feathers. The first in the end of the wing (I forget how many) are not like feathers at all. They resemble long, narrow little sabres, and these are the whistlers. When flying out to feed in the evening the woodcock moves quite rapidly, and in making a quick turn you will note that the whistle rings out clearly. The greater the speed the louder the whistle. This bird makes some odd sounds at the breeding season, but is usually mute at other times. He has also the strange habit of dropping straight down after rising to a considerable height. I never saw this done during the day, but think the sound then made is due to the rapid passage of the air between the quill feathers, and that they are turned more or less on edge to allow the bird to drop. Woodcock are queer customers, and when thoroughly aroused are surely wiser than Mr. Owl, for all the latter's big eyes and boasted wisdom. Both are night feeders.

THEODORE GORDON.

## A Beefsteak Memory.

In the course of my duties as a salesman for a large manufacturing company I struck a small town on Long Island noted as a resort in summer and a great place to shoot ducks in the fall; and as has been my custom when visiting places that have a reputation for good shooting, I made inquiry as to the condition at that time, and found I was late for the best of it. One merchant, however, who had at one time been a bayman and guide, told me that he had been so busy at his store he had not been out after duck once that season, and that he had the duck fever so bad that if he only had some one to go with him he would go, and was not afraid but that he would get his share, as he had the use of the best ducking rig on the bay. All this sounded good to me, and we arranged to go the following Monday, rain or shine. One Sunday I left New York with my outfit, which was no small affair, and consisted of an old but warm light-colored suit, a suit of extra warm underwear, a heavy tan sweater, a knitted hood and hip boots, all packed in a telescope. I also had with me a 12-gauge Winchester shotgun, one hundred shells loaded with 3½ drams of good smokeless powder, 1¼ ounces of No. 4 chilled shot, and wadded with white felt wads one size larger than the shells. This is not a crank load, but a good load, the best I know for duck in a 12-gauge gun.

I arrived at the town after dark, and my good friend the storekeeper met me at the depot and surprised me by asking if I was ready to start. I said I was, but I certainly stretched the truth, as I had not had anything to eat since dinner, and was expecting to get supper before starting. But he said, "Get in. We're off!" and we were on our way before the train had left the station. I did not know where we were going, but it did not take long to find out that we were bound for the beach, where he had a relative who was going to let us have his boat and decoys. We arrived there at about 10 P. M., and put the horse in the stable and got the guns and traps on the boat, which was a sloop-rigged affair about thirty feet long and twelve feet beam, and supposed to draw about two feet of water. Aft, it had a small cabin eight feet long with a bunk on each side and a small stove in the center up against the centerboard trunk. On the floor was a box of provisions, such as buckwheat flour, maple syrup, canned peaches, bread, butter, pepper, salt, and a nice large steak. My friend explained that he had sent them down during the day, and that they were for supper and breakfast. At the sound of the word supper a strange feeling came over me, and from that minute I was "on the job" and commenced to take some interest in the trip.

After changing clothes he said, "We will now get the decoys." I asked him if we would have to carry them far. "No, we don't carry them at all. We will float them around," he said. That seemed rather strange to me, but I felt sure he knew what he was about, so I said nothing, but followed him to the barnyard, where I found there was a pen that went down the hill to a small creek, and was fenced with wire netting. We had only one lantern to see by, but the sight I saw made me forget supper for a minute. There were ten live wild geese and over twenty black ducks, the most

of which, I afterward found, were trained decoys. Some of these we caught and put in a long box built like a flat boat with a slat top. We only took four of the geese. He opened a gate at the creek and floated the box out to a small skiff; and while I sat in the stern and held the short rope that was attached to the duck box, he poled the skiff out of the creek around to the big boat, and we pulled the box with the ducks and geese on to the deck. Everything being on board, we pulled up the anchor and poled the boat out in the bay. So far so good. By this time my new friend and myself were calling each other by our first names—I called him Henry and he called me Ed. Away we went. Looking at my watch I found it was 11:30. There was quite a breeze blowing, and the night was dark and cold; I could not understand how he could tell where he was going, and I think yet that he did some guessing.

Soon after we started, he suggested that I take the lantern in the cabin, and I would find some kindling wood and coal and a small lamp, which I had better light, then build a fire and cook some supper. It did not take me long to get in action, and how good that steak looked, and how good it did smell when I put butter, pepper and salt on it, and turned it over in the pan. I had cut some bread, and was about to call to Henry to stop the boat for supper, when the boat suddenly stopped itself, so suddenly that the lamp fell off the box, the centerboard flew up and knocked all the dishes I had put on top of the trunk to the floor, spilled the coffee all over one of the bunks, and made a great mess of everything but the steak. I held on to that, and started on deck with the pan, when I heard Henry say, "We must have struck a sandbar." "Yes," said I, "I reckon we did, but I saved the steak." I heard him say something that sounded like "chuck the steak," then he said, "We have got to get this boat off right away; the tide is running out fast, and if we don't get her off now we may have to stay until 8 o'clock to-morrow morning."

I looked at the steak, then at Henry, and carefully put the pan under the stove and went on deck for instructions.

We poled and pushed and gybed her, but finally gave it up. All this time Henry was saying things not fit to print. Then we held a meeting, as it were, and decided that we would move all the ballast aft; and Henry said he would go overboard and pry her nose around. It was then my conscience smote me, to think I was the cause of the trip and had not volunteered to do the overboard stunt. Still, it was December, and it was a dark and cold night; and I thought that as long as he was captain, it was not my place to interfere, so I let him have his own way. And, sure enough, over he went. There was only two feet of water, but the wind was kicking up a sea that soon had him wet through. After a lot of hard work, we got her off, and when we found the channel again, we dropped the anchor. I looked at my watch and found it was 2:10 A. M. So far we had had a strenuous time.

Henry came down in the cabin and changed his clothes. I put the steak, which was now cold, back on the stove, but he said, "There ain't any use of your bothering with that steak. We have got to get out of here at once. We must be fixed by 4 o'clock, so as to be settled before daybreak, and we have two miles to go yet. I want you to stand up near the bow and sound for bottom, and when you get four feet or less let me know."

I gave one more look at that steak, and under the stove it went again, and I on deck with a long pole wet with icy water sounding for bottom. Then again did I muse with myself and say, "Why did I come duck shooting, anyway? I ought to have better sense. I could be at home now in my good warm bed and not be freezing out there on the bay." Then, too, I was hungry; I was really getting sick; and how glad I was when he said, "Throw over the big anchor. We will leave her here." And we did.

The first I said after we got the sail in was, "How about supper?" And what do you think he said? "What kind of a duck shooter are you, anyhow? It seems to me you don't want to do anything but eat."

That remark was the unkindest cut of all. I was too far from home to talk back. And I had formed such a good opinion of Henry. It did not seem possible he could say anything like that and mean it. But I thought it would be best to talk gently to him, so I said, "Now, see here, old pal, I have had nothing to eat since yesterday noon, and I have just got to eat."

"Well, go and eat that steak and be quick about it. We must get fixed out, and there is no time to lose."

It was then I went at that steak. It was cold, for the fire had gone out while I was on deck looking for bottom; but it was good. He said he would not eat until we were all fixed; then, if we had time we would have some breakfast; if not, we would wait until about 8 o'clock, or when the morning flight would be over.

So we started to fix. First we pushed overboard the box with the decoys, and fastened the rope to the stern of the skiff, and started to pole for a dark streak which I afterward discovered was the shore of an island. When we got near enough to wade we got out. I pulled the skiff up in the grass, then went back to hold the lantern while Henry put out the decoys. It was a very interesting sight, as I had never seen live decoys put out in a scientific manner before. Every bird had a leather band sewed around the leg just above the foot, and each band had a small iron ring attached. The hobble consisted of a piece of codfish line about six feet long, with a snap tied to one end and a sharp stick about twelve inches long tied to the other. He would catch the snap in the ring, and with his foot push the stake in the sandy bottom; then let the duck or goose swim around. This was done until all were put out. The geese were in a bunch by themselves on the left. After putting out a few wooden decoys with the live ones, we pulled the empty box to the edge of the grass at the point, banked it up with weeds, grass and anything handy; then taking the bottom board out of the skiff, put it in the box, where it seemed to fit nicely; and then with a few more finishing touches to the blind, we were ready. Henry said we would have a half hour to eat breakfast; so we got in the skiff and poled to the sloop, started a wood fire and mixed some

buckwheat; and in that half-hour my appetite was gone, so were half a package of buckwheat and a bottle of maple syrup.

Now for the ducks. We got back into the skiff and poled it away around the point some two hundred yards from the blind and covered it up with grass, which we cut with the butcher knife. Then we waded to our sink-box, got in and lay down on our backs and waited for the ducks to come. We had not long to wait, as we had hardly got comfortably fixed, when we heard the swish of wings and the deep, long-drawn quack of a drake mallard. We could not see them, although they seemed to be within fifty yards of where we lay. It was then our decoys began to do business. It seemed as if each one got up and flapped its wings, and all quacked at once; even the geese honked. But the spasm did not last long, and things quieted down to a quack now and then. It was long before I felt Henry nudge me, and heard him whisper, "Just look at that!" I looked, but could see nothing, and told him so, when he said, "Look off to the left, the other side of the geese." And sure enough, there was a big bunch of ducks swimming up to our decoys. He whispered not to shoot until he gave the word, and "don't shoot anything in the water; remember those decoys don't belong to me." So I waited, hardly daring to breathe, first looking at the ducks then at the boss—I had come to look on him as such by that time—but he said not a word. I could stand it no longer, and whispered to him, "Let's get up and give it to them." But he said, "No," in a way I knew he meant it. Then I took another look and lay back and shut my eyes. I was mad; good and mad. I could not understand why we should not take advantage of the opportunity. The clouds had now gone by, and the sun just commenced to show, when my dear Henry said, "Now get ready, and take those on your side. Don't pay any attention to those on my side of the box." We rose up, and it seemed as if there were ducks all around us, some even in the grass as close as thirty feet from the box. And what a fuss they did make when they saw us. They must have been swimming in from all directions; but the reason he would not shoot sooner was because it was illegal to shoot before sunrise, so he said; but I thought that was drawing it mighty fine. Well, I got three and he got two dead and two cripples, which I wanted to finish then and there; but he said we must drive them out of the decoys first, which he did, and I shot them. It was a good start—seven black ducks to our credit.

We had pretty good shooting for about one hour, then they commenced to quit flying. There were only a few in sight, and they would not stool, no matter how much our decoys would call. I was just about to get up and stretch, when Henry took me by the arm and said, "Get down, down close! Don't move! Here comes a bunch of geese." And sure enough there they were, about twelve of them, coming up against the wind straight for the decoys and just above the water, 500, 400, now 300 yards away. It looked as if nothing could happen to keep us from getting a good shot. In fact, I had begun to pick the ones I was going to shoot at. They now seemed to be about 75 yards away, and I turned over on my side so I could raise quickly; but they saw me move, and that was enough. Up they went over backward, and off to the side in all directions but ours. We shot six loads after them, and only tipped the wing of one, and by the time it struck the water, it was a quarter of a mile away. I did not dare look the boss in the eyes. I don't know if he looked at me or not; but I felt guilty of a great crime. He did not have to tell me it was my fault, I knew it. All he said was, "Come on, get in the boat, let's go and get him." And away we went. The faster we went the faster the goose went. It was then I realized what a wild goose chase meant. But we finally got around him and drove him in a cove, and he was ours. When we got back we found that two of our duck decoys had pulled up their stakes and had swum around the point of the island. So we had to go after them; and it took such a long time to catch them, the boss said we might as well quit and go home, as it was so late there would be but little shooting during the day—the wind was wrong, or something. He knew I didn't. I was satisfied anyway. So we started to pull up.

First we took the bottom board out of the box and put it in the skiff where it belonged. Then we pulled the box out in the water and commenced to put the decoys back in it. Henry would go up to some of them and pull up the stake, then let them go, and they would swim for the box and try to get on top, anxious to get inside. But there were others that made a great fuss if we went near them. These, he said, were young ducks that had not been handled much, and he said that if the two that had got loose had been old ducks they would not have left the rest. He said they need lots of experience to make good decoys of them, and some never get good. Often a young inexperienced duck will be drowned the first time it is out when there is much of a sea on; but the old-timers can stand most any kind of a sea if the line is not too short. If a duck gets scared and turns tail to the wind, it is all over with it if the water is rough, for when their feathers get wet they can't keep on top of the water, and are soon down and drowned. The geese are always more or less nervous when any one goes near them, and pull hard at the stake, trying to get away. I asked him why he only brought four geese, when he had so many; and he said he could get much better work out of them when he took one of a pair, for the old geese were nearly all mated, and when separated they would call better. I found it so, for I noticed one old gander we had out would call every time a gull or any bird would come in sight.

At last we got them all in the box, and fastened down the top, pulled it to the sloop and got it on deck. Then Henry went into the cabin and came up with a tomato can full of corn, which he threw into the box for the decoys. We picked up the anchor and started for home. While Henry was steering the boat I counted the ducks we had killed, and found we had nineteen ducks and one goose.

It did not take long when we arrived at the mouth of the creek, to get the decoys back in the pen. I had changed my clothes as we sailed along, and we soon

had the horse hitched up and were on our way to the depot, where Henry divided the game, giving me the goose and taking ten ducks. I certainly felt proud of that bunch. Seven big black ducks, two mallards and a goose made a good pile; and it was all I could do to carry them with my gun and things; but I could not think of shipping them. I might check my telescope, but the birds had to go with me.

As we had to wait a few minutes for a train, Henry and I had a heart to heart talk. He said he allowed he had spoken harshly on one or two occasions, and hoped I took no offense. Then I said I guessed it was my fault that we had not killed all that flock of geese. So we shook hands and called it all off, and began to talk of another trip the next season. I was stiff and sore and sleepy for a week afterward, still I would go again. Why do we?

TRAVELER.

## The President's New Book.

It is often said that President Roosevelt has a genius for doing things, and it might be truly enough added for doing unexpected things. Such a thing has just been done in the publication by Chas. Scribner's Sons of a volume on sport and adventure written by the President and issued almost from the White House. Nothing like this has ever happened before in the history of this country, and the sportsmen and the nature lovers of the United States may congratulate themselves that the President of this country is a man who believes that nature and the things pertaining to nature are worthy of serious consideration.

The volume opens with a dedication—in the form of a letter—to that veteran naturalist and writer, John Burroughs, who has done so much to show the American public the joy and sweetness that there is in a life out of doors. It is a feeling and charming tribute, and calls particular attention to one of John Burroughs' many services, his war on the sham nature writers.

The book is made up of eleven chapters and an appendix, a total of 361 pages. It contains about fifty illustrations, many of them of great beauty. The frontispiece is a capital picture of Mr. Roosevelt in riding costume.

President Roosevelt's chapters With the Cougar Hounds, A Colorado Bear Hunt and Wolf Coursing have been printed within a year or two in Scribner's Magazine. Those on Hunting in the Cattle Country and A Shot at a Mountain Sheep, together with Wilderness Reserves and Books on Big Game have been revised and added to from various publications of the Boone and Crockett Club, while the chapters on the White-Tail Deer, Mule Deer and the Wapiti appeared in Mr. Caspar Whitney's Deer Family.

Every one of these chapters is full of interest and many original observations are recorded. The paper on cougars is a very valuable contribution to the natural history of this beast, and the skins and skeletons collected by the President on that hunt, together with the careful measurements taken, were most useful from a scientific point of view, and have been most helpful in settling certain vexed questions about the cougars. The book is written in a style which is simple, clear and direct. It abounds in touches which show careful observation and close reasoning, and in others which testify strongly to the author's enjoyment of outdoor life.

"All life in the wilderness is so pleasant that the temptation is to consider each particular variety, while one is enjoying it, as better than any other. A canoe trip through the great forests, a trip with a pack train among the mountains, a trip on snowshoes through the silent mysterious fairy land of the woods in winter—each has its peculiar charm. To some men the sunny monotony of the great plains is wearisome; personally there are few things I have enjoyed more than journeying over them where the game was at all plentiful."

Here is another bit of description which will appeal to every man who has enjoyed life in the mountains in winter: "The midwinter mountain landscape was very beautiful whether under the brilliant blue sky of the day, or the starlight or glorious moonlight of the night, or when under the dying sun the snowy peaks, and the light above kindled into flame, and sank again to gold and amber and sombre purple. After the snow storms the trees, almost hidden beneath the light feathery masses, gave a new and strange look to the mountains, as if they were giant masses of frosted silver. Even the storms had a beauty of their own. The keen cold air, the wonderful scenery, and the interest and excitement of the sport, made our veins thrill and beat with buoyant life."

On his wolf coursing trip Mr. Roosevelt met with a wolfer—not in the old sense—but a man who chases wolves with dogs, who captured coyotes alive in a manner so extraordinary that it is worth telling of.

"We had been shogging along for an hour or more when we put up a coyote and started after it. I was riding the big D pony I had ridden the afternoon before. It was a good and stout horse, but one which my weight was certain to distress if I tried to go too fast for too long a ride. Moreover, the coyote had a long start, and I made up my mind that he would get away or give us a hard run. Accordingly, as the cowboys started off at their usual headlong pace, I rode behind at a gallop, husbanding my horse. For a mile or so the going was very rough up over and down hills and among washouts. Then we went over gently rolling country for another mile or two, and then came to a long broken incline which swept up to a divide some four miles ahead of us. Lambert had been riding alongside of Abernethy, at the front, but his horse began to play out, and needed to be nursed along, so that he dropped back level with me. By the time I had reached the foot of this incline the punchers, riding at full speed, and had shot their bolts, and one by one I passed them, as well as most of the greyhounds. But Abernethy was far ahead, his white horse loping along without showing any signs of distress. Up the long slope I did not dare press my animal, and Abernethy must have been a mile ahead of me when he struck the divide, while where the others were I had no idea, except that they were behind me. When I reached the

divide I was afraid I might have missed Abernethy, but to my delight he was still in sight, far ahead. As we began to go down hill I let the horse fairly race; for by Abernethy's motions I could tell that he was close to the wolf and that it was no longer running in a straight line, so that there was a chance of my overtaking them. In a couple of miles I was close enough to see what was going on. But one greyhound was left with Abernethy. The coyote was obviously tired, and Abernethy, with the aid of his perfectly trained horse, was helping the greyhound catch it. Twice he headed it, and this enabled me to gain rapidly. They had reached a small unwooded creek by the time I was within fifty yards; the little wolf tried to break back to the left; Abernethy headed it and rode almost over it, and it gave a wicked snap at his foot, cutting the boot. Then he wheeled and came toward it; again it galloped back, and just as it crossed the creek the greyhound made a rush, pinned it by the hind leg and threw it. There was a scuffle, then a yell from the greyhound as the wolf bit it. At the bite the hound let go and jumped back a few feet, and at the same moment Abernethy, who had ridden his horse right on them as they struggled, leaped off and sprang on top of the wolf. He held the reins of the horse with one hand and thrust with the other, with a rapidity and precision even greater than the rapidity of the wolf's snap, into the wolf's mouth, jamming his hand crosswise between the jaws, seizing the lower jaw and bending it down so that the wolf could not bite him. He had a stout glove on his hand, but this would have been of no avail whatever had he not seized the animal just as he did; that is, behind the canines, while his hand pressed the lips against the teeth; with his knees he kept the wolf from using its forepaws to break the hold, until it gave up struggling. When he thus leaped on and captured this coyote it was entirely free, the dog having let go of it; and he was obliged to keep hold of the reins of his horse with one hand. I was not twenty yards distant at the time, and as I leaped off the horse he was sitting placidly on the live wolf, his hand between its jaws, the greyhounds standing beside him, and his horse standing by as placid as he was. In a couple of minutes Fortescue and Lambert came up. It was as remarkable a feat of the kind as I have ever seen.

"Through some oversight we had no straps with us, and Abernethy had lost the wire which he usually carried in order to tie up the wolves' muzzles—for he habitually captured his wolves in this fashion. However, Abernethy regarded the lack of straps as nothing more than a slight bother. Asking one of us to hold his horse, he threw the wolf across in front of the saddle, still keeping his grip on the lower jaw, then mounted and rode off with us on the back track. The wolf was not tied in any way. It was unhurt, and the hold he had was on its lower jaw. I was surprised that it did not strive to fight with its legs, but after becoming satisfied that it could not bite, it seemed to resign itself to its fate, was fairly quiet, and looked about with its ears pricked forward. The wolves which I subsequently saw him capture, and having tied up their muzzles, hold before him on the saddle, acted in precisely the same manner."

The concluding chapter At Home furnishes a fitting close to a volume that contains much that is good and much that is interesting; for this last chapter At Home, while it deals largely with those smaller things in nature to which many sportsmen pay no attention, is nevertheless full of that spirit of the naturalist which, to us, appears to account for all the many things which President Roosevelt has done in behalf of sport and in behalf of the preservation of natural things. No one can read over this chapter without seeing very clearly how good a thing it is for growing child, whether boy or girl, to be out of doors and to know something of nature in all her various aspects; to be interested in the common things which constantly cross the path, to be taught how to use eyes and ears in order to know what is going on in the woods and fields, and so to wish to know why it is going on. It is a good thing for the President's children that he and they go abroad together on equal terms to see and hear things in nature, and to learn about what they see and hear, that the children have pets in whose well being they are deeply interested; and it is not less a good thing for the President that he and his children possess this common interest in natural history work.

This chapter has in it a deep meaning for all the parents in this land, and if these parents have intelligence enough to read from this short essay of twenty pages the lesson that it contains, such reading cannot fail to be of great benefit to the generation of children that is now growing up.

Of the illustrations in the book we have already spoken. They are commonly of homely subjects, the camp, a mount, or the pack of hounds, but in pictures such as that of the bobcat in the pinyon, or the bear well up toward the top of a slender quaking aspen, we see things that are curious and unusual. Then, too, such illustrations as the pack train on the march, the ranch house and the loaded wagon all call back pleasant memories of a time that is gone.

## Virginia Shooting.

CHASE CITY, Va., Nov. 14.—Having had a temporary surfeit of quail shooting the past week some of the shooters have been successful in bringing down wild turkeys. First among them was Mr. W. I. Gordon, of New York, then Capt. O. J. Hayes, of Chase City. Every day the legal limit of birds are expressed to friends of hunting parties north. Dr. A. H. Boyd, of Charleston, W. Va., is among successful hunters. Mr. W. A. Faunce, of Atlantic City, and Mr. J. F. Wood, of Philadelphia, have been having every day fine sport with their dogs, brought with them, hunting quail. Yesterday Mr. W. J. Gordon, of New York, having a day or two before gotten the range of wild turkeys, killing one, brought in four fine bronze birds that would delight the heart of any sportsman, one gobbler and three hens. cleans out powder residue. Lubricates, never gums; 2oz. bottle, 10c. —Adv.

## Kings Afield.

From the Washington Evening Star.

WHEN a common person is honored by being an invited guest at a king's hunting party—even one of the little kings—the compliment is immense and the pleasure is correspondingly small. Even the princes, dukes, counts and peers who meet royalty every day and are more or less at ease in the exalted presence are not permitted to do much except to breathe in any manner or time not prescribed by a solemn ceremonial code; and as to the common person, the awful surroundings generally tend to make even that natural function of breathing anything but easy.

There was an American business man once—one of our merchant princes, you know—who worked it so that he was actually invited to Sandringham to hunt when King Edward was only the Prince of Wales and known as "Tummy" by his peculiar set of aristocratic Bohemians. The American was really after a chance to do that low and vulgar thing—sell goods to the prince.

He was a good shot and a keen sportsman in his own country, where he was and is very haughty and dignified, not to say pompous. But the splendor of royal majesty so overawed him that to this day he is unable to say what was shot, who shot it or even if he fired his own gun at all.

The only clear recollection that he has of those wonderful two days of royal hunting is: First, that on the second night the prince did him the incredible honor of appearing in his room in his shirt sleeves, and, secondly, that he sold a "bill of goods" before he left the sacred place.

And yet the Prince of Wales is not an overpowering sample of royalty. He has a ponderous, permeating dignity that is waterproof, but he is nothing like his nephew, Wilhelm of Hohenzollern, or even like that much more sociable old gentleman, Franz Joseph.

Their hunting parties rarely include ordinary persons who are not "born." The persons who are privileged to carry guns when these two king-emperors hunt have family trees with more branches than any of the trees in the forest where they shoot.

There are no Jacks or Bills, or even Johns or Williams among them. Every one has a handle, as long as a frypan whereby to be addressed, and if a stranger listened to the conversation all day he would never be able to tell a single name of a single guest, for all he would hear would be "Highness," "Durchlaucht," "Excellency," "Herr Graf," "Herr Prinz," "General" and other impressive titles like them.

A poor creature who is not even a "Herr von," but simply a plain mister, would find it impossible to do more than just survive in that rarified and high-class atmosphere. Enjoying the hunt would be out of the question.

Even the drivers (the peasants who beat the cover and chase the game toward the shooters) spot a commoner immediately and address him a little less respectfully than they would dare to do if he were alone and in his proper surroundings. The keepers and foresters look at him condescendingly and give him infuriatingly friendly advice as to his shooting.

Of course he gets the poorest place in the line, if it is a deer drive, as far away from any danger of shooting either the Kaiser's deer or the Kaiser himself as is possible without posting him outside of the woods altogether. And after the ordeal is ended and the royal party assembles for a jolly, unceremonious luncheon under the greenwood tree, he is saluted with a crushingly democratic "Well, Mister —, what luck?" from the very lips of royalty itself, and he may even be invited to take a very personal and intimate drink with such an absolutely terrifying air of camaraderie that the poor, unborn mister generally swallows it the wrong way and retires in confusion, not to recover for days and days till the splendid honor that was shown to him has become a less poignant memory.

For generations it has been an understood thing that when a king hunts the occasion shall be one for care-free merriment, without fetters of ceremony or rank; and in accordance with this tradition, it is always accepted that serene majesty shall pretend to be amazingly democratic and "equal." But it is also understood solemnly that none of the rest of the party shall dream of being the same.

So when the Kaiser appears on the terrace of one of his several score of hunting lodges with a delightfully familiar "Morning, gentlemen," there is little danger that any one will answer back. "Morning, Bill," or even plain "Good morning," without the "Bill." It is "Good morning, majesty," and a mighty devoted salute, too.

Nor is there danger that any of the many guests will have a cigar in his mouth when the Kaiser appears. Not till he lights cigar or pipe do the rest of the jolly, free and equal party light up.

Of course, the Kaiser gets the best stand. Equally, of course, only those who are extremely high born have the privilege of being posted near him. And unless he has informed all and sundry through his aid that they are to shoot when they are ready, it is manners to fire no shot till the royal gun has opened the ball.

If a fine boar, with extra big tusches, breaks out of the thicket and runs along the line, or if the head of a stag, crowned with thirty or more points, appears among the trees, it is manners to reserve fire and let the prize beast reach the royal stand.

Things are not quite as bad with the European princes and kings as they are in Persia, where it is court etiquette to pretend that the shah-in-shah has killed all the game that falls during a hunt, and where sharpshooters are posted all around him to fire at all animals at which he fires, so that game at which he aims never escapes. But though the two Kaisers are really good sportsmen, willing to play the game pretty fairly, they are far too much imbued with the creed of royal prerogative to be willing to see their guests kill all the game in a drive before they get a shot at it, or to find, after the hunt, when the kill is laid out in a long line, that the biggest stags or the heaviest boars have all been killed by somebody else.

Kaiser William, especially, feels that any really big stag has been predestined by an all-wise and properly respectful Providence to be the billet for his bullet. He wants

to get one that shall be the equal of the grand head of sixty-six points that was gathered in by Frederick of Prussia in 1696, and which was considered such a wonder that it was exchanged for a regiment of soldiers. The present Kaiser's best head of antlers is one of forty-four points, which is a trophy that can be shown by hardly another hunter in the world.

The Kaiser's preserves dot Germany east, west, south and north. In the east are great domains, kept wild as forests primeval by cunning forestry, where the true elk still live in herds, a far more royal game than our American wapiti. In still other forests are the great deer known as Edelhirsch. It is from these herds that the wonderful antlers come, for among these animals are deer mightier than any that the hunters of free Asia, Africa or America ever may hope to see.

There are boar preserves and pheasantries. Quail and grouse are bred by the thousands every year. In the south of the empire are chamois preserves, hanging to the sides of white mountains. In Lithuania there are even remnants of the wonderful prehistoric bison of Europe, the wisent, half again as big as our American bison.

Everybody knows that the emperor's left arm is withered. Few who see him swing his gun on game and shoot steadily all day long would suspect it. So well does he shoot that his score since 1872 amounts to 50,798 pieces of game. This includes all sorts of animals, from wisents and bear to rabbits and foxes, and all sorts of birds, from quail to ptarmigans and cranes.

His record of pheasants alone is enormous, for he is accounted one of the best pheasant shots of Europe, excelled only by Prince August of Coburg-Cohary, who once killed 997 pheasants out of a thousand shots in the preserves of Ferrieres.

Of course, these enormous scores could never be made by still-hunting, or even hounding, as we understand hunting here. The royal hunters don't incline much to the delights of the trail and the spoor. They don't waste any precious time in looking for their game. Long before they get out of bed on the morning of the hunt scores of beaters have begun to close in on the preserves from all directions, and the animals are beginning to bunch in the woods near the stands. Then all is in readiness for the final concentric closing in of the ring of beaters and drivers, to force the animals along the line of fire or past the stands.

These stands are made like little forts when royalty hunts, especially when the game is such vicious game as wild boars. There is little danger that even a desperate stag or a ravaging mother sow will be able to charge the station of the hunter with any chance of hurting the sportsman.

Past these stands the game flees in steady procession, driven out by the hidden men. The hunter has nothing to do except to shoot. To a real wilderness hunter, with whom the kill is only the final act, and not the most thrilling of the hunt, royal hunting would be like fishing. But poor old royalty does not know any better, and, if it did, could rarely get anything better, for royalty may not permit itself to go off alone into the wilderness and be a real dead game sport.

Within their limits, however, there are many degrees of sporting blood. Kaiser Wilhelm and Franz Joseph, for instance, though they are willing to shoot at driven deer, would disdain to shoot like the Czar and the grand dukes and grand duchesses of Russia, who shoot pheasants that have been carefully carried to the designated spot in the baskets just before they arrive.

People wonder at the energy of Emperor Wilhelm. He is a young man. Franz Joseph is seventy-five years old, and still climbs sturdily around his Austrian Alps to hunt chamois and eagles. Wilhelm's grandfather, Wilhelm I., hunted till his ninetieth year. The Grand Duke Adolf of Luxemburg was so enthusiastic a hunter until nearly into the nineties that it became a regular practice with his huntsmen to weigh all his game before it was drawn, while that of the guests was weighed in regular fashion after it had been cleaned. Then the old gentleman would smile all over and chuckle at the ever-recurring discovery that he still was able to beat all the young men.

There is one royal hunter who was almost democratic, and who really did play earnestly at being just plain human when he went a-hunting. That was Prince Regent Luitpold of Bavaria.

A few years ago, when he was eighty-two years old, he went into one of the deer preserves to hunt. The inhabitants had prepared a reception for him. Among other things they had selected the most skillful driver for the honorable post of driving the royal guest to the shooting grounds.

When everything was in readiness word was received that the prince regent did not wish to have any formality, and that he would arrive incognito as Mr. Somebody-or-Other. The committee told the driver immediately that he would not drive the prince, but would have a plain mister as passenger.

The disappointed man, who did not understand the subtle principles of traveling incognito, indignantly tore the decorations from the carriage and began to swear with the fluency of Bavarian swearers, which is pretty good.

The prince regent climbed into the carriage, and the driver whipped up his horses and continued to swear. The passenger tried to engage him in simpler conversation, without success. At last he fell back on cigars. He handed out a handful to the driver, and passed a gold piece to him at the same time.

The driver looked at the generous gifts for a moment. Then he whistled and turned around.

"Say," he said, "you, there! I was plenty good and mad when they told me that I wasn't going to drive his royal highness. But now I feel better. That miserable old prince regent can go and drive wherever he darned well pleases for all of me. I guess you're as good as any old relic of a royal highness, and me and you will just have a corking good time, hey?"

And the prince regent laughed, and said: "Yes, old boy: me and you will."

And they did.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## My First Camp Hunt.

RICHMOND, Va., Nov. 11.—On Monday, Nov. 6, I landed in Cheraw, S. C., bound for W. H. Powell's camp, five miles away. I was met by a young man who said, "I've come to meet the best looking man who gets off the train, and you must be the man." Lifting my baggage into the buggy, I was soon speeding away to the hunting camp, which was reached in an hour. I found a row of tents pitched, and every convenience for the comfort of a man who wanted to live out of doors and still be as comfortable as if he was at home. There were dogs galore, and good ones, too. I had my own dogs, but soon saw that I could make a better bag with those provided by Mr. Powell for his guests, and left mine in the camp. My guide knew every hog path in twenty miles of the place, and as he was able to get about, while I was inclined toward corpulency, I allowed him to do the walking, until birds were found. He carried a horn, and I responded to his calls.

It was rather early for good shooting, as the frosts had not killed the vines and grass, and many of the coveys found were too small to shoot. Besides, the weather was hot and dry, making it hard on both man and dog. Had I not been handicapped by my two hundred pounds of flesh and old age, many a bird now roaming the field would have fallen a victim to my old reliable Parker. At the age of sixty-one, I find myself about as good a shot as I ever was, but I can't get at 'em as I did when I was younger. As it was, I was satisfied with 141 quail in four days, the majority of them falling to my gun. My fifth day, and in a section where I was assured of a big find of birds, the rain poured down upon us, and we sought shelter under the hospitable roof of a farmer, who had 5,600 acres of land, and who insisted upon our staying with him until the weather cleared up. The horse show in New York, to which I had promised to go, forced me to leave on a beautiful day and at a time when the changed conditions in the weather had made it an ideal day for sport. My advice to those who come to the Powell camp is to live in tents, which are as comfortable and clean as any private house could be, and with a kitchen presided over by Green, a typical Southern darky of the olden time. He is not only a good cook, but possesses a rich fund of anecdotes about coons, possums and ghosts which makes a tired sportsman hate to go to bed. A man can get any kind of sport he wants now, for in addition to bird dogs, there are also some trained fox, coon and possum dogs.

I never stopped among a more hospitable people than those in and around Cheraw. I spent two nights in the old colonial home of Mr. J. H. Hartzell, whose charming lady knows how to take care of sportsmen, and in whose home ladies, as well as gentlemen, will be entertained delightfully while hunting with Mr. Powell. Mrs. Hartzell possesses a grace of manner and an air of culture and refinement which captivate and make a stranger feel at once that he is in the home of a friend, while her husband finds time to mingle with his guests and assist the hostess in preparing for the comfort of everybody. I have often thought it strange that visitors coming from the North seeking a milder climate, should put up at hotels, when they could be so much better off in every way in the homes of these cultured people, who appreciate the fact that some other things beside climate are necessary to the happiness of those who have to live away from home.

My possum hunt was a success, but its laughable and most enjoyable features must be left for another time, as this is already too long.

POLK MILLER.

## In the Maine Game Belt.

BANGOR, Me., Nov. 17.—*Editor Forest and Stream:* The big game shipments continue to hold up, and from the present indications not only will last year's record be surpassed but very probably the record of 1902, when the greatest shipments of deer and moose ever known in Maine were made. The pessimists were fearful for the supply of game in the face of such killing, but the fact that the deer have increased faster than the food in many localities has shown the need of killing off at least a large proportion of the normal increase, if this winter starvation would be avoided. October saw more deer shipped over the Bangor & Aroostook Railroad than in 1902, and during this month there have been many days when the deer shipments were very close to the hundred mark. Moose, too, are coming in good numbers, and some very nice antlers are awaiting the final touches at the hands of the taxidermists.

A story published by a Maine newspaper this week created quite a sensation, to the effect that the International Paper Company was about to enter upon a policy of driving off all camps from the vast tracts of timberland under its control. A camp owner in this office and talking with your correspondent about the matter said that if the rumor were true it meant enormous tracts of burnt land another season, for the enraged camp owners wouldn't hesitate to destroy all the timber they could in retaliation for such exclusion. This is but one phase of the question raised by the rumored action, but alone offers a mighty reason why the public camp owners, who are really the finest fire warden service possible and at the same time the cheapest, should be permitted to remain where they have established a business that hurts none, and benefits the land owner, as well as all who receive a part of the wealth distributed by the sportsmen visitors. It is gratifying to learn through the officers of the American Realty Company in this city, which is the Maine corporation looking after the International Paper Company's realty in this State, that no such action is contemplated, and that the camp owners are regarded as the best of protection against fire by the company, which courts more camps rather than desires to exclude those already built. Squatters and other irresponsible campers will, however, meet with small favor and be obliged to throw up their shacks elsewhere, as only reputable camp owners are wanted.

It was thought when Messrs. Howell and Morse, of Newton, Mass., went through here on their way home with a moose, four deer, a bear, fox and the limit of birds that this bag could safely be counted on to head

the list for the season. Three young men, however, passed through Bangor to-day with a bunch of game that certainly equals the above, and perhaps exceeds it by a bit. They are E. L. Howard, of Taunton, Conn.; W. G. Howard, of Boucksville, N. Y., and Marvin J. Howard, of South Londonderry, Vt., and they have been in camp with Abner McPheters and Byron Edgerly, of Penobscot county for guides. Their total bag included two moose, two bears, five deer and a magnificent lot of partridges, at least one of them having twelve. And for fear that they might have left some game in the valley of Scotts Brook, where they hunted, they brought along a fox.

This is rather an unusual year for albinos, among the rare specimens taken being an albino grouse, shot by Roswell L. Crane, of Whiting, and two albino otter, one of which was shot by James Hall, of Milo. Hon. Edward W. Hyde, of Bath, while at his camp at Doughnut Cove, Moosehead Lake, took an unusually handsome buck, almost pure white, with ten point horns. The buck was a large specimen for an albino, weighing about 150 pounds, and Mr. Hyde will have it mounted whole.

Sudden changes have marked the weather of the last week, and while for a few days it was sharp and clear, following a considerable snowfall of last week, this week has seen a change to warm, wet weather, which in most of the State has been rain, although coming down in snow in the higher portions. At the present writing the snow ranges from an inch or so to two feet in the game belt, and as it is rapidly growing colder, the hunting is sure to be very noisy until a snowfall occurs to cover the crust. At Norcross yesterday morning the ice was so firm in the cove of North Twin Lake that a hunting party was able to walk across the cove on the ice. Ice has formed in the coves of Moosehead, but thawed out or broke up so that up to date the big lake is still clear, as it probably will be for at least three weeks longer, and possibly a month.

Snow, a good fall of dry, light snow that will permit tracking without crusting, is what the hunters are looking eagerly forward to now, and if that comes within the week there will be some lively hustling among the sportsmen now in camp, many of whom are just staying day after day hoping each morning as they awake that the longed for blanket of white has come while they slept.

HERBERT W. ROWE.

## Massachusetts Game.

BOSTON, Mass., Nov. 17.—*Editor Forest and Stream:* Several reports on game conditions have come in this week from Massachusetts towns. One from Templeton, Worcester county, says that quail and grouse are scarce; one from Rutland, reports no quail seen and partridges "not very plenty." This writer says that sportsmen coming into the town and not satisfied with hunting, day after day themselves hire other men who are crack shots and carry home all the game they can get. In his opinion, this is overshadowing the thing, and ought to be stopped. There are no quail, some partridges in Granby, and the writer would have a law regulating the number of birds killed in a day, also in a season.

Your readers are aware that several States have such a law, but from its very nature it is difficult to enforce. To make it effective wardens should have a right to demand that the hunter show the contents of his game bag (and pockets) and, in case he refuses, to arrest him at once without the delay of securing a warrant. In our State legislators have not yet been convinced that it is safe to clothe wardens with that power. While the late Captain Collins was able to get almost everything he asked for from the Legislature, he was not successful in this particular, although he declared he would keep trying for it as long as he held his position as chairman of the commission.

Former Representative Butterfield, of Dunstable, Middlesex county, writes, that prospects for game birds are about as usual, but, though owners have been notified, dogs continue to run deer and he is at a loss to know how it can be stopped. He also wishes the violation of the Sunday law might be stopped, and adds that in his vicinity the game laws are not well observed.

Poor conditions are reported in Wayland, while Hopkinton, one of the towns benefited by quail planting two years ago, reports prospects good for birds this fall.

The town of Adams has a trapper named "Bill Nye," who has recently shot the largest wildcat seen in Western Massachusetts for a long time. It weighed twenty-nine pounds and was shot on Savoy Mountain.

A veteran hunter of Middleboro, P. W. Bump, celebrated his 88th birthday last week and is as fond of hunting as ever. He is the nestor of the Assawampsett Fox Club and is reputed to have killed more than a hundred foxes.

The accidental discharge of his gun while crawling through a barbed-wire fence in Needham, was responsible for the death of Mr. Joseph Nickerson, a well-known produce dealer in Quincy market, a man about 60 years old.

At Gt. Barrington yesterday P. Mougén, an unnaturalized Frenchman, was in court for hunting without a license and for snaring. His fines were \$10 and \$20 respectively. When Judge Sanford asked him if he was ignorant of the law, he replied: "Yes; if I had known the law, I would have done it in the night time, then I would not have been caught."

Our State commissioners have received a few pairs of capercaillie and black cock from Sweden. They reached Winchester on Thursday and, although when first liberated they were unable to walk; they soon recovered the use of their legs and appeared to have recovered from the effects of their confinement for sixteen days on their journey from Copenhagen. The birds were obtained by Mr. Josef Sanburg, of Winchester, a native of Sweden.

It will be remembered that in 1894 Mr. E. G. Gay, now of Clearwater, Me., made an effort to rear some of these species in captivity at Auburn, and about that time some of the black cock were liberated in the town of New Sweden, Me. It is said that last fall some of the species were seen in that neighborhood.

If any of your readers know the results of experiments with these birds elsewhere, I hope we may hear from them through your columns.

CENTRAL.

### Canadian Camp Dinner.

THE third semi-annual dinner of the Canadian Camp, held at the Hotel Astor, New York, on Tuesday, Nov. 14, was an occasion of much joy. There was a large attendance, a liberal feast of reason and many other things, and at the end of the dinner a most enjoyable flow of soul. The menu announced such unusual dishes as puree of Pennsylvania squirrel, à la Colonel Brainard—the eminent Arctic explorer; minced spiral-eared Polar mice (*sic*), and curry of the common or cow pasture variety of the New England woodchuck trapped by the sage of Cos Cob, no doubt Mr. Ernest Thompson Seton. There were many other good things to eat which are not so much out of the range of the average man's experience.

There were about 160 persons present, and the dinner, under the management of the dinner committee, Mr. Harry V. Radford and Dr. H. T. Galpin, went off very happily. At the guests' table were seated Dr. G. Lenox Curtis, president of the club; Rev. Dr. Wilton Mearle Smith, who acted as toastmaster; Lieut.-Gen. Nelson A. Miles, U. S. A.; Surgeon-General S. Suzuki, of the Imperial Japanese Navy; Dr. Howard Kelly, Dr. Robert T. Morris, Mr. Caspar Whitney, Harry V. Radford, ex-Governor Chamberlain, of Connecticut; John Taylor Humphrey, Henry Wellington Wack and Mr. L. F. Brown.

General Miles spoke interestingly of hunting in the West, his experience going back many years to the days of actual game plenty. Dr. Robert T. Morris gave a fascinating account of his exploring trip with Mr. Wako to Hudson's Bay last summer, and his story was illustrated by sixty lantern slides. There are few people who can talk more interestingly than Dr. Morris, or whose range of outdoor subjects is wider; and his talk gave very great pleasure to his audience.

Surgeon-General Suzuki spoke on Japanese interest in field sports, and Dr. Howard Kelly told of canoeing on the Mississauga. The occasion was one of great pleasure.

The fourth annual dinner was set for February next.

### Quail in Missouri.

LINCOLN, Mo., Nov. 10.—*Editor Forest and Stream:* Noting that your Missouri notes are few and since we are as desirous of representation in the shooting world as our neighbors, let me give you some notes on our to-day's shooting. My wife and myself drove out some four and one-half miles to the south of Lincoln, arriving about 7 A. M. at my brother's house. He accompanied us, and with our two pointers and setter we set out toward the cornfield in pursuit of Bob White. After walking perhaps 150 yards, coming to the margin of the field, in a little meadow our over anxious dogs came only fairly to a point when whirr was heard the wing note of a large covey (or rather two coveys in one), for about one-half the number were only half-grown birds. This caused us to reserve our fire; and luckily the birds divided nicely. We then went in pursuit of the grown birds and two minutes later were rewarded by three pretty points, each

dog north of a high hedge fence with a space of about twenty yards between each, and all standing as rigid as if statues. On pushing them in we had nice targets, and, despite the high hedge, managed to bag four plump birds.

We then abandoned the covey and struck to the south down a ravine through the cornfield. On walking about 200 yards my pointer began to draw and forty yards in advance came to a rigid point, backed staunchly by the other pointer. A deep and wide ditch was ample cause for my being the only person in range; so I pushed the dogs in and successfully brought down two birds, a third one flying in range of my wife's gun, caused it to drop to a double. On account of the wind blowing a considerable gale and the birds backtracking, we again abandoned the bulk of the covey and pushed on to the south, bagging occasionally a lone bird.

In this manner we spent the forenoon reaching the house at 12 o'clock sharp with a bag of twenty-one birds—seven birds each. We had raised some five large coveys, but owing to the high wind the birds would run after lighting, giving us and our dogs plenty of hard work to locate them again. We expect a more liberal bag of birds next time out, when we will be more conservative about the weather before starting.

We have a great many prairie chickens on the prairie north of town, but our game law makes them practically safe. After Nov. 15 he who bags one will have to use a cannon. Our shotguns won't kill chickens 100 to 150 yards, and that is as close as they will allow you after this season of the year, as they are now congregating into large packs and positively won't lie to the dog.

We also have a goodly number of turkeys in the timbered regions, and if successful we will probably furnish you some chat on this subject later. F. F. L.

### Wild Domestic Turkeys as Game.

*Editor Forest and Stream:*

I have long since thought that it would be most desirable if our game preserves and breeding parks, especially in the midland and South, would take up the matter of savaging domestic turkeys for use as game birds. In a forested country, where they can subsist by scratching, especially where there are gums, beech nuts, acorns, turkey berries and the like, they can easily be made wild, especially if turned loose with their broods as soon as the chicks are strong enough to run.

The best shooting on turkey I ever knew of was on the mountain side near Blackwell's Springs, Buncombe, N. C. The fowls were just tame enough to show themselves freely at the edge of the woods and then shy into the undergrowth, or run half a mile when approached. Occasionally bands would come to the barn premises in rough weather for a handout, but I think the better plan would be to put out brush piles and corn, feed systematically near runs (streams) and the upland vicinity of laurel and reed slashes. Wherever there are cultivated intervals of maize and pea vines the birds do best of all, especially if the patches are as near as half a mile apart between wooded areas.

On Dr. William R. Capehart's 5,000-acre estate at Avoca, Bertie, N. C., there are many bronze and gray turkeys in the woods, which are undoubtedly the progeny of reverted birds. Experiments in this direction seem to me to be more worthy of consideration than the importation of capercaillie and black cock at great expense. Who will take up the suggestion? The cost is a bagatelle and cuts no figure. CHARLES HALLOCK.

### Cleaning Rifles.

DEEP RIVER, Conn., Nov. 15.—*Editor Forest and Stream:* In last week's issue of FOREST AND STREAM I wrote that John P. Boagni asks for information about cleaning the high-power smokeless rifle barrel. The problem of keeping the barrel bright when using smokeless loads is a very troublesome one and a continual bother to a rifleman who takes pride in the condition of his gun. Strange to say, I have never met anyone who had a perfect method for cleaning out smokeless powder residue, although I have sent many queries to riflemen of my acquaintance. I have tried everything ever heard or thought of, but nothing seems to exactly fill the bill. Undoubtedly Mr. Boagni has discovered that ordinary oil is woefully inefficient for this purpose, and in spite of its liberal use rust still appears.

The first step is to swab out the barrel as clean as possible with kerosene. Now, take a brass wire brush and carefully worm out the stubborn caked powder deposit. A few turns won't do it, use the brush freely but carefully. With ordinary careful use the brass wire cannot possibly scratch. Finish up with a liberal coating of sperm oil or vaseline to which is added a pinch of washing soda, and you have the best thing I have ever found. RANCHER.

### Currituck Shooting.

RALEIGH, N. C., Nov. 15.—*Editor Forest and Stream:* I have received the following letter from John R. Upchurch, the chief State game warden, who Nov. 1 was sent to Currituck Sound for the season to prevent the infractions of the laws. The letter is dated at Poplar Branch, Currituck county, and says: "I have been here one week to-night, and have information against six persons for violating the laws; will get warrants to-morrow morning and start after them. Some live on Killie Haw Island and two in Camden county. I have just got my yacht (gasolene) and she runs like a top. She will easily make eight miles an hour. There are a large number of swan, geese and ducks already here, but gunners say they are very hard to kill and will be until the weather gets cold. There are no non-resident hunters here as yet, but we are looking for some to-morrow. I find the citizens very clever to me and I feel quite sure they will help me to enforce the law. The people here are very glad to have the wardens here to keep down fire lighting."

Upchurch is a nery and capable man, and I expect him to make a good record in looking after the most important ducking territory in all the world. FRED. A. OLDS.

### The Dominating Carp.

Third Paper.

EVANSTON, Ill., Nov. 9.—So much comment pro and con has been made in regard to the edible quality of the outlawed carp that I concluded that the culinary experience of others in this matter was not at all satisfying to me; as I desired practical evidence with my own salivaries. There are so many grades of gastrics that what would be a delight to some would be displeasing to others. Our waxen wings frequently melt under the cruel fire of reality while the white frost of experience discovers the spider's web. A Digger Indian, who rejoices in a grasshopper pie, would not be a fit subject with whom to discuss the toothsome of the carp, nor would an almond-eyed Celestial, who frequently eats his fish raw, be a desirable juryman. Nothing would satisfy me but the straight goods, and I therefore determined to masticate a few morsels of the transplanted carp, even if the coroner was to be called in after the banquet. In order to facilitate matters for bringing this culinary tableau of the kitchen into the lime light I gave a close tip to my agreeable and companionable host to bring on his return from Chicago a goodly carp for the evening dinner and criticism.

This was to be a state secret between us, as to the species of fish to be served at the forthcoming feast to the household which comprised, in addition to ourselves, the *maitresse* and her three lovely little daughters, ranging from six to ten years, and each of whom had a highly cultured palate, who could almost by intuition tell a coarse-grained fish from one of a more delicate fiber.

I met him at the station that evening and sure enough he had that particular fish upon which we were to sit in judgment and satisfy ourselves whether it was a thoroughbred and worthy to be classed with the imperial family of fishes or be declared of ignoble birth and consequently receive the frozen hand and icy heart.

We plotted as we tramped along the boulevard and drew many amusing pictures under roses and violets that we opined would take place around the banqueting board, for we were confident that the entire family would spurn the finny alien, as they had been generously luxuriating on whitefish the past day or two, and hence the decision would, under these circumstances, be of exceeding interest. The change would doubtless be too radical and really looked like packing the jury. If agreeable to the madame, it was determined to have it served as a boil, as the carp is at its very best so dished. It being de-

sirous to have immediate decision, the presiding deity of the culinary at once took charge of his carps, and on ascertaining that the hostess was heart and hand with us in the manner of serving it, it was soon in a bath of steam, sending its unquestionable fragrance throughout the circumscribed domain of the kitchen.

In about an hour after we had clicked the ivories over the green baize in the billiard room we were requested to prepare for the feast, which we did with military promptness.

"Suppose," I whispered to the host as we brought up the rear of the grand march to the dining room, "that the carp is pronounced all O. K., what then?"

"Why," he responded, "we will have to bow in humility and wear sack cloth for thirty days; but really I don't anticipate such a failure, for their palates are yet in evidence with the whitefish of yesterday, and no such fiasco is to be considered at all."

Thus reassured I walked on with an air of triumph possessing me as if I had already the prize in hand. It was really a momentous period after the empty soup dishes had been removed and the carp, all gracefully and daintily garnished and jellied, was brought in in his sepulchered tomb of china and placed at the head of the table. It made, amid the glitter of cut-glass and gleaming silverware and flashing lights, a brilliant picture, where a served-up crow might pass at a premium. It was really a skillfully executed piece of artistic work on the part of the *cuisinière*. This was our great danger, and we now felt as if the executioner would soon have our heads on the block. We began to pale and grew quite nervous and felt as if a bucket of ice water was trickling down our backs. The fish was soon in sections and the platters sufficiently hot, and the fragrance of the flowers that generously decorated the table all aided in giving a decided keenness to our gastrics. The madame was the first to roll a morsel under her tongue, and as she did so a troubled shade overspread her expressive face, and then she asked for the tabasco sauce, and at that my confidence as to success rose. The sauce was liberally sprinkled on the fish, as if we thought to make it palatable, and then another choice piece with additional sauce was taken for mastication. She worried with it quite awhile, as if in epicurean distress, and managed at last to let the salivaries take it in charge, and seemed pleased that she had parted with it.

Neither she nor her three handsome girls at this time seemed to be wallowing in epicurean voluptuousness, nor poised as if they were sybarites at a feast of Lucullus, they acted more like Pythagorean disciples striving for self-restraint.

She now nervously but gracefully turned to her devoted husband and interrogated as to the nomenclature of the fish under culinary treatment. He, fortunately, being noted for expedients when danger threatened, very promptly gave the oriental name of the fish, "Sassan." That is a very unique name, and thinking it a pleasantry in which he frequently indulged, responded in a slightly cynical manner: "That, I presume, is Sanscrit, and its interpretation signifies Sally Ann." At this the children seemed greatly amused and sent a rimple of melody rippling through the spacious room. The merriment subsiding, the madame very emphatically stated that "while the delicious and rose-like fragrance as well as toothsome of the whitefish we had yesterday lingers with me as a poetic reminiscence, I will not sigh for this fish of the wave."

At this juncture the oldest girl, a handsome little princess, who had laid aside her plate of "Sassan" almost untouched, said in tones of supreme disgust: "I really think the fish the most tasteless we have ever had." And then the platter, with contents, went into serving hands and out of sight.

Now, the sandwiched girl, the betwixt and between of the trinity, rose to the importance of the occasion and declared in a plaintive way that "The only thing worth considering was the egg sauce, and that was perfectly lovely." The kindergarten girl, who had long been waiting her opportunity for an opening, could not, now that she had the floor, let the discussion close without expressing an opinion as to the demerits of the fish, and therefore announced in a somewhat disappointing manner that "It was good enough for Joe," the handsome house dog, who would assuredly take the first prize for beauty at any bench show; and then the little fairy subsided, thinking, doubtless, that children who chase butterflies and catch grasshoppers should be seen and not heard.

The host and I did not go to such extremes as the epicurean critics, for we believed in that eternal justice which tends to foster in men those stronger qualities which would never permit them to accept a \$150,000 annual salary as a presiding official of an insurance corporation. We parenthetically mention this as an indicative of always presenting facts wherein the alien carp is under consideration. Having thus, we hope, established confidence with all we will take up the tangled thread of the discourse by stating that we could only endure the carp, not love it, for we looked upon it as ranking seventy-five per cent. below the whitefish, and a very slight shade, indeed, above the buffalo, another coarse fish, which has been consigned time and again to charm the lone ferry-

man of the Styx with anything but melodious accompaniment.

Here the governor, as the host is frequently called, explained to his wife that the term "Sassan" was applied to the carp in the regions of the Caspian Sea, where it was found in great numbers. At this explanation the madame smiled and responding, said:

"I really was under the impression that you were giving me a sprinkling of Attic salt, and I thought it would simply be a Roland for an Oliver by giving you a little pepper."

And with a liberal indulgence in some more substantial and delicacies, with coffee and choice wine, our carp dinner ended, not only delightfully but instructively, with its total abolishment from my host's larder. He was a *bon vivant* and believed in an enjoyable menu.

In connection with the above I will present a few figures for consideration and analysis in regard to the reproductivity of this fish, which exceeds by seventy-five per cent. that of any other fish. To illustrate, a carp weighing 4 or 5 pounds contains on an average 400,000 to 500,000 eggs, and some statements go much higher. Say, for instance, that from one carp at least two fish will survive. Now, take 1,000,000 carp, half of them being females, and the increase the first year would be 1,000,000.

Now, on the compound interest system the figures would stand for first five years at 64,000,000, for ten years the number would be 2,048,000,000. Again at fifteen years it would reach the enormous amount of 18,384,000,000. We now close the statement for twenty years, as the amount seems to grow so rapidly as to almost carry it beyond calculation. The figures are startling and amount to 1,181,276,000,000. With our Great Lakes of the Northwest containing, as a starter, 1,000,000 carp, of which there is evidently a much greater number in them now, you can probably, if the numbers are not confusing, realize what they will contain twenty years hence if the lakes will only hold them, and on that we have not figured. This is simply mathematics that establishes the facts and figures beyond dispute.

Having taken up mathematics to prove the dangerous results of carp propagation to our Great Lakes we will solve another problem as to its dire effects commercially, and this came authoritatively in conversing with an official of the Grand Rapids & Indiana Railway at Grand Rapids, Mich., previous to my departure for the fishing banks and streams of the Northwest. I questioned him as to the number of anglers that annually took the train over his railway. He stated that 10,000 would be near the figure. Now, each one of these would, on an average, spend \$40 for their rail fare, which would make a total of \$400,000. Exclusive of this amount their expenditures for the trip averaging a stay of a month, would be for each about \$150, aggregating a total of \$1,500,000. The sum total of the two would make an aggregate of \$1,900,000. Fully three-fourths of this would be lost to the railways, hotels, boarding houses, guides, boatmen, etc., if the carp reaches its culmination as foreshadowed by the figures above and rules supreme, which it assuredly would over the lakes and the rivers tributary thereto. This is only the loss that would be entailed through one railway, and now we leave it to you to figure on the other railways which radiate through other parts of the territory occupied by these lakes and rivers. When you come to fully realize on this enormous loss I don't think you will find any profits to realize on by the introduction of the carp to this country. It is a base alien that has nothing to recommend it, not even its edibility. Are we therefore to tamely submit to this outrage which bids fair to destroy our magnificent game and toothsome fishes?

Some men are apt to prefer error to fact. Their prejudice is like the spider that makes everywhere its home. It has neither taste nor choice of place, and all that it requires is room. If the one prepares her food by poisoning it to her palate and her use, the other does the same. Prejudice, therefore, may be denominated the spider of the mind. Whatever excites the spirit of contradiction is capable of producing the last effects of heroism, which is only the highest pitch of obstinacy in a good or bad cause, in wisdom or folly.

One of the greatest losses we deplore—and it will occur with the increase of carp—is the delights of the angle, the contemplative man's recreation. Many thousands of our citizens will lament with us this prospective calamity.

No sport embraces so extensive a literature nor has been so enthusiastically considered as that which descants upon the

"Dancing cork and bending reed,"

or which treats of the fascinations accompanying the poetic pastime of the ardent angler. Beyond all other recreations it is the most idyllic and most satisfying. It brings the angler into close and intimate communion with nature. It takes him into flowery meadows and shady woods; by the side of murmuring brooks, silver cascades and crystal rivers; through deep ravines and into valleys clothed in vernal beauty and made vocal with rippling waters and the warbling of feathered songsters. It is a fragrance of tenderness and of mild, soothing peace. "It has been so for us since Izaak Walton sang its beatific praises, and made its home classical for all ears and hearts. He has made fishing the type of the gentle mind that finds, even in the midst of hot and angry tumults, a refuge for quiet homes and a haunt of peace by happy river sides."

The very memory of it will ever keep me from despair, and all my life I shall thank God that I have often known its gentle touch to lead me to the heights I never could reach without it, and to replace my doubt and unbelief with a simple reverent trust. And now to think that this delicious pastime is in jeopardy is enough to make the very angels weep.

ALEX. STARBUCK.

### Old Man Bassford and the Shark.

It was at one of the swell Florida hotels, where the bell boys hand back, with a lofty air of disdain, any tip under a dollar. How old man Bassford blew into such an atmosphere I don't know, but he got there some way. Some one had caught an 18-foot man-eating shark and it had been hauled upon the dock in front of the hotel. The hotel guests were grouped around it as thick as bees.

The great fish was resting upon its belly, its great mouth hidden from view.

Mr. Bassford approached the guide, who had the fish in charge, and insisted that the shark be turned over. The guide hesitated to go to the trouble and wanted to know why Mr. Bassford wanted to see the face of the shark.

"Why," replied Bassford, "I want to see if he looks like our hotel manager."

That settled it, and the assembled guests seconded Mr. Bassford's request.

CHARLES CRISTADORO.

### The Carp Question—A Suggestion.

THE controversy "fur and agin the carp" may be expected to last for some years, and to furnish satisfaction for advocates of either side. Meanwhile, those of us who really know about the carp will keep in mind two salient points, irrespective of the controversy.

(1) The carp is an excellent food fish.

(2) The carp in some waters disturbs the balance of nature in such a way as to make him a nuisance in those particular waters.

I have a suggestion to make in reference to the second point. The jackfish (*Esox lucius*) is common in Canadian waters, and can be introduced much farther south without trouble. The jackfish frequently attains a size of more than 20 pounds—sometimes nearly double that. It is a very fine fish for the table, and individuals above 10 pounds weight require skill in the capture. The jackfish lives harmoniously enough with trout and bass in many waters to-day. Its favorite food consists of members of the carp family, and in trout and salmon waters I have usually found suckers in the stomachs of jackfish caught there. Sometimes a jackfish will pick up a game fish; but like most race horses, he is naturally lazy, and would rather walk than run. His favorite lurking place is among the weeds in shallow water, and let a carp beware if he seeks to eat up the house of the proprietor of any given weed patch. My belief is that the jackfish introduced into waters disturbed by an overplus of carp would restore the balance of nature in those waters, without at the same time becoming a nuisance himself. The reason for this belief is founded upon the facts of the known relation between jackfish and other game fish in waters in which they exist together naturally in Canada at present, and also upon the fact that the European jackfish keeps in proper balance in waters where he and game fish and carp have lived together for centuries. I would experiment with the jackfish not only in "carp infested" waters, but also in waters where the common pickerels (*Esox reticulatus* and *fasciatus*) have been introduced to the detriment of game fish. In the Adirondacks and in Maine the jackfish might be expected to eat up pickerel and suckers, and to allow the return of trout to waters where the pickerels have played havoc. Even where the jackfish did destroy some game fish, he would give the fisherman a quid pro quo in his great size, fine table qualities and character as a fish fairly belonging in the game fish list.

ROBERT T. MORRIS.

NEW YORK, Nov. 16.

### The New York Chief Protector.

Editor Forest and Stream:

The New York Evening Post says this evening (Nov. 20) that John B. Burnham, of Essex county, is in line for appointment to the office of Chief Game Protector, and that he will be appointed as ordinary protector in order to familiarize himself with the duties of the head office and prepare for the necessary civil service examination.

If Mr. Burnham is appointed to the office by Commissioner Whipple we can rest assured that everything possible will be done to stop the disregard of the State game and fish laws which has prevailed in the Adirondacks for time out of mind. Mr. Burnham is better fitted for that office than anyone I know of. His journey into and out of Alaska on skis, in a paper canoe and with dogs shows the kind of physique which will make him the leader in expeditions after crusters, and his woodcraft knowledge is such that he will be able to hunt out the miserable crew that jack and hound deer contrary to law, and, worse yet, contrary to the best interests of Adirondack game protection.

Anyone who has followed Mr. Burnham's articles in your paper knows that he is a woodsman, able with his rifle, ax and snow shoes—and that kind of a man is needed to direct and lead the movements of the game protectors of the State.

Mr. Whipple's choice of Mr. Burnham for Chief Game Protector is the best indication we have that the Adirondack region is in the hands of a man who intends to protect it from the men who have for years back spoiled the State's fairy land of nature.

I don't agree with Mr. Whipple in his belief that there is nothing to worry about in regard to lost State lands, but I do heartily agree with him if he puts the protection of the State's game up to Mr. Burnham. I hope and believe that this will remove one cause of anxiety which has festered the hearts of the nature lovers of the State.

RAYMOND S. SPEARS.

### Kingfish at Miami.

THE Miami Metropolis of Nov. 13 reports: The scarcity of kingfish is proving an unsolvable enigma to the local fishermen, who state that never before have they been known to be so late in making their appearance in these waters. On one or two occasions small schools of them have been seen and a few captured, but in the last week they have been totally absent. Last night Capt. Albert Hienkle went to sea in the Seminole and this morning made several trips over the fishing ground, but failed to get a strike or even see one of the game monsters. He was successful, however, in capturing several mackerel, and a number of amberjacks and barracudas.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

### The Houseboat and its Uses.

IN England the term houseboat is familiar enough, for houseboats have been in use there for about fifty years; but in this country comparatively few people know what a houseboat is. Not because houseboats have not long existed here, however, for a hundred years ago our forefathers used to journey down the Ohio and again down the Mississippi in arks or flat-boats, which differed in no essential particular from the simpler houseboats of to-day. The addition of power to the houseboat and its use as a pleasure craft, are modern developments.

Under the title "Houseboats and Houseboating," Mr. Albert Bradlee Hunt has brought together a great amount of interesting and useful information concerning houseboats and the manner of living on them. The purpose of the volume is three-fold; he wishes to make known the opportunities that American waters afford for the enjoyment of life on the houseboat; to set forth the developments which houseboating has attained in this country, and most of all, to so picture the advantages of the houseboat and the attractions of life on it that larger numbers of people may be led to prove for themselves its comforts and its pleasures. "The houseboat already has a place on many waters of the United States from Casco Bay to the Golden Gate; from the St. Lawrence to Lake Worth; and with every season the boats are increasing in numbers and growing in favor. Permanent popularity is assured, for the houseboat possesses qualities which are lasting in their appeal. Houseboating is simple and domestic. In it are combined life on the water, and that home life which we care the most for."

It seems an odd thing that this is the first volume ever written about houseboats, and it would seem as if it were so complete as to leave no room for any future volume unless unexpected improvements and discoveries shall be made in this connection. The book is a compendium of the architecture of the houseboat, giving beautiful pictures of different types of these vessels in different situations, and giving as well, by means of plans and diagrams, such full information as to their lines, interior divisions and general arrangements, that any builder—one might even say, any carpenter—could construct one from these plans. The illustrations include houseboats in England and in America, power houseboats and immobile houseboats. There is a chapter on gasoline power for houseboats.

To the women attracted to the subject and to many of the men, the most attractive chapters in this interesting volume will be the ones which deal with life on the houseboat. The pictures of the interiors show all descriptions of rooms, from the plainest bunk room to the most luxurious fittings with open fireplaces. In many houseboats there are on the lower deck kitchens, boiler rooms, laundries and bath rooms; above are the bedrooms and living rooms, which may be as attractive as the means of the owner can make them. Mr. Hunt's chapter on Interior Fittings and Furnishing is very suggestive.

Each houseboater has his own ideas of the joys of houseboat life, but interesting at this season of the year, when the winds blow chill and the dried leaves are chasing one another in a whirl across the fields and heaping themselves up in the fence corners, is this picture of houseboating in Florida: "During the season, beautiful Lake Worth at any moment during the day presents a pretty sight, with the many electric launches swiftly sailing in all directions, and with a half-dozen houseboats moored along the channel of the lake. At night these boats, with their electric lights and the distant lights of West Palm Beach, add greatly to the charms of the walk along the lake or front avenue. It is all very well to drift lazily in one's own boat and moor where one will; but it is an uncommonly pleasant thing to moor among other houseboats, to exchange social amenities, to meet other idlers informally under the gay awnings on summer afternoons, or in the moonlight to listen to the twang of guitars, the lilt of a girl's voice, the shiver of cracked ice against the glasses, to watch the expert handling of a chafing dish, to dance cakewalks down between the palms and flowers under the swaying Japanese lanterns; to be highly gregarious for a time, and then to go idling on, leaving conventions and social obligations behind. They do that sort of thing down on the Indian River; and since the time when the late Pierre Lorillard towed the first houseboat into those waters, a whole fleet of craft has sprung up, ranging in importance from boats little more pretentious than the shanty boats of the Ohio to floating homes, equipped with every convenience and luxury. Many of them represent an outlay of about \$500, while others will run up into the thousands, and are as spacious and luxurious in appointment as money can make them."

Compare with that picture one of the sportsman, who has his inexpensive houseboat on western lake or river, a craft which serves as a place for eating and sleeping, and is sternly practical and free from luxury; for one great beauty of the houseboat is that it may be made to fit the purse of the poor man or of the very rich; the cost may be trifling or it may be great.

A very interesting subject to Southern travelers is a description of the inside route to Florida by Capt. Thomas I. Smith, giving distances, charts with details as to canals, buoys and various matters of expense, which will be a positive help to any man who wishes to go to Florida by water.

To the man already possessing a houseboat, the present volume is not less interesting than to him who contemplates building one. No two of these crafts are alike, and each one has some wrinkle or peculiarity of its own which is worth adapting on some other craft.

Life on the houseboat seems to give that independence for which we are all working and slaving, for after all, a great fortune, the goal of the average American's ambition, is desired merely because the man wishes to feel that he can do just what he pleases. The man with a small income, obliged annually to face the summer

problem, may by the expenditure of a comparatively small sum on a houseboat, have a home which will last him year after year, where he has no taxes to pay, no lawns to mow, no establishment to keep up. He can move from point to point, though his moving may be very deliberate. Best of all, he has pure air and healthy surroundings, and he and his family may be by themselves or may mingle with others as they please.

There are many men who are debarred from enjoying a life on the water by the very reasonable objections of their wives and families to the cramped quarters of all except the largest yachts. Such objections, however, do not apply to the houseboat, where at a cost which is trifling compared with the cost of a yacht, one may have as much room as could be had in an ordinary summer cottage, together with a multitude of conveniences and a multitude of attractions that the summer cottage would never yield.

While we are disposed to think of the houseboat as being especially for the sportsman, it is a fact that the women and children of the family take more pleasure in this life than do the men. They throw themselves into the delights of life on the ocean wave; they fish and travel about on the water; they have their beds of flowers, and the time never seems to hang heavy on their hands.

"Houseboats and Houseboating" is full of novel and interesting matters, and may frankly be recommended. (Price \$3 net; postage 34 cents.)

### A Wholesome Boys' Book.

THE "Scientific American Boy" is a capital book of somewhat unusual type, but one that is extremely likely to have a wide popularity at first with parents, but afterward with the boys, who, in perusing it, will be-

come, if not scientific, at least well informed on a number of extremely useful subjects.

All boys are fond of nature, though probably most of them who have not had some special training or association would vehemently deny this. Nothing appeals to them more strongly than a life out of doors, and the study of wild things, whether they be quadrupeds, birds, plants or stones. They only insist that the things told them about these natural objects shall be interesting; and certainly this does not seem to be asking very much.

The author of the present volume, Mr. A. Russell Bond, takes his boys into a camp at Willow Clump Island and keeps them there for the better part of the year. Incidentally they do some shooting and fishing, but most of the time is spent in manufacturing tools or implements, or more pretentious constructions, which shall be useful to them, either by making them more comfortable, or by serving them in their various pursuits.

A perusal of the headings of some of the chapters suggests what they did when they were preparing to go to the Island. They learned how to make and use skates, sails, snow-shoes, skis and swamp shoes; they made their tents and then prepared for the expedition. Arrived at the Island they made surveying instruments, and mapped it. They made a bridge, canvas canoes, houses; they had trouble with tramps, during which their boat was stolen, and they invented a tramp proof mooring. They learned signalling by wigwagging and heliographing; made ice-boats, sledges, toboggans and scooters, and later took a long winter tramp. When spring came again, they put up some waterworks, built a log cabin and finally a gravity railway and a cantilever bridge. Every thing described in the book is most fully illustrated by diagrams, so that the dullest boy should not find it difficult to work out any construction that is shown. Besides these very numerous draw-

ings, there are many capital halftone pictures.

There is quite enough of story in the first part of the book to carry along very easily the instructive part, and toward the end, after the boys are thoroughly interested in their various constructions, there is less of the story and more of the building, an entirely natural and proper arrangement.

For any boy or for any group of boys that have the slightest mechanical bent, this is a book of the greatest value. The outdoor pastimes of shooting and fishing and most active sports, athletic or otherwise, have been very fully treated in many books, but it is a long time since we have seen a volume so practical, so useful and withal so interesting as the one in hand. It can be commended to all readers. Munn & Co., Price \$2.

### For Maine Campers.

"WHERE the Sportsman Loves to Linger" is a descriptive narrative of the most popular canoe trips in Maine, by G. Smith Stanton, son of Mrs. Elizabeth Cady Stanton. It is a pleasant exposition of the routes, the happenings and the needs of the camper who intends to journey on the Allagash and the east and west branches of the Penobscot.

Mr. Stanton has made many canoe and hunting trips through the woods of Maine, and is thoroughly familiar with the incidents and the needs of such excursions. He writes in a pleasant light vein, with much humor, and the book is well worth reading. It is noteworthy for the multitude of illustrations which it contains, most of them, we may presume, from the author's camera, and many of them of much interest. There are several pictures of wild moose and wild deer, besides other photographs of camps, picturesque spots and others. Price, \$1.

# YACHTING

## How a 90-Footer Behaves in an Ocean Race.

Being a Short Account of the Performance of the Yawl Ailsa in the Race for the Kaiser's Cup Across the Atlantic in 1905.

BY PAUL EVE STEVENSON.

A paper read at the thirteenth general meeting of the Society of Naval Architects and Marine Engineers, held in New York city on Nov. 16 and 17, 1905.

THE British-built yawl Ailsa was, with one exception, the smallest vessel that took part in this great race, her dimensions being 89ft. load waterline, 131ft. over all, 26ft. beam and 17ft. draft, her gross tonnage amounting to 116. She was designed by William Fife and built in Scotland in 1895. When she was first spoken of as a possible entrant for the race, there were many who considered it a preposterous conception and one that was worth hardly more than a passing thought.

"What, enter this 'crazy-eyed racing machine,' this 'composite basket' in a race across the North Atlantic! Even if she was a Scotch-built boat, she came over originally in a slow cutter; not under skittering racing sticks that she'll have to carry now to make any showing at all."

In this manner these maritime Solons expelled their weighty views and shook their salty locks. Gradually, though, interest in the undertaking gathered energy, and when the fine performances were recalled of the Vigilant and Navahoe in their ocean passages in fast time and without mishap, popular opinion among yachtsmen experienced a change of sentiment to a great degree; and a lively interest was kindled among them when Ailsa was definitely entered in the great contest.

This interest continued to grow when the insignificant size of the boat, compared with some of her big competitors was appreciated; and the experts reached the same conclusion, namely, that her only chance of winning lay under but one condition of weather, to wit, smooth seas and a head wind, or at least a close reach. Ailsa had left a very creditable record behind her after a long series of races with the Prince of Wales' Britannia; and if it should happen that we could find for her conditions favorable to her type, she stood a very good chance of finishing among the first three. No one thought of her as a possible winner in any other sort of weather, for in strong, fair winds her large antagonists would overpower her and in the event of heavy weather they would simply drown her out.

Immediately prior to the start, Ailsa was overhauled as completely as possible aloft and aloft; she was entirely replanked in many places, and generally strengthened so as to withstand the severe tests of a deep-water race. Among other preparations, 5ft. were clipped from her bowsprit, short as it was, till it seemed no more than the pointed end of a cigar jutting out of the stem, while the mizzen or jigger had been cut down to nothing but the pocket-handkerchief of ancient tradition. She carried, however, her racing mainmast and the mainsail itself was of the exact size for smooth-water racing. She also carried an extra stout triangular storm trysail—the riding sail of the Grand Bankers—made of Irish flax which was bent to the mast with toggles when required. A hooded slide was built over the fore-castle hatchway and another one over the skipper's hatch immediately forward of the wheel; while wooden battens and strong canvas covers were fitted for the skylights fore and aft.

The small boats carried in case of accident were fishermen's dories, lashed three in a nest just aft of amidships, the most wretched type of small boat imaginable in case

of a quick exit, except in the hands of fishermen born and bred in them and who know every detestable humor of these craft. The writer's opinion on this subject may not be of monumental worth, but he has had a good deal of experience in them with the fishermen out of Marblehead and the Kennebec; and while it is true that on the Banks a dory carries a ton of fish and two men in a heavy jumble of sea, these men know what they are about and are not asked to jump unaccustomed into them, three or four men to a dory, in a heavy, breaking sea. If it should come to abandoning the ship, this purpose being the only excuse for their presence on board, the result would be much too painful to contemplate. It is true that two large, strong boats scoured amidships would have occupied more deck space than the nests of dories; but they would have possessed the incalculable advantage of usefulness in a disaster. That the Yankee dory, strictly indigenous to New England, is the finest sea boat of its size known to sailors when properly handled, is a fact beyond dispute; but one has to know them from the cradle upward to understand all their madness in a seaway. Several of the other racers also carried dories as well as Ailsa; and only a providential immunity from an occasion to utilize them in heavy weather prevented what must have been a miserable loss of life. The notion of five or six men living in one of these little 14ft. boats in a breaking sea until picked up is unthinkable.

Because of our handiness as a racing "machine" we were enabled to get away first across the line at the start, followed immediately by Hildegard, Atlantic, Endymion and Hamburg, the latter being the only other pure racer in the fleet besides ourselves, though much larger and more powerful. On board of us there were 28 persons all told, three of us aft in the cabin, while the ship's company included a skipper, two mates, steward, mess boy, two cooks, and 18 men before the mast—precisely the complement that handles a modern 2,000-ton sailing ship with 3,500 tons of cargo aboard. Our cabin had been cleared of all unnecessary furniture and decorations and a large ice-box had been built into the floor; and as a vasty hummock of storm canvas occupied the rest of it, locomotion below was not accomplished by the customary methods. No carpets were down to hold any water that might be shipped, though this was a vain precaution, for the only salt water that found its way below in the whole fortnight was a bucketful through the inadvertently opened companionway. From the beginning of the passage till we let go in Southampton Water, Ailsa leaked no more than could be pumped out in five minutes each watch, even in heavy weather that we ran into in mid-Atlantic—a very different fulfilment of the dark prophecies that sprang from certain quarters before the start, when a basket was too sound an article for comparison with Ailsa's hull. It is also not unworthy of comment that only during the first six hours of the voyage did we have a head wind; after dusk fell that first night at sea we held the Jersey coast aboard, while most of the others split tacks and went away along the Fire Island beach. About 10 P. M. the wind shifted into the southward from E.N.E., and never again headed us during the 3,000 miles—a first hand illustration of the "brave west winds" of the Atlantic.

For two or three days afterward, the breeze held true and fresh from the southwest, and because it was fair we were able to carry all our kites, including the spinnaker until it split one afternoon, after the spinnaker boom had soared up to the spreaders in a heavy roll and broke into three pieces. We fished this boom, however, but lost a 20ft. section out of the middle of it, and during the rest of the passage we utilized the balloon jibtopsail as a spinnaker, as the original one would have been too large for the shortened boom. The sea had increased somewhat by this time and was running under us in

swift, white ridges; and Ailsa here first indicated how abominably this type of vessel steers running before a fresh wind and sea. With no forefoot to hold her steady, she yawed to every sea at least five or six points in spite of the most skillful steering. Nearly half the time the spinnaker was aback and was hindered from swinging inboard only by heavy preventers. Indeed one of the most disagreeable nights of the passage occurred in this part of the ocean, when on one occasion the wind had let go to a great degree; Ailsa minded her helm no more than if she had been rudderless, and teetered about on the crests with the big mainboom in charge of the deck, hesitating whether to gybe over or not. Later on this same night heavy rain squalls came on from the southward, and though there was not much wind in them we lowered down the mainsail and set the trysail for the first time. Having to depend on one mast entirely (for the absurd little sapling in the stern was a negligible quantity nearly all the passage) we had to take great care of the big boom, not having the advantage of the two and three-masted schooners that can afford to take some risks on their several spars. As for the trysail, it proved to be of almost incredible utility; many times afterward in the race, when running before it, with the 80ft. boom flinging around and nearly ripping things asunder when brought up short by the traveler, we would put the gaskets on the mainsail, get the little trysail bent and fill away again in perfect comfort; indeed, quite half the race was run under this sturdy little sail. With more placid conditions, however, Ailsa sailed a splendid race, and when laid close to the wind in a fresh breeze with no sea running, she steered like a knockabout, her wheel like the balance of a watch; and at times she sailed along for several minutes without a hand on the spokes. But as soon as we ran into a seaway, Ailsa went to pieces, as it were. If the sea was ahead she stopped almost dead short at every rise; if astern, she showed an unconquerable desire to look at her own wake.

Our best day's run was 268 miles, a trifle over 11 knots an hour, while in a single watch we did 50 miles and in one hour covered 13 knots; and our best day's work was followed at once by the only heavy weather we found during the voyage. This was in 45 deg. N., 34 deg. W., or about 1,400 miles E.N.E. from Sandy Hook; in short, mid-ocean. The gale took an entire 24 hours to make up from the southward, with violent squalls and then, shifting into the northwest in a succession of furious gusts lasting four or five hours, it settled down at that point to what sailors call a heavy gale, the wind rising to force 9 or 10 in the Beaufort scale, or from 50 to 60 miles an hour. At the end of a day and a half or so, a very high and dangerous sea had made, before which we ran the yacht up to the last moment of safety, and then hove her to on the port tack under the trysail only, with five oil bags over the weather rail. We had run her battened down for 30 hours and with four oil bags out; but at noon she broached heavily twice, the second time under the crest of a high sea; so, bailing oil out of a bucket to windward to make a "smooth," we put the wheel down, got the trysail sheet aft and stood by. Instead of lurching ponderously up to the wind like a square rigger would do under such conditions, Ailsa came to so swiftly as to almost throw us off our feet, and in less than a minute she lay hove to in perfect ease.

As long as we ran her before it, we had two men lashed to the wheel—merely a precaution—as not a semblance of heavy water boarded the boat, although we naturally had no assurance as to how long this would last; but of solid seas there actually came none on board; no sea broke on deck that a man could not stand up against unaided, and we had to lay her to simply because she would not steer. Of course, this broaching is a very dangerous business, and justified the second mate's pronouncement:

"You can call dese sea boats if you like, but de're tam bad ones." Nevertheless, as shown above, we shipped no solid water, and we were doubtless the only racer that could boast thus, with the probable exception of Valhalla, more than ten times our tonnage.

Through the bad weather, whether running or lying to, the easy motion of Ailsa was the most astonishing attribute of the boat; instead of knocking us about with battered shins and mangled joints, we found the rolling and pitching so pliant and comfortable as to astound us who were prepared for the worst moments in our experience. As a matter of fact the rolling and angle of heel, at their utmost, could not approach that of a large sailing ship either running her easting down or hove to in the Southern Ocean. The height of the largest seas was probably from 40 to 45ft. from crest to trough, about 30ft. shorter than the Cape Horn seas in which the writer was once hove to in a windjammer for a considerable period; but every one of these Atlantic seas broke heavily, with a curved edge, from which it was very difficult to get away, and their sides or flanks were almost vertical. The longer the sea, the easier to ride, of course, even though prodigious the height; the big regular Cape Horners by very reason of their size run but five to the mile, and the back or ridge of each individual sea often exceeds a mile in length. These break also, but without the hollow arch of a steep sea; they seem rather to roll along with a tumbling, thick crest. Indeed, had it not been for the "wave" oil, a compound of heavy oils, black and glutinous, which proved almost miraculous in its ability to smooth the crests, we would have had many disagreeable visitors. When we had arrived at Southampton, Lord Brassey, who had finished just ahead of us in Sunbeam, came aboard and declared that it was the worst sea that he had seen in twenty years. He also discharged the opinion that crossing in Ailsa was but little short of suicide; but had the Baron seen twenty-nine summers instead of sixty-nine, it is probable that our passage would have appeared to him in more brilliant hues.

"You'll have to drive her hard, win or lose," was a frequent counsel that we heard many times before the start. But as a matter of fact, driving a 90ft., modern, racing single-sticker with an emasculated forebody in such weather as we had for three days, before a strong gale and ugly sea, is an impossible theory begot in the minds of those who have perhaps never been out of sight of the land in a bulb-fin racer. In short, it is an anomaly. When a yacht or sailing vessel of any sort, large or small, has a hull under her fit to run with—that is, to drive—she can be driven to the ultimate moment, when she is often pooped and destroyed by the combers astern. But you cannot drive a vessel that has no forebody, practically no keel, whose mast is stepped so nearly in the middle of her that she cannot carry sail far enough forward to keep her ahead of the seas, and whose every inclination is to turn around against her rudder and look at you. She cannot be driven for the reason that she is out of control, and broaches in the crests and loses way, refuses to go ahead, and at any time is liable to lose boats, gear and men in a single sea through broaching. The build of every other vessel in the race enabled her to run out this gale, including Fleur-de-Lys, a smaller boat than

Ailsa. Fleur-de-Lys' decks were full of heavy water for long periods; yet she was driven through it because she was capable of being driven—was built to buck against or to run before a North Atlantic gale. Uncouth as Ailsa was when running, when hove to she rode as high and dry as a swan, shipping hardly a mist of spray. Not a little further misapprehension exists in the minds of many yachtsmen concerning the position of a sailing vessel when laid to. The notion is abroad that they "breast" the combers; while the truth is that they lie very nearly broadside to the sea, forging ahead about a couple of knots an hour; and this is as true of the sailing ship as of the yacht, except that the former, loaded almost to the deck, is swept by every heavy sea, which the yacht's buoyancy keeps her clear of. Only steamers head the gale when lying to.

One of the greatest misfortunes in the whole matter of this ocean race was that not a single naval architect of recognized ability crossed in one of the contestants. The excuse that they were too busy ought not to have prevailed in the face of the enormous amount of information they would have acquired on the passage, and in no other way. Watching the performance of one of his creations in a breeze of wind on the quiet sound, or even along shore, gives a designer no idea of how she behaves in a heavy sea more than a thousand miles from land, particularly in the matter of running and standing gear. No sailing yacht ever goes to sea in an easterly gale, which is the only possible condition under which, near land, the strains of a vigorous sea on hull and spars could be observed by the designer or naval architect; if he could but have been persuaded to cross in this race, he would have observed the countless points, great and small, that otherwise he would never see. No designer who had been there before would have sent Ailsa to sea with so preposterous a square foresail and yard. The trysail was the perfection of what such a piece of canvas should be—heavy boltrope, massive cringles and gear in general able to withstand the wear of the sea. But the square foresail was hardly fit for a joke. The quality was all there, but the size and shape of it would have been laughable if the conditions had not been serious. The business of such a foresail is to enable a vessel to keep ahead of a heavy, breaking sea when running, and ought to be nearly if not quite as long on the foot as on the head, to lift her over the seas and prevent burying when hustled on by the crest; instead of which we tottered along beneath a squaresail cut so nearly to a point on the foot that it looked like an inverted isosceles triangle. Had we possessed a squaresail commensurate with the size of the boat we might have even made a show of running out the breeze of wind and finishing fourth or fifth instead of eighth. As for the yard on which this fragment was stretched, it must have been conceived for a 70-footer to use off the Hook in August.

Concerning the yawl rig, it is our opinion that it is the most overestimated one, that appears in all the seven seas for any purpose except that of the British fishermen, and even they have rejected it almost entirely for the lugger and ketch. Many yachtsmen speak of the yawl rig as the very essence of everything desirable for a sea-going vessel; in their eyes it seems to have almost preternatural gifts in heavy weather; when

herculean tasks abound there is nothing to compare with it. "John is going up to Nova Scotia this fall," they say, "but then he's got a yawl rig, you know." The naked truth about the yawl is that the rig in the first place breaks up the sail area and reduces it for racing purposes; and in the second place it does not seem to be of any use at sea. When running, the little fright in the stern is out of commission entirely, and when hove to it is a positive danger when set, for well-designed boats crave the wind anyhow, and if the jigger were carried when laid to the boat would come all the way around on the other tack and create incredible confusion; and in moderate weather, close-hauled, a cutter will outpoint and outfoot any yawl of her size ever built. The proposition that a yawl heaves to at sea under head sails and jigger is a mere myth. As for the jigger's shortening up the main boom so that it is lifted well clear of the seas, it is equally untrue, for the jigger mast's presence does not in our case take more than 8ft. from the main boom, provided the latter were cut off level with taffrail, as of course it generally is for sea work. The Alice and Minerva are perfect illustrations of the fact that yachts as small as 40ft. on the waterline can cross the Western Ocean under sloop and cutter rig, without converting them into the ugly, useless and sluggish rig of the yawl.

The rest of our voyage lay in moderate weather with a long, rolling southwest swell, however, that kept us under the trysail much of the time, though we did 10 knots right along with almost the steamer's regularity; and it was in this vicinity that we exhibited the peculiar spectacle of a yawl churning along under six canvas triangles; three head sails, trysail, jigger staysail and jigger. We made our best hourly run about this time too, 13 knots in 60m., and passed the Lizard at about 4:30 in the morning of June 1, 14 days and 11 hours from Sandy Hook, beating the time made by other yawls, Vigilant and Navahoe, establishing a new transatlantic record for this rig, and also beating the passages of Yampa, Coronet, Dauntless, and Ingomar. Although we arrived eighth out of eleven starters, we made an excellent showing for a smooth-water racing machine even in heavy seas, and our passage across ought to illustrate the fact that a racing "ninety" can be handled and sailed even in wild Atlantic weather. With this as an established fact it seems more lamentable than ever that the hulls of our crack racing craft should be so over-pressed with canvas that even the larger ones dare not face a 20-mile easterly breeze and sea in our summer racing, lest they stretch their sails out of shape for the next race. That is, the very surface to which the motive power is applied must not be exposed to any but certain benign breezes, and that in smooth waters. A pity it certainly seems that we cannot arrive at a more moderate and reasonable sail plan, so that our racing yachts could exhibit their ability in strong winds and chop of a sea without the probability of maiming some feeble bit of timber. Perhaps, though, on the other hand, by virtue of their almost limitless experience in handling vessels in strong winds and freshening seas, the deep sagacity of our regatta committees is after all justified in calling off a race when some of the boats, having made an offing, are perceived to be in a state of unusual agitation. How can we maintain a defense in the presence of such godlike wisdom?

# HOUSEBOATS AND HOUSEBOATING

BY ALBERT BRADLEE HUNT,

Yachting Editor of Forest and Stream.

A volume devoted to a new outdoor field, which has for its purpose three objects:

- First**—To make known the opportunities American waters afford for enjoyment of houseboating life.
- Second**—To properly present the development which houseboating has attained in this country.
- Third**—To set forth the advantages and pleasures of houseboating in so truthful a manner that others may become interested in the pastime.

The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and halftone reproductions of plans and exteriors and interiors. A most interesting chapter is devoted to houseboating in England, where the sport is one of the most delightful features of outdoor life.

The book has been carefully prepared by MR. ALBERT BRADLEE HUNT, a well-known authority on the subject. See review of volume on a preceding page.

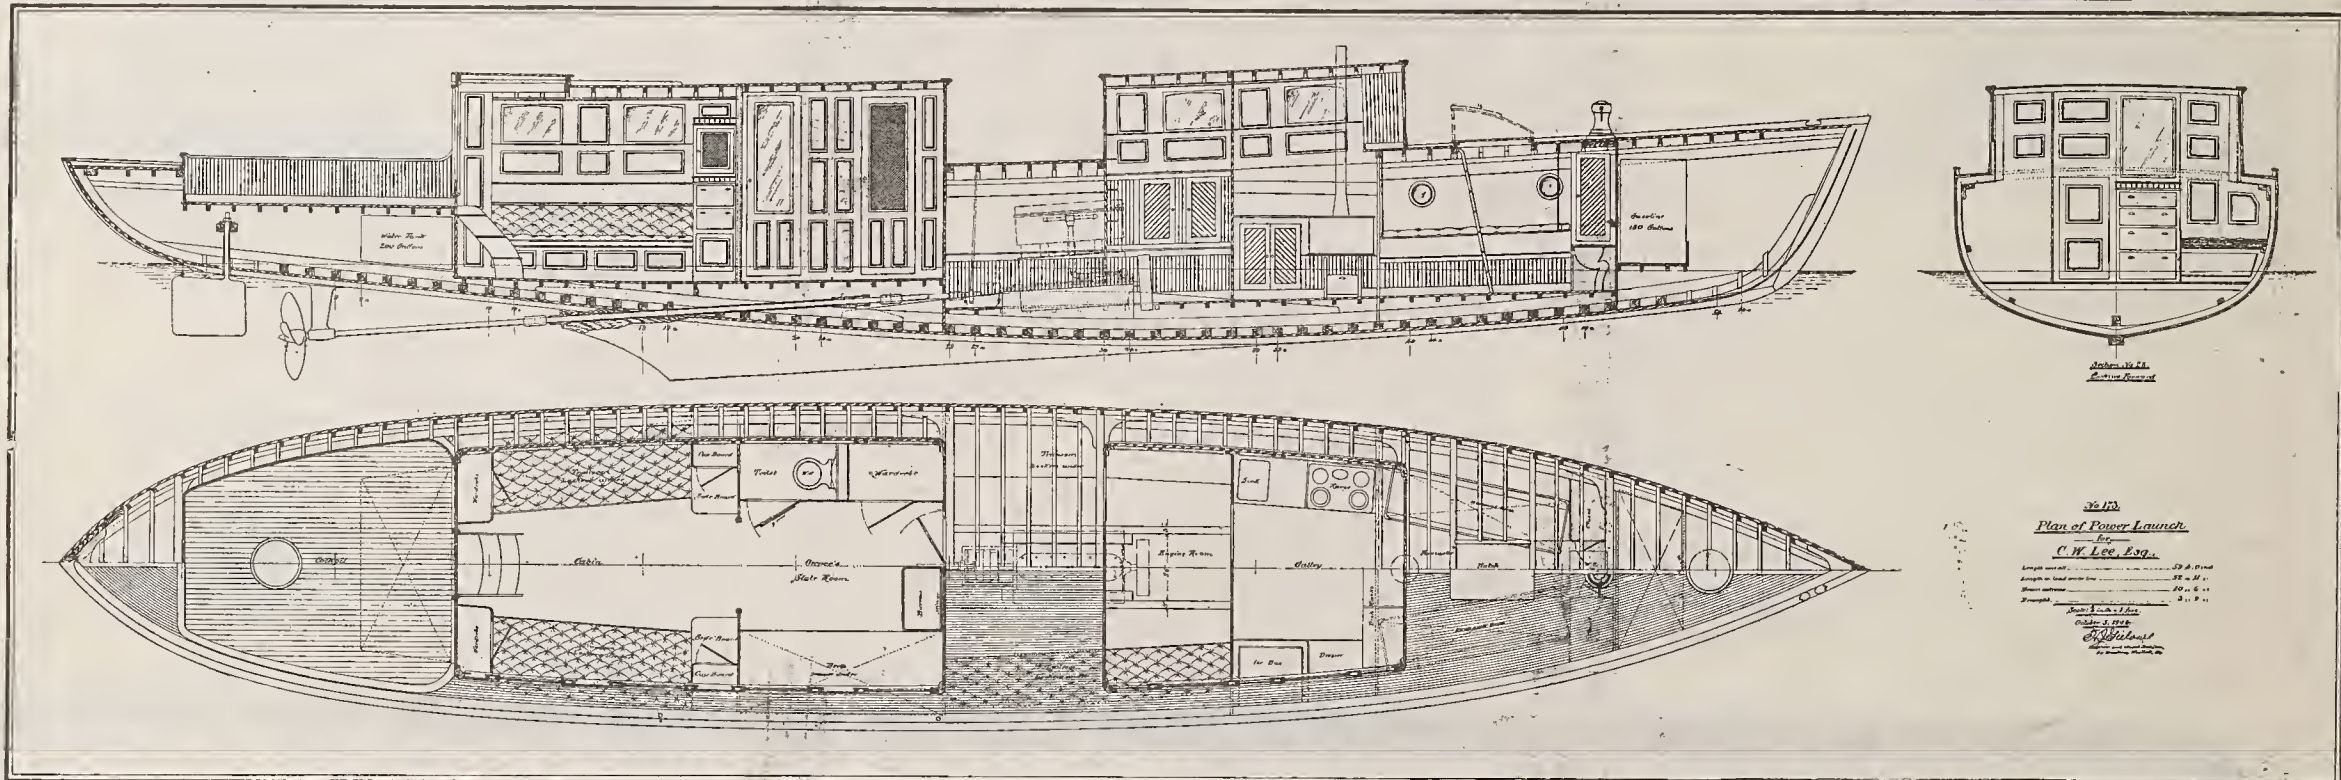

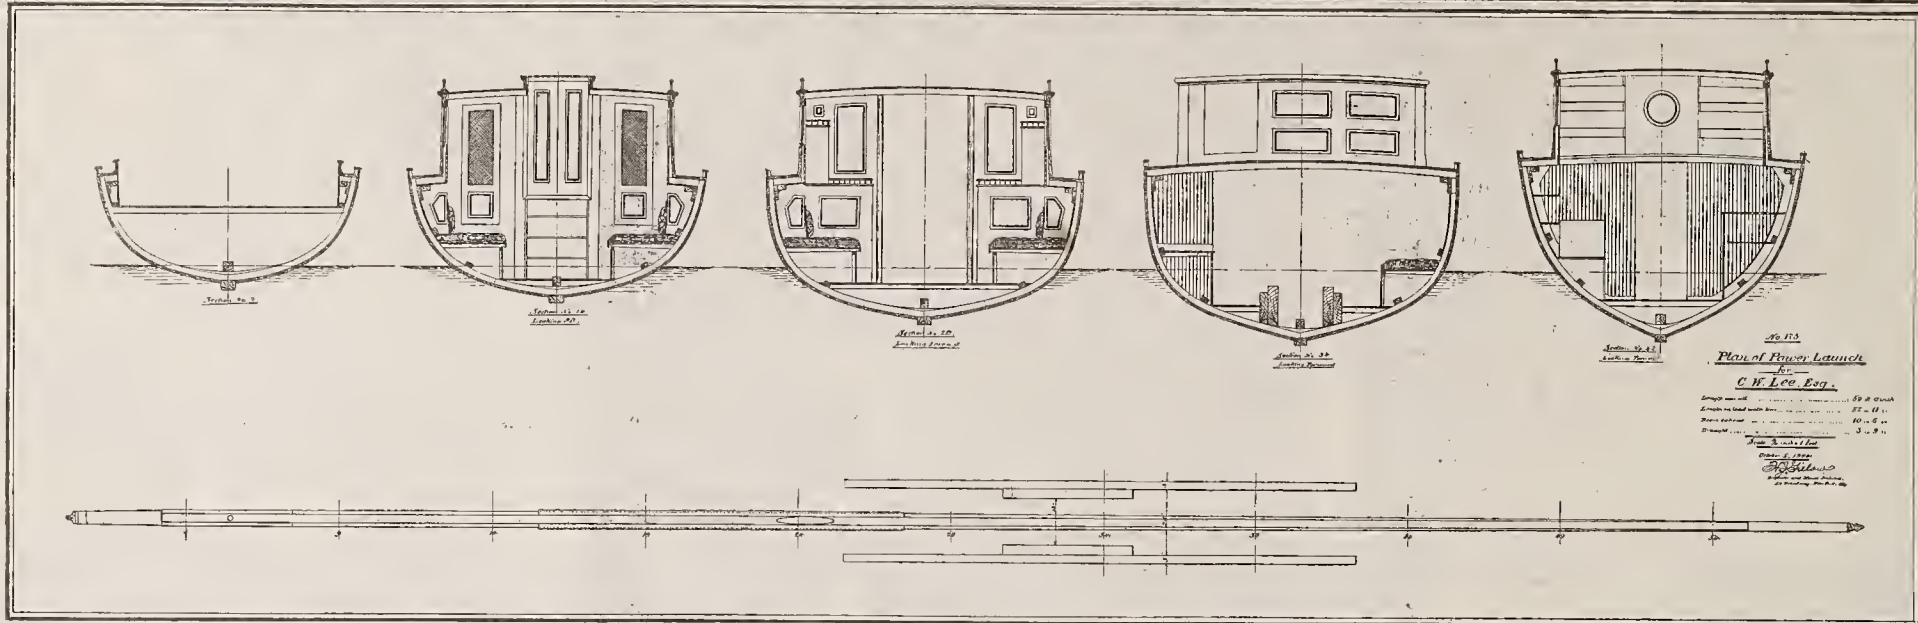

The work is printed on extra heavy coated paper, and is bound in olive green buckram.

The price is **\$3.00** net. (Postage 34 cents.)

The book will make a unique and most attractive holiday gift.

FOREST AND STREAM PUBLISHING CO., 346 Broadway, New York.

SACHEM II.—OUTBOARD PROFILE, SECTIONS, CONSTRUCTION AND CABIN PLANS—DESIGNED BY HENRY J. GIELOW FOR CHARLES W. LEE, 1904.

**Sachem II.**

THROUGH the kindness of Mr. Henry J. Gielow we are able to publish this week the plans of the cruising launch Sachem II., ex Dreamer II. The boat was designed and built for Rear Commodore Charles W. Lee, Manhasset Bay Y. C., and she was put together in Mr. Robert Jacob's yard at City Island.

The boat answered Mr. Lee's requirements so well that he is now building another boat of the same type, only a little larger, at the Jacob yard. The new boat was also designed by Mr. Gielow. Sachem II. is now the property of Mr. Frederick T. Adams, and with a 25 horsepower Standard engine she does better than 11 miles.

Aft there is a large water-tight cockpit 18in. deep. It is 8ft. 9in. long and 8ft. wide. There is an 8in. waterway all around. Under the cockpit there is a 200-gallon water tank.

The companionway, which is amidships, leads directly to the main cabin, which is 9ft. long. There is 4ft. 4in. floor room between the transoms at the forward end of the cabin and 3ft. 3in. at the after end. The transoms are 2ft. 6in. wide and 6ft. 6in. long. On either side of the companionway are hanging lockers 12in. deep, while forward, on each side, are 18in. sideboards with lockers above.

Forward of the main cabin is the owner's room 6ft. 8in. long. On the starboard side is a berth 2ft. 9in. wide, and the full length of the cabin. Beside the berth on the forward bulkhead is a bureau 16in. by 24in. with a mirror above. On the port side is the toilet room, which is 2ft. wide and 3ft. 6in. long, and the wardrobe, which is 3ft. long.

A door opens into the engine room and this enables the steward to pass from the galley through to the main saloon.

The after part of the engine room has not full head room as the deck is flush for a length of 5ft. Under the flush deck there is 4ft. 5in. head room. The forward part of the engine room is under the after end of the forward house. In this part of the engine room and in the galley there is 7ft. 4in. head room.

The galley occupies a space of 5ft. 7in. in the forward house, thus giving a roomy, light and well ventilated place for the steward to work in.

The forecabin is under the forward deck. On either side are transoms with pipe berths above. Forward, on either side, are clothes lockers for the men and between is a patent water closet. In the next compartment is a 180-gallon gasoline tank.

The after house is 16ft. long and the forward house is 10ft. long. Both are 2ft. 8in. high. There is 6ft. 2in. head room under carlins in the after house. There is 15ft. of deck space forward.

Sachem II. was beautifully built and Mr. Jacob is doing another fine piece of work on Mr. Lee's new boat. Sachem II. has oak frames and 1in. cedar planking. The arrangement below has been well worked out and she is a very practical and livable boat.

The dimensions follow:

Length—			
Over all .....	59ft.		
L.W.L. ....	52ft.	11in.	
Overhang—			
Forward .....	2ft.	4in.	
Aft .....	3ft.	9in.	
Breadth—			
Extreme .....	10ft.	7½in.	
L.W.L. ....	9ft.	10½in.	
Draft—			
To rabbet .....	2ft.	4in.	
Extreme .....	3ft.	9in.	
Freeboard—			
Forward .....	5ft.		
Least .....	3ft.	2in.	
Aft .....	3ft.	5in.	

RECENT SALES.—Mr. H. G. Tobey, New York Y. C., has sold his sloop Lyda Louise to Mr. John W. Bird through the office of Mr. Stanley Seaman. She is a keel boat designed by Crowninshield, built by Lawley in 1902, 57ft. over all, 35ft. waterline, 14ft. 7in. breadth and 7ft. 8in. draft. Mr. Bird, who lately moved to New York, is an old Boston yachtsman, and will use her for cruising on Long Island Sound. The same agency has sold a naphtha launch for Mr. W. H. S. Wood, president of the Bowery Savings Bank, to Mr. R. E. Henry, New York.

LIGHTHOUSE AT PORT JEFFERSON BURNS.—The lighthouse, which is located on the breakwater that protects Port Jefferson harbor, was totally destroyed by fire on the evening of Nov. 16. The keeper, Herman Burke, jumped overboard to save himself from being burned. The local firemen went to the scene of the fire in an oyster boat, but they were too late to render any assistance.

**A Designer's Views of the Universal Measurement Rule.**

THE subjoined interview with Mr. A. Cary Smith appeared in the New York Herald of Nov. 19:

"I have known the New York Y. C. since the days when races were started from Hoboken and sailed to and around the Southwest Spit, and have seen all the changes in measurement since that time.

"First, area of sail was used, then length multiplied by breadth. This measurement was changed to displacement on the advent of the Cambria and her owner of many letters and protests. Displacement was found to be too variable and vexatious, and was changed to cubic contents, measured to the lowest place in the deck above the waterline at side of boat.

"At last the fallacy of this measurement was shown—it favored shoal and low boats—and sail area and waterline was adopted, with the waterline as the basis of classification. Some years after, corrected length was adopted as a basis instead of the waterline. This called forth very severe criticism from prominent designers and yachtsmen. The contention was made that this modification would produce a canoe-shaped vessel with small sail area.

"The soundness of their judgment may be known, when the Reliance is the outcome of this rule. After the reign of the fin keel, the joy of the repair shop and a constant bill of expense to the owner, the present measurement was evolved by the 'Wizard' of Bristol, and while he was at work Mephistopheles sat at his elbow and prompted him.

"The quarter beam length, as it is now called, is a line parallel to the center line at a quarter of the beam from that line, extended fore and aft to a point one-tenth of the beam above the waterline. This takes in about as much of the overhang as the boat uses, and is really the true length.

"We now have a choice of dimensions. The only restriction is that the quarter beam, or L measurement, is the basis of draft. And this is the place where the fine hand of Mephistopheles came in. As this line determines the draft, there is a temptation to make this line as long as possible, and if made shorter a centerboard will be needed to give the required lateral resistance.

"When too late, it is found a deep boat does not like a centerboard; in fact, but a few feet can be used to advantage. The knowledge of the proper location of the centerboard is esoteric, and will remain so for some time.

"The profile of the modern boat does not leave much room to place a centerboard. Again the shape of the

cross section has a great deal to do with the weatherliness of the boat. The schooner *Elmina* only draws 8 in. more than the schooner *Corona* without her centerboard, and yet the *Corona* is no match for the other to windward, even when her centerboard is down. The *Lasca*, drawing less than 11ft., would not bear more than 4ft. 6in. of centerboard; if more was used she would not forereach as fast.

"This makes it appear as if the day for the centerboard has passed. If the modern profile is used there is no place to locate it, and if not properly located the centerboard is of little use. The long overhang, small cross section fin, the joy of the repair yard and the vexation of the owner, is legislated out of existence, and no tears will be shed at the passing of this species of naval architectural graft. And the fact that the cube root of the displacement expressed in cubic feet is used as a divisor puts a premium on large displacement and really makes a full boat measure less.

"And the old bugbear of a boat going below her waterline is a thing of the past, and the real speed that is in a boat can now be got out of her by more or less ballast, as the case may call for. One of the great factors of speed is the proper amount of weight, and this is known only to the inner circle. This perception must be born, and cannot be learned.

"The large displacement does away to a certain extent with the need of light construction in order to make the boat float at a certain line or be outclassed.

"The designer now has a free hand to select what dimensions he deems the best for his purpose. And, what will be good news to the owner, the best racer with a small rig will be the best cruiser and a cruiser that will sail fast and have more than the virtue of a can buoy.

"Finally, it is the opinion of those who are qualified to judge that the new measurement will produce an honest boat, and if continued long enough will produce the best boats we have ever had—boats that will give good service."

### Boston Letter.

**BOSTON Y. C. CHAMPIONS.**—The Regatta Committee of the Boston Y. C. has announced the following percentages for championships for the season of 1905:

Class	Average.
<b>Class E—22-footers.</b>	
Tyro, W. H. Joyce.....	.917
Medric II., H. H. White.....	.717
Peri II., Morton Prince.....	.645
Rube, H. L. Bowden.....	.623
Nutmeg, A. C. Jones.....	.462
Clotho, Cheney & Lanning.....	.421
Medric, George Lee.....	.307
Clorinda, Cheney & Lanning.....	.125
<b>Class I—18-footers.</b>	
Bat, C F Adams 2d.....	.808
Bonitwo, G. H. Wightman.....	.784
Dorchen, A. W. Finlay.....	.611
Hayseed, H. L. Bowden.....	.591
Aladdin, Keith Bros.....	.381
Fritter, A. P. Loring.....	.370
Nicknack, F. B. Holmes.....	.348
Mirage II., J. W. Olmstead.....	.282
Hayseed II., H. L. Bowden.....	.194
Otter, A. F. Irving.....	.167
Gertrude II., H. E. Lynch.....	.092
Cuyamel, A. W. Godfrey.....	.087
Little Miss, B. S. Permar.....	.018
<b>Class T—15-footers.</b>	
Vera II., H. Lundberg.....	.928
Cigarette, M. F. Prince.....	.333
Nibclung, E. G. Loring.....	.277
Princess, J. P. Prince.....	.167
Little Misery, A. P. Loring.....	.055

In addition to the foregoing the following championships are announced: First rating class, Meemer, Mr. R. C. Nickerson; second rating class, Opitsah III., Mr. W. F. Whitney; cabin power boats over 40ft. waterline, Right o' Way, Mr. L. R. Speare; cabin power boats under 40ft. waterline, Blink, Mr. C. W. Estabrook; open and hunting launches under 40ft. waterline, Tama, Mr. F. L. Dunne.

**KETCH FOR NEW ORLEANS.**—Messrs. Small Brothers have an order for a shoal draft auxiliary ketch for Mr. J. G. Martin, of New Orleans. She will have a 20 horsepower engine. Her breadth will be generous and there will be considerable room below decks.

**TWO LOCAL CLUBS AT NEW YORK CONFERENCE.**—The Eastern Y. C. and the Boston Y. C. were represented at the conference to revise racing rules, which was held in New York on Nov. 20.

**MR. W. H. JOYCE ENTERTAINS YACHTSMEN.**—Last week Mr. W. H. Joyce, of Philadelphia, owner of the champion 22-footer *Tyro*, entertained over 100 Boston men at a week-end stay at Philadelphia. There were several yachtsmen who have raced in the 22ft. class in the party. The Harvard-Pennsylvania football game was taken in on Saturday, and the party was tendered a dinner by Mr. Joyce. On Sunday autos were taken for a 100-mile trip through New Jersey, ending at Lakewood, where the train was taken for Boston.

**CRUISER FOR SOUTHERN WATERS.**—Messrs. Stearns & McKay, at the Marblehead Yacht Yards, have designed a novel power boat for a Southern yachtsman, to be used for offshore and river cruising. This boat will be 41ft. over all, 10ft. breadth and of quite light draft. She will be equipped with two 12 horsepower engines estimated to give her a speed of about 11 miles an hour. The design shows a boat of generous freeboard, the sides from about amidships forward being carried up to nearly the height of the cabin trunk. There is a small raised pilot house, which really takes more of the form of a conning tower. This house is built very strongly to withstand the onslaughts of heavy seas. There are good accommodations below decks, and sufficient gasoline may be carried for a cruise of 1,000 miles.

**PASSENGER BOAT FOR MR. H. U. HAYDEN.**—The passenger boat which Messrs. Burgess & Packard are designing for Southern waters is for Mr. H. U. Hayden, a member of the Southern Y. C. She is to be 103ft. long and will have two Standard engines of 100 horsepower each, with which a speed of 18 miles an hour is guaranteed. JOHN B. KILLEEN.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

### YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

**PRINCE LOUIS GUEST OF NEW YORK Y. C.**—A reception was given by the New York Y. C. on Friday evening, Nov. 17, to Prince Louis of Battenberg and to the officers of the vessels of the British fleet. The club house was decorated with flags, palms and American Beauty roses. The Seventh Regiment Band played the British national anthem when Prince Louis reached the club house about midnight. Mr. George A. Cormack met Prince Louis on his arrival, and, after introducing him to Commodore F. G. Bourne, all passed into the model room, where there were some 500 members and guests. It was a most representative gathering and the affair was by far the most successful ever given by the club. The America's Cup was displayed on the big center table, as were the cups won by Mr. Wilson Marshall's *Atlantic* in the ocean race and the *Dover-Heligoland* race last summer.

**NEW YORK Y. C. NOMINATIONS.**—The following officers and committees have been nominated to serve the New York Y. C. for the year 1906:

- Commodore—Cornelius Vanderbilt; steam yachts *North Star* and *Mirage* and sloop yacht *Rainbow*.
- Vice-Commodore—Henry Walters; steam yacht *Narada*.
- Rear Commodore—Seymour L. Husted, Jr.; schooner yacht *Crusader II*.
- Secretary—George A. Cormack.
- Treasurer—Tarrant Putnam.
- Regatta Committee—Oliver E. Cromwell, chairman; H. De Berkeley Parsons and Ernest E. Lorillard, secretary.
- Measurer—Francis W. Belknap.
- House Committee—Thomas A. Bronson, chairman; Hunter Wykes and George A. Freeman.
- Committee on Admission—Henry C. Ward, Tracy Dows, Edward F. Whitney, George A. Adee and Alexander S. Cochran.
- Library Committee—T. O'Connor-Sloane, John H. Cole and George A. Armour.
- Model Committee—Paul Eve Stevenson, James D. Sparkman and Albert Bradley Hunt.
- Committee on Club Stations and Anchorages—No. 1, William H. Thomas; No. 2, Henry H. Rogers; No. 3, Cord Meyer; No. 4, Augustus C. Tyler; No. 5, Charles Lane Poor; No. 6, Maximilian Agassiz; No. 7, Alfred C. Harrison; No. 8, Henry C. Ward; No. 9, William Lanman Bull; No. 10, J. Harvey Ladew; No. 11, P. G. Thebaud.

The Nominating Committee is composed of the following members: Lewis Cass Ledyard, chairman; J. Pierpont Morgan, Philip Schuyler, Seymour L. Husted, Jr.; Robert P. Doremus, George C. Clark, E. D. Morgan, F. L. Rodewald, F. H. von Stade and W. Butler Duncan, Jr., secretary.

The Grosse Point Ice Yacht Club, situated near Detroit, Mich., will hold a regatta on Lake St. Clair on Jan. 8 to 12, 1906. These races will be open to every organized ice yacht club in the world. Cups and \$500 in money prizes will be distributed. The club has forty-eight ice yachts in their fleet, measuring from 700 to 300sq.ft. of sail. Forty races were held last winter. Most of the yachts are of the lateen rig. The officers are: Com., Archie D. Michieli; Vice-Com., Edward C. Vernier; Rear-Com., Alex. I. McLeod; Sec'y and Treas., Miner A. Gregg; Meas., U. G. Huff; Fleet Capt., John Kies; Fleet Surgeon, Dr. Muentz; Chairman of Race Committee, Gilbert Moran; Judges, Walter H. Oades, John H. Pringle and Herman Dietz. Eight new boats are now building, and a new \$2,000 club house is being built.

**CLUB DELEGATES DISCUSS RACING RULES.**—On the evening of Nov. 20 there met at the New York Y. C., 37 West Forty-fourth street, New York city, representatives of the Atlantic, Eastern, Larchmont, Corinthian, of Marblehead; Corinthian, of Philadelphia; Seawanhaka-Corinthian, Beverly, Boston Y. C.'s and Y. R. A. of Long Island Sound. The object of the meeting was to bring about uniform racing rules among clubs. Now that nearly all American organizations are racing under a uniform measurement rule it was thought advisable to amend the various racing rules in order to make them all alike. A sub-committee was appointed to make such changes as might be thought necessary and advisable. The following delegates were present:

- Eastern Y. C.—Henry Howard and Louis M. Clark.
- Atlantic Y. C.—T. D. Wells, Hendon Chubb, John B. O'Donohue and Henry J. Gielow.
- Corinthian Y. C., of Marblehead.—Henry A. Morss and Herbert S. Goodwin.
- Corinthian Y. C., of Philadelphia.—Addison F. Bancroft.
- Seawanhaka-Corinthian Y. C.—Clinton H. Crane and Victor I. Cumnock.
- Boston Y. C.—Alfred Douglass and Winfield M. Thompson.
- Beverly Y. C.—R. W. Emmons, 2d, and F. A. Eustis.
- Y. R. A. of Long Island Sound.—Oliver E. Cromwell, Edward M. McLellan, H. W. Hanan, Colonel F. A. Hill, G. P. Granbery, H. de B. Parsons and C. P. Tower.

**MOTOR BOAT CLUB OF AMERICA.**—The Motor Boat Club of America has received its certificate of incorporation. An election of officers took place at the Hotel Manhattan on Nov. 15 and with the following result: Com., A. D. Proctor Smith; Vice-Com., Frederick Sterry; Rear-Com., George Gillig; Sec., Hugh S. Gamble; Treas., Charles Francis; Board of Governors, for three years, Edward R. Thomas, Howard Gould; for two years, William B. Hayden, H. H. Behse; for one year, John J. Amory, George J. Vestner. The directors for the first year are E. R. Thomas, Proctor A. Smith, Charles P. Tower, Hugh S. Gamble, Charles S. Francis, H. H. Behse, John D. Roach, George J. Vestner and Seymour Oppenheimer.

### The Kennel.

#### The Problem of Scent.

WE all know by experience that under certain conditions of weather there will probably be a scent, and on a hunting morning we all like to air our views and to make forecasts as to the scenting qualities of the day; but, as a rule, we are only able to give vague guesses, and, having no basis to go upon except similar instances which may occur to our mind, our prophecies are frequently unfulfilled. There can be no doubt, however, that there must be working rules for scent, as there are for all other natural phenomena. Many scientific facts have been known for centuries, but modern progress only dates from the time when, by presuming a rule from certain known facts, scientists were able to forecast other results, and so have a guide to their experiments. It would be far beyond my power to attempt to deduce any working formula for scent, but I shall endeavor to show that the problems which present themselves on all sides when we consider them are not so abstruse as they are commonly supposed. I shall first state certain facts which have been established by scientists, and then we shall see how far these facts help us to account for some of the vagaries of our subject.

Scent itself consists of extremely minute particles given off from the whole of the body, which, although much too small to be perceived by either the organs of taste or touch, are readily appreciated by the organ of smell. It has not yet been decided whether the sense of smell depends in the first instance on a chemical or on a physical process. Ramsay has a theory that the sense of smell is excited by vibrations of a lower period than those which give rise to the sense of light and heat. It is, however, necessary that the air containing the odor be forcibly driven against the membrane, and that the membrane itself be moist; if it is dry, or too wet, or covered with too thick a layer of mucus the sense is much weakened. The latter fact we have all experienced when we have had colds in the head. Any irritation, such as is produced by dust or severe cold, will cause excess of mucus.

We will now consider the conditions which affect the amount of scent or particles given off by a hunted animal. This amount depends on the size, nature and bodily condition of the animal, and is an important consideration, as the greater the number of particles, the more powerful is their effect on the nose of the hound. It is obvious that the larger the animal the greater will be the number of particles given off; thus a deer has a stronger scent than a fox. On the other hand, the scent of certain smaller animals appears to be more powerful, though no doubt less in quantity. A careful observer of nature has placed these animals in order of strength of scent as follows: 1, otter; 2, martin; 3, polecat; 4, deer; 5, fox; 6, hare. The constitutional condition of the animal also affects its scent-giving capabilities, but we have little knowledge on the subject, beyond that the temperature of the body appears to exercise some influence. Thus a sitting bird, which is more or less in a state of fever, has very little scent, except immediately before hatching, when the fever subsides; similarly with a beaten fox, which is also in a feverish condition, the scent fails. The pace at which an animal is going probably influences the scent. Apparently when in a state of repose or in very slow motion there is but little discharge of effluvia from the body; but with increase of action there is also an increase of scent. This is exemplified in the case of a squatting hare, which has practically no scent, and how often have foxes been drawn over and viewed after hounds have left the covert? There are probably many other factors which affect the discharge of scent, and if we knew the reasons for some of the complicated maneuvers which hunted animals, guided by their instinct, execute, we should learn some curious facts in physiology.

We now come to the forces which act on the particles after they have left the hunted animal. In order that there should be a scent it is necessary that they should not be scattered before the pursuer arrives, and also that there should be moisture to damp his olfactory nerves. Here we have conflicting conditions, and are confronted by the main difficulty which prevents us from correctly estimating the scenting qualities of a particular day. Unless the particles are held down by a heavy atmosphere they have a tendency to rise above the level of a hound's nose; as how often one can smell a fox oneself when hounds are not able to make anything of it. Now a heavy atmosphere means a dry one, i. e., a high barometer, but at the same time moisture is essential, and so to have a good scent these two conditions must be reconciled. Perhaps the best example of a favorable condition is when the glass jumps up suddenly after wet weather, which in winter usually results in a sharp frost. This is well borne out by the fact that many of the best runs on record have been immediately followed by a long frost. While on the subject of the weather, we must remember that a strong wind is a deterrent to scent, as it scatters the particles, the exception being when hounds run up wind, the particles in this case being forcibly driven against the membrane, which increases the power of the scent. At the same time, on a perfectly still day there is generally a bad scent, one with a gentle breeze being more favorable. The temperature of the atmosphere and ground must also be taken into account; it is probably the best when they are much the same and not too cold. It is extremely difficult to arrive at any satisfactory conclusions when dealing with so variable a subject as the weather, and, as will be seen from the above statements, we have several necessary conditions which are directly opposed to each other; it is, therefore, very hard to say when the perfect state is arrived at. It is quite certain that everyone is able to cite instances which appear to be in direct contradiction to what I have written. Sometimes with a low barometer and drenching rain we have excellent sport, though in this sort of weather there is seldom a scent in covert; again, in September and March hounds often run hard when the ground is as dry as a bone; but so many things come in that in these cases probably the other conditions are favorable. Finally, there is the state and quality of the ground. A wet, heavy country usually holds a scent, and this is but natural; on the other hand, when the ground is over saturated the scent seems to

improve when housed get on to lighter soil, which bears out the fact that too much moisture is undesirable. To sum up, for a probability of sport we should look for a high barometer, a fair amount of moisture, and a gentle breeze.—E. L., in London Field.

Points and Flushes.

"RULES, STANDARDS AND STATUTES" is the title of the booklet issued by the Irish Terrier Club of America, for 1905-1906. It also contains a list of officers, the official list of judges, list of members, list of winners of the different trophies. O. W. Donner, 117 Wall street, New York, is the secretary.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Nov. 23.—Edgewater, N. J.—Palisade G. C. A. A. Schoverling, Sec'y.
  - Nov. 23-24.—Kansas City, Mo.—Missouri and Kansas League of Trapshooters' fifth tournament. C. B. Clapp, Sec'y.
  - Nov. 28-29.—Marsailles, Ill., G. C. R. E. Loring, Sec'y.
  - Nov. 30.—Utica, N. Y.—Riverside G. C., all-day target tournament. E. J. Loughlin, Sec'y.
  - Dec. 2.—Lowell, Mass., R. and G. C. all day shoot. E. J. Burns, Sec'y.
  - Dec. 12-13.—Omaha, Neb.—Interstate team race, between teams of Nebraska, Iowa, Missouri and Kansas. W. D. Townsend, Sec'y.
  - Dec. 20.—Phillipsburg, N. J.—Alert G. C. first annual holiday shoot.
  - Dec. 14.—Travers Island, N. Y.—Amateur championship of America, under auspices of New York Athletic Club. Gus E. Grieff, Chairman, 302 Broadway, New York.
- 1906.
- Jan. 16-19.—Hamilton, Ont., G. C. annual winter tournament. Ralph C. Ripley, Sec'y.
  - May 16-17.—Auburn, N. Y., tournament. Knox & Knapp, Mgrs.
  - May 24-25.—Montreal, Can.—Canadian Indians' first annual tournament. Thomas A. Duff, High Scribe.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Cumberland Gun Club, of Bridgeton, N. J., is preparing for a good tournament on Dec. 7. The programme will total 150 targets, \$10 entrance.

Messrs. Knox & Knapp, Managers, inform us that there will be a tournament at Auburn, N. Y., on May 16-17, with added money and 1½ cent targets.

Mr. H. S. Welles, of Schoverling & Welles, New York, made the record of the grounds at the shoot of the Bound Brook, N. J., Gun Club, on Nov. 16. He broke over 100 straight, besides being high average for the day.

In a five-man team contest between Yale and Princeton, on the grounds of the former, Nov. 18, Yale was victor by a score of 202 to 168. Morrison, of Yale, was high man of the contest. He scored 44. A high wind was unfavorable to high scores.

In the contest for the E. C. cup, emblematic of the individual championship of the State of New Jersey, between Messrs. F. C. Bissett, of South River, N. J., and J. J. Fleming, of Newark, on the grounds of the Bound Brook Gun Club, Nov. 16, Mr. Bissett won by a score of 46 to 27.

Mr. Justus Von Lengerke made the excellent average of 89 per cent. in the series of Northern New Jersey League contests, and was high individual average thereby. He shot in the series in all the contests and under all conditions. The Newton team was first, the Montclair was second, and the Morristown was third.

The Shooting Committee of the Hudson Gun Club, of Jersey City, N. J., has not determined upon the day for the shoot, but they have definitely decided that it would be held about the middle of December. All the members are energetic and enthusiastic in making the shoot a success, and there is now no doubt but that it will have a scope which will make it interesting to all visitors, both concerning targets and dinner.

In the contest for the November cup, at the shoot of the Crescent Athletic Club, at Bay Ridge, L. I., Nov. 18, Dr. Raynor scored a leg on that cup, with a full score of 25. In the Stake trophy contest, Mr. F. B. Stephenson broke 25 straight in the shoot-off with Dr. Keyes, Dr. Raynor and Mr. L. C. Hopkins on a tie of 24. The two-man team contest was won by Mr. A. G. Southworth and W. W. Marshall with a total of 45 out of 50.

Mr. Irby Bennett, an important official of the Winchester Repeating Arms Co., and President of the Interstate Association, is in the Post-Graduate Hospital, New York, convalescing from a surgical operation for appendicitis. His friends, of whom he has hosts, will heartily rejoice on learning that he came through the ordeal without any serious consequences as to shock, complications, etc. He expects to be up and about in less than two weeks. It is hard to down a good man.

The card issued by Messrs. Von Lengerke & Detmold announcing their change of business from 318 Broadway to 349 Fifth avenue, Dec. 1, has on it a beautiful portrayal of holly leaves, suggestive of the happy holiday season, and the many beautiful articles they have in stock for the holiday trade. Their new place of business is opposite the Waldorf-Astoria.

The November cup of the New York Athletic Club was keenly contested, at the club shoot on Saturday of last week. Dr. Held proved to be the winner, thereby securing his second win on that beautiful trophy. Good sport and good companionship are salient features of the shooting contingent of the club, at their Saturday shooting gatherings on the beautiful grounds at Travers Island.

The Jackson Gun Club was victorious in the second contest of the Passaic and Bergen County League, on Saturday of last week on their grounds at Paterson, N. J. The five men of the Jackson team scored a total of 100 to 90 for the Northsides and 76 for the Mount Pleasants. Two or three more clubs are expected to join this League, which will add both to the interest and to the competition.

Mr. Carl Von Lengerke, notwithstanding his change from guns and powder to dog medicines as a business—he is now the New York agent of the Polk Miller Drug Co., proprietor of the Sergeant Dog Remedies—has not forgotten his old fondness for the dog and gun. He contemplated a whirl at the ruffed grouse this week. He is succeeding admirably in placing the Sergeant remedies.

Capt. C. G. Blandford writes us that "On Thanksgiving Day, from 1:30 P. M. till 5, the Ossining Gun Club will have an old-fashioned poultry shoot. Turkeys, ducks and chickens will be the prizes, and the entrance fees to events will be just enough to clear expenses. All events will be handicaps, 14 to 22yds. Any friends who are not members are invited to come up and shoot. We expect to have a good time, and the more there are there the merrier the time. Come up and win the turkey you didn't buy for your Thanksgiving dinner."

The New York Athletic Club, Shooting Committee is working industriously in furtherance of the amateur championship of America, to be held on the club's grounds at Travers Island, New York, on Dec. 14. The conditions are 100 targets, entrance, price of targets. A handsome sterling silver trophy will be the prize bestowed on the winner. All amateurs of the United States are eligible to the competition. Those who intend to participate in this event will greatly aid the committee by sending their names to the Chairman of the committee, Gus E. Grieff, 302 Broadway, New York.

Mr. Geo. Stubblebine writes us as follows: "The Alert Gun Club, of Phillipsburg, N. J., will hold their first annual holiday tournament, Dec. 20. The programme will consist of twelve events of 180 targets; and entrance to amateurs, \$9.50. Targets will be thrown from a Leggett trap at 1½ cent each. Professionals shoot for targets only, and all shooters will have lunch served to them on the grounds free of charge. Past tournaments held by this club have proved successes, and the management will see that all shooters will leave the grounds well satisfied with their day's sport. Further information will be given on request by George Stubblebine, Chairman, Phillipsburg, N. J."

The trophy and laurels which appertain to the championship of Delaware, are worn with uncertain constancy; for strong hands are frequently stretched forth to seize them. The last attempt was made by Mr. James T. Skelly, Mr. Wm. M. Foord defending the championship successfully. At the end of the 100 targets, they had tied on 89. In the shoot-off at 25, Mr. Foord won by a score of 22 to 20. Mr. Alden B. Richardson, of Dover, ex-champion but a short time, will be Mr. Foord's next opponent, and the contest for the championship will be either on the grounds of the Wawaset or Wilmington club. No moss grows on the trophy emblematic of the championship of Delaware.

BERNARD WATERS.

Penetration and Velocity.

FROM time to time we are vigorously called over the coals for our allegiance to the test of velocity as a means of judging the penetration of a charge of shot. The differences of opinion between the old and the new schools may, perhaps, be diminished reviewing the developments which have occurred. Black powder was so stable an explosive, and its action so little open to variations of one kind and another, that a rough and ready test of penetration by way of shooting at a gunpowder tin was sufficient to judge the strength of the charge, provided the pattern was already known to be satisfactory. Close observation of results and ingenious theorizing to elucidate hidden truths provided the nearest approach that was then possible to scientific gun experiments. At such a time the sportsman occupied as favorable a position as the trade expert for making the kind of test which was then regarded as determining the behavior of the gun or cartridge. The very enthusiasm with which these researches were conducted necessarily paved the way for the series of developments which have carried experimental gun work beyond the reach of the ordinary shooter equipped with a whitewashed plate and a supply of Pettitt's pads. The scientist has now carried things so far that our own mission in instructing sportsmen is almost entirely confined to explaining in the language of the elementary textbook the experiments which are now conducted to determine the behavior of guns and nitro powder.

The stumbling block in all modern experiments is to demonstrate to the sportsman that the measurement of velocity over 20yds. provides an efficient index to the penetration of a charge of shot. Mr. Griffith, in his historical experiments to determine the stringing out of a charge of shot, fired at a circular plate of 12ft. diameter, which made about five and a half revolutions per second. It was shown that at 20yds. the charge of shot had strung out over a distance of about 40in., whereas at 40yds., nearly 9ft. separated the front from the back pellets of the charge. These figures are constantly brought up against us as evidence of the fact that our chronographic measurements take account only of the behavior of the front pellets of the charge. A careful examination of the diagrams reproduced on page 52 of Part I, of "Sporting Guns and Gunpowders," shows that 90 per cent., at least of the total number of pellets which struck the target at 20yds. range are concentrated into a little over 20in. Considering that at the usual sporting distances the shot is traveling with more than ten times the velocity of the bird, it would seem as though for all practical purposes the 20yds. velocity test might be regarded as fully covering the behavior of the entire charge. Mr. Borland spent a considerable amount of time, and his company no doubt contributed a proportional amount of money, to analyze still further the measurement of velocity. The arrangement used registered alternatively the arrival of the first pellets and the whole charge. The fact that Mr. Borland employs the ordinary method of testing velocity over 20yds. for the routine work incidental to the manufacture of E. C. powder seems to suggest that he, at any rate, after trying both methods, is satisfied that the simple arrangement is also the best.

If a cartridge gives a suitable velocity over 20yds., as judged by present-day standards, it seems impossible to understand how it can give abnormal results at other distances. In the course of a year hundreds of tons of powder are graded and regulated on the 20 yards test, and no one appears yet to have discovered a single instance in which a correctly regulated powder gives different results when properly loaded and fired in an ordinary gun. Experience again confirms the obvious conclusion that a

powder with a weak velocity proves deficient in penetration when tried on game. In a similar manner an excess of velocity, however it may be produced, is at all times liable to produce such a scattering effect of the pellets as will diminish the effectiveness of the shooting. We thus have overwhelming evidence that the velocity test of penetration is completely satisfactory from whatever point of view it may be regarded. Notwithstanding this weight of evidence, we are still told that every gun must be considered as a thing apart, and that the velocity test of a cartridge affords no index of how it will behave in a given gun. It is just the particle of truth underlying this statement which makes it difficult to provide a comprehensive answer. If the generality of guns in use are regarded as complying within approximate limits to a pre-determined standard, it is clear enough that a million of cartridges containing powder which has passed the velocity and other tests, will give better results in the aggregate than a similar number of cartridges complying with a different specification. If every gun in which these cartridges are used could be subjected to a special test for velocity, there is no doubt that a definite proportion of them would be found to give abnormal behavior. The proper remedy to adopt would be to alter those guns which are susceptible to alteration, and to throw out of use the others, which, by reason of excessively large chambers, badly shaped cones, or unduly wide barrels, are found to be deficient in necessary material. Failing the mechanical remedy, some improvement might be made by modifying the charge of powder so as to correct in some measure the bad behavior of the gun. Such a course is bad, because it admits the principle of correcting a fault in the gun by introducing another in the cartridge.

The above observations seem to imply the need for every gunmaker to test the velocity of every gun before sale with properly loaded cartridges. Such a suggestion is, however, impracticable, but it nevertheless carries with it a useful indication of the means which should be adopted to make the generality of guns so that they may produce the results anticipated by the powder maker when he regulates his product. At the time when we were engaged in supervising the manufacture of our experimental barrels for testing sporting cartridges, it became necessary to work out a specification for the chamber, cone, and bore which would give a proper standard of velocity. The early barrels were found to give an extraordinary excess above the expected amount of velocity. This abnormality was traced to the dimensions of the chamber and the shape of the cone. When the barrel had been adjusted to a new set of dimensions a specification was arrived at, which proved to give satisfactory results in all barrels subsequently manufactured. The gunmaker who carried out this work on our behalf at once appreciated the importance of this discovery, and he instantly put in hand a set of gauges and cutting tools to control his own output on the lines approved by our tests.

We have been instrumental in other directions in privately initiating the same useful reform, and it has been interesting to find, whenever the opportunity has arisen for testing subsequent output, that all the guns controlled by the gauges so determined have given the correct amount of velocity. Such an experience seems to demonstrate the utility of the 20yds. velocity test as a means of regulating the behavior not only of the cartridge but of the gun as well. To insure a repetition of the proof barrel results in the sportsman's own weapon, it is clear that the guns should be chambered and bored truly to gauge. If the gun is incorrect in these respects the sportsman will suffer more or less, according to the amount of error existing. He cannot gain any useful information from penetration tests; and without a large amount of experience, which in the nature of things he cannot possess, it is impossible for him to learn much from examining patterns on the whitewashed plate. The regulation of the gun is purely and simply a question for the gunmaker, and it is in the selection of a man who knows his business that the sportsman stands his best and only chance of getting a gun which will include, among the many attributes of successful use in the field, a form of chamber and bore capable of showing the cartridge on its best behavior.

From what has been said, it will be apparent that the sportsman's own tests of thirty years ago must now be dismissed as embodying superstitions of the middle ages. To attempt to prove that the stringing effect of the shot is a factor which the practical sportsman must bear in mind is on a par with the assumption that penetration can be judged by examining the characteristics of the splash the pellet makes on the target. The only test which comes to us from the days preceding modern electrical developments is that of the whitewashed plate. Even this is of secondary importance to the proper gauging of the interior of the barrel. To correct the shooting of a gun without regard to the shape of the chamber and cone is blind groping in the dark.

Pattern tests are certainly of very great use in determining the selection of charges and the choice of a suitable size of shot. At a time when the gunmaker controls his output with standard gauges, and the powder maker is clear as to the characteristics that must be imparted to the explosive, and finally, when sportsmen appreciate the importance of a sound system of loading, of which the Field system may be regarded as the parent type, the most satisfactory test of the joint behavior of a gun and cartridge is on game. A distinct impression remains after each day's sport as to whether or not one's individual contribution to the bag has been in proportion to the skill exercised, and it is by the guidance so derived that the sportsman will be able to select from the recognized charges available the particular combination of powder and shot that best suits his own particular gun and style of shooting.—London Field.

At Point Breeze.

PHILADELPHIA, Pa., Nov. 18.—The two events at live birds, shot on the Point Breeze track to-day, were notable for good scores. Eight men tied on straight kills in the 5-bird event.

Ten birds, \$5 entrance, Rose system:

Churchill, 27.....222212222-10	Shew, 26.....12211202*1-8
See, 26.....2*2222222-9	Bailey, 28.....1220222020-7
Stauffer, 26.....1222122*2-9	Edwards, 28.....200220210-6
Muller, 30.....22222*2022-8	Martin, 26.....111*12001-6
McDonald, 28.....*021212111-8	Paulson, 28.....2221200*20-6
C Brown, 28.....2222202022-8	

Five birds, \$3 entrance, high gun. Same handicaps as the former shoot:

Muller.....22222-5	Shaw.....22222-5
Churchill.....22222-5	Stoll.....22222-5
See.....22222-5	Martin.....01121-4
McDonald.....22222-5	Paulson.....220*2-3
Bailey.....22222-5	Edwards.....02202-3
Stauffer.....22222-5	

Five Hundred Air Gun Clubs.

THE Air-Gun Association, which sprang into existence in 1902 and has its headquarters in Birmingham, has now 500 clubs affiliated, with a membership of 40,000 in all parts of the kingdom.

Beautifully accurate British-made guns have been placed on the market at a figure well below that of the foreign article, and one manufacturer has just turned out a powerful rifle which promises good results at 40 to 50yds. The production of air-rifles has practically established a new and most valuable industry in Birmingham.

An ordinary gun and equipment cost at least £3. But with an air-rifle a shooter may equip himself with a first-class weapon for a couple of pounds, and his pellets will only cost him 1s. 2d. per 1,000.—London Mail.

The Yale-Princeton Match.

NEW HAVEN, Conn., Nov. 9.—A dual shoot between Princeton and Yale gun teams was held at New Haven, on Saturday morning, Nov. 18, and resulted as follows:

Yale.		Princeton.	
Morrison.....44	Sands.....37		
Thompson.....43	C Munn.....36		
Borden.....42	McIlvaine.....35		
Pugsley.....37	Throckmorton.....34		
King.....36-202	Morton.....26-168		

The match was at 50 targets, and Yale won by 34. A high wind prevented good scores. JOHN BORDEN, Pres.

Boston Athletic Association.

BOSTON, Mass., Nov. 18.—In the contest for a silver cup presented by a member of the Boston Athletic Association, Mr. D. E. Hallett won.

In the 100-target contest, Mr. O. R. Dickey was high with 87, while D. E. Hallett was close up with 86. Scores:

Dickey.....87	Blinn.....86
Hallett.....86	Adams.....85
Owen.....80	Daggett.....79
Gould.....66	Hutchinson.....56

# V. S. Government Ammunition Test.

Accuracy test of Krag-Jorgensen .30-Caliber Cartridges held at Springfield Armory by order of the Ordnance Department, United States Army.

TESTED—Ammunition of all the American Manufacturers.

CONDITIONS—10 and 20 shot targets, muzzle rest.  
10 and 20 shot targets, fixed rest.

DISTANCE—1,000 yards.

RESULT and OFFICIAL REPORT: **U. S. Cartridges excelled all others.**

MANUFACTURED BY

**UNITED STATES CARTRIDGE CO.,**  
LOWELL, MASS., U. S. A.

Agencies: 497-503 Pearl St., 35-43 Park St., New York.

114-116 Market St., San Francisco

## WESTERN TRAP.

### Cincinnati Gun Club.

Nov. 18 was cloudy and dark, the air was smoky, and it was difficult to see the targets, so that shooting was stopped by 4 o'clock. Most of the regulars are away in different parts of this or other States after Bob White, and the attendance to-day was small, only ten men shooting in the Clements trophy contest. Harig was high with 45 from 19yds. Keplinger, from 16yds., was second with 44, and Herman third with 43. Randall talked less and shot more to-day, and got into the four-hole with 42. Not much practice shooting was done. Hardy shot at 5 pairs and broke 4. Supt. Gambell says there will be something doing on Thanksgiving Day, and the boys better be on hand. Randall says there is the best of quail hunting around Mason, O., where he resides when not breaking targets at the club grounds, but unfortunately few birds are found. The world's "champeen," Fred Gilbert, will be at the grounds on Nov. 26, and members are urged to come out and bring their friends to welcome him. It is probable that a team match will be shot between the Goshen Gun Club and Cincy on that day.

On Nov. 12 the following scores were made in the Ackley trophy contest:

Bleh, 20.....	14 14 16-44	Miles, 16 .....	8 8 14-30
Bonser, 17.....	14 12 16-42	H Sunderbruch, 16 .	10 9 11-30
Dick, 16 .....	10 12 14-36	Harig, 19 .....	11 11 16-38
Gross, 17 .....	14 9 12-35	Howe, 16 .....	8 8 15-31
Davies, 16 .....	11 6 14-31	Colonel, 16 .....	4 2 2-8
Baldwin, 16 .....	11 8 12-32		

An effort is being made by Supt. Arthur Gambell to form a league of clubs in Ohio cities for the purpose of engaging in a series of team contests. The following conditions to govern these matches, give a clear idea of his scheme, and he invites correspondence on the subject from all interested. Some such thing is necessary to keep the interest in the sport alive, and to promote more fraternal relations between the trapshooters of the State. An addition to the plan, as outlined, which would be of value, would be to provide a medal for each member of the winning team. A portion of the money set aside for refreshments might well be used for this purpose:

Teams shall be composed of ten men, either expert or amateur, who are in good standing with their club, and who reside within fifteen miles of the club with which they enter.

Under no circumstances can a contestant compete with two clubs.

Each team entering shall post \$50 at the first contest, and \$10 per team at every other contest.

Nine contests will be held alternately with each club. The team having the highest average to take the entire purse.

Names of probable contestants must be furnished each club thirty days before the first shoot. Should any club desire to challenge a contestant they must do so ten days before a contest takes place.

A committee of five, appointed by the competing clubs shall make rules, conditions and decide all disputes, etc.

A tournament is to be given at each contest, the number of targets, division of money, etc., to be decided by the committee.

Two cents will be charged for targets, one cent of which is to be used for the proper entertainment of all competitors at these shoots. The races will be at 100 targets per man.

To-day's scores:  
Clements trophy, 50 targets, handicap:

Harig, 19 .....	45	Tuttle, 16 .....	37
Keplinger, 16 .....	44	Miles, 16 .....	36
Herman, 18 .....	43	Jones, 16 .....	33
Randall, 16 .....	42	Du Bray, 16 .....	31
Williams, 17 .....	40	Mieninger, 16 .....	26

Match, 100 targets:	
Crippen .....	79
Brier .....	73

### Ohio Notes.

The principal event at the shoot of the Cleveland Gun Club on Nov. 11 was the fifth contest for the Bowler and Burdick cup, emblematic of the amateur championship of northern Ohio, at 100 targets. The conditions were not favorable to high scores, a strong wind affecting the flight of the targets. Tryon won the cup with 88. The cash prizes were won by Doolittle and Mack with 86 and 81 respectively. Spencer and Wallace 74 each, Hopkins 66, Kople 65, Freeman 63, Board 61, Williams 53.

The Indianapolis Gun Club proposes to make a strong effort to land the next G. A. H. There may be other clubs which could handle this big event, but there is certainly no club in the country which could do it any better or which has better grounds and club house facilities.

The Northern Kentucky Gun Club, of Bellevue, Ky., has elected the following officers: Geo. Dameron, President; Barney Forstner, Vice-President; George Frost, Secretary; Chas. Cunningham, Treasurer; Alfred Gowling, Captain. The club has well equipped grounds at the East Newport Ball Park.

Wilson Howard, Chas. Dingle, Irvin Terwillinger, James Harrod and Beech Graham, of Wapokoneta, started for Maine on Nov. 12 on a hunt for big game. At Detroit a number of sportsmen from Ada, joined them, and they continued their journey in a special car. They will be gone several weeks.

The attendance at the fall tournament of the Youngstown Gun Club on Nov. 9 was smaller than expected, owing to bad weather, wind and snow. The Youngstown team—Ewalt 23, Atkinson 22, Shaner 22, Seaborn 22, Tully 5-104—won a silver cup offered as a trophy, defeating a team from Cleveland—Rice 22, Allen 21, James 20, Wallace 20, Cramer 17-100. H. P. Shaner was high gun with 157 out of 170; Rice second, 152; Ewalt third, 149; Atkinson fourth, 146; Seaborn, 143. Thirteen men shot the entire programme.

At the annual shoot of the Fourtownships Gun Club, held at New Lebanon, Nov. 15, Charles W. Piatt won the cup with a score of 25 out of 34. The members of the club represent the townships of Jackson, Perry, Jefferson and Madison. The match is at 25 targets, with a handicap of extra targets to shoot at, and the winner holds the trophy until the next annual contest. B. W. Troutman was second with 19 out of 32; A. Wooden, 16 out of 34; O. F. Ermel, 13 out of 32; G. Poffenberger, 5 out of 27. Sam Arnold, of Farmersville, held the trophy the

past year. After the trophy shoot eight sweeps at 10 targets each, were shot; 50 cents entrance, three moneys in each. Brandy was high with 55 out of 70; Piatt, 52 out of 80; Troutman, 49 out of 70; Wooden, 29 out of 60; Rike and Heikes, 19 and 16 out of 20 respectively; Ermel, Ganvey and Weaver shot at 10 each and broke 5, 4 and 2. In a match at 25 targets Heikes defeated Carr, 18 to 15. In a second match Carr turned the tables on Heikes and won, 24 to 23. Shooting at 12 pairs, Heikes broke 23, Rike 20, and Brandy 19. Troutmann broke 12 out of 8 pairs. As a closing event, Rike and Heikes shot at 15 pairs each, the latter winning, 22 to 21.

A few facts about the Indianapolis Gun Club may be pretty good reasons why Indianapolis would be a nice place for the next G. A. H., the banner trap event of the year, and which Dayton, O., Chicago, Ill., and Nashville, Tenn., would like to get. The facts are from a reliable source, and are susceptible of proof: The club has a membership equal to that of the allied clubs of Chicago; more members than Dayton, Columbus and Nashville combined, with Colorado Springs added. Hotel accommodations ample and all located within three blocks of the Traction Terminal station, and none more than five blocks from the Union Station. The street car company will give a written guarantee that the timetable submitted and asked for by the club will be granted, and adhered to. The club invites sportsmen to let their wants be known through the papers, and if they can "deliver the goods" they will retire from the firing line and support the city and club that can.

### In Other Places.

We note that when the Canadian gun clubs desire to hold a tournament, they announce that the American Association rules will govern.

The Baton Rouge, La., Gun Club has announced through its secretary, that, though the club has had a prosperous season, the weekly shoots will be abandoned until next spring. Many of the members are so much engaged with business that they cannot shoot on week days, and on Sundays they will find the recreation of watching the fight of the mallard or following the setter as he scents the Bob White in the cover. The tabulated scores made for the past summer will soon be ready for publication.

Jacob Breitenstein, who for many years conducted a sporting goods store at Warsaw, Ill., dropped dead from heart disease on Friday last while in the act of sweeping out his store.

The clubs known as the Neighbors, of Aldan, Pa., will hold a carnival in the shooting line on Thursday, Nov. 30. The leading attraction will be big fat turkeys.

The Hamilton, Ont., Gun Club has about perfected arrangements for the middle of January tournament. There will be a \$500 and a \$200 guarantee, and all are invited to shoot at live birds. Commencing Nov. 25, there will be live-bird shoots held every other Saturday.

The last heard of E. Arnold and Ed. O'Brien they were busy holding a shooting tournament at Larned, Kans.

Since a visit by a "Tramp" to the town of Lacon, Ill., there has been a gun club with twenty-five members organized. Lacon is situated on the Illinois River, where the ducks do congregate, and as the town is full of hunters and all have guns the members will meet and try their skill at lively flying clay targets on Thanksgiving Day.

Much interest has been awakened through the advent of team shooting in the districts of New Mexico and Southwest Texas.

Manchester, Ia., Gun Club reports a successful shoot as being held last Wednesday at their club grounds. Mr. Morrell Hamblin won first honors, missing but 8 out of 150 targets.

The Kendrick, Idaho, Gun Club is raising a purse of \$150 with which it is intended that they should purchase pheasants for stocking purposes.

The Greenville, O., Gun Club is keeping up the regular weekly shoots.

Much interest is being taken by the members of the Houghton, Mich., Gun Club in their weekly events. Likewise there are many spectators who are interested in the success of their friends. Last week the wind was strong, facing shooters, yet scores were fairly good. J. H. Rice won the cup event, with J. J. Lealand a tie. F. I. Cairns won the handicap match.

Fred Gilbert was reported as doing the oil fields of Philadelphia with a shotgun.

Shooting for a cup by the members of the Montana gun clubs has been started, and the first shoot, held last Sunday, at Butte, brought together the very best shots of the big cities. The arrangement centered into being that each straight score of 25 targets counts a point. Four strings of 25 were shot. Mr. Cowan made three straights, while Coyne, Confarr, Nickey and Walker made two. Then Matthewson, Lody, Nell, Borg and Coyne made one. The next shot will be held Dec. 3.

There was plenty of sport at the gun club grounds, Tucson, Ariz., Thursday last, and a large crowd was in attendance. Henry Steinfeld was head man, as he made 17 out of 20 on doubles. The Thanksgiving shoot will be the largest ever held in the Territory. It was stated in a programme issued by the Hamilton Gun Club that "The referee would tell you just what had happened."

A gun club at Chihuahua, N. M., has for its first officers: Edward Cully, President; Gen. J. M. De la Vergne, Vice-President; Lieut. Rafael I. Alvarez, Secretary, and Francisco C. Terrazas, Treasurer.

There will be a big turkey shoot on "turkey" day at Salt Lake City, Utah.

M. D. Wehorrie won the first shoot of the Will County Gun Club shoot on Sunday last. Scores: John Fenolio 76 per cent., H. Peel 88, M. D. W. Larrie 93, J. Liess 64, Dr. McGarm 68, P. C. Pell 86, Dr. Kingston 71, H. Clark 70, J. Startz 68, R. Bruce 85, Dr. McGuinnis 66, Tim Pell 87.

A new gun club is to be organized at West Alexander, O. All the gun clubs centering in the territory adjacent to Dayton, Ohio, are about to be organized into a league. The members met at the N. C. R. headquarters and were much encouraged with their success.

The Mishawaka Gun Club, South Bend, Ind., will hold a shoot Nov. 28.

Last Sunday there was an interesting shoot held by the local shooters at Ladd, Ill.

Lexington, Mo., is reported to have such a splendid park for shooting purposes that there is a prospect of the State shoot being held there next year.

The officers of the Canon City, Colo., Gun Club are: N. F. Carrier, President; T. M. Harding, Jr., Vice-President, and A. A. Parker, Secretary.

### Bound Brook Gun Club.

BOUND BROOK, N. J., Nov. 16.—The State championship shoot to-day was a success. Mr. Bissett, of South River, N. J., defeated Mr. Fleming, of Newark, by a score of 46 to 27 out of 50 blue-rocks. Mr. Welles won high professional average, breaking over 100 straight, which is the record for the grounds. Messrs. Bissett and Markley, of Easton, Pa., tied for high amateur average, breaking 140 each out of 150. Mr. Markley won the gold badge in the shoot-off. Mr. Pleiss, of Easton, won the silver medal for second high average. Messrs. Evans and Truax tied for third. Mr. Heath, a trade representative, deserves credit for his assistance in the office. Mr. Frank Butler made a presentation speech. Mr. Crow, of Newton, won the Ithaca hammerless gun.

Event 6 was the championship contest between Messrs. F. C. Bissett, of South River, N. J., and John J. Fleming, of Newark, N. J., for the E. C. trophy, emblematic of the individual championship of the State of New Jersey. Scores, 50 targets, follow: J. J. Fleming.....27 F. C. Bissett .....46

### Sheepshead Bay Gun Club.

SHEEPSHEAD BAY, L. I., Nov. 14.—There was a good attendance of visitors, the trade being well represented by Messrs. Butler, Welles, Glover and Schneider. The scoring was irregular, even among the known experts. Schortemeier scored 15 twice, and Sim did so once. These three straight scores were the only ones made during the shoot. Scores:

### Championship of Delaware.

WILMINGTON, Del., Nov. 14.—On the grounds of the Wawaset Gun Club to-day, in a contest for the championship of Delaware, Mr. Wm. M. Foord successfully defended his title to the championship of Delaware against the onslaught of Mr. James T. Skelly, who has been shooting in championship form during some months past. The contest was at 100 targets, and each of the renowned contestants scored 85 and tied, hence at this stage each was equal to the other. In the shoot-off at 25 targets, Mr. Foord broke 22 to Mr. Skelly's 20, and won. The targets had swift flights, which accounts for the low scores.

It is credibly stated that Mr. A. B. Richardson, of Dover, ex-champion of Delaware, will challenge Mr. Foord to defend his title, and that the contest will be held either on the grounds of the Wawaset Gun Club, or on the grounds of the Wilmington Gun Club.

Mr. Skelly steadied down and shot better as the match progressed in the 100-target part, as the scores herewith will show: Foord .....23 21 21 20-85 Skelly .....21 20 22 22-85

In the shoot-off at 25 targets, Mr. Foord dropped but 3, while Mr. Skelly dropped 5.

The race was close, as was expected, in view of the small difference in scores of Messrs. Foord and Skelly in recent shoots. In the first 100-bird race, at Dover, they tied on 80; Mr. Foord winning in the shoot-off. In a race held at the Aurora Gun Club some time later, Mr. Skelly made a score of 97 against 89 for Mr. Foord, the race being at 100 targets. At the previous championship race at the Wawaset grounds, Mr. Skelly broke 89, Mr. Foord 90. At a later shoot on the same grounds, for a purse, Mr. Skelly broke 91, while Mr. Foord broke 88. In the past five shoots at a total of 500 targets, Mr. Skelly has broken 451, while Mr. Foord has broken 441.

Crescent Athletic Club.

BAY RIDGE, L. I., Nov. 18.—The weekly shoot of the Crescent Athletic Club had eight trophy contests, besides the three main events—the November cup, the Stake trophy, and the two-man team match.

Trophy, 15 targets: F. B. Stephenson 14, D. C. Bennett 13, E. W. Snyder 12, A. E. Hendrickson 12, C. W. Browne 11, C. A. Lockwood 10, A. G. Southworth 10, W. C. Damron 7, W. W. Marshall 5.

Trophy, 15 targets: A. G. Southworth 14, D. C. Bennett 14, W. C. Damron 13, F. B. Stephenson 10, A. E. Hendrickson 10, C. A. Lockwood 9, C. W. Browne 8, W. W. Marshall 7.

Shoot-off, same conditions: A. G. Southworth 14, D. C. Bennett 12.

Trophy, 15 targets: A. G. Southworth 14, F. B. Stephenson 13, W. W. Marshall 12, D. C. Bennett 12, A. E. Hendrickson 11, C. A. Lockwood 10, E. W. Snyder 10, C. E. Browne 8, W. C. Damron 8.

Trophy, 15 targets: D. C. Bennett 15, F. B. Stephenson 14, A. G. Southworth 14, Dr. J. J. Keyes 14, A. E. Hendrickson 14, Dr. Raynor 14, J. H. Ernst 14, L. C. Hopkins 13, E. W. Snyder 13, W. W. Marshall 13, C. A. Lockwood 12, W. C. Damron 11, C. W. Browne 9.

November cup, 25 targets: Dr. Raynor 25, Dr. Keyes 24, L. C. Hopkins 23, F. B. Stephenson 22, A. G. Southworth 22, W. C. Damron 20, J. H. Ernst 20, W. W. Marshall 19, C. A. Lockwood 19, A. E. Hendrickson 18, C. W. Browne 15, J. P. Fairchild 13.

Team event, 25 targets: A. G. Southworth and W. W. Marshall 45; Dr. Keyes and D. C. Bennett 41; Dr. Raynor and E. W. Snyder 41, C. A. Lockwood and A. E. Hendrickson 34.

Stake trophy, 25 targets: F. B. Stephenson 24, Dr. Keyes 24, Dr. Raynor 24, L. C. Hopkins 24, A. G. Southworth 23, D. C. Bennett 23, W. W. Marshall 19, W. C. Damron 21, A. E. Hendrickson 16.

Shoot-off, same conditions: F. B. Stephenson 25, L. C. Hopkins 24, Dr. Keyes 23, Dr. Raynor 21.

Trophy, 15 targets: A. E. Hendrickson 15, A. G. Southworth 14, C. A. Lockwood 14, J. P. Fairchild 14, W. W. Marshall 13, D. C. Bennett 13, J. H. Ernst 12, W. C. Damron 11.

Trophy, 15 targets: D. C. Bennett 14, A. E. Hendrickson 14, F. B. Stephenson 14, L. C. Hopkins 14, W. W. Marshall 13, E. W. Snyder 13, J. P. Fairchild 13, Dr. Keyes 12, A. G. Southworth 11, C. A. Lockwood 11, W. C. Damron 9, J. H. Ernst 6.

Shoot-off, same conditions: L. C. Hopkins 14, F. B. Stephenson 13, A. E. Hendrickson 9.

Trophy, 15 targets: W. W. Marshall 15, L. C. Hopkins 14, A. G. Southworth 14, C. A. Lockwood 14, F. B. Stephenson 13, W. C. Damron 13, A. E. Hendrickson 9, J. P. Fairchild 8.

Trophy, 15 targets: A. E. Hendrickson 13, C. A. Lockwood 11, A. G. Southworth 9, W. W. Marshall 7.

Hoopston Gun Club.

HOOPSTON, Ill., Nov. 15.—Yesterday the energetic members of the Hoopston Gun Club had everything arranged to hold a successful tournament on their fine grounds at the race track, known as the McPherrin Park.

Only two traveling men put in their appearance, viz., W. Tramp Irwin and W. D. Stannard. Others from outside of town were A. P. Smith, Goodwin, Ill., who was breaking in his new trap gun; C. A. Lee, East Lynn, with a gun stock too crooked for him; A. Ferris, of Crescent City; J. G. Miller and W. P. Phares, of Oxford, Ind. These parties, together with four of the Hoopston boys, shot through a 100-target programme and then wound up with doubles, team race, and the home boys enjoyed these features.

Mr. Stannard was high with 93 out of 100. Mr. Smith high amateur, 87. Scores:

Table with columns: Events, Targets, Name, Shot at, Broke.

Trap Around Reading.

LEBANON, Pa., Nov. 18.—Freeman Rump and Francis Reinohl, two of the best shots of the Keystone Gun Club, this city, were matched to shoot at 25 live birds each for a purse of \$50.

Tamaqua, Pa., Nov. 13.—Sportsmen from all parts of the coal region watched a live-bird match between Edward O'Donnell, of Lansford, and Thomas Fredericks, of town, for \$200 a side and the gate receipts. O'Donnell won, killing 12 out of 13 birds, while Fredericks killed but 9. Several thousand dollars changed hands on the result.

Ashland, Pa., Nov. 15.—William Lavelle and Wm. Sweeney shot a live-bird match near Centralia, the former killing 4 to his opponent's 3 out of 11 birds. The purse was \$100.

Shenandoah, Pa., Nov. 13.—A large crowd of sportsmen saw James Parry, of Girardville, defeat James Downey, of this city, in a live-bird match for \$300 a side, at 25 birds, by killing 11 out of 14 to his opponent's 7 out of 13. Parry shot at the fourteenth bird to decide a \$50 side bet, which caused great enthusiasm among his backers when he killed it.

Reading, Pa., Nov. 15.—The shooting match held at O. C. Miller's Hotel was largely attended. The contest was for a bull weighing 1,900 pounds. Tobias H. Moyer, Jacob Gable, Ambrose Moyer and Alvin Rohrbach, each broke 23 out of 25 targets and tied for the bull, Moyer buying the others' interest in the bull instead of shooting off the tie.

New England Kennel Club.

BRAINTREE, Mass., Nov. 18.—In the two cup contests at the weekly shoot of the New England Kennel Club to-day, there were respectively six entries. Dr. C. Z. Weld and Mr. R. O. Harding tied on 22 in the weekly cup event. Dr. Weld won in the shoot-off.

In the contest for the season cup, Messrs. Henry N. Richards and R. O. Harding tied on 24 out of 25, Richards winning in the shoot-off.

The shoot-off for the best average of actual breaks, held over from the shoot of the preceding Saturday, in connection with the annual autumn shoot, was won by Dr. Weld. Scores:

Table with columns: Brk. Hdp. Tot'l., Name, Score.

North Side Gun Club.

EDGEWATER, N. J., Nov. 11.—The scores made at our shoot to-day follow:

Table with columns: Events, Targets, Name, Score.

Passaic-Bergen League.

PATERSON, N. J., Nov. 18.—The second contest of the Passaic and Bergen County League resulted in a victory for the team of the Jackson Park Gun Club.

A large gathering witnessed the contests, and there also was a large number of professionals in attendance who added materially to the interest of the shooting.

Mr. John Y. Doty, of the Jackson team, distinguished himself admirably. He broke 24 out of 25 in the team event, and shot well in the sweepstakes also.

The popular captain of the Jackson Park Club, "Count" Charles F. Lenone, shot in rare form throughout the match, finishing with the good score of 22 out of 25, evoking general applause. Van Horn and Sindle finished strong, getting 19 and 17 respectively.

The Northsides shot a good average score. The Mount Pleasants did not shoot up to expectations. They were compelled at the last moment to dispatch a messenger for one of their youngest members to fill out the team, as their regular man did not put in an appearance.

The shooting in this contest will become more interesting later. The men will get more accustomed to the conditions which confront them at the beginning of any match shooting which is new to them.

An effort will be made to secure at least three more clubs to enter the League, so that two clubs can shoot on three different grounds every week instead of the three clubs shooting on one ground every week, as at the present time. The schedule committee will meet at Garry Hopper's store, 40 Main street, to draw up the new schedule. It is expected that two clubs will enter. The scores:

Table with columns: Jackson Park, Northside, Mount Pleasant, Name, Score.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Nov. 18.—Shooting members of the New York Athletic Club are having good sport every Saturday afternoon. All feel very much interested in the coming amateur championship of America, which will take place on their grounds Dec. 14, on arrival of the 9:45 train from 129th street and Third avenue, New York city.

The November cup was won for the second time by Dr. Held. Event 1, scratch, was won by Mr. Grieff; No. 2 by Mr. T. H. Keller after a shoot-off with Mr. Chas. Billings. Event 4 was won by Gus E. Grieff with a full score of 25 straight. Event 5 was captured by Mr. J. Dickerson.

Event 1, 25 targets: G. E. Grieff.....22 Chas. Billings.....20 J. Hibbard.....15

Event 2, handicap, 25 targets: Handicap. Total. Grieff.....0 23 De Wolf.....3 20 Hibbard.....5 20 Dickerson.....7 17 Dr. Held.....7 15 Kuchler.....7 20

Event 3, November cup, 25 targets, handicap: Grieff.....0 23 De Wolf.....3 19 Hibbard.....5 22 Dickerson.....7 14 Dr. Held.....7 25 Robinson.....7 22

Event 4, 25 targets, handicap: Grieff.....0 25 De Wolf.....3 21 Hibbard.....5 20 Dickerson.....7 20 Dr. Brown.....6 23 Dr. Held.....6 24 Keller.....4 24 C. Jacobs.....7 23

Event 5, 25 targets, handicap: Grieff.....0 24 De Wolf.....3 21 Billings.....4 24 Dickerson.....7 25 Dr. Brown.....7 23 Dr. Held.....7 24 Apgar.....0 24

Montclair Gun Club.

MONTCLAIR, N. J., Nov. 18.—A very jolly crowd faced the traps to-day, there being nothing special on the programme. Neville made his first essay at the traps, and did very well for a beginner. McDonough, another new hand at the traps, showed considerable improvement. An impromptu team race for a box of cigars was run off, and this was won by team No. 2, composed of Cockefair, Batten, Crane and Winslow, after shooting some four or five times for the prize and tying each time.

SIDE LIGHTS OF TRADE.

The Hunter Arms Co., Fulton, N. Y., have recently gotten out a new catalogue, which will be sent free to applicants. The different grades, from that costing \$740, to the one costing \$20, are fully described and illustrated. Excellent portraits of the Hunter Brothers adorn the frontispiece. On the first page is an excellent reproduction of gold medals won at the Lewis and Clark Exposition, showing obverse and reverse sides. The catalogue is a beautiful exemplar of the up-to-date art of the printer and illustrator.

Rifle Range and Gallery.

Independent New York Schuetzen Corps.

In the shoot held at the Zettler Bros.' range in West Twenty-third street, Nov. 17, August Begerow and George W. Ludwig tied for the best two targets, with totals of 481 out of the possible 500 points at 75ft., offhand. The scores follow:

Table with columns: Name, Score.

At Walnut Hill.

WALNUT HILL, Mass., Nov. 18.—A strong gusty, variable wind was a formidable weather condition against good scores.

Mr. W. Charles was highest with 44 at long range. He used a Krag.

A. Niedner was high at 200yds., with the good score of 222. In the pistol match, I. James was high man with 94, which raised his record several points. He also won the silver medal.

The Wednesday afternoon shoot will be discontinued until further notice. The scores:

Silver pistol medal—Won on ten scores of 86 or better by I. James.....86 87 86 89 86 90 87 86 90 88

Members' offhand match: A. Niedner.....18 20 22 25 24 20 25 23 23 22—222

Pistol practice match: T. Carlson.....10 10 9 7 7 10 10 9 9 10—91

Rifle Notes. The West Elkton, O., Rifle Club held their regular monthly medal contest on Nov. 9, five members taking part.

In the competition for the Milliken medal on Nov. 16, at the revolver range in City Hall building, Patrolman Allen Moore won for the second time. He made the very fine score of 195 out of a possible 200.

The members of the Jackson Township Rifle Club had fine weather on Nov. 11 for their monthly medal shoot, and good scores were the rule. In the shoot for the medal, 100yds., offhand, four shots, possible 48, G. W. Izor scored 12, 12, 10, 12—46.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

1905, \$4 A YEAR, 10 CTS. A COPY. }  
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, DECEMBER 2, 1905.

VOL. LXV.—No. 23  
No. 346 BROADWAY, NEW YORK.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be received. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

*The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.*

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

### PRIZES FOR GAME HEADS.

THE FOREST AND STREAM offers three prizes of \$20, \$10 and \$5 respectively for the best moose heads secured in year 1905 in the hunting grounds of the United States and Canada.

It offers also three prizes of \$15, \$10 and \$5 respectively for the best white-tail deer heads taken in the hunting season of 1905 in the United States or Canada.

The heads will be judged from photographs submitted to the FOREST AND STREAM. In estimating their merits two qualities of size and symmetry will be taken into consideration. With the photograph of each head must be sent a memorandum of the place and the time of its being taken and the name of the person taking it. The competition will be open to amateur hunters only; and with this restriction it will be open to the world. There are entrance fees. The photographs submitted will be the property of FOREST AND STREAM. Entries for the competition must be made not later than Jan. 15, 1906. The awards will be determined by a committee of representative sportsmen to be announced later.

### THE NEW YORK GAME PROTECTOR.

THE New York Evening Post of Nov. 22 printed an article commenting on the proposed appointment of Mr. John B. Burnham as Chief Game Protector of New York, and cited reasons why it thought the appointment should not be made. The reasons given were that among Mr. Burnham's indorsers were certain pulp-mill concerns, which had been stealing Adirondack timber; that Mr. Burnham "has been a champion of pulp-mill pollution of Lake Champlain," and that "he is a large owner in a power and light plant." These two interests, the Post thinks, "are believed to have imbued him with industrial sympathies, which, at a moment when power, electric, pulp and paper companies are making a general assault on the resources of the public forest reserves, would not be in harmony with public interest."

As to the first of these reasons, the simple fact is that Mr. Burnham has not had the indorsement of the firm of pulp mill operators named by the Post, nor of any other pulp mill owners. As to the second charge that Mr. Burnham "has been a champion of pulp mill pollution of Lake Champlain in antagonism to a subsequent State Board of Health report and the action of the State of Vermont," it may be said that the participation he had in the discussion of the Lake Champlain pollution question consisted in communications he sent to this journal, and an examination of what he wrote will disclose the fact that he did not champion the pulp mill pollution of Lake Champlain, but he had no question that any such pollution existed in the places named to the extent that it had been alleged to exist. To question the existence of pollution is a different thing from championing pollution. Nor has it ever been shown, either in health board reports or otherwise, that Mr. Burnham was in error in his statement respecting that part of Lake Champlain of which he wrote.

It is true, we believe, that Mr. Burnham has an interest in an electric light plant which lights the town of Essex, and that the power for it is obtained by damming a stream in the hills; but it is as fanciful and as far-fetched to assume that this interest "has imbued him with industrial sympathies not in harmony with public interests," as it would be to reason that the Evening Post, because it consumes tons of paper made from wood pulp, must

therefore be in industrial sympathy with the wood pulp despoilers of the Adirondacks, and that for that reason we should not accept in good faith its exposures of the Adirondack raiders.

If John B. Burnham shall be appointed Chief Game Protector of New York, the friends of the forests, the fish and the game need not in the slightest degree be disquieted by this newspaper attack on him. Mr. Burnham will not be prompted by industrial sympathies not in harmony with public interests, nor by any other sympathies except those which are in full accord with the protection of the State's forests, fish and game. The FOREST AND STREAM has supported Mr. Burnham for this place because we believe that an indispensable qualification of the man who is to be the Chief Game Protector of New York must be an absolute and unswerving honesty, and that he must have a singleness of purpose to do his duty and to serve only the interests of the State. Mr. Burnham, whom we know with the knowledge that comes of daily association extending over the six years during which he was on the staff of FOREST AND STREAM, we know to be such a man; and it will not take very long after his assumption of office for the timber thieves, the trespassers and the poachers to discover it for themselves.

### FATE OF THE EUROPEAN BISON.

AN interesting side effect of the rebellion and perhaps revolution of which we read in Russia is the possible speedy extinction of a species of animal which for many years has been jealously protected by the Czar. In times of national peace and contentment the European bison lives in the imperial forests of Lithuania, presumably unmolested; but whenever there is a rising in Poland and the rebels take to the woods they use this herd of bison as a part of their commissary, and kill them for beef. For many years there has been a gradual lessening in numbers of this herd, which by many zoologists is thought to be due to inbreeding; yet, there are others who believe that the decrease in this protected herd, which fifty years ago numbered nearly 2,000 and which lives wild in its native habitat, is too rapid to be accounted for solely by inbreeding, and must be due to destruction by man, notwithstanding the efforts made by the authorities to protect them. Statistics of the Bielowitza herd in Grodno show that between 1833 and 1857 these bison increased from 768 to 1,898, but from this time on the decrease has been constant until, in 1892, the herd numbered less than 500.

The butchery of human beings in Russia, which is reported to be taking place on a scale quite unparalleled in times of peace for the last hundred years, stirs the emotions of the world, yet zoologists will view with keen regret the diminution of the European bison, which for hundreds of years has been preserved from extinction only by the very hand that brought its numbers so low.

Of the herd of these bison which inhabits the mountains of the Caucasus in the province of Kuban, we know little or nothing, but the same causes which seem likely to bring about the absolute extermination of the herd in Grodno will be operative in the Caucasus, and the race seems likely now to receive a blow from which it can never recover.

On one or two estates in Europe and in a few zoological gardens, there are living specimens of these bison, but their numbers are very few. Perhaps the little herd belonging to the Prince of Pless is the most numerous. There is a pair in the park of the New York Zoological Society in the Borough of the Bronx.

THE work of the California Outdoor Art League, one of the affiliated societies of the American Civic Association, has become of international interest in its efforts to preserve the Calaveras groves of big trees. About thirty women, headed by Mrs. Lovell White, a member of the Association, have been able to arouse the whole country to a sense of the awful mistake it would be not to preserve these trees for all time against the greed of man's axe. When the pyramids of Egypt were being built by man's ingenuity, some of these trees, the only survivors of their kind of the glacial period, were standing in calm majesty on the Pacific coast of this country, in the prime and vigor of seeming youth. It would be no more vandalism to use the stones of the pyramids for paving

blocks than to cut down these trees, as is being done, to make toothpicks and cigar boxes. Woman's clubs, federations and societies and branches of the Woman's Outdoor Art League all worked in unison with women and men's organizations for the passage of a bill through Congress in the last session for the purchase by the Government of the Calaveras groves. President Roosevelt did what a President of the United States has never done before—sent a special message to Congress recommending the passage of a bill which had its initiative with women. A petition of over a million and a half of names was presented in favor of the bill. In spite of all this the measure failed of enactment. This year a new bill will be introduced, and the Calaveras Big Tree Committee of the League, of which Mrs. White is chairman, will renew its efforts. A strong backing for the movement should be formed in every State in the Union. The big trees belong not to California but to the nation.

THE Eastport, Long Island, Gun Club members are grappling with a mystery. Last March they put out on the preserve a hundred northern hares imported from Maine, with the expectation of having an abundant stock for the present shooting season. The game was distributed in the fields, the woods and the swamps; and that was the last ever seen of them. During the month of November the club members have been on the field almost every day, three or four of them out, and have made a thorough search for the hares, but have seen none. Beagles have failed to raise them. What has become of them is a mystery.

THAT is an extremely interesting resumé of the work of the Massachusetts Fish and Game Protective Association for the year, and it is a stimulating and instructive showing, because it demonstrates the value and accomplishment of united and well-planned effort. The Massachusetts Association is one which is in service all the year through; the results of its efforts are cumulative and lasting. Its appeal for a large support throughout the commonwealth is based on a substantial claim to public confidence and co-operation, and should meet generous response.

THE exposition to be given by the New England Forest, Fish and Game Association in Boston from Dec. 25 to Jan. 6, promises to be unusually complete in the scope of its exhibits. The groups will comprise forestry, food and game fishes, animals, game, song and insectivorous birds; trade exhibits, art associated with forestry, fish and game, and loan exhibits. The previous sportsmen's exhibitions given in Boston have been of high character, and the coming one is planned on the same generous and comprehensive scale.

THE annual meeting of the New York State Fish, Game and Forest League will be held in Syracuse on Dec. 7. One of the most useful activities of the League is the effort it is annually called on to make to choke off bad legislation. Individual sportsmen and organized clubs owe it to themselves to give the League active support, and all clubs throughout the State are invited to ally themselves with the organization and send representatives to the annual meeting.

WE have already referred to the suit brought against a Rome, N. Y., angler for having fished in a small brook which had been stocked with trout from the State hatcheries, and which the Fish and Game Commission had sought to close to fishing as a public inland waters. It was claimed for the defendant that this small stream, flowing through farm lands, could not properly be closed as public waters; and this contention has now been sustained by the court.

NINETEEN football players have been killed in the games of this year, the causes of death comprising concussion of the brain, internal injuries, fracture of the skull, blood poisoning, and peritonitis, spinal meningitis and heart puncture. There have been in addition one hundred serious injuries, and unnumbered cases of minor injury. It is high time that there should be revision of the rules and a change of methods.

## THE SPORTSMAN TOURIST

### In the Lodges of the Blackfeet.

#### II.—The Ruse of a Savage Lover.

It was agreed that I should join Berry in the autumn, when he would begin the season's trade with the Indians. He owned a large bull train, with which he hauled freight from Fort Benton to the mining camps in summer, finding in that much more profit than in trading for the deer, elk and antelope skins, which were about the only things of value that the Indians had to barter at that season. Buffalo robes were valuable only from animals killed from November to February inclusive. I did not wish to remain in Fort Benton; I wanted to hunt and travel about in this land of glorious sunshine and dry, clear air; so I bought a roll of bedding, large quantities of tobacco, and .44 rim-fire cartridges for my Henry rifle, a trained buffalo horse and saddle, and pulled out of the town with Sorrel Horse and his outfit. Perhaps if I had gone to the mines instead I would have done better in a financial way. More steamboats had arrived, the place was full of people bound for the gold fields, and there were many just from there with heavy sacks of gold dust in their battered grips and greasy bags. They had made their stake, they were bound for the States; for "God's country," they said. God's country! If there was a more beautiful land than that of the great sunlit plains and mountains, grand and soul-inspiring in their immensity, I never saw it. And I'm glad I did not get the mining fever, for then I would probably never have learned to know them intimately. There are some things of far more value than gold. For instance, a life free from cares or duties of any kind; a life in which every day and every hour brings its share of pleasure and satisfaction, of excitement, of happily earned and well enjoyed fatigue. Had I, too, gone to the placer fields I might have made a fortune, and returned to the States, and settled down in some deadly monotonous village, where the most exciting things that ever happened were church festivals and funerals!

Sorrel Horse's wagons, a lead and a trail, drawn by an eight-horse team, were heavily loaded with provisions and trade goods, for he was going with a band of the Piegans, the Small Robes, on their summer hunt. And this was what had made me at once accept his invitation to accompany him; I would have an opportunity to study the people. Much has been written in these columns about the Piegan Blackfeet, and those who have not read the various articles and are interested in the subject should read Mr. Grinnell's books, "Blackfoot Lodge Tales" and "The Story of the Indian." I must necessarily confine myself in these articles to a few incidents in my long life on the plains which seem to me worth relating.

Sorrel Horse's brother-in-law, L-is'-sis-tsi, Wolverine, and I became great friends. I soon learned to use the sign language, and he helped me in my studies of the Blackfoot language, so difficult that few white men ever did become proficient in it. I may say that by diligently committing my studies of it to writing and by paying especial attention to pronunciation and accent, I learned to speak it as well as any white man ever did, with perhaps one or two exceptions.

How I enjoyed that summer, part of which we passed at the foot of the Belt Mountains and part on Warm Spring Creek and the Judith River. I joined in the frequent buffalo runs, and on my swift and well trained horse managed to kill my share of the great animals. I hunted antelope, elk, deer, bighorn and bear with Wolverine. I would sit for hours on a mountain slope or the summit of some lone butte, and watch the herds and bands of game about me, gaze at the grand mountains and the vast and silent plain, and pinch myself to realize that I was really I, and that it was all real and not a dream. Wolverine apparently never tired of all this any more than I; he would sit by my side, a dreamy look in his eyes as he gazed about him, and frequently exclaim "i-tam'ap-i," which is the word for happiness or perfect content.

Yet, Wolverine was not always happy; there were days when he went about with a long face and a preoccupied air, never speaking except to answer some question. One day in August when he was in this mood I asked what was troubling him.

"There is nothing troubling me," he replied. Then,

after a long silence: "I lied, I am in great trouble. I love Piks-ah'-ki and she loves me, but I cannot have her; her father will not give her to me."

Another long silence: "Yes, well?" I urged, since he had forgotten or did not feel inclined to enlighten me further.

"Yes," he went on, "her father is a Gros Ventre, but her mother is Piegan. Long ago my people protected the Gros Ventres, fought their battles, helped them to hold their country against all enemies. And then the two tribes quarreled, and for many years were at war with each other. This last winter they made peace. It was then I first saw Piks-ah'-ki. She is very beautiful; tall, long hair, eyes like an antelope, small hands and feet. I went much to her father's lodge, and we would look at each other when the others there were not noticing. One night I was standing by the doorway of the lodge when she came out for an armful of wood from the big pile lying there. I took hold of her and kissed her, and she put her arms around my neck and kissed me back. That is how I know she loves me. Do you think"—anxiously—"that she would have done that if she did not love me?"

"No, I do not think she would."

His face brightened and he continued: "At that time I had only twelve horses, but I sent them to her father with a message that I would marry his daughter. He sent the horses back and these words: 'My daughter shall not marry a poor man!'"

"I went with a war party against the Crows and drove home myself eight head of their best horses. I traded for others until I had thirty-two in all. Not long ago I sent a friend with them to the Gros Ventre camp to ask once more for this girl I love; he soon returned, driving back the horses and this is what her father said: 'My daughter shall never marry Wolverine, for the Piegans killed my son and my brother.'"

I had no comment to make. He looked at me hesitatingly two or three times and finally said: "The Gros Ventres are encamped on the Missouri, at the mouth of this little (Judith) river. I am going to steal the girl from her people; will you go with me?"

"Yes," I quickly replied. "I'll go with you, but why me? Why don't you ask some of the Raven Carriers to go with you, as you belong to that society?"

"Because," he replied, laughing a little constrainedly, "because I might fail to get the girl; she might even refuse to go with me, and then my good friends would tell about it, and people would always be joking me. But you, if I fail, I know you will never tell about it."

One evening about dusk we quietly left the camp. No one except Sorrel Horse—not even his wife—knew of our departure. Naturally, she would be alarmed about her brother's absence, and he was to tell her that the youth had gone in to Fort Benton with me for a day or two. But how genial old Sorrel Horse did laugh when I told him where we were going and for what purpose.

"Haw, haw, haw! That's pretty good! A pilgrim, only three months in the country and going to help an Indian steal a girl!"

"When does one cease to be a pilgrim?" I asked.

"When he has learned all about things and ceases to ask fool questions. I should say, in your case, that people will quit calling you 'pilgrim' in about five years. It takes most of 'em about fifteen to become acclimated, as you may say. But joking aside, young man, this is a pretty serious thing you are going in for; don't get into any trouble; always keep close to your horse and remember that it is better to run than to fight; you can live longer by doing so as a general rule."

We left the camp at dusk, for in those days it was not safe for a couple of men to ride over the great plains in the daytime, too many war parties of various tribes were abroad, seeking glory and wealth in the scalps and chattels of unwary travelers. We rode out of the Judith valley eastward on to the plain, and when we were far enough out to avoid the deep coulees running into it, turned and paralleled the course of the river. Wolverine led a lively but gentle pinto pony on which we had packed in a manner some bedding, and a large bundle of his done up in a fine buffalo robe and bound with many a thong. These things he had taken out of camp the night before and hidden in the brush. There was a glorious full moon, and we were able to trot and lope along at a good pace. We had not traveled many miles

from camp before we began to hear the bellowing of the buffalo; it was their mating season and the bulls kept up a continuous deep, monotoned bellow or roar as they charged and fought about from band to band of the great herds. Several times during the night we rode close to a band and startled them, and they ran off thundering over the hard ground and rattling their hoofs, away, away in the soft moonlight; we could hear them still running long after they had disappeared from view. It seemed as if all the wolves in the country were abroad that night, for they could be heard in all directions, near and far, mournfully howling. What a sad, solemn cry theirs was; so different from the falsetto, impish yelping of the coyotes.

On, on Wolverine went, urging his horse and never looking back, and I kept close up and said nothing, although I thought the pace too fast on a plain honey-combed with badger and prairie dog holes. When at last day began to break we found ourselves in the country of high pine clad buttes and ridges, and two or three miles from the Judith valley. Wolverine stopped and looked all around, trying to pierce the distance still shrouded in the dusk of early morning.

"So far as I can see," he said, "everything looks well. The buffalo and the prairie runners (antelope) feed quietly. But that is not a sure sign that an enemy is not near; even now some of them may be sitting in the pines of those buttes looking down upon us. Let us hurry to the river—we must have water—and hide in the timber in the valley."

We unsaddled in a grove of cottonwoods and willows and led our horses to water. On a wet sand bar where we came to the stream there were a number of human footprints so recently made that they seemed to be as fresh as our own tracks. The sight startled us and we looked about anxiously, holding our rifles in readiness for a quick aim. There was no timber on the opposite side of the stream at that point, and we had just come through the grove above us, so we realized that the makers of the tracks were not in our immediate vicinity.

"Crees or men from across the mountains," said Wolverine, again examining the tracks. "No matter which; they are all our enemies. We must be careful and keep a good watch, as they may be nearby."

We drank our fill and went back into the grove, tying our horses so that they could eat a little of the grass and wild pea growing luxuriantly between the trees.

"How could you know," I asked, "that those whose tracks we saw are not Crows, or Sioux, or other people of the plains?"

"You noticed," Wolverine replied, "that the footprints were wide, rounding, that even the prints of their toes could be seen; that was because they wore soft bottom moccasins, the sole, as well as the upper part, of tanned deer or buffalo skin. Only those people use such footwear; all those of the plains here wearing moccasins with hard parfleche soles."

I had been very hungry until I saw the footprints in the sand, after that I was too busy watching, listening for a possible enemy to think of anything else; and I fervently wished that I had remained in camp and left the young Indian to do his own girl-stealing.

"I will go around the inner edge of the grove and have a look at the country and then we will eat," said Wolverine.

I wondered what we would eat, well knowing that we dared not kill anything, nor build a fire, even if we had meat. But I said nothing, and while he was gone I re-saddled my horse, remembering my friend's advice to stay close to it. Presently Wolverine returned.

"The war party passed through the grove," he said, "and went on down the valley. About two nights from now they will be trying to steal the Gros Ventre horses. Well, we will eat."

He undid the buffalo robe bundle and spread out a number of articles; heavy red and blue cloth, enough for two dresses. The stuff was made in England and the traders sold it for about \$10 a yard. Then there were strings of beads, brass rings, silk handkerchiefs, Chinese vermilion, needles, thread, earrings—an assortment of things dear to the Indian women.

"For her," he said, laying them carefully aside and producing some eatables; dry stale bread, sugar, dried meat and a string of dried apples.

"I stole them from my sister," he said. "I thought

at we might not be able to shoot any game or build a re."

That was a long day. By turns we slept a little, that Wolverine slept. I'm sure I scarcely dozed, for I was always expecting the war party to jump us. Yes, I was pretty young at the business then, and so was the Indian. What we ought to have done, after getting water, was to have ridden to the top of some butte and remained here during the day. From such a point we could have seen the approach of an enemy a long way off, and our swift horses could have easily taken us beyond their reach. It was mere luck that we were not seen to enter the valley and the cottonwood grove, for there a war party could have surrounded us and rendered our escape difficult, if not impossible.

Up to this time Wolverine had made no definite plan to get the girl away. Sometimes he would say that he would steal into the camp and to her lodge at night, but that was certainly risky, for if he did succeed in getting to the lodge without being taken for an enemy come to steal horses he might awaken the wrong woman and then there would be a terrible outcry. On the other hand, if he boldly went into the camp on a friendly visit, no doubt old Bull's Head, the girl's father, would suspect his purpose and closely watch her. But this discovery of a war party moving down the river toward the Gros Ventre camp gave him a plain opening.

"I knew that my medicine would not desert me," he said suddenly that afternoon, laughing happily; "and see, the way is clear before us. We will ride boldly into camp, to the lodge of the great chief Three Bears. I will say that our chief sent me to warn him of a war party working this way. I will say that we ourselves have seen their tracks along the bars of the river. Then the Gros Ventres will guard their horses; they will ambush the enemy; there will be a big fight, big excitement. All the men will rush to the fight, and that will be my time. I will call Piks-ah'-ki, we will mount our horses and fly."

Again we rode hard all night, and at daylight came in sight of the wide dark gash in the great plain which marked the course of the Missouri. We had crossed the Judith the evening before, and were now on a broad trail worn in deep furrows by the travois and lodge poles of many a camp of Piegiens and Gros Ventres, traveling between the great river and the mountains to the south. The sun was not high when we at last came to the pine-clad rim of the valley and looked down into the wide, long bottom at the mouth of the Judith; there, whitely gleaming against the dark foliage of a cottonwood grove, were the lodges of the Gros Ventres, some 300 and more. Hundreds and hundreds of horses were feeding on the sage brush flat; riders were galloping here and there, driving their several bands to water, or catching up fresh animals for the daily hunt. Although still a couple of miles away we could hear the confused noise of the camp, shouts, childish laughter, singing, the beating of drums.

"Ah!" Wolverine exclaimed. "There is the camp. Now for the big lie." Then, more seriously, "Pity me, great sun! pity me, you under-water creature of my dream! Help me to obtain that which I seek here."

Oh, yes, the youth was in love. Cupid plays havoc with the hearts of red as well as white people. And—dare I say it?—the love of the red, as a rule, is more lasting, more faithful than the love of the superior race.

We rode into the camp stared at by all as we passed along. The chief's lodge was pointed out to us. We dismounted at the doorway, a youth took charge of our horses and we entered. There were three or four guests present enjoying an early feast and smoke. The chief motioned us to the seat of honor on his own couch at the back of the lodge. He was a heavy, corpulent man, a typical Gros Ventre, Big Belly.

The pipe was being passed and we smoked a few whiffs from it in our turn. A guest was telling a story, when he finished it the chief turned to us, and asked, in good Blackfoot, whence we had come. Nearly all the older Gros Ventres at that time spoke Blackfoot fluently, but the Blackfoot never could speak Gros Ventre; it was too difficult for anyone not born and reared with them to learn.

"We come," Wolverine replied, "from up the yellow (Judith) river, above the mouth of the Warm Spring. My chief, the Big Lake, gives you this—producing and handing him a long coil of rope tobacco—and asks you to smoke with him in friendship."

"Ah!" said Three Bears, smiling, and laying the tobacco at one side. "Big Lake is my good friend. We will smoke with him."

"My chief also sends word with me that you are to keep close watch of your horses, for some of our hunters have found signs of a war party traveling this way. We ourselves, this white man here, who is my friend, and I, we also have come across their trail. We saw it yesterday morning up the river. There are twenty, maybe thirty of them, and they are on foot. Perhaps to-night, surely by to-morrow night, they will raid your herd."

The old chief asked many questions as to what tribe

the war party might be, just where we had seen their tracks, and so on, which Wolverine answered as best he could. Then some boiled meat, some dried buffalo back fat and some pemmican were set before us, and we had our breakfast. While we were eating the chief conferred with his other guests, and they soon went away, as I presumed, to tell the news and prepare to surprise the expected raiders. Three Bears informed us that his lodge was ours; that our horses would be cared for; our saddles and bridles were brought in and piled near the doorway. I forgot to mention that Wolverine had cached his precious bundle away back on the trail soon after daylight.

After our breakfast and another smoke, during which the chief asked all manner of questions about the Piegiens, Wolverine and I strolled through the camp and down to the banks of the river. On the way he pointed out the lodge of his prospective father-in-law. Old Bull's Head was a medicine man, and the outside of his abode was painted with the symbols of his particular dream-given power, two huge grizzly bears in black, below which were circles of moons in red. We sat by the river a while, watching a lot of boys and young men swim; I noticed, however, that my companion kept an eye on the women continually coming for water. Evidently the particular one he longed to see did not appear, and we turned back toward the chief's lodge, after a time. A couple of women were killing a fat pup of three or four months just back of it by strangulation.

"Why are they killing that dog?" I asked.

"Ugh," Wolverine replied, making a wry face, "it is for a feast for us."

"A feast for us!" I repeated in astonishment. "Do you mean that they will cook the dog, will expect us to eat it?"

"Yes, these Gros Ventres eat dog; they think it better than buffalo meat, or other meat of any kind. Yes, they will stew it and set it before us, great bowls of it, and we must eat of it or they will be displeased."

"I will not touch it," I cried. "No, I will never touch it."

"But you will, you must, else you wish to make enemies of our friends; and"—despondently—"perhaps spoil my chance of getting that which I have come for."

Well, in due time the meat of the dog was set before us; very white it looked, and certainly the odor of it was far from disagreeable. But—it was dog. Never in all my life had I dreaded to do anything more than to taste of it, yet I felt that I must. I grasped a rib, set my muscles determinedly, and bolted the meat upon it, blinking and swallowing and swallowing to keep it down. And it stayed down; I made it stay, although for a moment it was a toss-up which would win—the nausea or my will. In this manner I managed to eat a small part of that set before me, partaking liberally of some berry pemmican, which was a sort of side dish. I was glad when the meal was over. Oh, yes, I was very glad; and it was many an hour after before my stomach became normal.

It was thought that the expected enemy would possibly arrive that night; so as soon as it was dark nearly all the men of the camp picked up their weapons and crept out through the sage brush to the foot of the hills, stringing out far above and below and back of their feeding herds. Wolverine and I had our horses up and saddled, he telling the chief that in case a fight began we would ride out and join his men. My comrade went out early in the evening, I sat up for an hour or more, and as he did not return, I lay down on the couch, covered myself with a blanket and was soon sound asleep, not waking until morning. Wolverine was just getting up. After breakfast we went out and walked around and he told me that he had found a chance to whisper to Piks-ah'-ki the night before, when she had come outside for wood, and that she had agreed to go with him whenever the time came. He was in great spirits, and as we strolled along the shore of the river could not help breaking out in the war songs which the Blackfeet always sing when they are happy.

Along near noon, after we had returned to the lodge, among other visitors at tall, heavy, evil-featured man came in; by the nudge Wolverine gave me as he sat down opposite and scowled at us I knew that he was Bull's Head. He had a heavy growth of hair which he wore coiled on his head like a pyramid. He talked for some time with Three Bears and the other guests, and then, to my surprise, began to address them in Blackfoot, talking at us, and there was real and undisguised hatred in his tone.

"This story of an approaching war party," he said, "is all a lie. Look at it; the Big Lake sends word that his people have seen their trail; now, I know that the Piegiens are cowards; still, where there are so many of them they would be sure to follow such a trail and attack the enemy. No, they never saw any such trail, never sent any such word; but I believe an enemy has come, and is in our camp now not after our herds but our women. Last night I was a fool. I went out and watched for horse-stealers; I watched all night, but none

came. To-night I shall stay in my lodge and watch for women-stealers, and my gun will be loaded. I advise you all to do the same."

And having had his say he got up and flounced out of the lodge, muttering to himself, undoubtedly cursing all the Piegiens, and one in particular. Old Three Bears watched him depart with a grim smile, and said to Wolverine:

"Do not remember his words; he is old, and cannot forget that your people killed his son and his brother. Others of us"—with a deep sigh—"others of us also lost brothers and sons in the war with your people, yet, we made the great peace. What is past is past; the dead cannot be brought to life, but the living will live longer and be happier now that we have ceased to fight and rob one another."

"You speak the truth," said Wolverine. "Peace between we two people is good. I forget the old man's words. Do you also forget them and guard your horses, for this night surely the enemy will come."

Again at dusk we saddled our horses and picketed them close to the lodge. Wolverine putting his saddle on the pinto pony and shortening the stirrups. He intended to ride his own animal bareback. He told me that Piks-ah'-ki had been under guard of her father's Gros Ventre wives all day. The old man not trusting her Pigan mother to accompany her after wood and water for the lodge. I again went to sleep early, my companion going out as usual. But this time I did not rest until morning, for I was awakened by the firing of guns out on the flat, and a great commotion in camp, men shouting and running toward the scene of the fight, women calling and talking excitedly, children crying and shrieking. I hurried out to where our horses were picketed, carrying my own rifle and Wolverine's. He owned a fine Hawkins, 32 balls to the pound, which Sorrel Horse had given him. I learned afterward that old Bull's Head was one of the first to rush to the rescue of his horses when the firing began. As soon as he had left the lodge Wolverine, who was lying nearby in the sage brush, ran to it and called his sweetheart's name. Out she came, followed by her mother, carrying several little bags. A minute later they came to where I stood, both women crying. Wolverine and I unfastened the horses.

"Hurry," he cried, "hurry."

He gently took the girl from where she was crying in the embrace of her mother and lifted her into the saddle, handing her the bridle reins.

"Listen," cried the mother, "you will be good to her. I call the sun to treat you as you do her."

"I love her, and I will be good to her," Wolverine answered, and then to us: "Follow me, hurry."

Away we went over the flat, straight for the trail upon which we had entered the valley, and straight toward the fight raging at the foot of the hill. We could hear the shots and shouts, see the flash of the guns. This was more than I had bargained for; again I was sorry I had started out on this girl-stealing trip; I didn't want to charge in where the bullets of a fight that didn't interest me were flying. But Wolverine was leading, his sweetheart riding close behind him, and there was nothing for me to do but follow them. As we neared the scene my comrade began to shout:

"Where is the enemy? Let us kill all of them. Where are they? Where do they hide?"

I saw his point. He didn't intend that the Gros Ventres should mistake us for some of the raiders. But the latter, suppose we ran on to any of them?

The firing had ceased and the shouting; all was quiet ahead of us, but we knew that there in the moonlit sage brush both parties were lying, the one trying to sneak away, the other trying, without too much risk, to get sight of them. We had but a hundred yards or more now between us and the foot of the hill, and I was thinking that we were past the danger points when, with a sputter of fire from the pan and a burst of flame from the muzzle, a flint-lock gun was discharged right in front of Wolverine, and down went his horse and he with it. Our own animals suddenly stopped. The girl shrieked and cried out:

"They have killed him! Help, white man, they have killed him!"

But before we could dismount we saw Wolverine extricate himself from the fallen animal, spring to his feet and shoot at something concealed from us by the sage brush. We heard a deep groan, a rustling of the brush and then Wolverine bounded to the place and struck something three or four hard blows with the barrel of his rifle. Stooping over he picked up the gun which had been fired at him.

"I count a coup," he laughed, and running over to me and fastening the old fuke in the gun sling on the horn of my saddle, "carry it a ways until we get out of the valley."

I was about to tell him that I thought he was foolish to delay us for an old fuke, when right beside of us, old Bull's Head appeared, seeming to have sprung all at once out of the brush, and with a torrent of angry

words he grasped the girl's horse by the bridle and attempted to drag her from the saddle. She shrieked and held on firmly, and then Wolverine sprang upon the old man, hurled him to the ground, wrenched his gun from him and flung it far; then he sprang lightly up behind Pika-ah-ki, dug his heels into the pony's flanks and we were off once more, the irate father running after us and shouting, no doubt for assistance to stop the runaways. We saw other Gros Ventres approaching, but they did not seem to be hurrying, nor did they attempt in any way to stop us. No doubt the angry old man's words had given them the key to the situation, and, of course, it was beneath their dignity to mix up in a quarrel about a woman. We went on as fast as we could up the steep, long hill, and soon ceased to hear the old man's complainings.

We were four nights getting back to the Piegan camp, Wolverine riding part of the time behind me and part of the time behind the girl, when we were on the trail. We picked up, en route, the precious bundle which Wolverine had cached, and it was good, the next morning, to see the girl's delight when she opened it and saw what it contained. That very day while we rested she made herself a dress from the red cloth, and I can truthfully say that when she had arrayed herself in it, and put on her beads, and rings, and earrings, and a lot of other pretty things, she certainly looked fine. She was a very comely young woman anyway, and as I afterward learned, as good as she was handsome. She made Wolverine a faithful and loving wife.

Fearing that we would be followed we had taken a circuitous route homeward, and made as blind a trail as possible, and upon our arrival at camp learned that old Bull's Head had got in there two days ahead of us. He was very different now from the haughty and malevolent man he had been at home. He fairly cringed before Wolverine, descanted upon his daughter's beauty and virtues, and said that he was very poor. Wolverine gave him ten horses and the fuke he had taken from the Indian he killed the night of our flight from the Gros Ventre camp. Old Bull's Head informed us that the war party were Crees, and that his people had killed seven of them, and that they had not succeeded in stealing a single horse, so completely were they surprised and attacked.

Well, I went on no more girl-stealing raids, but I believe I did other things just as foolish on the plains in my youthful days.

## Love of Nature and Character.

As Illustrated in Hon. J. Sterling Morton.

Editor Forest and Stream:

The recent article about a monument to the "Father of Arbor Day" brings freshly to mind some incidents of travel with Mr. Morton, which may interest your readers. In the '80's we were both abroad, and meeting near London, agreed to travel together for a while. Matters of social and political economy interested both, and he was a most congenial and profitable companion. His intelligent alertness was remarkable—his purity and simplicity of character not less so.

On a bank holiday in London he arose early and went to Haymarket to study conditions of life as there manifested. He said he saw more drunken women that morning than in all his previous life; also, that the "billingsgate" was the worst he ever heard. The shock to his moral nature was evident.

At Antwerp the guide employed asked that we go out with him at night and "see the sights," at the same time intimating quite plainly their nature. He seemed surprised at our refusal. In referring to the incident afterward, Senator Morton said: "What a commentary it affords on the average American traveler! It makes me ashamed that because he found we were Americans he should have felt at liberty to make such proposals." Mr. Morton's interest in the art galleries at Antwerp was keen, and his criticisms intelligent and appreciative.

The one hour's ride from Antwerp gave some charming scenes of country life—all the ground was cultivated and the whole appearance was fine. Mr. Morton was enthusiastic. At Brussels another side of his character was manifested. Visiting the Palais de Justice we admired its exterior appearance very much. It was lofty, massive, and impressive—a combination of Corinthian, Doric and Ionic styles in Belgian limestone. But the interior was disappointing, saddening. Massive columns, well-proportioned to the building, were of crude material covered with mortar in imitation of the exterior limestone. The sham was apparent to a little scrutiny, and Mr. Morton's remarks about all shams showed the through and through fineness of his grain.

After a hurried lunch we rushed for the 5 o'clock train, and missed it. But we soon learned that it was better so, as the Cologne train did not leave till 5:50. Senator Morton then said, "This illustrates that many of the hills of life are but imaginary."

Regretfully we bade him good-by at Mayence, once the home of John Gutenberg, of printing fame. The impression made by Mr. Morton during those self-revealing days of travel was indelible and treasured. And that there was an intimate relation between his love of nature and his sterling worth of character is the firm belief of

JUVENAL.

## The Sang Digger.

THE Parson, the Professor and the Superintendent waited until the Sang Digger's wife and the older children had gone off in the dark to the little village church when they slipped across the street to sit by his warm, bright kitchen stove. His youngest girl had remained at home and she was sitting at the table near the lamp working out her problems in multiplication for the next day of school. The Sang Digger, a small wiry man, browned by the weather to the color of a late autumn leaf, was pottering around the stove and the table looking over some fishing tackle preparatory to a trip for bass the next day. He seemed very glad to have the visitors call on him and did his best to make them feel at home.

The Parson was tired. He is a heavy man, and the day's pheasant hunting over the mountains had pretty nearly played him out, and after he had lighted his Pittsburg stogie, he sagged down into his chair like a lump of dough. The Professor had not slept well the previous night. He is a small man, and as his bed fellow weighed nearly three hundred pounds, and in addition to occupying the middle of the bed had snored terrifically whenever he lay on his back, the Professor had put in the night between cat naps and spells of kicking the big man awake and over into his own side of the bed. So the task of interviewing the Sang Digger and making him talk about his experiences in the woods and along the streams fell to the Superintendent.

The Sang Digger was given to much circumlocution in his conversation. He would back and fill, start over again, get ahead of his story, and tell the same thing again with slight variations, so that it was somewhat difficult to get him to make progress in his story. One favorite theory of his—that if you found that the bass would not bite in one pool, and you would go down to the next pool where they would bite, and then return to the first pool you would find them ready to bite there—he told over so many times and with such slight changes that the Superintendent was compelled finally to switch him off to keep the Parson from falling out of his chair with inward laughter.

But finally he was headed in the direction of his experiences in the digging of ginseng, which he followed from the middle of August until the heavy frosts so broke down to the tops of the plants that he could not find them in the woods, and when well started he proved an entertaining talker.

He had a theory that ginseng plants and butternut trees are always associated in the woods and that the presence of red oaks always indicated the absence of ginseng. But his one example seemed to prove only the one section of his rule. He and his partner had climbed to the top of a high knob and were debating which direction to take next. Just below them was a small flat covered with little red oak saplings, and the Sang Digger said that there was no use to hunt down there. But after some further argument his partner plunged down over the bank into the red oaks and the Sang Digger followed. Near the edge of the red oak tract the Sang Digger discovered a few scattering plants which he stopped to dig. In the meantime the partner wandered away some little distance and soon found a large patch of plants from which he finally dug several dollars' worth of roots. And, to cap the climax, the Sang Digger found in the same locality a still larger patch. From the two patches they dug in all some seven or eight dollars' worth. All of these plants were among the red oaks, but when he came to examine more closely he found that near each patch was a small butternut tree.

His adventures had been mostly with rattlesnakes. In his hunt for ginseng he was compelled to travel the mountains for fifty and sixty miles around, and his trips sometimes lasted for weeks, at which times he would live in the woods like an Indian. One evening he had come down a small mountain stream until he reached a fall, and near this fall he found a little lean-to camp made by a fisherman. It was nearly dark and a light rain was falling. He threw his coat and bag of ginseng in on the dead boughs that had made the bed of the former occupant of the shelter and hurriedly prepared and ate his supper. He then built up a good fire for the night and went to get his coat to dry it. As he picked up his coat he heard a rattlesnake "sing out," as he expressed it, and on making light enough to see inside, he found that a large yellow rattlesnake had rounded out among the boughs a depression that looked not unlike the nest of a hen and was lying coiled up in this nest, with head and tail both up. "But a snake that he could see he had no fear of," and he soon killed it, and after determining that there were no others in the neighborhood, he calmly lay down and slept until morning.

At another time he and a companion had made camp at the foot of a mountain after a long and hard day's tramp. After eating supper and getting ready for the night both had pulled off their boots to rest their feet. Just before lying down to sleep the companion stepped outside the light of the fire in order that he might see if he could tell what the weather would be on the morrow. In a minute the Sang Digger heard him call in an alarmed way for a light. The Sang Digger snatched a burning stick from the fire and hurried out when he found his companion standing with his feet wide apart and a coiled and rattling snake exactly between them. He had known from the sound that it was very near and had not dared to move for fear of stepping on it. And from between his legs the Sang Digger had killed it with neatness and dispatch before the man had dared move an inch.

Once in daylight he was coming down a mountain side that was bare of anything but scattered vegetation and covered with thin, flat rocks. He had cut a long, stout pole to assist him in the descent, and when near the middle of a patch of stones he heard a snake rattle. Standing still he managed to turn over with his pole many of the flat stones nearest to him, and under nearly every one he found a snake. After killing ten or twelve he made a more violent movement than usual and heard a snake rattle under the large stone on which he was standing. Moving back a little he pried up this stone and found under it three rattlers, all of which he killed. The odor given off by these snakes nearly made him sick.

He was once bitten by a rattlesnake, and his behavior

on this occasion shows how little he could be stampeded in an emergency. He was hunting ginseng on the side of a mountain thickly covered with big timber and the moss-covered trunks of fallen trees. In getting over one of these trunks his foot broke through, and, to catch himself, he put a hand behind him, when a rattlesnake bit him between the thumb and forefinger. After killing the snake and cutting open and sucking the wound in his hand, he went down to the road at the foot of the mountain for mud to plaster over the cut. At this point he missed the little pick he used in his work and went back up the mountain and got it. At the first house he came to he procured indigo and whisky, and his description of the pain when the indigo was applied was very graphic. A physician did not see him until the next day, but the effects of the bite were gone in a few days. He only remembered that there was a peculiar constriction of the chest that was very painful while it lasted. He is a very vigorous man whose heart and circulation are probably perfect, and this may account for the slight effects of the poison. Or is it possible that he was bitten in a spot where there are few blood vessels, or that the snake did not get a fair whack at his hand?

He was lying one night beside and partly under a large fallen tree, near which he had built his fire, when he was aroused by something touching his cheek. He brushed it away with his hand and dozed off again only to be partly aroused by the same thing again. After this had occurred several times he was so wide awake that he got up and proceeded to investigate, when he found that a big porcupine had been rubbing its nose across his cheek. He seemed to think that it would have been very funny if the porcupine had used its tail instead of its nose, or if, when he was brushing it away, he had struck its quills with his hand.

But the Parson's stogie was smoked to the smallest point, the Professor, who is a great botanist, had extracted all the information, scientific and otherwise, that he could get from the Sang Digger, the Superintendent had learned as much as possible about the mountains and streams that he hunts and fishes, the little girl, with her head pillowed on her curls on the table, was sound asleep, and the lanterns were coming down the road showing that church was over; so the three tired and sleepy hunters stumbled back through the dark to their own lodgings to sleep and perhaps to dream of a better day with the pheasants to-morrow.

## The Biography of a Bear.—XI.

WHEN we awoke next morning I felt that our first night's sleep in the tent had not been as refreshing to me as it might have been. For some reason the fishing I had dreamed about, while it had seemed full of excitement, had made me tired. I have only given a synopsis of it in the foregoing chapter, to establish beyond question my veracity as a historian. I submit to my readers that there are many temptations attached to any account in which fish cut a figure, and I point with emotion to the evidences of integrity with which I have chronicled this nocturnal attack of delirium with which I contended. Had I not been scrupulously conscientious in regard to details, I would scarcely have refrained from some little license with which to make the account thrilling. I would not have been content with landing plain salmon, mackerel and a few codfish, where I had an inland ocean of unknown resource from which to produce sea serpents, crocodiles or whales. It is true he hooked fast to something that threatened to be extraordinary, but plain print bears me out in the assertion that I refrained at a critical moment.

Nevertheless, as I saw the sun peep fiery red above the blue summits to the eastward, and as I scanned the waving grass and rushes of the dry lake, I felt regret that it could offer no such possibilities as I had vividly experienced in my dream. The very notion of fishing for smaller fry now palled upon my—"piscatorial propensities." Neither of those words were premeditated. I use them only in emergencies. What I am getting at is the fact that I had lost interest in fishing for a while. I coaxed Dick and Enochs to try the little stream, which they finally did, and reported that there were only a few fingerling trout dodging about among alders, willows and other impediments to any efforts to catch fish there. The swamp, as far as we explored it, offered no sufficient inducements to cause us to attempt excavating a lake big enough to make it attractive as a fishing place. It was attractive enough in other ways, and we gave our time to other pursuits.

The first day we did little more than pike around camp, or collected a little wood, added to the comfort of our tent furniture, and the cooking equipment. We overhauled our supply of provisions, which embraced considerable stuff in cans, that we had learned to look upon with suspicion and sorrow. Our coffee, teas, spices, sardines; in fact, about everything we had in tins or packages put up by American firms, were either adulterated or they were so inferior as to have made adulteration too expensive. It may be we had gotten a bad lot, but as most of them were put up in San Francisco and marked absolutely pure, "So and So's best," "positively warranted," with many other trite maxims, we wondered what something different could possibly be like.

American ingenuity and inventive talent has not wholly exhausted itself upon mechanical devices. It is true, however, that the Patent Office has a bewildering collection of hardware on hand, fashioned after the fancies of a very versatile population. I believe that, properly speaking, it is the world's museum for misfit machinery, both mechanical and administrative, and I had a little to do with that confederation of the sciences a few years ago. I had invented, or I had become entangled with the fancy that I had evolved, a new thing in clocks. I wanted to run them all by electricity, upon a similar system to the telegraph. My plan and its mechanical method was to have all the clocks of San Francisco, New York and the less important centers of the world strung upon a wire. I wanted a central clock, which would open and close the electric circuit as its pendulum swung to and fro, thus furnishing motive power for the thousands of secondary dials. By this system all the clocks would just have to be correct to

an instant, while the people of the world would not have to devote so much of their time to winding and repairing clocks, pawning and redeeming watches, and such like frivolities, while no two time pieces in any one region ever agreed as to the real time.

My scheme was a good one, and some time in the course of events, some trust will use it to monopolize and dispense time to the confiding, time-serving serfs of civilization; and it will pay the shareholders. Well, I sent my data to Messrs. John Wedderburn & Company, patent attorneys, Washington, D. C., U. S. A. These attorneys had their patent emporium in close proximity to the Federal patent warehouse. Wedderburn & Company accepted some of my money as a preliminary overture, and then they sent me assurances in print that my invention was unique and patentable. They also sent me copies of all such patents on file as might in any way have anticipated my contrivance; and they also sent me a solid silver medal, worth 40 cents, upon which is stamped:

.....  
 : REWARD OF GENIUS :  
 : Presented by :  
 : JOHN WEDDERBURN & CO., :  
 : PATENT ATTORNEYS, :  
 : Washington, D. C., U. S. A. :  
 : .....

After receiving this evidence of their sincerity and integrity, I reluctantly sent them more money. Well, at intervals that seemed to be rather frequent if they were spasmodic, they beguiled me of funds necessary to the presumable prosecution of my affairs, about which detail I have no further assurance. Wedderburn's catalogue of "How to Get a Patent," or similar title, was a thing of genius itself. It was full of fine illustrations of Wedderburn in his office surrounded with luxurious furnishings and female secretaries and operatives. It was full of testimonials and descriptions of his invincible methods of squeezing even doubtful cases through the Patent Office. To clinch his hold upon public confidence, he printed in this catalogue the *verbatim ad literatim et scriblerendum* testimonials and recommendations of living United States Congressmen and Senators.

All this tangible evidence had assured me, at my own expense, and some thousands' of other residents of the United States, that Wedderburn & Company might be intrusted to handle funds necessary to get things into and out of the Patent Office. About the time I had begun to think Wedderburn had eloped with my clock, I was advised by a circular, issued by the Commissioner of Patents, that John Wedderburn had been debarred from practicing in (or perhaps upon) the Patent Department, with the further intimation that I might prosecute my own case, or monkey with another attorney. Shortly after, I was the recipient of an elaborate manifesto from another patent confederation, which in effect stated that they had taken up Wedderburn's business, and for money they would do more things. If they have done more things I am not among them, nor upon the new schedule. I hope the Government at Washington got some of my money away from Wedderburn, and that it has, or will some time apply it to providing a home for veteran Washington attorneys, many of whom deserve the snuggest kind of an asylum. I did not dream this story, for I can show two or three pounds of documents and the medal. I have never worn the latter upon my manly brisquet, and will not, unless I get my money back.

But what I was trying to get at is a declaration of my belief that we need a national exposition of American inventive faculties and products devoted to foods, clothing, cutlery, cross-cut saws, tinware and patent medicines, including whisky. Few people will fully realize that there are more things in heaven and earth than are dreamed of in my philosophy, unless such an exposition is established and thrown wide open to the public—that is to say, transportation and admittance free. The United States has been so prosperous in its manufactures and bottled products, in its canned matters, its pig iron scissors and cutlery, its frescoed furniture, its varnished tinware, its venerated wearing apparel, its rawhide leather with the hair on it, its bogus milk, butter and honey, its tadpole sardines embalmed in petroleum, its coal oil enriched with swamp water, while its river water is so full of contagion it is no wonder that we are the epitome and synopsis of intellectual supremacy. We can point to a thousand millionaires, and laugh at the efforts of those foreign nations who are trying to exalt our burglars, our train robbers, our pirates, our highwaymen and members of Congress, as the only Americans whose social position is unassailable, and whose money is clean. It is no wonder the Chinese are boycotting American products, when they are debarred from getting into business here, and when we are trying to confine them to the use and consumption of our products. A San Francisco Chinaman once told me confidentially that he "sabied Melican man," adding very cautiously that in his own country they decapitated men when they got that way. He admitted, inadvertently, that he had no notion of going back to China—not as long as the city policemen gave him lottery privileges at regular rates, and kept hoodlums from raiding his joint.

These reflections may not be entertaining, but they are not altogether irrelevant to this history. They allude to things that have made men take to the woods, thereby affecting the supply of fish and game. Gambling and speculative people are at times full of desperation that looks like real energy. We have at this period in California a class known as prospectors who hunt for gold in the mountains. They are "grubstaked" by more or less opulent townspeople, clapped upon the back as good, honest fellows, and encouraged to go into rocky places and dig. Many of them live for a while upon grubstakes, then they take to grubworms, fish, frogs and whatever they can find to masticate. Their raiment consists of one suit and a half of denim, with shoes fashioned from rawhide and hobnails. They sometimes have a blanket or two, and one or two guns, with a supply of cartridges limited to their physical powers of endurance in carrying their burden from one cave, shack or improvised brush heap to another. They shoot game and other creatures as long as their vitality endures.

Sometimes these men find a mine, or a ledge of rock

that will sell—that is, when it is salted a little. In such cases the prospector, if he gets money enough out of it, makes a bee-line for town, where he can always get a few drinks of a kind of whisky that is put up for transient passengers. Unless he is kidnapped before his money is, he drinks more of the whisky, and after a while we all lose interest in him, except the undertaker. If the mines can be "developed" it is usually through a promoter, who gives way to the stock-jobber. If the latter can reach enough opulent imbeciles east of the Mississippi, or abroad, a smelting plant is the process by which they are at this time induced to pay a superintendent and his lieutenants fat salaries, while a few laborers do more or less work that might be productive if they were occupied anywhere else. This system of industrial procedure scatters some money, but no one can detect that it is of any advantage to California; that is, no one can do it with a placid face and without undue excitement. These are passing notes, and I do not recommend them to the reader for other than true, prosaic and uninteresting items.

From our camp in the mountain wilderness, when we were not overcome with indignation and other ills connected with our supply of groceries, we sallied out daily into the forest in quest of deer and to such points of interest as were least likely to tempt us into disturbing the resident bears which wore such cumbersome feet and paws. We came upon their tracks often enough to keep us from forgetting the propriety of avoiding complications that might prove disconcerting. Sometimes, when we strayed into a rocky ravine, or a jungle, where we discerned bear tracks, and where there was no more room than those animals might want at any time, we strayed out of them again with notable diplomacy. I had a good gun and I had no doubt of my ability to make it go; but I really had no desire to shoot any of Jack's relations, even though they might be distant ones. As for Jack himself he wandered everywhere, but rarely missed being on hand at meal time, and he was always in camp at night.

So far, we had only succeeded in killing two small deer, one upon the road before we had reached the summit, and the other near our present camp. These had kept us supplied with sufficient meat, such as it was, but we all wanted a big one with something upon his ribs worth while, and as we smoked and talked at our evening camp-fires, we dwelt oftener and longer upon the big bucks that we proposed to bring in. At such times, while he had enlarged from time to time upon the buck that he had in view—in his mind's eye—Enochs freely explained that the buck part of his programme was a mere incident; the bear that he proposed "bringing in" was the main feature. Dick and I both yawned when he lingered too long upon the theme, and Jack frequently interrupted him by various social liberties that made Enochs edge away.

The amount of it was that, although there were many large tracks to be found of big bucks, and although we knew the animals at this time were in prime condition, we could not get more than an occasional glimpse of one as he ducked into the jungle or thick timber. Dick and myself were both experienced deer hunters, and either of us was good for a deer at anywhere from 100 to 500 yards; but day by day we failed to get a shot at any kind of a buck. Smaller deer and does we ignored.

One day each of us hunted independently, each having selected a course from camp, and we were not to meet until evening, or until we met at camp. We got all in readiness the night before, and at dawn we each set out variously and independently. This order of departure from camp was a new one, and as afterward developed, it had queered Jack.

The course I had selected was toward Magee's Mountain, and took me in the direction of the tamarack road. I had been out most of the forenoon without success, and I was climbing one of the sloping spurs of the main peak, when it began to get very warm, and I was suffering some for water. I had gone into a mass of buckbrush, silver leaf and chinquapin, which had been laid all one way by snows of winter, and which was matted and tangled to a degree that made it almost impenetrable.

I had brought one of the dogs with me, and as I was clambering and crawling to get through a particularly dense thicket, the dog sniffed and growled. Listening intently, I presently heard the breaking and snapping of brush a few rods below, in the direction of a ravine to which I was trying to make my way for water. The sounds became louder, and were steadily approaching me, while the dog was bristling and growling more earnestly. I decided that my time for a more or less unpleasant adventure with a bear in a bad place was at hand. The dog was excited, and I knew that it would be almost impossible to restrain him or keep him quiet under the circumstances. He would, without doubt, attract the attention of the bear, precipitate an attack upon himself, and in that event he would bring the animal to me in this tangle of brush and rocks from which there was no escape with any satisfactory degree of speed.

The brush continued to crash, and the steady heavy tread of the animal continued in my direction with a persistence that implied that its curiosity was aroused. To my right, in a tangle of undergrowth, lay a prostrate tree, an immense log with the top part extending down the hill, but the entire trunk was overgrown with a tangle of vines, briars and brush. After several attempts, during which I lost and recovered my hat and my hunting knife, and scratched my flesh and tore my clothes, I at last got upon the log. The brush was thrashing and snapping just below me, and my dog was on the point of breaking forward. I got my rifle ready, laid down my hat, and slowly rose upright on the log and peered over the brush.

At that juncture, I perceived the ugliest gun that I ever saw pointed directly at my eye, and only about ten yards distant. I next realized that there was a man behind this gun, and he was about the hardest looking case, as he cocked an eye over the gun sight that I ever want to collide with.

"Don't!" I gasped. "Not now; please don't, mister!" As the gun failed to lower perceptibly, I threw up my hands and said, "Oh, don't, I thought it was a bear." As my hands went up the long gun sank slowly, about as reluctantly as anything I can think of, and the man finally ejaculated, "Ho, pardner!" It developed a little

later that he was somewhat deaf, and had not heard my heartfelt petition. This consoled me a little. I signaled to him now that I wouldn't do anything to him, and I clambered down to where he was. After a good deal of shouting on my part, I learned that he had hunted out from the road, and was making a side tour to connect with his party and his wagon further along. He was a little longer and almost as gaunt as his gun—an old muzzle-loading yager, with an iron ramrod. He looked like Daniel Boone might have looked, had he lived until now, without a shave or a change of clothing.

After he had eyed me furtively, he examined my gun—the latest Winchester model—and said it was too dingy-fangled for him. "This hyar ole shootin' iron's good fur ennything I kin git a bead on at a hunder' yards. But I heven't seed a thing ter shute sence I sot out. Hev yer got a chew of terbaker?"

I had nothing but some smoking tobacco; but he made that answer, and there was half enough of it to fill half of one side of the cavern that yawned to receive it.

We went together down into the ravine, where we found some water, and we went around the thicket until we reached some open ground that sloped in the general direction I had decided to take toward camp.

We had separated but a short distance, when my dog started a small deer, a yearling, from somewhere in the thicket. The deer passed between Mr. Boone and myself, and after a few jumps it stopped a moment; then it went forward broadside to him, but away from me. I might easily have shot it, but I watched the man's proceedings with interest. I wanted to see if this antiquated combination of man and gun could get into action.

The old chap put his gun to his shoulder a dozen times, but failed to get the bead and risk his single shot. Seeing that the deer was about to escape, I unlimbered and opened fire. My chief object was to shoot clear of the man and make as much noise as possible. I wanted him to see a Winchester rifle in active operation.

About the fourth or fifth shot, I saw the old fellow strike for a tree and disappear, all excepting a yard or two of his gun, which four or five feet of the tree failed to cover. When I had about emptied my gun I saw the deer drop, some one or more of the shots having taken effect. I went to the dead deer and shouted in vain for the long man with his long gun, but he had vanished. I wanted him to come and help dress and share the deer. I never saw him again, but my grandfather told me afterward that he had stopped at the summit. He told him that he had "Seed a young feller over on the moun'tin yonder doin' some of the gol darndest shootin' he ever heerd; thet the bullets was whistlin' thro' the trees in han'fuls, an' thet when he sorter lef' thar he c'd see nothin' but smoke." He had concluded this tale by saying, "I'll bet a mule thet feller didn't git the deer. Hit may be easy ter shute them ding-fangled masheens, but thay ain't never goin' to hit nothin'."

He had left me with a deer on my hands that I had no urgent use for. I was several miles from camp, with a rough and densely wooded country intervening. I shouldered the deer with regret that I had shot it, and after a weary tramp reached camp about sundown. Neither Enochs, Dick nor Jack was there, and the outdoor part of the camp appeared to have been struck by a cyclone. The tent was flat on the ground, and its furniture, bedding and contents scattered about everywhere. But all about me was silence, with no evidence to show for the disaster.

RANSACKER.

### Sportsmen and Forestry.

THE game law chart and pamphlet issued by the Government at Washington show that the sentiment in favor of the protection of fish and game in the United States has at last become pretty well voiced and given effect in and by the laws in relation thereto. Year by year the respective States of the Union are swinging into line for the preservation of game and fish. It is a striking illustration of the power of public sentiment. It is fair to suppose that the lovers of forest and stream have had much to do with the growth of this sentiment. Why not now do something for the forest and stream. Suppose all of the lovers of out of doors should send to the United States Department of Agriculture a request for Farmers' Bulletin No. 173, "A Primer of Forestry," by Gifford Pinchot, forester. It will be sent for the asking. Gifford Pinchot, forester, is modest and calls it a primer; but it is an evangel. It will make a forester of every good man who reads it. A public sentiment as powerful as the combined power of the American sportsmen would result very soon in a statutory crusade in all of the States looking to the preservation of the forests and woodlands throughout the land. It's a good world. So far as I know, it's the best one I've ever been to; and, if I only knew how, I'd like nothing better than to try to preserve its beauty and grandeur, its motherliness and fatherliness, for those who come after me, for those who stay here after me. Wouldn't you?

GEORGE KENNEDY.

### How to Start a Balky Horse.

SOME years ago in Cincinnati, during the noon hour, in one of the busiest streets, a horse attached to an express wagon became balky. Many remedies were tried without effect. Presently one of Cincinnati's best-known horsemen came along. When he saw the trouble he smilingly asked for a stone, which was given to him. Then he asked the driver to lift up one foot of the horse, and with the stone he struck the shoe a number of times.

"Now," he said to the driver, "get up on your seat and drive off."

This the driver did, amid the cheers of the bystanders. The horseman said he had no idea why this made a balky horse go, but he had found it an unfailing remedy. —New York Times.

# NATURAL HISTORY

## The Crow in Winter.

WHILE other birds migrate from necessity, the crow, I think, does so from choice. He either goes or stays as he thinks fit.

Among the intelligences of the feathered tribe, there are but few that can compare with that of *Corvus americanus*. Chapman says he can talk. But if he cannot talk, he can certainly think, and to some purpose. Were it not so, he would have been exterminated long ago, for every man's hand has been against him. To a sombre, bodiful appearance he adds the character of a thief, and then his voice!

But really, after all, he is not as bad or undesirable as he is supposed to be, and, thanks to unprejudiced men of inquiring, scientific minds, his good or useful qualities are now coming to be known. But it is doubtful if the popular mind will ever completely overload the aversions and superstitions which the ages have piled up, in regard to him and his family.

However, *C. americanus* doesn't care. He will go on living and being tolerably happy, despite our enmity, and there are certainly no grounds for believing that he is becoming scarcer in the land.

I think I never saw so many crows around New York as I did last spring in Flatlands during the preparations for sowing. The fields were literally half black with them. As long as the plowing merely was being done the attitude of the farmers toward them was one of friendly indifference; but the moment the seed was in the ground war was declared. But I would bet a dollar that not half a dozen crows were shot during the season. It must be terribly exasperating to a farmer to find that when he goes out unarmed he can approach the marauders within a few yards before they will stir; but no sooner does he appear with a gun than they are up and away. Or, if he should try to steal on them along a fence, an alarmed "ker-aw, caw!" from a well posted sentinel will sound long before he gets within a shot, and effectually frustrate his design.

From the spring until the fall our sable friend has an easy life of it, food being abundant. And I do not think that he considers the question of migration till the very last moment. Then he may decide to go or stay, as the signs which he knows so well appear to indicate a mild or hard winter.

I have seen it stated that all our crows (*i. e.*, the crows of this latitude) migrate in the fall; and that those we see in the depth of winter come from further north. This may be generally true, but it is not absolutely so, for a friend of mine who lives in Pennsylvania, tells me that a crow with a white feather in his tail, which was familiar to him during the summer, made his appearance several times during the winter. (It would seem by the way, that the white feather in this instance belied its proverbial significance.)

Whether, however, the crows we see in the depth of winter are our old familiars of the spring and summer, or strangers from the north, their work is cut out for them to keep the wolf from the door. For even in mild winters there are certain to be more or less prolonged periods of frost and snow. This is not so bad for little birds like the chickadees, who are satisfied with a few grubs or larvæ, but for big voracious birds like the crows it is a very serious matter indeed. Fortunately for them, however, they have an omnivorous appetite. A chance potato, or apple, a dead bird, or rodent, a fish cast up by the sea, or anything edible whatever—all is welcome. Then as foragers they are unsurpassed. With the first light of dawn they leave their roost, with a clamorous cawing, and scatter over the country. All day they ply their industrious search. You will see them in ones, or twos, or threes, never in a hurry, but always vigilant, with one eye open, as it were, for chance provender, and the other for some lurking enemy. In very severe weather they will venture into farmyards to forage. But warily do they move about, avoiding especially anything that looks like a trap. Apropos, your correspondent, Mr. Charles A. Taft, notes that they would not go near the troughs which he erected for the feeding of quail.

Only rarely do we come across a dead crow, and then he is pretty sure to be the victim of old age or disease. (His normal age, by the way, is supposed to be near a hundred.) Tough, tough he is, in sooth, and the popular saying, "To eat crow," has a most pointed significance.

When day begins to decline, the various members of the roost or rookery start for home. Not as in the spring, referred to so felicitously by Tennyson in his line,

"The many wintered crow that leads the clanging rookery home,"

do they fly now, but silently, and, as a rule, singly—or one behind another, at a long distance. The sight of the dark solitary bird winging its flight over the desolate landscape has an effect which must have been dear to the superstitious imagination.

The wayfarer does not fly directly to his accustomed place of rest, but alights on some point of vantage, to reconnoitre presumably. Others do likewise, and when all are assembled (if, perchance, all have escaped the hazards of the day), at a given signal from some recognized leader, they will arise, circle noisily over the roost and gradually drop down upon it. For a while the cawing is kept up, and then funereal silence succeeds. Every bird has found his perch, and ruffling his feathers, settles down to pass the winter night.

There let us leave them; but as we sit in our comfortable rooms, or lie in our warm beds, let us waste no sympathy on them, for, though a crow may feel hungry, I doubt if he ever feels cold.

FRANK MOONAN.

## The Quails of the United States.

BY SYLVESTER D. JUDD, ASSISTANT, BIOLOGICAL SURVEY.

(Continued from page 411.)

### Gambel Quail (*Lophortyx gambeli*.)

THE Gambel quail in general appearance is much like the valley quail, but, among other differences, lacks the scale-like feathers of the lower parts and has considerable chestnut along the flanks. It lives in the Lower Sonoran zone, from western Texas to southeastern California and from southern Utah and Nevada south through central Sonora, Mexico. The desert is its home, but it is rarely found far from water. Its favorite haunts are patches of bushy vegetation, such as mesquite, mimosa, creosote and patches of prickly pear. It frequently takes up its abode about cultivated land, living in alfalfa fields or nesting in vineyards.

An interesting account of the habits of the Gambel quail in the Pahump Valley, Nevada, is given by E. W. Nelson:

"I noticed that when a flock of quail came to feed on grain left by the horses an old male usually mounted the top of a tall bush close by and remained on guard for ten or fifteen minutes; then, if everything was quiet, he would fly down among his companions. At the first alarm the flock would take to the bushes, running swift-

GAMBEL QUAIL (*Lophortyx gambeli*).

ly, or flying when hard pressed. They roosted in the dense bunches of willows and cottonwoods growing along the ditches. \* \* \* When feeding they have a series of low clucking and cooing notes which are kept up almost continually."

The love note, according to Coues, may be represented in words as "killink, killink." Nesting takes place in April, sometimes not till May. About a dozen eggs usually constitute a clutch. In sections where this quail is still numerous the birds pack in bands of from 100 to 500 after the breeding season.

From the sportsman's point of view the Gambel quail as a game bird does not approach the bobwhite. It will sometimes lie to a dog fairly well, but as a rule it takes to its legs with all haste and leaves the dog on point, to the vexation of the hunter. It is, however, a useful species, which brightens the desert with its presence and contributes a welcome addition to the fare of the traveler. While less valuable than the bobwhite as a destroyer of noxious insects and as an object of sport, this bird well deserves protection for its food value and its beauty. It thrives under desert conditions and might be successfully introduced in the arid regions of Colorado, New Mexico and Texas.

### FOOD HABITS.

Stomachs of twenty-eight birds collected mainly in Arizona and Utah, from January to June, have been examined. Only 0.48 per cent. of the food consisted of insects; the remaining 99.52 per cent. was vegetable matter. Like the valley quail, this is one of our least insectivorous birds. Its insect diet includes ants, beetles, grasshoppers, leaf hoppers and stink bugs. Among the beetles are the western twelve-spotted cucumber beetle. The young chicks, however, will doubtless be found highly insectivorous and therefore useful.

The vegetable food of Gambel quail was made up as follows: Grain, 3.89 per cent.; miscellaneous seeds, 31.89 per cent., and leaves and plant shoots, 63.74 per cent. From the present investigation the bird appears less frugivorous than any of the other American quail, for not one of the twenty-eight stomachs contained fruit. Observers, however, say that the bird is somewhat frugivorous, and no doubt in a country well stocked with berries and fruit it would rapidly develop a frugivorous taste. Baird, Brewer and Ridgway, for instance, state that dur-

ing summer it makes its home in patches of *Salaunum* and feeds on the tolerably palatable fruit, and also that it is known to eat gooseberries. Coues says: "In the fall it gathers cherries and grapes. \* \* \* It visits patches of prickly pear to feed upon the soft juicy 'Tunas' that are eaten by everything in Arizona, from men and bears to beetles."

The grain eaten by the Gambel quail was corn, wheat and oats. In flocks numbering from 50 to 100, it feeds about grain stacks with domestic poultry. It is even more industrious as a browser on foliage than the valley quail. Succulent foliage and shoots form 63.74 per cent. of its food. Much of this comes from alfalfa, bur clover and the foliage of other legumes. Vernon Bailey, of the Biological Survey, says that at St. Thomas, Ariz., in January, 1889, this quail fairly swarmed on alfalfa fields, feeding on the green leaves and pods. He found flocks of from twenty-five to fifty in such situations, and during a five minutes' walk often saw a hundred birds. The same observer, when in Mohave county, Ariz., found that the bird fed principally on juicy plants when it could not procure water. At times it eats grass and its inflorescence, and it has been known to devour showy flowers. In spring it shows a fondness for buds. Baird, Brewer and Ridgway note that then it feeds largely on the willow buds, which impart to its flesh a distinctly bitter taste.

The seed-eating habits of Gambel quail closely resemble

those of the valley quail. Leguminous plants furnish the largest part of the seed food—21.17 per cent. of the annual diet—alfalfa, bur clover and kindred plants appearing to be preferred, but cassias, acacias and lupines also are taken, as well as the beans of the mesquite, which in many places are a staple with birds and mammals. The seeds of alfalfa, another bird staple, furnish 2.28 per cent. of the year's food. Miscellaneous seeds form 8.44 per cent. They are obtained from grasses, mallows and such cruciferous plants as mustard and peppergrass, also from chickweed and *Atriplex*.

### Mountain Quail (*Oreortyx pictus*.)

The mountain quail occurs in the forested mountains of the humid Transition Zone of the Pacific coast, from Santa Barbara, Cal., to Washington, and in the mountains of the more arid Transition Zone on the west side of the Cascades in northern Oregon and south over the Sierra Nevada to northern Lower California. The birds of the Sierra Nevada winter at lower altitudes than they nest, but those of the coast mountains do not make this vertical migration. This species is the largest and among the handsomest of American quail, with two long jet black crest plumes and rich chestnut throat and flanks, the latter broadly banded transversely with spotless white.

The nests of the mountain quail are placed on the ground and usually contain ten to twelve eggs, which vary from pale cream color to a much darker hue. At Tillamook, Oreg., June 30 and July 4, 1897, A. K. Fisher found newly-hatched chicks; and at Donner, Cal., July 11 and 19, at an altitude ranging from 6,100 to 8,000 feet, Vernon Bailey found nine broods, varying in age from newly-hatched chicks to half-grown birds. Bendire, quoting L. W. Green, of the United States Fish Commission, says that the earliest date of the nesting of the plumed mountain quail (*Oreortyx p. plumiferus*) known to him was April 15, and the latest, Aug. 15. He states also that the cock bird takes care of the young. Chester Barlow, in writing of the habits of the mountain quail, says that at Fyffe, Cal., it begins to nest the last of May or early in June. All nests that he found were built in a

\*The name is used here to cover both the typical dark birds of the humid coast forests (*Oreortyx pictus*) and the paler one (*O. p. plumiferus*) of the more arid Transition Zone in the Sierras and Cascades.

growth of "mountain misery" eight to ten inches high. On Mount Tallac and the higher slopes of Pyramid Peak W. W. Price found newly-hatched young as late as Aug. 15. He noted that by Sept. 1 the quail became restless and soon began their peculiar migration from the east slope to the west slope of the Sierras. From four to six adults with their young form a small band of from ten to thirty individuals, and pursue their way almost wholly on foot to a more congenial winter climate; and by Oct. 1 all had abandoned elevations above 5,000 feet. In spring they migrate back singly or in pairs.

There are many admirers of this bird because of its exquisite plumage, but most sportsmen prefer a game bird that lies better to the dog. Its flesh is excellent, and the bird sells well in the market. H. W. Henshaw reports that in the late fall of 1880 he found the markets of Portland, Oreg., well supplied with live mountain quails which had been trapped in the neighboring mountains, cooped, and sent to the city for sale. Nowhere is it so numerous as the California quail, or the bobwhite in the Southern States, and it is more of a forest-loving species than any other American quail. The mountain quail sometimes enters cleared fields, but so far as the records of the Biological Survey show it does no appreciable damage to cultivated fruits or other crops and it is a useful destroyer of weed seeds.

#### FOOD HABITS.

No stomachs of the mountain quail of the humid regions were available for examination, but Sandys writes that the bird feeds on insects and various seeds, including grain, and Elliot says it sometimes approaches farm buildings in search of scattered kernels of grain.

The food of the mountain quail of the arid regions has been studied in the laboratory of the Biological Survey. The stomachs examined, twenty-three in number, were collected in California. Five were collected in January, two in May, six in June, three in July, three in August, and six in November. The food consisted of animal matter, three per cent., and vegetable matter, 97 per cent. The animal food was made up of grasshoppers, 0.05 per cent.; beetles, 0.23 per cent.; miscellaneous insects, including ants and lepidopterous pupæ, 1.90 per cent.; and centipedes and harvest spiders, 0.82 per cent. Among the beetles was a species of the firefly family, a ground beetle and a leaf beetle. Vernon Bailey informs the writer that the young eat many ants. The vegetable food consisted of grain, 18.20 per cent.; seeds, practically all of weeds or other worthless plants, 46.61 per cent.; fruit, 8.11 per cent.; and miscellaneous vegetable matter, 24.08 per cent. The grain included wheat, corn, barley and oats. Of the seed element the seeds of grasses formed 7.78 per cent.; of legumes, 10.41 per cent.; of weeds of the family *Euphorbiaceæ*, 3.16 per cent.; of alfilaria (*Erodium cicutarium*), 2.76 per cent., and of miscellaneous weeds, 22.50 per cent. The legume seeds include seeds of alfalfa, cassia, bush clover, vetch and lupine. The miscellaneous seeds come from wild carrot, tar weed, labiate plants, dwarf oak, snowbush and thistle.

Concerning the feeding habits of mountain quail of the dry country J. E. McClellan says: "Their feeding hours are early in the morning and just before sundown in the evening, when they go to roost in the thick tops of the scrub live oaks. Their feeding habits are similar to those of the domestic hen. They are vigorous scratchers, and will jump a foot or more from the ground to nip off leaves." This bird is especially fond of the leaves of clover and other leguminous plants. It feeds also on flowers, being known to select those of compositæ and blue-eyed grass. Flowers, leaves, buds and other kinds of vegetable matter form the 24.08 per cent. marked miscellaneous. The birds probably eat more fruit than these stomach examinations indicate. Lyman Belding says that this quail feeds on service berries, and that during certain seasons it lives almost entirely on grass bulbs, which it gets by scratching, for which its large, powerful feet are well adapted. The fruit in its bill of fare includes gooseberries, service berries and grapes. The bird is probably fond also of manzanita berries, for it is often seen among these shrubs.

#### Scaled Quail (*Callipepla squamata*)†

The "cotton top," or scaled quail, as it is commonly known, is bluish-gray on the back, with black-edged feathers on the under parts, which appear like large scales. Its conspicuous white-tipped crest has given it the local name of cotton top. It is found in southern Colorado and in the Upper and Lower Sonoran zones from Arizona to western and southern Texas and south to the Valley of Mexico. The birds of the lower Rio Grande region are darker than those farther west. According to Bendire, this quail lives on open arid plains overgrown with yucca, cactus and sagebrush, and often gathers in coveys numbering twenty-five to eighty. It lays about a dozen eggs, and he believes that two or three broods are reared in a season. The cock assists in the care of the young, but not in incubation.

#### FOOD HABITS.

The food habits of this game bird are of especial interest. Stomachs and crops of forty-seven specimens have been examined, most of which came from New Mexico, the others from Arizona and Texas. They were collected as follows: January, seven; May, one; June, two; July, three; September, thirteen; October, nineteen, and November, two. As with all other gallinaceous birds, more or less mineral matter is swallowed, usually small pieces of quartz. The food consisted of animal matter, 29.6 per cent., and vegetable matter, 70.4 per cent.

The food of the cotton top differs from that of all other American quails in that it contains a large proportion of insects. These comprise no less than 29.03 per cent. of its food, a percentage almost twice as great as that of the bobwhite, although if more stomachs of the present species had been available for examination the ratio might have been different. However, the important fact is established that this bird is a large consumer of insects, instead of being, like most other western quail, practically graminivorous. Of the insect food, grasshoppers comprise 15.86 per cent.; beetles, 10.43 per cent., and miscellaneous insects, largely ants, 3.27 per cent. A

few spiders also are taken, but they constitute only 0.03 per cent. of the food for the year. The beetles are in the larval as well as the adult forms. The family of ground beetles, a favorite one with terrestrial birds, is well represented. A single beetle with a feather-like antenna, of the family *Pyrochroidæ*, had been eaten. Some longicorn beetles and plant-eating scarabæid beetles also were eaten. A bird collected in June had consumed forty-four of the latter beetles, which were leaf-chafers, apparently closely related to the genus *Serica*. The scaled quail destroys also weevils, such as the clover weevil, *Sitones*, and certain species of the family *Otiornychidæ*, or scarred snout beetles. It takes also leaf beetles, the very injurious twelve-spotted cucumber beetle. Further studies of the beetle food undoubtedly will disclose a large number of pests. The bird will probably be found to be a useful consumer also of grasshoppers, since a third of its September food consisted of them. Their remains were so fragmentary, however, that identification of species was unsatisfactory. In one case a member of the genus *Trimicrotopis* was recognized. Ants had been eaten by fifteen of the forty-seven birds examined. The other miscellaneous insects included small bugs and the chrysalis of a fly. One of the queerest objects found by the writer in birds' stomachs is the "ground pearl," several hundred of which were contained in the stomach of a cotton top shot at Roswell, N. Mex., June 17, 1899. They are lustrous and look like pearls, but are merely scale insects that feed on the roots of plants.

Vegetable matter furnished seventy per cent. of the food of the scaled quail. Grain contributed 0.57 per cent.; seeds, mostly weed seeds, 52.85 per cent.; fruit, 12.65 per cent., and leaves and other green tissue 4.33 per cent. The species resembles the ruffed grouse in its habit of feeding on green leaves and tender shoots. It feeds upon budded twigs, but more often limits its choice to chlorophyll-bearing tissue, often picking green seed pods of various plants. Like domestic fowls, it eats grass blades. Fruit was eaten by only six of the forty-seven birds, and none was taken from cultivated varieties. As might be expected from inhabitants of arid plains, these birds like the fruit of cacti, and have been found feeding on the prickly pear. The blue berries of *Adelia angustifolia*, which furnish many desert birds and mammals with food, are often eaten by the scaled quail. Different kinds of *Rubus* fruits are relished, and the berries of *Koerberlinia spinosa* and *Momisia pallida* also are eaten. The fruit and succulent parts of plants no doubt serve in part in the parched desert as a substitute for water.

Seeds of various plants form a little more than half of the food. Legumes furnish 21.84 per cent., the mesquite, a staple with both man and beast, being utilized, as are the seeds of mimosa, besides various cassias and lupines. Seeds of vetch are a favorite food. The bird at times will eat clover seeds. Miscellaneous weed seeds yield 31.01 per cent. of the annual food. Nearly half of these are seeds of bindweed, an abundant and troublesome weed in the South, where it often throttles other plants. The following miscellaneous seeds were found among their food: Thistle, wild sunflower, coreopsis, aster, chamomile, pigweed, gromwell, borage, mallow, turkey mullein, croton, alfilaria and spurge. Grass seeds have not yet been found in quantity in the crop of the species, but panicum seeds have been recognized.

In summing up the economic status of the scaled quail it should be noted that although the bird is a desert species, it comes into more or less direct relation with agriculture, sometimes feeding upon cultivated land and about farm buildings. Moreover, half of its food consists of the seeds of weeds. Lastly, it is highly insectivorous, fully one-fourth of its food consisting of insects.

#### Mearns Quail (*Cyrtonyx montezumæ mearnsi*)‡

The prevailing colors of the male Mearns quail are black, white and chestnut. Its thick speckles of white and its peculiar shape suggest a miniature guinea hen. The species is found on the table-lands of Mexico from the City of Mexico north to western Texas, New Mexico and Arizona, but the bird considered here is limited to the northern part of this range.

It is a confiding bird, and either from excess of curiosity or from stupidity has been known to remain on the ground to be killed by a stick. From this lack of suspicion it has received the name "fool quail." It affords the sportsman with a dog much better shooting than its more erratic crested relatives. Grassy or bushy cover is more necessary to this bird than to the scaled quail or Gambel quail. Unlike the latter species, it does not pack, though it is more or less migratory. Its nesting habits are not well known. Bendire describes a nest found in Kinney county, Texas, June 22, 1890. It was placed in a depression of the ground and contained ten eggs.

#### FOOD HABITS.

The food habits of the Mearns quail are not well known. The Biological Survey has examined the contents of nine crops and stomachs, secured in Texas and New Mexico during August and November. Two of the birds were killed in a patch of cactus. They contained seeds and spines from the prickly pear, acacia, and other seeds, grass blades and a trace of insects—weevils and other beetles—besides a large quantity of coarse sand and iron ore. The other seven birds were shot in August. Two had their crops filled with the bulbs of a lily. The others also had eaten lily bulbs, which in the five birds made three-fourths of the food. The other food was prickly pear fruit, seeds of legumes and spurge, and such insects as weevils, smooth caterpillars, hairy caterpillars, bugs, crickets and grasshoppers. Cassin states that the contents of the crop of a specimen sent him from Texas by Captain French "consisted exclusively of fragments of insects, pronounced by Dr. Leconte to be principally grasshoppers and a specimen of *Spectrum*." According to Baird, Brewer and Ridgway, the Mearns quail appeared quite at home in cultivated fields and stubble of the ranches. Away from civilization it prefers districts covered with open forest, with alternate areas of grass and scattered bushy undergrowth, or hillsides covered with grass and bushes. Its habits vary considerably with the locality. Bendire records that the species lives in rocky ravines and arroyos, but quickly adapts itself to

‡The typical Massena quail (*Cyrtonyx montezumæ*) is a bird of the mountains about the Mexican tableland, and gives way to the peler Mearns quail (*C. m. mearnsi*) in northern Mexico and the southwestern United States.

ranch conditions and may be seen running about to gather kernels of scattered grain. He says also that it is fond of acorns, mountain laurel, arbutus, cedar and other berries, and notes that its large, strong feet are well suited to unearthing the bulbs on which it feeds. He found holes two inches deep which it had dug for this purpose. These quail often come out into mountain roads to search for scattered grain and to dust themselves. As they are readily tamed, they could doubtless be successfully introduced into other regions.

## Another Snake Story.

THIS story should by rights be told either by Coahoma or Horace Kephart. For, I freely admit, it is the kind of story which requires a more authoritative name than mine for its sponsor; which requires a boldness in the telling possessed only by those who have seen snakes climb trees without wriggling, and stand on the tips of their tails on the picture moulding.

The other night I was going down in the country to kill thirty-three quail, and a man in the smoking compartment of the car told me the story exactly as I relate it, and gave me his name and address, and said that I might print the latter as proof, at least, of my own sincerity in repeating it. He said:

"When I was a young man, living on a farm in the mountain region of Pennsylvania, one of the women folks came to call me, stating that there was a large rattlesnake in the barn. I ran up there, and in the manger part of the ground floor of the barn, found a rattler about four feet and a half long and as thick as my wrist. I got a hay fork and got over the feed rack and stuck one of the tines of the fork through his body. He thrashed around at a terrible rate, and I was somewhat at a loss to know how to kill him, so I called to the girl to come over and hold the fork, which I had then shoved up tight against the wall, until I could get a stick and kill the snake. The snake was still thrashing around when she took hold of the fork, the handle of which was five or six feet in length, but almost immediately thereafter the snake ceased its struggles, raised its head, opened its jaws wide and shot out at that girl two streams of liquid, which fell on her dress about six inches apart and actually trickled down the dress. It was a pink calico dress, and the poison took the color out of the dress and left it with the two streaks showing white."

Now, the man who told the story was the kind of a man that—well, you know there are two kinds of men; one kind that cannot be believed, either because they are not close observers or because they are not conscientious; and the other kind, that somehow carry conviction to you; and this man was of the last-named kind. I felt that he was truthful. If the story is true, it means that a rattlesnake when it strikes is able to exercise control over his "hypodermic" and to regulate the dose. That here was a very mad snake who could not get at the person it wanted to poison and so undertook to administer it at long range.

And if this is true, it is possible to adduce the proof. For if a poisonous snake can control the ejection of its venom there is a sort of constrictive muscle attached to or about the poison sac, and the muscle is supplied with a motor nerve with which to set it in operation.

It seems to me I never go hunting that I do not see and hear something. The next day, while walking through the woods, my companion said, as a chicken hawk flew by overhead, "What kind of a bird is that?"

"That," said I, as my Parker barked and the bird tumbled far down the hillside, "is the kind of creature you read about now and then in the papers, that eats a quail a day for thirty days."

GEORGE KENNEDY.

## Work of the Biological Survey.

### Economic Ornithology.

From advance sheets of the Report of the Secretary of Agriculture.

THIS section of the Biological Survey is engaged in the study of birds in their various relations to man. Two principal lines of investigation are followed. In the first, the habits of birds are studied in the field, especially with reference to their food. Orchards, gardens, and grain fields are visited in order to determine whether birds damage crops, attack insects, both injurious and beneficial species, and to what extent they feed upon wild fruits and weed seeds. In this field study it is desired to enlist the co-operation of every cultivator of the soil. In the second, stomachs of birds are examined in the laboratory and their contents tabulated. In addition to the stomachs collected by our own assistants, many are obtained from ornithologists throughout the country. From 1885 to 1897, 24,000 stomachs had been collected, and of these about 12,000 had been examined. Since then stomachs have been received at an average rate of more than 4,000 annually, and the number is constantly increasing from year to year. The total number now on hand is about 66,000.

### Economic Mammalogy.

In connection with the study of the geographical distribution of mammals, field naturalists are instructed to observe particularly the food habits of each species, to secure data concerning their relation to the farmer, whether beneficial or injurious. Many stomachs have been examined and others are now on hand awaiting examination.

During the past eight years experiments in the use of poisons and other means for destroying noxious mammals have been made, both in the laboratory and in the field. Rats, prairie dogs, ground squirrels, rabbits, field mice, and pocket gophers have been the subjects of these experiments.

Special reports on prairie dogs, ground squirrels, pocket gophers, jack rabbits, and coyotes have been published, and investigations concerning these and other mammal pests are being continued. A great mass of notes on the habits of mammals has been accumulated, and reports on the economic relations of field mice, beavers, wolves and skunks are now in course of preparation.

†The name of the species is used here to include both the typical scaled quail (*Callipepla squamata*) and the more restricted chestnut-bellied quail of southern Texas (*C. s. castanogastris*).

Experiments with fences to protect sheep and other domestic animals from the depredations of coyotes, dogs, and other predatory animals are in progress in co-operation with farmers in Oklahoma and Kansas.

#### Game Protection and Introduction.

The duties of the section of the Biological Survey devoted to supervision of game protection and introduction grow out of three acts of Congress: Act of May 25, 1900, commonly known as the Lacey Act, requiring supervision of importations of wild birds and animals from foreign countries and of the preservation of the birds and game of the United States; act of June 3, 1902, requiring supervision of the importation of eggs of game birds; and act of June 7, 1902, requiring supervision of the preservation of the game of Alaska.

#### Entry of Foreign Birds and Animals.

Since the passage of the Lacey Act, May 25, 1900, constant vigilance has been exercised to prevent the entry of injurious species of birds and mammals. The annual importations of birds and animals are large, and include canaries and miscellaneous cage birds, shipped mainly from Germany, Australia, China and Japan; a few pheasants and other game birds, for liberation or confinement in aviaries, and rare birds and animals for the various zoological parks of the country, brought in chiefly at New York and San Francisco; pheasants for aviaries imported from Canada at ports along the northern border, and parrots and monkeys from Mexico and Central America, entered at southern ports. Inspectors have been appointed at seven of the principal ports to examine all large shipments or such as may possibly contain injurious species.

During the five years ending June 30, 1905, 1,591 permits have been issued for the entry of 1,006,964 birds (principally canaries), 2,846 mammals, and 38 reptiles and 13 for the entry of 6,500 eggs of game birds. Of the consignments entered 402 have been inspected. To prevent inconvenience in cases where no danger exists, the requirement of permits for reptiles and a number of species of well-known mammals was removed at the end of the first quarter of the operation of the law. So far as is known, no injurious species have been entered. Seven mongooses, 54 flying foxes or fruit-eating bats, 1 kohlemeise, 15 blaumeisen and 2 starlings have been refused entry, and either killed or reshipped to the original port of shipment. Six keas were refused entry at Honolulu.

#### Interstate Commerce in Game.

Through co-operation with the Department of Justice and game officials throughout the United States 166 violations of the Lacey Act, involving the shipment of 24,424 head of game and 2,608 plume birds, have been investigated, and forty-nine convictions have resulted. Of the convictions thirty were secured in Federal and nineteen in State courts. In addition to securing convictions for violations of law, great effort has been made to secure observance of both the Federal and State laws. Summaries of the principal provisions of the game laws of the United States and Canada have been issued annually and widely distributed, and several publications on special subjects have been prepared.

Aid in framing satisfactory laws has been extended to State officials and legislators; the conditions of illegal traffic in game have been carefully studied and in special cases have received personal investigation, and copious correspondence and many personal interviews have been had with State game officials with a view to securing better legislation and more rigid observance of the laws. To this phase of the Department's duties railroad and express companies have lent cordial and valuable co-operation.

#### Protection of Game in Alaska.

Thorough supervision of game protection in Alaska has not been possible because of the limited means available for this purpose. With the cordial co-operation, however, of the Treasury Department, through its customs officials at Port Townsend, Seattle, San Francisco, and various points in Alaska, a rigid surveillance has been maintained of all exports of game trophies and specimens from the Territory. During the three years the law has been in operation 155 permits for such exports have been issued, under which 93 trophies were shipped, including heads of 29 moose, 38 sheep, and 3 caribou, as well as several consignments of specimens for scientific purposes. Owing to expressed local dissatisfaction with the law, a bill materially modifying it was introduced into Congress in the session of 1904-5. For this reason it was deemed desirable to further restrict the issue of permits, and very few have been granted during the present year.

#### Bird Reservations.

It is well known that certain favorable localities form breeding places for large colonies of birds. Such localities offer tempting marks to those who gather eggs or plumage for commercial purposes, and if these depredations are unchecked complete extermination of certain species is sure to result. Within the past three years three such breeding grounds have been converted by the President into bird reservations. Pelican Island, a breeding resort for pelicans, off the coast of Florida, was so set apart on March 14, 1903; Breton Island and two smaller islands off the coast of Louisiana, a breeding ground for gulls and terns and a wintering resort for hundreds of thousands of ducks, were reserved on Oct. 4, 1904, and four small islands in Stump Lake, North Dakota, which form a breeding colony for many ducks and other water birds, on March 9, 1905. The department co-operates in the establishment and regulation of these reservations.

#### Cuvier's Annual.

THE thirty-second annual dinner of the Cuvier Club was held on Thursday of this week. The guests were received and welcomed by Col. Robert J. Morgan and Capt. Luther Parker. Ex-President Alex. Starbuck, now a resident of Chicago, was the guest of honor, and was heartily greeted by his old friends. The feast was served from 5 to 11 P. M., and during that time nearly 400 members and their friends were entertained.

## Fauna and Flora of Kiska Island.

DURING the summer of 1904 the following zoological and botanical specimens were collected, or observed and identified, by the writer at Kiska, one of the western islands of the Aleutian chain.\* Incomplete—almost fragmentary—as we know the list to be, it is hoped that it may prove of value as a contribution to the classification of the fauna and flora of this region.

Specimens of species marked with an asterisk (\*) were collected for the United State National Museum. Only the flowering plants of the island were collected, and of these, two species (*Trollius patulus* Salisb. and *Veronica grandiflora* Gaertn.) have been added to the National Herbarium. Mr. F. V. Coville, Botanist to the United States Department of Agriculture and Curator of the National Herbarium, informs us that the specimen of *Trollius patulus* presented the national collection is the first specimen of this species known to have been collected on American territory, the plant being an Asiatic immigrant.

Acknowledgment is here made of the kindness of Mr. Coville and the officials of the Smithsonian Institution for assistance in the identification of species.

#### ANNOTATIONS.

No terrestrial mammal was discovered on Kiska; neither batrachian nor reptile. Early in September a monster dolphin grounded on the beach in Kiska Harbor and was killed. Specific identification has not yet been made. The general color was bluish-gray; length 18½ feet; estimated weight, 3,600 pounds; sex, male. Body was quite regular in shape and rather rotund, the greatest circumference being about midway between dorsal fin and tip of the rather short snout. This dolphin was hauled alongside the ship, stripped of its blubber and the oil extracted. Some of the flesh was eaten. The oil obtained was of excellent quality. It was particularly desired for use on the wire of the deep-sea sounding machine used aboard the Patterson.

The salmon were first observed in the fresh-water streams of the island Aug. 11.

Eggs or young of the following species of birds were found on Kiska—proving it to be a breeding haunt: Red-throated loon, cackling goose, Pacific eider, forked-tail petrel, Townsend's ptarmigan, tufted puffin, green-wing teal and Aleutian song sparrow.

The lupine (*Lupinus nootkatensis* Donn.) is perhaps the most conspicuous and widely distributed plant on the island, the "wind flower" (*Anemone narcissiflora* L.) being also very abundant. The roots of both these plants are edible, and in former times were much used as food by the natives of the Aleutian Islands. The starchy bulbs of the *Fritillaria* furnish, however, a better article of diet and one that has long been a staple among the Aleuts. Boiled alone or with meat they furnish an excellent substitute for potatoes. They are, however, also eaten raw.

The procumbent arctic osier is the sturdiest shrub found on Kiska Island. There are no trees.

DR. J. HOBART EGBERT.

U. S. COAST AND GEODETIC SURVEY, Washington, D. C.

## Mammals of North America.

THE Field Columbian Museum has just published "A Check List of Mammals of the North American Continent, the West Indies, and the Neighboring Seas." By Dr. D. G. Elliott, Curator of Mammals in the museum. It is a ponderous volume, in which are enumerated not less than 1,308 species of mammals. As a check list, it is strictly technical, and yet it is a volume that should be in the possession of every American who is at all interested in the fauna of his country, and above all, in mammals. The genera are numbered, there being 222 in all. The species are also numbered, as already indicated. Following the number of each species comes its Latin name, with that of the describer, and two or three synonyms, just enough to identify the species beyond a peradventure. The English name, the type locality and the geographical distribution follow in order. In cases where there are subspecies, these are enumerated under letters of the alphabet. The preparation of such a check list represents an enormous amount of labor. The whole volume includes 761 pages, of which the index comprises no less than 216 pages.

## New York Zoological Park.

THE New York Zoological Society has just issued a second series of its views of the Zoological Park. These are Albertypes from photographs taken by Mr. Elwin R. Sanborn, the official photographer, and form a very beautiful set of views. Very naturally most of the pictures represent animals, but some show buildings, and a number of pages contain several pictures of different scenes in the Park. Very striking are the pictures of the Barbary lion and the Malay tiger. The flying cage, the Alaska totem pole and chief's house are also interesting, and the series is one which ought to be in every house, especially in every house in which there are children.

# GAME BAG AND GUN

## stern Hunting.

### Observations and Reflections of a Sportsman.

We read of the big game which once frequented the Western part of the United States in such large numbers, traveling over that section in a Pullman it is surprising to remark that we seldom see any evidence of it. Leave the line of the railway and settlement, the monotony of the sterile plain covered with sagebrush is unrelieved by any signs of animal life, except horses and cattle and occasionally herds of sheep. The old life has passed and the new has hardly developed sufficiently to supply its place.

Here and there may be found spots which excite the ardor of sportsmen, but they are generally inaccessible except through the agency of a competent guide. The great herds of buffalo which once swept over the plains in such vast numbers as to endanger the life of the pioneer, have disappeared entirely; the elk have almost vanished and their annual migrations have ceased to be a terror to the ranch man, who fenced in his hay to protect it from the famished herds. Even the smaller game has greatly diminished. There are still some localities where primeval conditions still continue to a great extent; about the most noted is the country south of the Yellowstone National Park. To the providential care of the National Government, in laying out this great preserve, is due the preservation of the principal sport which now remains. Large bands of elk frequent this preserve during the greater part of the year, until the heavy snows drive them down from the higher elevations to obtain pasturage. Other game beside elk may be hunted in the country adjacent to the Park, such as sheep, goats, antelope and black-tail deer, besides smaller animals. With a pack of well trained dogs it is also possible to hunt with success cougars, bobcats, lynx and sometimes bear. Elk and deer do not, as a rule, frequent the same locality to any extent. If one desires to hunt sheep and goats a still different plan of operation must be adopted, while antelope inhabit a country where neither elk, deer, sheep, nor goats are likely to be found, except by merest accident. The time when a sportsman could pitch his tent most anywhere and expect the wild animal life of forest and plain to come to him like they came to Adam when he first named them, has long since vanished. To hunt with success one must be thoroughly versed in woodcraft, be possessed of a good knowledge of the habits of game and the localities where they are to be found different seasons of the year—a good eye to pick out a desirable head—must be a reasonably good judge of distance, to gauge the proper elevation of a rifle. The happy combination of these qualities make the skilled hunter; marksmanship, provided it be fair, is the least of all. There are a great many men who are good shots at a stationary target who are bad shots at game, there are men who are good shots at game, who are by no means experts in shooting at a mark. This statement may seem paradoxical but readily admits of explanation. The marksman has his range given him, he takes his time, and is not betrayed into sudden action. Change these conditions and he is out of his element. If his eye is not trained to judge distance in timber or on the plain, he can easily misgauge it, and shooting at a moving object he cannot take his time; the absence of any spot on the animal near the point he is aiming at is another disadvantage to the man of the target. The practiced hunter knows his distance; his quick eye readily distinguishes his quarry, although it may blend with the landscape, so that the unpracticed eye might easily overlook it; he is accustomed to taking a quick sight and shoot, making proper allowances for the moving object; if a quick advance is possible and necessary to cut off the game before it can pass a given point for which it is heading, the huntsman chooses his course, as if by intuition, and often has a chance to get several more shots where another would fail of his opportunity. The skill of a hunter generally brings him within such proximity of game, as to relieve him of the necessity of making an extra difficult shot. It is surprising how seldom the huntsman discharges his rifle, compared to one who practices at a target. The man who is fond of target practice will probably use up as many rounds of ammunition in one afternoon shooting at a mark as the average huntsman will consume in an entire year.

A sportsman who is a fair shot and who goes in a locality where game is fairly plentiful, has every reason in the world to expect success, provided he is accompanied by a real hunter, such an one as I have above described. It is very important to employ a competent guide if one expects a successful hunt. When I speak of a competent guide I mean a man who is a good hunter and also capable of managing a hunting outfit.

Guides may be divided into three classes:

(1.) Ordinary frauds who are watching an opportunity to "work" some "dude", by which name sportsmen are sometimes designated in the slang of the country.

(2.) Backwoodsmen who are good hunters and tireless and will supply a sportsman with the best they know how to provide, but being ignorant of the ordinary comforts of civilized life, treat their sportsmen with the same cruel neglect to which they have accustomed themselves.

(3.) The man who makes a regular business of acting as a guide, who is both a good hunter and who knows how to provide a first-class outfit. Game having greatly decreased before the advance of civilization and the wanton slaughter which took no thought of the future, the wild life which survives owes its preservation to the almost inaccessible character of the country in which it has taken refuge and animal cunning, which of necessity has become very acute.

To know the habitat of game and outwit its wariness requires the skill of the practiced hunter.

We have heard a great deal about roughing it. That phrase as formerly understood, must be greatly qualified if the modern sportsman patronizes an up-to-date outfit.

Going to a wild and rather inaccessible country has a certain charm of novelty about it, and part of that charm grows out of the idea of roughing it. Some people have a tendency to greatly exaggerate the ordeals through which they pass, in order that they may enhance the interest of their experience. This goes with the same weakness for overstating the distance and increasing the apparent difficulty of the shots, which they make in securing their trophies, in which error they are too frequently sustained by the somewhat elastic conscience of the guide. This is an age of progress, and that phrase applies to methods of enjoying sport quite as well as it does to anything else. Having good sport with comfort in camp life is simply a question of dollars and cents. The mind of the average person is behind the times in understanding the present conditions of sporting life in a wild country. It must be borne in mind that hunting in the rough sections of the West, where the big game still abounds, although in much smaller numbers than formerly, everything has to be carried on pack horses. What you are to take is limited simply by the supply of pack horses you care to engage. In an up-to-date outfit the open camp-fire, such a picturesque feature in an illustration, has been supplanted by a plain sheet-iron stove, which is placed in the tent, with a few feet of pipe attached, to carry off the smoke. If one wants the open fire, it of course can be easily supplied, and at first a good many sportsmen desire it on account of the romance and novelty of the experience, but the same pampered tastes which have forced man from a savage life to adopt the comforts which civilization supplies, will invariably lead to the open camp fire being abandoned for the commonplace sheet-iron stove—very unromantic but thoroughly practical and useful. The open camp-fire, with the smoke blowing in your eyes from every direction, which gives you the sensation of being scorched on one side and frozen on the other, does not appeal to the modern sportsman, who disassociates sport from martyrdom.

Folding tables and chairs can be "packed" quite easily, and it is much pleasanter to sit in a chair and eat off of a table than to sit on a log trying to make a table of your knees, and occasionally converting your lap into a plate for your spilled victuals. A portable rubber bathtub, if one objects to jumping into cold water, satisfies the desire for cleanliness. With a fire in the stove one can take a bath as easily and comfortably in camp as at home. For thorough cleansing it is best for one to take a bath in a tent in warm water, but I strongly recommend for those who can stand it a plunge in cold water or having a bucket or two thrown over one every morning before dressing for the day. This stimulates the body and gets the system in fine condition.

For those who find it uncomfortable to sleep on the hard surface of the ground I would recommend a pneumatic mattress. An ample supply of canned stuff insures against the chance of bad cooking, because it requires little or no skill to prepare canned provisions, if the other food in camp is not particularly appetizing.

This article is not intended for the experienced huntsman who has had plenty of experience of Western hunting; nor is it intended for the man who has his heart set upon roughing it in the sense that he desires to see how much he can go through and survive. A great deal of the advice given to people has been in the opposite direction, namely, to cut out as much as possible from their hunting outfit. I claim that the average person who desires sport with as little hardship as possible, except what is unavoidable, should be very careful about reducing his outfit too much. Most sportsmen live most of the time surrounded by the ordinary comforts and conveniences of life. It is perfect folly for such people to attempt in a short time to harden themselves to the frontier life, so that they may endure its hardships with the same indifference as the hunter or trapper who lives that life all the time. I have run across sportsmen who have had their hunting trips spoiled by attempting "to rough it" too much. If you are accustomed to living well and in comfort it would be wise to recognize the fact that you are a "tenderfoot" and act accordingly. The object of a hunting trip in the West for the average sportsman is to obtain diversion and acquire health. All the roughing it one requires is the vigorous exercise, the fresh air, with an occasional dip in ice cold water, which is conducive to health; the rest of the hardship it is well to leave out as far as possible.

My experience has led me to add to a hunting outfit the oftener I go out, rather than depleting it. The first time I really saw an up-to-date outfit was in 1902, when I engaged as my guide Edward Sheffield, of Idaho. I joked him about all the things he was taking along and called him a "tenderfoot." He replied that "he had had all the roughing it he wanted in his time, and those who really knew what it was generally wanted a camp as comfortable as possible." I experienced during that trip and a subsequent one I took this fall such comfort, combined with good sport as I never had before.

In conclusion, I would advise taking an emergency case supplied with all the ordinary remedies. I have known the time when such a thing has proved extremely useful, and I have also known of sportsmen who have had their sport ruined because of the want of some simple remedy.

## North Carolina People are Happy.

RALEIGH, N. C., Nov. 24.—*Editor Forest and Stream:* The partridge shooting season has now been on almost a month. I predicted weeks before it opened that plenty of birds would be found, and the result proves this was an accurate statement. Some of the birds are not fully grown, and the other day some of my farmer friends declared they thought it would be a capital idea to have the close season extended to Dec. 1. In fact, they asked me if I would not try to get this matter attended to by the Legislature, through the Audubon Society, which is now so powerful in North Carolina. The fact is, that the good shooting really does not begin until December, the weeds now being very rank and stiff, making it hard on dogs. This year a heavy freeze came much earlier than usual, and the woods are more open than is common at this time of year, but in the blackjack and post-oak scrub the leaves hang on until the spring. The fall has been very dry and the birds are quite largely along the streams. Where there are rivers the partridges are remarkably smart, taking care as soon as flushed to fly across the stream. This is the case around Moncure, where the Deep and Haw rivers unite and form the Cape Fear. A friend tells me that the birds anywhere near these streams make a practice of going directly across as soon as flushed, so there is only one crack at a covey. I have known birds to do this near Raleigh also.

A gentleman who was out last week a few miles north of Raleigh tells me he found eighteen coveys during the day, which is a very good number. He found some birds not grown, as I have already stated. Mr. Robert Baldwin and Mr. Charles Hervey, of Raleigh, went down on the Carolina Central Railway, between Hamlet and Wilmington, near the South Carolina line, and found good sport, getting ninety-six birds in two days, besides other kinds of game. I want to recommend that section to sportsmen. It is on the Seaboard Air Line, and Hamlet is a good point to start from, as one can go out on the road toward Maxton or Gibson or up a little ways toward Charlotte, and get back in the evening, though a better way still is to get acquainted with people out in the country, go to their homes and rough it. This is the best way not only to get acquainted with the people but to get the best results as to game. Of course, hunters from the cities will miss some comforts, but what do they care for that, so long as the sport is good and the people clever? I had a talk with Mr. Charles H. Gattis at Raleigh, the district passenger agent of the Seaboard Air Line, about this matter, and he said that if people would write to him he would be glad to show them where they could get good shooting. A number of letters from people up north have already come to me about these matters.

Mr. Neill Spence, of Raleigh, tells me that during his life, which has not been a long one, he has killed 700 wild turkeys. He usually hunts along the Cape Fear River, south of Raleigh, now reached by a new railroad, and last week out of eight shots he killed seven turkeys. He goes out with a dog, any time in the day, finds the turkeys, scatters them, then waits about two hours and "yelps them up," as the hunters say in this country, using a "yelper" for this purpose. By the way, an old man named Draughan, who lives at Fayetteville, makes the best turkey yelper I ever heard of, and also makes calls for other kinds of game very cleverly indeed.

T. K. Bruner, secretary of the State Board of Agriculture, and Herbert Brimley, the curator of the State Museum, left a day or so ago for Newberne and vicinity, to get some shooting at ducks and geese at Lake Ellis and the other lakes to which reference was made in FOREST AND STREAM some months ago. It was in one of these lakes that Mr. Brimley had some exciting adventures with big alligators. In one of them is a colony of cormorants, of which mention has also been made. Near this point is a stream known as Slocum's Creek, much affected by hunters. A devoted sportsman who came up from there to-day, declared that yesterday there were fourteen gasoline boats in the creek (by count) and that the gunners were so excited that they would shoot if they even heard the "honk" of a wild goose; as a result having scared all the game away. The lakes are on land which is private and very closely preserved, and so the pot-hunter cuts no figure there, only invited persons getting a chance at the fine sport to be had. Governor Glenn and the writer will get there later in the winter, having been specially invited some months ago.

There has only been one cold spell this season so far, during which the temperature fell as low as twenty degrees here. It lasted only a day, but many ducks and geese came into the sounds near the coast. There was a little flurry of snow at the same time. In several of the sounds wild celery has been set and wild rice planted, but Currituck Sound, the headquarters of the ducks and geese, is the one where the bottom for miles is covered with celery, which these birds love so well. In some of the inland lakes rice has been planted, and this attracts ducks very freely.

For some reason or other an unusually large number of bear are being killed this season, particularly in the eastern counties, the dense swamps, which are a tangle of bay bushes and all sorts of semi-tropical growths being the lurking places of these beasts. I have heard of more than 200 being killed in eight or ten counties already. Many deer are being killed also, mainly in that section, but some in the mountains.

Speaking about partridges, I want to say that very good shooting will be found in Johnston county, around Smithfield, where the people are very sociable and live in good style, as they have always been used to doing. That county has always been a good point for partridge

shooting, though relatively few people go there, simply because they do not know about it. It can be reached by the Atlantic Coast Line and the Southern Railway. I have always thought there were as many partridges east of Raleigh as there are west of it. For one reason the winters are not so hard and there is much more natural food for them, in addition to this being the fact that there are great areas planted in cornfield peas, this being the best of all food for partridges. And right here let me say to sportsmen who come here from the north, for heaven's sake, never use the word "quail" while in North Carolina, for not one countryman out of a hundred (no not one perhaps out of a thousand) will know what you mean. Everybody here says "partridges." That always has been the word, and it always will be. It was suggested early in this article that people who come to North Carolina to hunt ought to go out and take pot-luck with the farmers. They can get accommodations at very reasonable rates, and the companionship will do them good and will also be of benefit to the people with whom they stop, for the average sportsman is not only a clever fellow but a well informed one also, and his visit does no harm to any community. By being on the spot he can get more hunting and more kinds of hunting. For example, he can get some fox hunting, as there is a pack of hounds in range in many sections of the State; he is sure to get good rabbit hunting with hounds, and there certainly isn't any jollier sport than this, and no such chance to get all the fun there is out of a nigger, who would rather hunt rabbits than do anything in the world, unless it may be to capture a 'possum. By being out in the country a northern sportsman can also get the benefit of 'possum hunting, and this is good fun and plenty of it. A little "dram" of North Carolina corn whisky, just a nip, taken immediately after each 'possum is caught, is considered the correct thing, besides which some fried chicken and biscuit, an apple or two, or maybe a piece of home-cured ham or bacon and some North Carolina sweet potatoes make up a midnight lunch for which John D. Rockefeller would be willing to give \$500, no doubt. North Carolinians who live in the country enjoy these things as they do the very air the good God gives them, and as they talk about the time they have had in the woods there is never a shade of envy of the poor wretch, their brother man, who toils and moils in some city. Are there a happier people on earth than these Tar Heels? No. President Roosevelt, when he was here in October, declared that in all his life he had not seen a happier lot of folks, and he was right. This much is to be said of these clear-eyed, clear-headed, nature-loving and hunting people here, and this is that they are the very essence of the straight Anglo-Saxon strain in this country. If anybody wants to mingle with Americans, right here is the place to find them. One piece of advice to strangers coming here is to be sociable and fall right into line with the people, no matter whether it be in city, in town or in country. Nothing pleases the people here so well as this and nothing will be of so much benefit to a visitor. But the true sportsman generally knows exactly how to do these things, and this is one of the secrets of his popularity anywhere.

It must be remembered that the North Carolina annual tax on non-resident gunners is \$10. The money which has been derived from this source has certainly been well expended by the Audubon Society, which receives it, and a world of good work has been done since that Society was put on its feet by the North Carolina Legislature. The fact is, that the Society, and the State as well, has been wonderfully well served by the secretary, Mr. Gilbert Pearson, whose reputation as a worker, writer and speaker is not confined to North Carolina. Last week he was over in South Carolina and is setting things going there. The example of what North Carolina has done is a happy one. A number of plans for the further extension and improvement of the work are now on the way.

F. A. OLDS.

## Adirondack Deer Hunting.

In the northern part of the Adirondacks hunters have met with excellent success this fall, while in the southern portion they have, as a rule, been but poorly rewarded for their time and labor. From Lake Placid, Tupper Lake, Chateaugay Lake, Wolf Pond, Plumadore Pond, McCullom's and other points in the upper section of the wilderness it is reported that more deer have been killed than ever before in one season, and it is said that in the Cranberry Lake region there have been more deer this fall than for some years past. In the southern and southwestern portions of the Adirondacks, however, the number has been small in comparison with other recent years. This is true of the Moose River, Beaver River, Black River and West Canada Creek regions, Piseco Lake, Honnedaga Lake, the Bisby Lakes, Fulton Chain, Racquette Lake and Big Moose Lake, according to the best information now obtainable, although why such should be the case is not easy to explain.

It seems strangely contradictory and almost inexplicable that on the northern slope of the Adirondacks the best deer hunting ever known should be enjoyed, while in the southern portion of the wilderness sportsmen should meet with comparatively poor success. The fact that few if any complaints as to the scarcity of deer in the southern Adirondacks have been heard this year tends to increase the mystery and render the situation still more puzzling. So far as can be learned, deer are quite plentiful all through the lower portion of the wilderness, as well as farther north, but hunters have found it an extremely difficult matter to obtain a shot. The most common explanation that is given for their lack of success is that the undergrowth was exceedingly dense this year and the leaves remained on the trees and bushes until very late, thus rendering it difficult for a person to see a deer, and that an additional drawback was encountered after the leaves had fallen, owing to the fact that they were very dry and crisp, and it was impossible for a hunter to move about in the woods without making sufficient noise to alarm any game that might be in the vicinity.

With November snow came, and thereafter the hunting materially improved. A good many deer were killed during the closing days of the season in all parts of the woods, but the fact remains that the aggregate number

taken this fall was probably considerably smaller than last year or the year before.

W. E. WOLCOTT.

UTICA, N. Y.

## Massachusetts Association.

Editor Forest and Stream:

We desire to ask your attention to the work done by the Massachusetts Fish and Game Protective Association during the present year.

We have attended all hearings given by the legislative Committee on Fish and Game upon bills relating to the protection of either fish or game, opposing such as we deemed objectionable, and favoring those we considered wise.

We strongly urged the passage of the bill requiring unnaturalized foreign-born residents to procure a license for hunting (\$15), believing its enactment and enforcement would keep out of the fields and woods a class of hunters accustomed to kill everything from a chicadee to a ruffed grouse, and who have destroyed many of our song and insectivorous birds. The Association proposes to see that it is strictly enforced.

### Hunters' License.

The bill requiring every hunter to procure a license, paying therefor the sum of \$1, was not favored by the Association for the following reasons:

First.—We were of the opinion that the section exempting the farmer and members of his family on his own premises would lead to complications in attempts to enforce the law.

Secondly.—It having come to our knowledge that many agriculturalists of the State were opposed to the bill, it did not seem to us wise to antagonize them at a time when there was ample evidence of rapidly increasing interest among them in the preservation of our game and fish. It was our belief, that, without the approval and moral support of those on whose lands the game is to be found, the law would be difficult of enforcement and therefore fail to accomplish the purpose of its advocates.

The House chairman of the Committee on Ways and Means offered objections before the committee at the hearing of the bill, to the manner provided in it for the expenditure of the amount to be derived from the sale of licenses, as being wholly at variance with the established policy of the commonwealth, which, he claimed, has been to make direct appropriations to meet the wants of the various departments for definite and specific objects. The plan of the bill to apply one-half the proceeds from sale of licenses to the payment of wardens, and the balance to the purchase of live quail for stocking he pronounced to be a new departure and wrong in principle.

While we were aware that some of the farmers were in favor of a license law we believed the majority of them were opposed, and at the hearing before the committee they made a strong showing in remonstrance, as we had anticipated.

The witness above referred to, and others, declared that if the bill were enacted it would lead to the posting of their lands by holders generally throughout the State. We were of the opinion that if that were to be the result of the law it would be a great detriment to the public—that it would lead to the condition which now prevails in the British Isles, where there is absolutely no opportunity for hunting except for the landed proprietor and his guests—a condition wholly un-American and which we should greatly deplore.

While prevented by what seemed to us reasons of great weight, from giving our support to the bill, we were and are in full accord with the purposes of those who presented it and urged its enactment.

We are aware that some thirty-five States of the Union have non-resident license laws, eight of them have resident licenses, which, in the case of five of them, apply to the shooting of small game.

We have believed that in proper form a license law would contribute to the protection of our game and that when public sentiment shall have become such that it will not produce the result above mentioned, when the people in the rural districts shall become sufficiently impressed with the importance of game preservation, the time will be ripe for the enactment of a law for the licensing of hunters.

### Lobster Bills.

When the hearing was given on the bill to legalize the sale of lobsters of nine inches imported from Nova Scotia or elsewhere, the Association went on record as a remonstrant.

In addition to providing the opponents of the pending bills with extraordinary expert testimony, a petition in favor of holding the present law signed by hundreds of prominent bankers and business men of Boston, and another by all the leading hotel proprietors of the city, with letters of remonstrance from prominent members of the Association, were placed in Senator Harding's hands. The result was the defeat of the proposed bills—a decided victory for the Association.

Twice before has the Association saved the present law, each time by the interposition of the Governor's veto of bills reducing the legal limit to nine inches.

### Bill for Bounty on Foxes.

Early in the year, we made a careful investigation of the injury done to game by foxes, and have now on file a large number of letters received in answer to inquiries bearing on that subject. In many of these the testimony weighs heavily against the fox, while a few are of a different tenor. But in view of the declaration of the Biological Division of the Agricultural Department of the United States Government, that the States which have tried bounty laws have found them very unsatisfactory, and have caused their repeal, the officers of the Association did not take a stand in favor of the bounty bill. The committee reported against it.

### December Shooting of Quail.

A bill was presented in the Legislature to change the shooting season on quail, making it November and December instead of October and November. At the hearing before the committee the author of the bill appeared

alone in favor of the proposed change, while several members of the legislative committee of the Association and of the central committee, together with officers of several prominent clubs, and some individuals, not less than twenty in all, spoke strongly against the bill. But in spite of the overwhelming mass of testimony in opposition, the committee, much to the surprise of everyone cognizant of the facts, reported in favor of the bill. A circular stating the facts and giving the views of the sportsmen, was distributed among members of the Legislature, and sufficient time elapsed before final action for the Solons to learn the opinions of their constituents, and the committee, seeing the mistake they had made, reported a modified bill, closing October against quail shooting without opening December, leaving the law as it now stands, the month of November only being open to the shooting of quail.

### Quail Cards and Food.

Early in the year we caused to be printed cards with an appropriate illustrated heading, adapted for display in public places, urging people to feed the quail. These cards were sent to postmasters all over the State, as well as to associations and individuals known to be interested in birds, and at the same time the announcement was made through the press that all applicants would be supplied with quail food free of charge.

A mixture of various grains and bird seeds was purchased and bags, containing either twenty-five or fifty pounds each, were sent out to some 150 different towns in the State, amounting in the aggregate to several tons.

Instructions in methods of feeding were also sent to those who applied for grain, and to many persons who fed the birds with grain purchased by themselves. In this way many birds were carried through the winter that otherwise would have perished from starvation.

### Birds for Stocking.

During the year 1904 our committee was successful in obtaining about 2,000 live quail in Kansas. They were strong, hardy birds, and were liberated here in excellent condition; but our efforts in 1905 to obtain birds from the same source were entirely unsuccessful, although throughout the season we were led to believe by letters and telegrams that birds were liable to be shipped any day. Our efforts in North Carolina, while unsuccessful in 1905, will undoubtedly be rewarded this year, as we have obtained the proper permits to take quail from that State, and are at present arranging to have the birds trapped and are perfecting suitable shipping crates, and the committee is satisfied that a large number of quail will be obtained this year for restocking purposes.

We are glad to acknowledge the valuable assistance and co-operation of numerous societies and clubs in every branch of our work and especially in matters of legislation and of restocking the covers with game.

H. H. KIMBALL, Secretary.

## Trappers and Indian Fighters.

C. W. MASON writes in the Brooklyn Eagle of "Bill" Hamilton's book in this appreciative strain:

"I recommend the book most cordially as a man's book. Mr. Hamilton is the real thing—simple, reticent and unadorned, and the conviction that his Indian fights are unexaggerated realities, instead of romance, makes them keen reading. It is outdoor stuff and frontier history, told by a man who is old enough to desire no longer to pose as a hero. I do not mean to imply that when he was younger Mr. Hamilton desired to pose for a hero, because he is Scotch by birth. But heroes—real heroes, like the old trappers—were not without a big-lunged boastfulness. It is the author-kind that has built up the impression that a braggart is a coward. I, personally, from a rather cosmopolitan experience, am prepared to take a good many braggarts at their word. When a man steers into camp, flourishing revolvers and announcing himself as the holy terror of Kansas, I am sitting quiet and leaving it to some other literary person to see his flush. But there is no conscious braggadocio about Mr. Hamilton.

"So to the man on the boundary there is always one who has gone beyond in comparison to whom the pioneer recognizes himself a novice. The original pioneers long recognized the superiority of the Indian. Mr. Hamilton proves most conclusively that the Indian was no match for the pale face in the supreme business of fighting, either at long range or hand to hand, but I find him always writing of the Indians as men to be respected. Indian fighting has figured so much in romance that we hardly realize that it was the normal condition of pioneering, and that is what makes the American pioneer and his descendants a human item as reliable an evolution as steel wire is in mechanics. Few conquered nations that I recall have put up as prolonged a fight as the Indian. They resisted invasion inch by inch so long that a whole generation was trained in hardihood. I like to hear that the trappers scalped the Indians as a matter of course. I like to hear that when they overtook a marauding tribe they showed it no mercy. Indian warfare did not encourage sentimentalism, although it was just as rampant in the East then as to-day. The one sure cure for sentimentalism is the sight of the mutilated corpse and burned homestead of your brother. It releases the healthiest of all passions—unrelenting revenge. We don't call revenge a healthy passion in our stuffy civilization because it disturbs things. But at the distance of fifty years and the Rocky Mountains it looks very healthy. The men who lived, not spasmodically, in the stress of the magnificent human passions were as men purged of the unhealthy, the sentimental, the morbid. The passions of war are not morbid passions. These trappers took battle as a matter of course. They were not excited about it, as our young volunteers and the young volunteers of England get excited when they go to war and are called heroes. When the rifle practice was over and it came to "toothpicks" and tomahawks these big pale faces in their woolly buckskins were fighting devils. But before and after they had a grim, good natured sangfroid about it. We haven't room for them in cities now, but we must recognize that the American nation would not be what it is without the hardy strain they planted."

## Work of the Ohio Commission.

COLUMBUS, Ind., Nov. 23.—*Editor Forest and Stream:* I beg to inclose herewith clipping from the New Albany Daily Tribune giving a sample of the work we are doing in Indiana at present. Since the adjournment of the Legislature last March we have made over 300 convictions, and there never was a time when the fish and game laws were better respected than at present.

Z. T. SWEENEY, Commissioner.

"William Rowley, Jacob Schuman, Peter Knabel and Fred Petri, residents of Lafayette township, were arrested yesterday afternoon by Deputy Game Wardens John W. Newhouse and W. L. Martin, of Indianapolis, on charges of violating the provisions of the State game laws prohibiting the hunting or shooting of game with shotguns or other weapons on Sunday.

"This is the first time that efforts have been made to enforce the law, although there have been many complaints of violation, and there was consternation among the hunters when the deputies made their descent. The deputies arrived in the city Saturday night but kept their identity a secret. Yesterday morning they engaged a livery rig and drove to the country and bagged their game.

"The hunters were notified to appear before Justice Fogle this morning, and their weapons, a wagon and game, were taken from them as evidence. They were permitted to return to their homes until to-day. One of the four men attempted to escape but was overtaken by Deputy Newhouse, and when caught protested that he was only trying to catch a rooster that had escaped from a hennery.

"The deputy had some difficulty in convincing the men that they were authorized to take their shotguns, as the farmers thought they might be swindlers who were trying to work some new game on the unsophisticated ruralite, but a display of their credentials by the deputies soon convinced them that they had the authority.

"The four men appeared to-day before Justice Fogle and were fined \$1 and costs, amounting to \$30.80 each. Knabel at first thought he would lay it out in jail, but he changed his mind. All either paid or arranged for friends to "stay" the fines and costs. Deputy Newhouse stated last night that the arrests yesterday would probably save the lives of thousands of quail."

## Cleaning Rifles.

BOISE BARRACKS, Idaho, Nov. 21.—*Editor Forest and Stream:* In your issue of Nov. 18 John P. Boagni asks how to keep the barrels of high pressure rifles clean and bright. Having used the .30-40-200 U. S. Government, known as the Krag, for the past eight years, I have found the following a good method to pursue and one which will work well with any of the high powers. Upon returning from the hunt or the target range, make a saturated solution of sal soda in hot water, the hotter the water the better, then dipping a soft cleaning cloth in this wipe thoroughly. The rag should not be tight, as it is better and safer to draw through an extra time or two rather than have a rag jammed in the rifling. This will remove all residue. Then with clean, dry rags wipe thoroughly, or if one prefer, the first rag after the solution is used may be wet with clean hot water; this will eliminate the sal soda. After thoroughly drying—and the fact that the barrel is hot from the use of the hot water will help to get it dry—oil lightly by drawing through a rag lightly oiled with any good gun oil. We use the pure sperm, as that answers the purpose and is furnished by the Ordnance Department. If the gun has been used in military firing and has been heated to such a degree that it is uncomfortable to hold in the bare hand, it is well to examine the rifling on the day following the shoot, when, if any discoloration shows, a dry rag will take all out; and then the weapon will remain bright until used again.

We of the army are compelled to keep our carbines clean, in fact to keep everything that way; and I have always found the above method to give me a barrel shining like glass. Of course this method will not do for a hunting trip; then, after shooting for the day, a clean, dry rag, to take out the loose powder grains, followed by an oiled rag will keep the gun serviceable until one can get a chance to get at it properly. I used this method in the fall of 1899 from Oct. 1 until Dec. 9, and used a good bit of ammunition also, being in Lawton's northern expedition when we were chasing Aguinaldo's column to the north through Luzon, P. I. In all that time we were never really in camp for more than a day or so at a time, and then all we had was a leather thong, a bit of rag torn off of our clothes; with a little oil; yet, when I came to thoroughly clean up my carbine in December and went at it as above, I found that in fifteen minutes I had as bright a barrel as could be wished for.

In case the gun has been allowed to stand for several days after shooting and before cleaning, it is well to place an empty shell in the breech and fill the barrel with hot water, or the hot sal soda and allow to stand until the barrel feels hot to the hand. This will open the pores of the steel and allow the solution to get to work on the residue from the burnt powder, and also on the coating of cupro nickel, which is on all of our barrels, caused from the extreme velocity of the bullet passing through the barrel wearing off portions of the cupro-nickel with which the bullet is jacketed. This proceeding will answer for any of the high powers. I have used it on the .30-30, .25-35, .303, and the Luger automatic.

EDWARD O. LYMAN,

First Sergeant Troop E, Third Cavalry.

BUFFALO, N. Y., Nov. 27.—*Editor Forest and Stream:* In your issue of Nov. 18 Mr. John P. Boagni asks for information regarding the cleaning of the high power smokeless rifle barrel, in which connection will say that if he will get a small box of Tripolene, a soft paste, manufactured by the Matchless Metal Polish Co., Chicago, Ill., and use it in this manner I think he will have no further difficulties in that direction. First take some good oil, three-in-one is the best I ever used, and soak up whatever you may wish to remove from the barrel,

then take a clean rag, well oiled, and covered with a little of the Tripolene, and pass it back and forth through the barrel several times, the more the better of course, as elbow grease is very necessary in these cases, and he will be surprised at what he will get. After taking out all the powder residue and lead, should there be any, wipe perfectly clean and oil with the three-in-one and your gun will be as bright and clean as the day it came from the factory. This will apply to shotgun barrels as well as to rifles. I have found this much better than any metal cleaner in the shape of brass or wire, as it will reach every part of the barrel, clean and polish it nicely, leaving a soft oily finish, and cannot possibly scratch or injure the barrel, as well as being very quickly and easily done.

TRIPOLENE.

MORGANTOWN, W. Va., Nov. 23.—*Editor Forest and Stream:* I reckoned the question asked recently by John P. Boagni concerning the cleaning of smokeless powder rifle barrels would be fully answered by some one in this week's issue, but I see it is still open. I have never used the high power powders myself, but please allow me to say that I have never yet found any substance adhering to the inside of a rifle barrel which could not be readily removed by applying wood alcohol to the swab used for cleaning. I have used it with success where everything else failed, and never think of using anything else.

EMERSON CARNEY.

## Long Island Duck Netters.

THE East Moriches, L. I., correspondent of the Brooklyn Eagle says:

"When the guides of this place, with one of their number, a special game protector, as leader, raided the gill-nets containing many redheads and other wild ducks, as told in the Eagle a week ago, it was thought that no further action would be taken than the destruction of the nets, as it was believed that the raid would be a lesson for the netters, although the guides in this section were determined to break up the illegal, indiscriminate slaughter of the birds, by law, if practicable, but otherwise, if necessary.

"Justice Howell did not decide to proceed without notifying State Game Protector Overton, who, under instructions from the Fish and Game Commissioners, decided to prosecute the alleged violators of the law. Steps are being taken for a vigorous prosecution of the netters, and it is probable that within the next two or three days a Westhampton fisherman will be called to appear and defend himself upon the charge of illegally taking wild-fowl, and that two of the man's sons will be jointly charged with netting ducks. There is declared to be sufficient evidence to justify beginning proceedings against the parties.

"Numerous affidavits are being taken on which to commence action. There will be quite an array of witnesses, as most of the local guides have at one time or another watched the netters. The guides are supported in their effort to stop the practice by the city sportsmen.

"One of the latter told Game Protector Smith on the morning of the raid to take the nets ashore burn them, and send his, the sportsman's, card to the owners of the nets, and he would assume all responsibility. The guides making the raid asked the Eagle reporter, at the time, not to use their names, but now that legal proceedings against the alleged violators of the law are sure to follow, there is no reason why the guides should longer hesitate to have their names appear, especially as they all, and many others, are to be called as witnesses for the prosecution.

"The guides making the raid were Howell C. Smith, who is also a special game protector; Capt. Elbert Brown, Russell G. Smith, Edgar Benjamin, Frank Albin and George W. Palmer. They are the leading guides for wild-fowl shooting in this section.

"The number of the birds alleged to have been illegally taken is so large that with the penalty of \$25 for each bird, the gross amount of the penalties will be a big sum for men in such circumstances as the accused parties to pay. Herein lies the best chance for the accused to escape conviction, according to the theory of the prosecution, whose only misgiving as to the result is that some 'tender-hearted' jurymen may stand out against a conviction for the sole reason of the excessive amount of the combined penalties."

## Mr. Burnham's Appointment.

NEW YORK, Nov. 24.—*Editor Forest and Stream:* When I saw the article printed in the Evening Post of the 22d inst. attacking the appointment of John B. Burnham, of Essex, N. Y., to the game wardenship it was my intention to contradict it at length, but to those who know Mr. Burnham it is so patently a perversion of the truth that I shall devote only a short time to its denial.

The article contains an innuendo, the fabric of which is libel, whose warp is lies and whose woof is malice.

For six years I have had the honor of calling John Burnham friend, and during that time I have been associated with him closely and intimately, and I have known his personal and business affairs almost as thoroughly as he himself. I know him to be the soul of honor and integrity; a man of high ideas and ideals; a man who cannot, be the consideration what it may, be swerved from the path of duty and uprightness.

In the community where he lives Mr. Burnham has been upheld and vindicated in the position which he took in regard to the charges made as to the pollution of Lake Champlain.

H. B. WALMSLEY.

## Prince Louis Joins the Canadian Camp.

HARRY V. RADFORD, secretary of the Canadian Camp, announces that Rear Admiral Prince Louis of Battenberg has accepted membership in that organization. Prince Louis' acceptance was received through Dr. G. Lenox Curtis, president of the Camp, on the morning of the former's departure for Gibraltar. The Prince is an ardent sportsman. Admiral Evans, who represented the United States Government during the recent entertainment of the Prince and the officers and men of his fleet during their stay in American waters, is a member of the advisory board of the Canadian Camp.

## Indian Wild Beasts.

THE number of people killed last year, in British India, native States excluded, by elephants, tigers, leopards, bears, wolves, snakes and other wild animals, was, according to an official return, 24,037. Snakebites accounted for 21,880 of the deaths, the total under this head being larger than in 1903. Anti-venene, prepared at the Pasteur Institute, Kasauli, is reported to have been used with success in a couple of cases of snakebite; and since the return was compiled—within the last few weeks, in fact—further proof of the efficacy of the remedy has been afforded. A sepoy was bitten by a cobra last month, at Trichinopoly, and his life is said to have been saved by the administration of anti-venene two hours afterward. Treatment by permanganate of potassium is also found beneficial; and in the central provinces, where 1,550 deaths from snakebite were reported during the year, steps are being taken to make this remedy better known. But the best way of reducing the mortality from snakebite is to give rewards for the destruction of the venomous kinds, or, still better, to buy snakes' eggs at so much a thousand. During the twelve months, between Rs. 2,000 and Rs. 3,000 was spent by the authorities on the destruction of snakes, and the amount would probably be increased were it not that the practice of breeding snakes for the sake of the Government reward is not unknown to the astute Indian. Twenty people were killed in Bengal during the year by elephants, and eighteen in Assam. Fewer people were killed by tigers than during the previous year, though there were 342 deaths from this cause in Bengal alone. In one district of Burma twenty-one persons were killed by tigers; three man-eaters, of whom two have since been shot, being held answerable for the majority of these casualties. On the Upper Chindwin, a single man-eater, who has since been poisoned, is said to have killed fifteen persons during the year. The Government paid over Rs. 35,500 in rewards for the destruction of tigers in 1904, at an average rate of about Rs. 26 a head.—London Standard.

## Betting on Quail Pools.

CHASE CITY, Va., Nov. 23.—Wednesday last a Mecklenburg quail shooting pool match was made up, the participants paying \$1 each for the privilege of guessing the nearest to the number of birds that would be killed on Nov. 22 by the three couples of contesting sportsmen. The result was declared in the evening by posting the contesting pairs as follows: Dr. A. H. Boyd, Charleston, W. Va., and Col. W. T. Hughes, 44; Mr. W. A. Faunce, Atlantic City, N. J., and Mr. Arthur L. J. Smith, New York city, 36; Messrs. R. B. Clark and W. J. Gordon, New York city, 39, making a total of 119 birds. Mr. J. E. Wood, a crack Philadelphia shot, was the successful gunner and took the pool money.

## Fox Trapping in Vermont.

*Editor Forest and Stream:*

Having just returned from my vacation spent in Walden, Vt., I should like to add to the columns of your paper my experience with sly reynard for the month of October. It was my first vacation from business in the city for eight years, so I was somewhat out of practice. I commenced Oct. 1 to get things into shape and look the ground over, but did not put out any traps until the middle of the month, and took them all in Nov. 2; in the meantime I took fifty foxes into my traps and saved forty-three, seven succeeded in getting away. Game birds are also plentiful in that section and afford excellent shooting.

O. E. KITTREDGE.

## "In the Lodges of the Blackfeet."

PHILADELPHIA, Nov. 24.—*Editor Forest and Stream:* If the subsequent chapters on "In the Lodges of the Blackfeet" are as interesting and instructive as the first one, your paper is extremely reasonable with everything else left out.

STEPHEN P. M. TASKER.

THE VAGABOND BOOK, by Frank Farrington, comes to us from the Oquaga Press, of Deposit, N. Y. It is an attractive little volume, consisting of short essays and poems on outdoor life, much of the matter having already appeared in various periodicals. Many of the essays have in them much real feeling. They cover hours out of doors at all seasons of the year, and deal with the fields, the woods, the rivers and the springs, and with walking, camping, trapping and fishing, and generally with judicious and timely loafing and rest. Mr. Farrington preaches well the out-door gospel to which so many people are nowadays being converted, and much that he says will appeal to all of those who have a love for out of doors. Price \$1.00.

ADIRONDACK MURRAY—A biographical appreciation by Harry G. Radford.

The Broadway Publishing Co. has just brought out in a tiny illustrated volume, Mr. Radford's sketch of William H. H. Murray, better known as Adirondack Murray, published in 1904. Many of us remember Mr. Murray in the zenith of his fame as a man brilliant to the verge of eccentricity, and a talker and writer of pure and beautiful English. He was a keen sportsman, and his most famous book, "Adventures in the Wilderness," did much to bring the Adirondacks to popular notice. Price, 50 cents.

## Over 100 Ways to Work One's Way Through College.

THIS book, by Selby A. Moran, printed at Ann Arbor, Mich., gives more than a hundred different suggestions as to how money to pay his way may be earned by the student. The author started out to work his way through college, the possessor merely of the clothes he wore and \$9.27 in cash. He earned his entire college expenses and graduated a few years later. Since then, residing in a university community, he has been in close touch with students, many of whom have earned a large part or all of their expenses. He is thus peculiarly qualified by experience to write on this subject.

## An Angler in Newfoundland.

Editor Forest and Stream:

Having spent a most delightful summer in Newfoundland, that Mecca of fishermen, I thought it might interest some of my brother anglers to give them a few of my experiences in that almost unknown region.

The climate of this beautiful country to the parched and sun-cured denizen of New York and to the tired and used-up sportsman is like a bracing tonic. Think of the thermometer ranging from 58 to 68 degrees during the torrid months of July and August! While your friends in the States are sweltering under the heat, you are tucked under two blankets, dreaming that the summer is ended and wondering perhaps if there will be frost in the morning. In July there were still large amounts of snow lying in the valleys.

Newfoundland can also boast of mountains, those of the Southwest Range varying from 1500 to 1800 feet in height. They are covered to the top with a species of fir whose branches spread over the ground and make a capital bed for the sportsman to sleep on. They are so used by the caribou hunter in the fall on his way to the barrens—large, flat plains, miles in extent, covered with short, wild grass and crisp, white, curly moss, the main food for big game during the winter months. As for the wildflowers, they are of every conceivable hue and shade, forming combinations of color that Turner would delight in.

Many people living in the States have the impression that Newfoundland is a low, flat, rocky and unattractive country. The truth is quite the reverse. It is a land of mountains, glorious, rushing rivers, fertile plains and well-cultivated valleys. As for the natives, though primitive in their living and views, they extend a warm welcome to the stranger and do all in their power to make him comfortable. I wish I could remember all their little acts of kindness during my recent trip. To give an example: On Sunday, which is a day of rest from fishing, the farm horses were hitched up to the Sunday-go-to-meeting wagon and I was invited to take a drive to a point of interest some twelve miles away. This was a free ride and never charged in the \$7 weekly bill. I thought of those drives, extras put up for my lunch, mending and drying my clothes, and felt mean when I made a little present to the family and help. On leaving, the kind shake of the hand, the pat on the shoulder, and the voices which said: "We hope you will come again, when you will find things more comfortable," make one feel that life is worth living surrounded by such sympathetic, loving folk. I met a man, while staying at the Bay of Islands, who intended visiting some copper mines, miles up the coast. I asked him where he stayed, as his journey led through a very sparsely settled country. His reply was simple and to the point, "At night, you make a bee-line for the first house you come across. Walk in and you will be given the best the house affords, not always a bed, but plenty of blankets, a good breakfast and started on your way the next morning with the good wishes of your host, and no money asked. If you should happen to be a native you could travel from one end of the country to the other without costing you a single cent for board and lodging." He added that he had a house of his own at York Harbor, which was generally full during the winter with strangers passing through, and of these he would take money only from those who were able to afford it.

On arriving at Port au Basque, Newfoundland, after a six-hour night trip on a most up-to-date little channel steamer, The Bruce, having left North Sydney, Cape Breton Island, the night previous, you are summoned to appear before the Customs and declare what you have dutiable in the shape of sporting implements. There is a duty of 20 per cent. on all rods, rifles, shot-guns, covers, etc. The money, however, will be refunded if you produce the articles on your return home. The custom house officers I found most obliging and welcomed the old guard, who come year after year, calling them by their first names.

I left a deposit on my rods, and as my small bills were about used up, I offered a \$50 bank note. I received a lot of paper certificates, printed on a form similar to a receipt book, engraved with these mystic words: "The Commissioners of Charities will pay to James Smith, pauper, three dollars." I had some of the Smith, Brown, Jones family with varying amounts, and one old "Brown, pauper," for eleven dollars. I rebelled at first, but was pacified when told that they were taken at all places at a premium over notes, even guides preferring them to silver dollars. As things are not very expensive in this land of simplicity, it took me nearly a month to work off this valuable amount of script.

While at the Customs, I noticed a party of young men under the care of a fishing tutor (most probably sent by their father) to be crammed up for their next fall exams, and also to get health and muscle in the woods. They were told they must first pay the duty or leave their effects behind. They all had new outfits. This unexpected demand on their purse cast a gloom over the whole party, the sporting tutor, no doubt, expecting to get his charges into camp and then get his remittances later.

My first experience of Newfoundland fishing was at Doyles, on the Grand Codroy, but as it was late for that river (I found most of the salmon had been taken early in June and most of the attractive pools occupied), I contented myself with catching some sea trout and grilse, but no salmon. To fish this river we had to row three miles up in a light-built dory to the tide-water pool, the time spent in making this morning

journey was one of the pleasantest of the day. The river is wide, rather sluggish, with few large boulders to hit upon, high, densely-wooded hills, dropping gently down to walls of rock which descend to the river's edge. In places I noticed trees which had fallen or rather seemed to have been wrenched from their roots fully fifty feet above the river's bed. I was told that this was caused by the ice coming down in the spring freshets. The lights and shadows falling on the water from trees and rocks, painting its surface with varying tints of green and purple rising into harmonies of brown and red, made a picture never to be forgotten.

It was on one of these forest excursions to unknown pleasures awaiting me in casting a fly, that I found, on arriving at the pool, I had lost my fly-book, containing leaders, etc. I told my guide to row back and see if we could find it. I remembered putting it in an outside pocket of my fishing jacket, on starting, but as the after part of a dory is rather limited, it must have worked itself out as I turned from side to side to take in the beauty of the scenery. After paddling slowly for about a mile, Tom remarked: "I thought I saw something floating like a chip about here. It might have been that book," but we reached home without it.

I got some more tackle from Halifax, after three days, in the meantime using a trout rod and small flies I had in a pocketbook. I told the youth of the place to search the edge of the river and offered a reward to the finder, but without results. Nine days after, without a particle of wind or ripple on the water, we started for the pool. After rowing about two miles, not thinking of the lost book, it suddenly came to my mind that we must be in the vicinity of the floating chip. I called Tom's attention to the fact. He said: Too bad, that book must have cost \$25; but you won't find it, as it must be soaked and gone to the bottom. The boys have hunted and have not overlooked a stone, hoping to get that "fiver." In meditating upon my loss, I looked to the bottom of the river and spied my book. At first I thought it a red stone, but this stone had a stripe about in the middle, which I at once recognized as the elastic band. "Back water, Tom," I cried. "There's the book."

His answer was: "Well, gosh!" With the aid of a gaff we pulled it to the surface, out of five feet of water. But, alas! what a sad shame-faced book! On opening it and letting it shed a few tears of joy at getting back in my possession, the duplicity of the fly-makers was clearly exposed. Here were my beautiful silver-doctors mingling the blue of their hackles with the gaudy yellow of the Durham-rangers, and over both, like a pall, were cast the black and brown of the Dose and brown-fairies. I remembered the tackle dealer saying: "These are all made from the natural feathers and none dyed."

While fishing on this river at the Over Fall pool, with little success, the fish not rising to any of my flies, I saw on the opposite bank a boy of about fifteen years of age, doing good work; he took three grilse to my none. He was fishing with a birch rod cut out of the woods and I saw him put on a new tip which he cut from a tree behind him with a jack-knife, tying it on the rod with a piece of string. Meeting him on my way home and knowing him to be the son of a guide, who guided for a friend of mine, I asked him to show me the fly he was using in the morning. He laughed and said, "Certainly, Mr. W., I will give you the one I was using and you will kill some salmon. I lost two about 8 pounds each this morning, as these hooks are no good." He took out of his jacket pocket a cheap penny memorandum book, in which were placed between the leaves the feathers of the Newfoundland jay and the small screech owl. Both were of a mixed color, from gray to black, producing a pepper and salt effect. From his trousers' pocket he brought out a thin match box containing about a dozen small iron trout hooks with an eye in the shank, and sold in country stores at a cent apiece. Seating himself on the shingle, he selected a few feathers, which he tied to the hook with a piece of black thread—no body, nor gimp, nor feathers of the jungle cock for him. It took him about five minutes to make a fly, using more of the jay for the salmon fly, while the owl feathers were "killers" for grilse. Total cost for two flies, five cents! He had in his canoe nine grilse and one salmon, about 9 pounds, which he had taken the day previous, having camped at the pool over night. He had a companion, a younger brother about ten, who assisted when the fish were brought to land, by wading in and flopping them ashore by a dextrous upward fling. He used no gaff, perhaps not having the price of one. He sold this outfit, a second-hand trout reel, with a linen line, for \$2 to some Baltimorean fishermen, for their collection after landing an 18-pound salmon! I gave him some good hooks and he went on his way rejoicing. I looked at my 75-cent flies, imported from the best makers in England, and felt something was wrong.

On going further up the country to Bay St. George, I entered the smoker of a Newfoundland passenger train. This train allows the fishermen to get on or off at any point on the line he desires, for a day's sport at a pool; and stops for him at night on the return trip. If it is too dark, the fisherman has only to light a pine bough to have his whereabouts known.

Speaking of gnats and the various varieties of insect life in the Newfoundland woods, I can only say, "they are fierce." The black flies commence in the morning at 5 o'clock and keep it up till sundown, when they disappear and the mosquitoes arrive and stay with the sportsman till sunrise. At dawn the sand-flies, not to be outdone, join in the chorus to show their sym-

pathy with their brethren. I have heard persons give this conundrum: "What do you suppose mosquitoes were ever made for?" In Newfoundland they ask the same question as to sand-flies. The answer is: "I give it up."

The solution of the mosquito riddle applies to the fisherman's train. It is usually an hour or more late. On one occasion I wanted to fish a pool and started for the station to be on time—the train had not been on time for two months—but that morning it left five minutes ahead of schedule. I noticed some fishermen gotten up with great care in the smoker, one especially, his legs encased in wading stockings, over which were buckled canvas shoes, with hobnails, a heavy, woolen fishing jacket, a cloth cap, covered with flies of all colors of the rainbow, a large fishing creel, two salmon rods, and a gaff large enough to gaff a tarpon. I wondered whether the salmon would take the fly to show their appreciation of the get up! The thermometer in car registered 75 degrees.

I reached Stephenville Crossing—on the Bay St. George—on a perfect afternoon in July, and put up at the Bay St. George Hotel. The weather remained one of early September in the States, so cool, crisp and pure, that the mountains to the east in the far distance, tinted with blue and purple, looked as though they had been cut out of cardboard and pasted against the sky. The Bay St. George in the middle distance emptying itself into the sea, its tiny billows crested with white and gently lapping the shore of a sandy beach, along which, on the rising ground, grew pine, birch and fir trees. To the northwest was a high, rocky headland jutting out into the Atlantic.

The Bay St. George Hotel, or log cabin, I found most comfortable, all the furniture in the house being of natural wood (no paint or polish), cosy lounging rooms, plenty of books and attractive engravings on the walls. After my farmhouse and camping experiences I could hardly realize that I was still in the wilds of the north!

While conversing with some gentlemen at the hotel, interested in the fisheries, from St. Johns, I was told that the laws relating to the taking of salmon were sound in principle, but not carried into effect, as no poacher or illegal netter had been brought to trial in the capital, St. Johns. This gentleman stated that while fishing one of the rivers this season he had found a net extending out beyond the law limit. He told the owner he must take it up and place it where it belonged. The man seemed surprised and said no one had asked him to remove it before. When asked if the river warden had not noticed it, he replied: "He might have, but as his grandfather had always had nets there he supposed it was all right." "How many quintals of salmon did he take?" "About a hundred and twenty." "How many did your father take in his time?" "About sixty." "How many have you taken this season?" "About twenty." "How many do you expect your son to take?" When I returned, I found the net taken up and placed where it belonged. I advised the Fish Commissioners to give that man \$100 to stop netting and make him the river warden. If this scheme was carried out at the mouth of all the rivers, the salmon would become plentiful again in rivers that are now almost depleted by such means.

While fishing a pool on Harry's Brook I saw a large number of eels near the bank. The guide said they followed the salmon up the river and ate the spawn, and seemed pleased to see them. With a smile of satisfaction he said: "We will have eels for supper." They caught all they wanted, using an old tin cracker box and the roe of a salmon tied to a string. They laughed when I offered them hooks, their process was a simple one. It consisted only of placing the cracker box under the water, tilting the edge to the level of the stream, throwing in the roe tied with a string. Soon they had the eels tugging at it, slowly drawing them to the edge of the can, they flopped them in. We had eels for breakfast but I found them tough and stringy. They however would not touch smoked or broiled salmon till all the eels were eaten.

To broil a salmon in the woods, cut a stick about five feet long, split the stick three feet down from the end, whittle out the center, take a salmon that has been hanging over the camp fire for two or three days, place it tail downward in the split stick, tie the upper end of the fish to the stick above the fish, jab the end in the ground in front of the fire and incline toward it; when done you have a dish fit for an epicure.

The woods are certainly the place intended by the Creator for man to live in. All the old fellows know it, and as the air softens the cool blasts of spring, they long to kick off the shackles of being tied to a desk and flee to the woods, with its wonderful changes during twenty-four hours. The early morning, the sun just topping the trees, the rushing river and woods of ever-changing beauty, the hot noon time, the buzzing of insects, the goshawk chasing the kingfisher, the splash of leaping fish, then evening twilight, the darkening of the forest, the cry of the lynx, the hooting of the great-horned owl, the exquisite night, with its invigorating air, the twinkling stars, shining above you, while you lie with your feet stretched out to the camp fire, listening to the tales spun by your men of the glories of the past. Take a trip next summer to this land of delight and you will experience all the moods of nature and see the glories of God. If all the old men and middle-aged club men, the dyspeptic bankers or brokers who make an annual trip to some German watering place, would turn their faces toward Newfoundland and try a cure in the wilderness for the same period spent abroad, swing a salmon rod a few hours a day or cast a fly-rod, eat good salmon steak or trout just taken

and cooked over the camp fire, breathe in the invigorating air of the pine woods and live simply as men usually do in camp, I imagine most ailments would flee before such treatment, to be had at a third of the expense and the saving of all-cure doctor's fees. On leaving the woods you can take the after-cure, as they insist upon abroad, by stopping a week or more at the Bay of Islands to rest under the big trees surrounding the most comfortable hotel, a mile from the station. As a part of the cure system is a walk before lunch, you can go to the station for the daily paper brought by the only train of the day. After lunch you can rest by feasting your eyes upon the most intensely interesting scenery in Newfoundland. The Humber Basin, whose gigantic hills run precipitously down to the deep fiord, the dark green waters lit up by rippling ripples of sunshine dancing on its surface, the freshness of the air, the valleys running between high mountains in the distance, with their purple crowned tops make a wonderful picture of beauty and sublimity.

Into one of these valleys to the north empties the king of all Newfoundland rivers, the Humber, with its ever-rushing and swirling current running between rocky and wooded banks, and its wonderful waterfall with salmon leaping on its surface. On your homeward journey stop at the Spruce Brook log cabin on Harry's Brook. Here we have another log cabin-hotel similar to the one on the Bay of St. George. This was the first one started in Newfoundland and was looked upon by the inhabitants as an innovation, as it was the first attempt at a sportsman's home on the island. It is about two hours by rail from the Bay of Islands, facing a great inland lake, from which runs Harry's Brook. As the train hauls up at the Spruce Brook Station, after passing through a wilderness of beech, pine and fir, suddenly the eye is treated to a blaze of color by the flower gardens surrounding the hotel. I have seldom experienced such a thrill of delight as passed over me on beholding this garden, dropped, as it were, from heaven, to give glory to the center of what otherwise might be called a howling wilderness.

BABYLON, L. I.

## The Golly Brook Case.

From the Utica, N. Y., Press, Nov. 14.

COUNTY JUDGE PRITCHARD yesterday afternoon handed down his decision in the case of the people against Elliott O. Worden, the Rome attorney, who was convicted of violation of section 156 of the New York State forest, fish and game laws July 18 last, and was later convicted in the Rome City Court on complaint of M. R. Brigham, secretary of the Rome Forest, Fish and Game Association. Mr. Worden was determined to fight the proceedings against him, and after being convicted in the Rome court, he appealed his case to the County Court, and has been rewarded with a decision in his favor. The case created considerable attention in Rome, because it was at first supposed to be a joke on Mr. Worden, but it proved to be more serious when taken up by the Game Association, and a number of attorneys and sportsmen interested themselves in it. Mr. Worden claimed he had permission to fish where he did and that the stream, Golly Brook, in the town of Lee, was not affected by section 156, and as proof he presented sections governing the size of the streams. Judge Pritchard's decision is as follows:

Oneida County Court.—The People of the State of New York, respondent, vs. Elliott O. Worden, appellant. Elliott O. Worden in person and M. H. Powers of counsel for the appellant. E. M. Willis, district attorney, and H. C. Wiggins of counsel for the respondent. Pritchard, County Judge.

On the 22d day of August, 1905, the defendant was convicted by the City Court of Rome of a misdemeanor. The offense charged is a violation of section 156 of the Forest, Fish and Game law in that the defendant on or about the 18th day of July, 1905, fished in Golly Brook, in the town of Lee. There is an appeal from such conviction. The law claimed to have been violated is as follows:

Section 156—Closed Season Established in Towns. "The Commission may, upon the request of a majority of the Town Board of any town in which fish have been or shall be placed at the expense of the State, prohibit or regulate the taking of fish from public inland waters therein for not exceeding five years from the first day of May next after such fish have been furnished. At least thirty days before such prohibition or regulation shall take effect a copy of the same shall be filed in the office of the clerk of the town to which such prohibition or regulation applies, and printed copies thereof, at least one foot square, shall be posted along the shores of the waters affected, not more than fifty rods apart. Whoever shall violate or attempt to violate any such prohibition or regulation is guilty of a misdemeanor, and in addition thereto shall be liable to a penalty of \$60 for each violation, and an additional penalty of \$5 for each fish taken or possessed in violation of this section."

It appears from the evidence that Golly Brook is a small stream, ranging from three to ten feet wide, and varies from four to twenty inches in depth. It rises in the town of Lee and flows through part of the town of Rome into Canada Creek, and is about two miles long.

The appellant sets forth several grounds for the reversal of the judgment of conviction, among them that the information and the proof upon the trial did not show that a crime had been committed, and claims that Golly Brook is not public inland waters within the meaning of section 156.

Under no definition of any lexicographer, text-writer, statute or case does Golly Brook come within the definition of "public water," but the respondent claims that it comes within that meaning by virtue of the construction that should be placed upon the Forest, Fish and Game law, and further that it has become public waters within the meaning of the section by virtue of a dedication by John Golly some time between 1883 and 1888. Then the decision of this appeal involves a construction of the Forest, Fish and Game law as to the words "public inland waters," and as to whether the words and acts of John Golly are sufficient to dedicate it to public use.

Under the definitions found in the cases the term "public waters" is quite well defined, and the words as used in this statute are so plain that they hardly need a construction. The rule as to the construction of the penal statutes is that they shall be strictly construed.

There is no doubt about the power of the Legislature

to regulate and prohibit fishing, even in private streams.

People v. Doxtater, 75 Hun, 472.

The question in this case is, did it do so?

It is argued on the part of the respondent that it was the intention of the Legislature to place a meaning upon the term "public inland waters" that would include all streams which had been stocked by the State or at its expense, and that without including within that term such streams as Golly Brook the statute would be nugatory, and that it is necessary to include such streams as Golly Brook under the term "public inland waters" for the purpose of carrying into effect the Forest, Fish and Game law. I do not think that such contention is well founded. If such were the case, then the State might stock any stream within the State of New York with trout fry, and that act would make that stream public water as far as the provisions of that act are concerned, because there is nothing in the section which provides for any consent by the owner of the private waters.

The contention of the respondent that the provision of the law would be null and void and ineffective if such a construction were not put upon section 156, is not well founded, because there are many streams within the State which come under the head of public inland waters, either by reason of their natural capacity or by statute.

The rule of statutory construction of penal statutes is well set forth by Justice Greene in People v. Hall, 8 App. Div. 15, as follows:

"The purpose of this statute is to make it a criminal offense, and therefore an offense against the people at large, for one to enter upon the lands of another, who has complied with the conditions prescribed, for the purpose of shooting wild birds or animals, or of fishing in the pond, lake or streams thereon. Evidently, the provisions referred to are of a highly penal character, and by all canons of construction, they must be strictly construed, and not be extended by implication."

My attention has not been called to a single case which so construes a penal statute so as to make an act which is innocent at common law a crime, unless the language of the statute justified such construction.

It is further contended on the part of the respondent that the fact that John Golly at some time prior to 1888 permitted some one who was acting for the State to put fry in Golly Brook on his premises made it "public waters" by virtue of the Forest, Fish and Game laws.

Section 212 of the Forest, Fish and Game law, which is a part of the Private Park article thereof, at that time did not contain the proviso which it now contains, and which reads as follows:

"Provided, however, that all waters heretofore stocked by the State, or which may hereafter be stocked by the State from any of the hatcheries, hatching stations, or by fish furnished at the expense of the State, shall be and remain open to the public to fish therein the same as though the private park law had never existed. But nothing herein contained shall be construed as affecting any rights now existing of persons owning lands or holding leases of private grounds, waters or parks prior to the passage of this act."

That proviso was added by chapter 319 of the laws of 1896. Prior to this amendment there was nothing in the Forest, Fish and Game laws, nor in any other statute which provided that waters stocked by the State would be created public waters, and at the time that John Golly permitted this trout fry to be put into Golly Brook the common law was in effect.

Section 156 of the Forest, Fish and Game law has been three times under legislative consideration, and if the Legislature intended that "public inland waters" should mean all inland waters it had ample opportunity to express itself in the statute. Having deliberately failed to express itself, I do not think that it is the duty of a court in a criminal action to place that meaning upon it.

In the case of Rockefeller v. Lamora, 85 App. Div., 262, which was an action under the "private park" article of the Forest, Fish and Game law, the court says:

"The Legislature could not authorize the State Fish Commissioners to enter upon a man's private fishery, without his knowledge and consent, and deposit therein fish hatched by the State and thus convert his property to public use and destroy his private rights. This would be taking private property for public use without just compensation. \* \* \* The owner of a stream could doubtless dedicate it to public use, as he could his lands for a public highway, but this imports consent on his part and a bargain entered into between him and the public authorities. \* \* \* Our interpretation of the statute is that the stocking of streams and waters, the beds and adjacent lands of which are owned by an individual or corporation, in order to give the right to the public to fish therein, must be with the consent of the owner or of one having a right of fishery therein, and that only the particular stream, lake or pond thus stocked is so made publicly, and that such stocked does not open to the public streams to which they may be tributary, and that this stocking of such a stream by the State and the owners above or below does not have the effect of opening to the public that part of the stream situated on lands of an owner who has not consented to such dedication, and that the public is not permitted to follow migrations of the fish and take them in that part of the stream on private lands without the owner's consent."

That opinion was by Justice Houghton.

In the same case, 96 App. Div., 91, Justice Chase reiterates the same language. It will be seen from that language that in order to dedicate this stream to public use by John Golly, there must be the same formality as in dedicating lands for public highways. Two things are necessary for the dedication of private property to public use.

First—The intention or acts, which amount to the same thing, of the true owner to give the use of his real estate to the public.

Second—Acceptance of such gift by the public.

At the time the fish fry were put in Golly Brook, which is claimed to create a dedication in this case, there was no law which implied that the putting in of such fry, supplied at the expense of the State, would convert the stream to public use.

The section of the Private Park act, as above stated, was not then a law, and the dedication must have been a common law one. There is no evidence in this case sufficient to show an intention on the part of John Golly to open up the stream over his lands to public use, and there

is no evidence that the public accepted it, or that it was ever used by the public under such act. The following is the testimony on the subject:

"I am familiar with Golly Brook. I knew John Golly in his lifetime. He was my uncle. I know where he lived and where his farm was. Golly Brook runs through it. I went there to his farm several times. I went there at some time and took fish there. I can't remember when it was, but it was some time between 1883 and 1888. They were trout—some rainbow and brown fingerlings. I got them from the State. I had some talk with John Golly. I bade good morning and I said that I had some fish. He came and peeked into the can, and said it was a shame they could not get to some size before they caught them out. We took them down to the brook and put them in. It was Golly Brook. He was there when I put them in." There is no other evidence of dedication or consent. Fish were put in Golly Brook several times after, but there is no evidence of any knowledge or consent on the part of the then owners.

In order to sustain a criminal prosecution I think the evidence on this point should be clear and specific. To hold that such an act, as testified to, was a dedication of private property for public use, upon the evidence in this case, would be to jeopardize title to private property. Further, a dedication must be by the true owner. John Golly, at the time of the claimed consent, held the title to the land in question, but it was subject to mortgage which had been given by him, and which was afterward foreclosed, cutting off all such rights in the premises as he might have had.

I think the term "public inland waters," as used in section 156, is not broad enough to include streams like Golly Brook, and that the evidence in this case does not show the commission of the offense charged in that section by this defendant.

The judgment of conviction is, therefore, reversed.

## Do Fishes Shed Their Scales?

THIS question is asked by Dr. Maret Tims in the course of a paper on the development of fish-scales, published in the latest issue of the Quarterly Journal of Microscopical Science. The author leads up to this question by referring to the theory that the age of fishes can be determined by counting the number of lines of growth in their scales. This theory he is disinclined to support, one of his reasons being that scales first develop at different periods in different parts of a fish's body, so that if any comparison be made of their lines of growth the scales should be taken from the same region. This, however, is a minor objection, and of but little importance in comparison to the question as to whether the scales are periodically shed and renewed. The author states that experienced fishermen on the east coast of Scotland are fully convinced that such "moulting" does take place, more especially among fishes that have recently spawned. It is said to be specially noticeable in the herring; and the author remarks that, in view of the ease with which the scales of that fish become detached, such a replacement would, *prima facie*, seem to be highly probable. Even if such shedding and replacement does take place, it might be urged that it need not necessarily invalidate the value of the rings of growth as an age test, as the scales might be reproduced with the same number of growth lines as those they replaced. This Dr. Tims is disposed to regard as an improbable supposition; but it may be pointed out that, so far as we are aware, the scales on any region of an individual fish's body always have the same number of rings, thus suggesting that if they are shed they are renewed in the exact likeness of their predecessors. Information from anglers who may be able to throw any definite light on this subject from direct personal observation would be of interest.—London Field.

## Are Fishes Deaf?

TRAVELING through South Malabar I reached the village of Kundotti, which is one of the centers of the Moplah community in that district. Close to the Moplah mosque there is a tank used for bathing and washing. The public road adjoins the tank, which has a parapet wall on all its four sides, and rough stone steps lead down on all sides to the water, some ten feet or twelve feet below the level of the ground. When some Moplahs asked me if I would like to see the fish in the tank I went and looked over the parapet wall, but nothing was to be seen except the water. Then some of the Moplahs clapped their hands, and almost immediately afterward a number of large murrel rose to the surface. A fowl was thereupon thrown into the tank, and was torn to pieces by the fish. In this case vibrations may have been communicated to the water by the feet approaching it, but, if so, similar vibrations must have been communicated all day and every day by the feet of persons using, or passing by, the tank. Even if vibrations were communicated, there was certainly no sign of the fish until they were invited by the clapping of hands to their gruesome dinner, and the fowl was not thrown into the tank until after the fish appeared. It seems impossible that the clapping of hands communicated any vibrations to the water, or, if it did, that vibrations would have differed from other vibrations so as to be interpreted by the fish as a signal. If, then, fishes are deaf, how came these murrel to understand the invitation given them?—Wontiga in London Field.

## Chicago Fly-Casting Club.

THE first reunion and banquet of the Club was held on Monday evening of this week at the Sherman House.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## Co-Operation on the Delaware.

THE upper Delaware River is an ideal stream for the fishermen. Having its source in pure mountain streams, its waters flow clear and undefiled, here and there dashing over rapids and anon forming into pools where the sunlight glistens or where the waters lie dark under the shadows of the overhanging trees. Realizing the capabilities of the Delaware, the Legislatures of the three States bordering on its shores have passed legislation forbidding the use of all destructive appliances for fishing in so much of the river as lies above Trenton Falls, leaving the rod and line of the angler as the only legal method by which fish can be taken.

Under the protecting ægis of the law, the fish should multiply wonderfully and the river afford as fine sport as any stream in the eastern section of the country; but there is no Eden without a serpent, and in spite of the protective laws the fish pirates have done much destructive work in depleting the waters of the Delaware of fish. With the organization of the Department of Fisheries of Pennsylvania two years ago, more energetic measures were taken in the line of protection and for breaking up the evil practices of the violators of the fish laws. Correspondence was entered into with the Fish Commission of New York and New Jersey and those officials promptly signified their assent to co-operate with the Pennsylvania authorities in breaking up the piracy on the boundary river.

The first case to come up was that of a sturgeon fisher in the lower Delaware. Caught red-handed in the act of taking immature sturgeon, he escaped from a Pennsylvania warden, who was in a rowboat, by the superior speed of his naphtha launch. A telegram to a New Jersey warden was swifter than a naphtha launch engine, and on landing in New Jersey the pirate found himself in the hands of a New Jersey warden. From the insecure lockup in which he was placed the man escaped during the night and hurried to his home in Pennsylvania only to find a Pennsylvania warden close upon his heels. Panic stricken, he went to Delaware where a letter from his wife informed him that a requisition from the Governor of Pennsylvania would be sent to the Governor of Delaware asking for his return. With such a prospect before him, the man concluded, like Davie Crockett's coon, to come down, so he surrendered to the Pennsylvania warden and paid his fine.

Last fall Mr. J. S. Whipple, Forest, Fish and Game Commissioner of New York, notified the Department of Pennsylvania that eel baskets were being placed in the Delaware River in the waters lying between New York and Pennsylvania. The officials of the Erie Railroad also sent word that an eel weir was reported in the Delaware River near one of their stations. Both the New York officials and the railroad authorities offered to co-operate in clearing the river and the Department of Pennsylvania promptly sent two wardens to the spot. On reaching the river at Matamoras, the wardens discovered several eel baskets in the river with stone dams almost entirely closing the stream so that nothing could descend while the eel baskets were of a type that would permit little or nothing in the way of fish life to get through. Ostensibly built for the taking of eels, which fish, the builders said, are so very destructive to fish life, there was little that went into the baskets that was not kept by the operators.

From one basket, it was currently reported, five hundred pounds of rock bass had been taken in a night, while upon the slats of all of them were stranded numbers of young shad, caught in their efforts to descend the stream. The Pennsylvania wardens one night watched the baskets near the Pennsylvania shore and when they had sufficient evidence to convict the fishers, started to arrest the violators who turned out to be R. R. Bowley and W. A. Bond, of Port Jervis, New York.

Not a boat could the wardens secure to take them out to the basket as every boat owner seemed to be in sympathy with the operators of the fish basket. Finding that they were detected the two men fled to

the New York shore, where they were arrested by the New York wardens, who turned them over to the Pennsylvania officials who had hurried over after them over the bridge.

Unfortunately, the two men could not be held under Pennsylvania warrants as they were in the jurisdiction of New York, and their attorneys advised them not to return to Pennsylvania for trial. The wardens telegraphed their find and a special deputy was sent from the Department to the spot. A warrant was sworn out for the two men and to this was attached the testimony of the wardens as to the guilt of the men who fished the basket and a requisition was asked for by the District Attorney of Pike county.

The deputy brought this request to Harrisburg when it was taken in charge by Mr. William E. Meehan, the Commissioner of Fisheries, who presented it to Governor Pennypacker, who promptly granted it. Armed with this requisition the sheriff of Pike county went to Albany, where New York Commissioner Whipple took him to Governor Higgins who promptly signed the requisition. When the two men learned that the wardens were backed up by the authorities of the two greatest States in the Union, they concluded that the easiest and best way out of it was to go before the Justice of the Peace, in Matamoras in Pennsylvania, plead guilty and pay their fine of \$50 each.

This was the first move in the decided steps that the joint authorities of Pennsylvania, New York and New Jersey intend to take in clearing the Delaware River of the violators of the fish laws. In the recent cases the Pennsylvania authorities are loud in their praise of the support that was accorded them by the New York authorities and the officials of the railroads. It is hoped that this severe lesson will do much to abolish the eel baskets in the upper Delaware, thus giving the young shad a chance to return to the sea, making clear stream for the lordly salmon with which it is hoped to stock the stream, and leave for the angler the gamy bass or its not less gamy companion, the pike perch.

## An Angler's Golden Wedding.

THE St. Louis Republican of Nov. 22 contains a note which we are sure will be interesting to the many angling friends of the author of "When, Where and How to Catch Fish on the East Coast of Florida":

"Yesterday was the fiftieth wedding anniversary, the 'golden wedding,' of Mr. and Mrs. William H. Gregg, No. 3013 Pine street. While scores of friends remembered the occasion and the house was flooded with flowers, many gifts in the precious metal, and telegrams and notes of congratulation, the day was most informally observed by Mr. and Mrs. Gregg, a family dinner at 6 in the evening being the only festivity. Mrs. Gregg is not in the best of health, which precluded a larger and more general function, which they had expected might include all their many St. Louis friends.

"Mrs. Gregg was Miss Orian Thompson fifty years ago, and belonged to one of the best known and most representative families of the city. On Oct. 22 she was sixty-nine years old. Mr. Gregg is five years older.

"This interesting couple, who have been identified with the best social and business interests of St. Louis for half a century, travel a great deal. They go each winter to Florida, where Mr. Gregg has long owned a fine steam yacht, the Orian, and on board of which he spends many happy hours. He has explored the Florida waters from one end to the other, and has written several treatises on the fish of Florida, which have given to him a prominent place among writers of Waltonian lore. His book on the tarpon and some of its kindred is authority. Mr. and Mrs. Gregg spend their summers about as far north as they go south in the winter. They own a commodious cottage in Canada, in the Province of Ontario, at the picturesque little point Pennatanguishene, where the hospitality of "Cedar Knoll," as it is called, is far famed.

The dinner party guests last evening consisted only of members of the Gregg family. They are Mr. and Mrs.

Charles Hayes, of Canada, who arrived this week for the celebration; Mr. and Mrs. Norris B. Gregg, Mr. and Mrs. Ezra Hunt Dyer, Mr. and Mrs. Will Gregg, Miss Orian Gregg and the couple's seven grandchildren."

## More Light on the Carp Controversy.

DR. ROBERT T. MORRIS, of this city, informed us that he had had a discussion on the carp question with the Prince of Colloredo-Mannsfeld while the latter was in this city on a visit, and that the Prince had informed him that on his estates the balance of nature in carp waters is managed very well by the pike.

The Prince subsequently informed a FOREST AND STREAM representative that while he would be very glad to give some expression of his opinion on the question he wished first to read in FOREST AND STREAM the discussion that has been running through several issues, and this he would not have time to do until his return to Austria, when he promised to give facts and figures from the statistics in his library at home for the information of our readers. He sailed for home on the 28th inst. Among other things he said:

"Not having with me some statistical notes about carp breeding and their relation, as in number, etc., to the pike when stocked as in our country, I could only give very short and valueless information on this subject. After reviewing the discussion relating to the carp and the nature of the complaints and their causes, it will then give me great pleasure to write a few detailed notes, which would, perhaps, be of some interest, and this I will do as soon as I arrive home in Austria.

"It is quite true that we succeed in preventing the carp from multiplying through the pike (*Esox lucius*), and the Hungarian pike or fogos; and that the places where we keep the carp for breeding purposes must be kept entirely free from the pike, but this is only the case in lakes or artificial ponds, and I doubt very much if it would have any considerable effect in running waters."

## The Carp to Stay.

PRINCE'S BAY, N. Y.—*Editor Forest and Stream:* In the issue of FOREST AND STREAM of Nov. 18 I read the carp story. I do not believe it is a story; I put it down as an actual fact. Here in our little village a man has on his estate a small pond, and he has in every way tried to rid it of carp; he has even, after leaving the pond drained for some time, covered the bottom with lime and then let the water in slowly; but the quick-lime process did not kill the germs; they are in the pond yet, and I agree with W. O. Watson "the carp is here to stay." At this time, when some people are praising the qualities of carp, I wish FOREST AND STREAM would republish the fact about the man that was black bass fishing and caught a carp, put a willow twig through his gills and stuck the twig in the mud beside the river. Four years afterward, going by the same spot, he noticed the willow had taken root and the carp was in the top of the tree alive and well. Of course, there are more details to this fact, and if you cannot recall the circumstances I think I can rewrite it word for word. \*\*\*

## New York League.

SENECA FALLS, N. Y.—We want you one and all, and if you have at heart the objects for which the League was formed, a hearty welcome awaits you. Our next annual meeting will be held at Syracuse on Dec. 7, 1905, and we hope for a full representation from all parts of the State. Won't you see that your particular section is represented at that meeting, either by an organized club, or by individual sportsmen? Full information and application blanks will be sent you by either our secretary or the undersigned. We want every county in the State represented. Do not delay action but let us hear from you at once. If unable to perfect organization so soon, come to the meeting and thus lend strength to the cause.

ERNEST G. GOULD, Secretary.

# YACHTING

## THE KING'S CUP.

KING EDWARD VII. of Great Britain has become a patron of American sport. The presenting of the cup, of which he has made the New York Y. C. custodian, to be raced for annually off Newport, is a very gracious act, and it has immediately given him a place in the hearts of all American yachtsmen.

From the remarks made by Commodore Bourne at the special meeting of the New York Y. C. on last Monday evening, it is easy to trace the course of events which led up to the presentation of the trophy by His Majesty.

When the foreign entries in the trans-Atlantic race for the German Emperor's Ocean Cup arrived at New York, their owners received cards and invitations for all the good clubs in town extending the courtesies to them. Among the visitors was Lord Crawford, owner of the fine British auxiliary Valhalla. Lord Crawford spent the larger part of his time at the New York Y. C. He was interested in the fine library and the magnificent collection of models; and then again he found there many men with whom he had much in common. In a word, the club house and its atmosphere proved to be most congenial.

Many of the club members got to know him well and all were attracted by his charm of manner, his unassuming ways and his wide knowledge of the sea. Lord Crawford's contact with the members enabled him to learn their desires, ambitions and hopes in so far as the club and its future was concerned, and he perhaps was better able to advise King Edward regarding the trophy, which he has just presented, than any other Englishman that has ever visited here.

The conditions governing the trophy are sufficiently clear to avoid complications, yet explicit enough to insure good clean racing.

As the annual contests will take place off Newport during the cruise, this will make the cruise a more popular one than ever, and intrenches Newport more firmly as a great yachting center.

Schooners and sloops of about 60ft. waterline are now finding favor in the eyes of those building new vessels, and the conditions permit such craft to compete.

The whole idea was a very happy one and we hope the consummation of the project will be as satisfactory as was its conception by King Edward and Lord Crawford.

It is pertinent to recall that King Edward, then Prince of Wales, was at the head of the Royal Yacht Squadron when the Dunraven episode occurred; and his attitude in presenting this cup is a complete vindication of the New York Y. C. in connection with that unfortunate affair, if, indeed, any was necessary so far as he was concerned.

## AN OCEAN RACE FROM SAN FRANCISCO TO HONOLULU.

INTEREST in ocean racing has extended to the Pacific coast and on June next a fleet of yachts hailing from the Hawaiian Islands and California ports will start on the 2,100-mile race from San Francisco to Honolulu.

While there are many enthusiasts who indulge in yachting on the Pacific, the sport has hardly made the progress there that it has in the East, and the fleet will not rival the one which sailed from Sandy Hook last May in the race across the Atlantic for the Kaiser's Ocean Cup. However, it is just such races as this that will lay the foundation for a large fleet of off-shore cruisers, and the more men that support it and do their part as individuals the greater the success the first race will be.

In this race there are no restrictions as to size or type, for the list of possible contestants is so small that restrictions could hardly be drawn that would not bar some boats.

Size is not so important a factor if the boats are sound and well equipped. It will be a less hazardous trip than the one across the Atlantic, and at the time the race takes place there is little or no danger of the starters encountering boisterous or dangerous weather, and the unfailing trade winds assure a quick passage.

This race should greatly promote interest in yachting on the Pacific, and it is quite probable that a match from San Francisco to the Hawaiian Islands will become an annual event.

### King Edward VII. Presents New York Y. C. with a Cup.

At a special meeting of the New York Y. C., held on Monday evening, Nov. 27, Commodore F. G. Bourne, who presided, announced that King Edward VII. had presented the organization with a cup, which will be raced for annually off Newport.

There were over 100 members present, and the announcement was a great surprise, and all were most enthusiastic regarding the King's very courteous act, and the sentiment marking the acceptance was of the proper sort.

In addressing the members present Commodore Bourne said:

"Some time ago I received an informal and confidential letter from Lord Crawford informing me that it was His Majesty's desire to present a cup to the New York Y. C., to be sailed for annually under terms and conditions to be formulated, and asking my co-operation in order to arrive at a set of rules, or regulations, which would at the same time carry out His Majesty's object and be agreeable to the New York Y. C.

"Thereupon some exchange of communications took place between us and rules and regulations of the character I have mentioned were formulated, and I have received from Lord Crawford a letter in which he says: 'It is, therefore, my pleasing duty on behalf of His Majesty to inform you formally that it is his desire to present a cup to the New York Y. C., which shall be competed for annually by yachts belonging to any American yacht club of good standing, subject to the rules and regulations sent.'

"The rules and regulations referred to by Lord Crawford as being desired by the King and as constituting the terms and conditions of the gift will be laid before you.

"It is proper for me to say to the club that I have examined them with very great care and that, while they embrace everything which His Majesty desired in order to carry out the real intention of his gift, yet nothing can exceed the courtesy and liberality of spirit with which His Majesty has received such suggestions as I thought it wise to make concerning the form of the rules. I wish to say to the members of the club that the rules and regulations are such as to receive my very hearty approval, and that I do not doubt they will commend themselves to the club as being wise and eminently fitted to secure a permanent and lasting success for a racing event which we all cannot but regard as one of very great importance."

The conditions governing the races, which amounts to a deed of gift, are as follows:

1. This cup is to be known as "The King's Cup."
2. The cup shall be forever held by the New York Y. C., to be sailed for annually. The name of each yacht winning it and the name of her owner shall be suitably inscribed thereon, and each winning yacht shall receive from the New York Y. C. a suitable medal or other trophy to commemorate her victory.
3. Races for this cup shall be sailed under the racing rules of the New York Y. C. as the same shall be from time to time in force, including the rules for measurement and time allowance, except as otherwise provided in these terms and conditions.
4. Any yacht belonging to any yacht club in the United States in good standing shall be eligible to enter in these

races, provided, that, in the case of a single-masted vessel, she shall be of a waterline length of not less than 50ft., and that, in the case of a vessel of more than one mast, she shall be of a waterline length of not less than 60ft., but these limitations of dimensions may be from time to time altered by the unanimous action of the flag officers of the New York Y. C. taken not less than ten months prior to the race to which such alterations shall be applicable.

5. The courses and dates and any other conditions of the races not inconsistent with these conditions or with the racing rules of the New York Y. C. shall be determined from time to time by the flag officers of that club, but, unless circumstances shall arise which in the judgment of the flag officers make it inexpedient to do so, the races shall preferably take place over one of the courses off Newport during the annual squadron cruise of the club.

6. All races for this cup shall be sailed without time limit.

7. Entries for these races must be in writing, and must be lodged with the Regatta Committee of the New York Y. C. not later than forty-eight hours before the time of starting.

Ex-Commodore Lewis Cass Ledyard moved that the following vote of thanks be offered. This was seconded by ex-Commodore J. P. Morgan and it was unanimously adopted:

"The New York Y. C. desires to express its very deep appreciation of the gift of His Majesty, King Edward VII., of the cup to be known as 'The King's Cup,' and accepts the terms and conditions of the gift.

"The club recognizes with sincere gratitude the honor thus bestowed upon it.

"His Majesty's keen interest in the sport has ever been regarded with admiration by American yachtsmen; and his powerful influence in maintaining its best standards and highest traditions has been as effective in American as in English waters.

"The club will always cherish with pride the trophy thus committed to its trust."

Mr. George A. Cormack, secretary, cabled this resolution to King Edward after the meeting had adjourned.

JUST PUBLISHED.

# HOUSEBOATS AND HOUSEBOATING

BY ALBERT BRADLEE HUNT,

Yachting Editor of Forest and Stream.

A volume devoted to a new outdoor field, which has for its purpose three objects:

**First**—To make known the opportunities American waters afford for enjoyment of houseboating life.

**Second**—To properly present the development which houseboating has attained in this country.

**Third**—To set forth the advantages and pleasures of houseboating in so truthful a manner that others may become interested in the pastime.

Illustration from "Houseboats and Houseboating."

The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and halftone reproductions of plans and exteriors and interiors. A most interesting chapter is devoted to houseboating in England, where the sport is one of the most delightful features of outdoor life.

The book has been carefully prepared by Mr. ALBERT BRADLEE HUNT, a well known authority on the subject.

The work is printed on extra heavy coated paper, and is bound in olive green buckram. The price is \$3.00 net.

(Postage 34 cents.)

The book will make a unique and most attractive holiday gift.

FOREST AND STREAM PUBLISHING CO.,

346 Broadway, New York.

### An Auxiliary Cruising Yawl.

THE most popular of the moderate sized cruisers to-day are the auxiliary sloops and yawls of about 35ft. waterline. We present this week the plans of a cruising yawl 37ft. waterline. She was designed by Mr. Morgan Barney and will be built in one of the big yards near New York this winter.

The boat has a very fairly sharp section, is of moderate draft and has a small sail plan. It is the intention of the owner, who will use the boat for cruising Long Island and the Maine coast, to carry but two paid hands. While the boat was not designed for racing, should her owner care to participate in any matches or squadron runs, she would measure in the 33ft. class.

The cockpit is 10ft. long and the cabin house is 20ft. 6in long. On the port side of the cabin house is a companionway which gives access to the compartment in which is located the boat's power equipment, which consists of a 12 horsepower gasoline motor. The gasoline tanks are under the cockpit. A water-tight bulkhead separates the space given over to the engine, etc., from the living quarters of the boat.

On the starboard side of the cockpit is another companionway which leads to the main cabin 9ft. long. On either side are wide berths, and in front are transoms. On the port side is a sideboard with a locker above. Opposite, on the port side, is a toilet room 2ft. 6in. wide with patent closet and folding wash basin.

The owner's room on the starboard side is 7ft. long. Beside the berth there is a bureau and a folding basin. On the port side is another smaller sleeping cabin which must also be used as a passageway for anyone passing from the main saloon to the galley. The galley is 4ft. long and extends the width of the boat. The forecabin has accommodations for two men.

In the cabins the interior finish is butternut with mahogany trim. The underside of the cabin top is of white enamel.

The boat is planked with yellow pine 1 1/4 in. thick and the frames, keel, stem, etc., are of oak. Every third frame is sawed and doubled, and intermediate frames are steam bent. The cabin house, plank sheer, covering board, skylight, hatches, cockpit trim, etc., are of mahogany.

The dimensions are as follows:

Length—		
Over all .....	52ft.	6in.
L.W.L. ....	37ft.	
Overhang—		
Forward .....	7ft.	
Aft .....	8ft.	6in.
Breadth—		
Extreme .....	12ft.	9in.
Draft—		
To rabbet .....	3ft.	10in.
Extreme .....	5ft.	6in.
Board, down .....	9ft.	
Sail area—		
Jib .....	306 sq. ft.	
Mainsail .....	960 sq. ft.	
Mizzen .....	254 sq. ft.	
Total .....	1,500 sq. ft.	
Ballast—		
Lead, all outside .....	10,000 lbs.	

**YAWL DAISY SOLD.**—Congressman Joseph C. Sibley, of Pennsylvania, has purchased the auxiliary yawl Daisy from Mr. Robert Galloway, of Memphis, Tenn., through the agency of Mr. Stanley M. Seaman. Daisy was designed by Mr. Henry J. Gielow. She is a shoal draft centerboard boat and was built at Tom's River, N. J., in 1904. She is 80ft. over all, 65ft. waterline, 18ft. breadth and 3ft. draft. Her power consists of a 40 horsepower Craig engine.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

### Boston Letter.

**AMERICAN-GERMAN SERIES.**—The Eastern Y. C. has received a cable dispatch from the Kaiserlicher Y. C., of Kiel, stating that the German Emperor has formally approved the plan to establish an international trophy for small yachts, to be competed for by boats representing Germany and the United States. Information is also given that a letter from the Kaiserlicher Y. C. is on its way to this country, relating, it is believed, to a challenge for the first series of races for the trophy, which, according to previous arrangement, must be sailed off Marblehead. This measure is the result of a proposal made to the Kaiserlicher Y. C. in September by Mr. Henry Howard, chairman of the Regatta Committee of the Eastern Y. C.

Under the conditions proposed at that time the races shall be sailed under the classification of the challenging club, and it is also provided that the competing yachts shall be designed and built in every particular in the respective countries which they represent. It is believed that if a challenge is received from Germany the yacht specified will be one of the class in which Uncle Sam, designed by Mr. B. B. Crowninshield, was so successful in German waters. The rules for this class provide for a boat quite similar to our raceabouts. At the time of the discussion in Germany there was considerable talk of having the competition between boats of about 30ft. waterline, but intimation has since been received of the change of intentions as noted in the foregoing.

In order that races may be sailed in September of 1906 it is necessary under the agreement that a challenge must be received by Dec. 1 of the present year. It is not actually known that a challenge is contained in the mailed

message from the German yachtsmen, but the members of the Eastern Y. C. evidently have some reason to believe that the challenge is on the way, for a committee consisting of Messrs. Charles Francis Adams 2d, Louis M. Clark and Henry Howard has been appointed by the club to arrange details of the match. In the event of a challenge being received this committee will have charge of building the defending yacht and of sailing her. The series will consist of the best three out of five races.

No trophy has yet been offered for such races, but it is understood that the Emperor William has intimated his willingness to offer one.

**CORINTHIAN Y. C.**—A meeting of the Corinthian Y. C., of Marblehead, was held at the Boston Athletic Association on Thursday evening, Nov. 26, at which the following committee was appointed to nominate officers for 1906: William S. Warren, Frank E. Clark, Henry A. Hildreth, Frits E. Talbot and Arthur Binney. A committee consisting of Herbert S. Goodwin and Vice-Commodore Henry A. Morss, was also appointed to revise the club routine and signal code. Commodore John O. Shaw retires from office this year and it is understood that Vice-Commodore H. A. Morss will be senior flag officer.

**ATLANTIC COAST CONFERENCE.**—Movements like the recent conference in New York to establish uniform racing rules for Atlantic coast yacht clubs is one that finds favor in almost every quarter throughout Massachusetts Bay. The fact that about every recognized yacht club in this section was represented is considered likely to go a long way toward general satisfaction with the results. Special representatives were sent by the Boston, Eastern Y. C.'s and twenty-six other yacht clubs in Massachusetts Bay were represented by delegates of the Yacht Racing Association of Massachusetts.

**DAVY JONES FOR LONG RACE.**—Mr. Richard Hutchinson's new cruising power boat, designed by Messrs. Small Brothers, is to be built by George B. Loring, of East Braintree, who also built Mr. Hutchinson's Highball. Davy Jones is already entered for next season's long-distance race of the Knickerbocker Y. C., from Marblehead to New York for the Rudder Cup. She will rate 33ft. 5in. with twin Jager engines of 12 horsepower each.

**NEW SCHOONER FOR MR. C. H. CLARK, JR.**—Mr. Arthur Binney has received an order for an 80ft. waterline auxiliary schooner for Mr. C. H. Clark, Jr., of Philadelphia, for whom Mr. Binney designed the 60ft. auxiliary schooner Savarona a few years ago and also the 60ft. speed launch Hupa last year. The new boat will be something of a large edition of Savarona, which is one of the most beautifully turned schooners on the Atlantic coast. She will be 113ft. over all, 23ft. beam and 10ft. draft. She will have a Standard engine of 100 horsepower with six cylinders. The boat is laid out below decks with every accommodation for cruising. The owner's quarters consist of a large main saloon, four staterooms and bathroom. Off the engine room there are four staterooms for the sailing master, the engineer, cook and mess man and the stewards. There is a very roomy galley, forward of which are quarters for the crew. The finish in the owner's quarters will be in mahogany, white enamel and woven panellings.

JOHN B. KILLEEN.

**British Letter.**

**Y. R. A. DECISIONS.**—At a recent meeting of the council of the Yacht Racing Association some cases which had arisen during the racing season were brought up for adjudication. The most interesting of these was one which involved the explanation of the term "weighing the anchor" as applied to cases when an anchor or kedge has been let go during a race to prevent a yacht drifting, or for any other reason. In the race for the ex 52ft. class, from the Nore to Dover, sailed on June 17, under the burgee of the Royal Thames Y. C., the cutter Viera, when close to the finishing line, had to let go her kedge to avoid being swept back by the strong tide—there being little or no wind at the time. Soon after, a breeze sprang up, and the yacht gathered way. In trying to get the kedge, the eight men who were hauling in the rope felt it leave the ground, but immediately after, it caught in a cable or some other obstruction, and in spite of all their efforts, the rope was wrenched out of their hands, and kedge and rope were lost. The yacht crossed the line, receiving the winning gun, and her owner, Mr. F. Last, signed the usual declaration that he had complied with the Y. R. A. rules, at the same time accompanying the declaration with a letter in which he gave a full explanation of the loss of his kedge, but stated that he considered the kedge was "weighed and not slipped," in accordance with Rule 36, inasmuch as the anchor had left the ground. The committee of the Royal Thames Y. C., however, while accepting Mr. Last's statements as contained in his letter, disqualified Viera for a breach of Rule 36, and the council of the Y. R. A. upheld their decision. Mr. Last is a well-known and thoroughly sporting yachtsman, and his appeal to the Y. R. A. will clear up a vexed question, as the reading of the rule is not altogether as explicit as it might be. It is, however, only one of those cases where the spirit of the rule is to be obeyed rather than its letter, and this decision will prove of the utmost use in future races. It is clear that if an owner lets go his kedge during a race he does so at his own risk, and if from any cause the kedge is not recovered and got on board again, the penalty is disqualification. It is quite conceivable that another yacht might have been abreast of Viera and have had her kedge caught in the same obstruction, but not have been able to free it. Then, if Mr. Last's contention were to hold good he would have been entitled to the prize because he had unwittingly slipped his kedge while the other boat was still left hung up. This would be obviously unfair, and as the principle of the thing is what has to be enforced, the fact that the loss of Viera's kedge on the day in question could not have made any difference to her winning position need not be entertained.

A somewhat similar case occurred with the 52-footers Magdalen and Gauntlet in 1901, except that in this instance the kedges were used to haul off the mud. The two yachts in hunting each other too closely after the

start went ashore on the mud. Both got their kedges out, and after a time Gauntlet got off. Ten minutes later Magdalen was hauled off, but the kedge rope parted, and although she caught Gauntlet and beat her badly, she was disqualified because, under Rule 35, she did not get her anchor on board again. The wording of this rule is quite clear, but it is obvious that Rule 36 is intended to read the same way.

**CLYDE FIXTURES.**—A meeting of delegates from the leading British clubs took place at the instigation of the council of the Y. R. A. at the Langham Hotel, London, on Nov. 3, the chief object being to see whether some more satisfactory arrangement of the dates of the chief regattas could not be made, so as to let yachts take part in all the British fixtures and the Belgian and German ones as well. Mr. Burton's proposal that the season should commence with the Clyde Fortnight—a most sensible suggestion—met with some opposition, the delegates from the Royal Harwich and New Thames clubs saying that they were instructed to inform the meeting that their dates were fixed for the second week in June and would not be altered. The representatives of the leading Clyde clubs were at first antagonistic to the scheme, but upon receiving promises from owners in the big class and of the 52-footers to be present if the Clyde opened the season, they agreed to report to their clubs, in the hope that they might be induced to change their minds. If the season does commence on the Clyde, all the fixtures can be worked in, and if the Royal Harwich and New Thames stick to their original fixtures, their regattas will be failures, and they will be brought to their senses for next season. It is absolutely necessary that some radical alteration should be made, and the convenience of yacht owners is the first consideration.

The clubs must work in harmony, not in opposition, if they wish for success. Nothing definite was decided, but it is hoped that the Clyde clubs will see the advisability of falling in line with the general scheme. The meeting was adjourned to a future date, to learn the feeling of the Scottish clubs.

E. H. KELLY.

**A Ship's Cordage.**

WHILE the three-masted schooner John H. May was aground near the lumber district the other day a large crowd stood on the dock watching the crew attempting to free the boat. Of course advice was handed out right and left, and many thought that they could easily get the boat free if they were on board. One young man in particular who was nicely dressed seemed to know it all, and he was telling the crowd just what should be done. An old riverman stepped up to him and asked:

"Young man, can you tell me how many ropes there are on that schooner?"

The young fellow glanced up at the maze of ropes and said that he thought there must be at least a hundred.

**An Ocean Race.**

From San Francisco to Honolulu.

LONG-DISTANCE RACING has now reached the Pacific side of the continent, and a race from San Francisco to Honolulu next summer is an assured fact. The Hawaii promotion committee have offered a valuable trophy for a yacht race across the 2,100 miles of ocean to Honolulu. The yachtsmen of the Pacific Coast, from San Diego to Seattle, are hailing the event with genuine delight, and there will be many entries for the race. Nothing of the kind has ever been held on the Pacific before, and it will bring out the sea-going boats that have not been in the habit of venturing far off shore. This event will create a new interest in the sport, and open the wide cruising ground that the great Pacific Ocean offers. Hawaii is the

LURLINE.

nearest group of islands which offer much that a cruising yachtsman seeks—ideal weather conditions, good harbors, grand scenery, active volcano, and hospitality, for which the island people are famous. And to the south and southwest are hundreds of islands, some of which are seldom visited by white men, which make them attractive to the investigator and traveler.

Last year Com. Sinclair, of the South Coast Y. C., California, cruised in his schooner yacht Lurline to

Chispa of San Francisco.

Regatta Day—Honolulu.

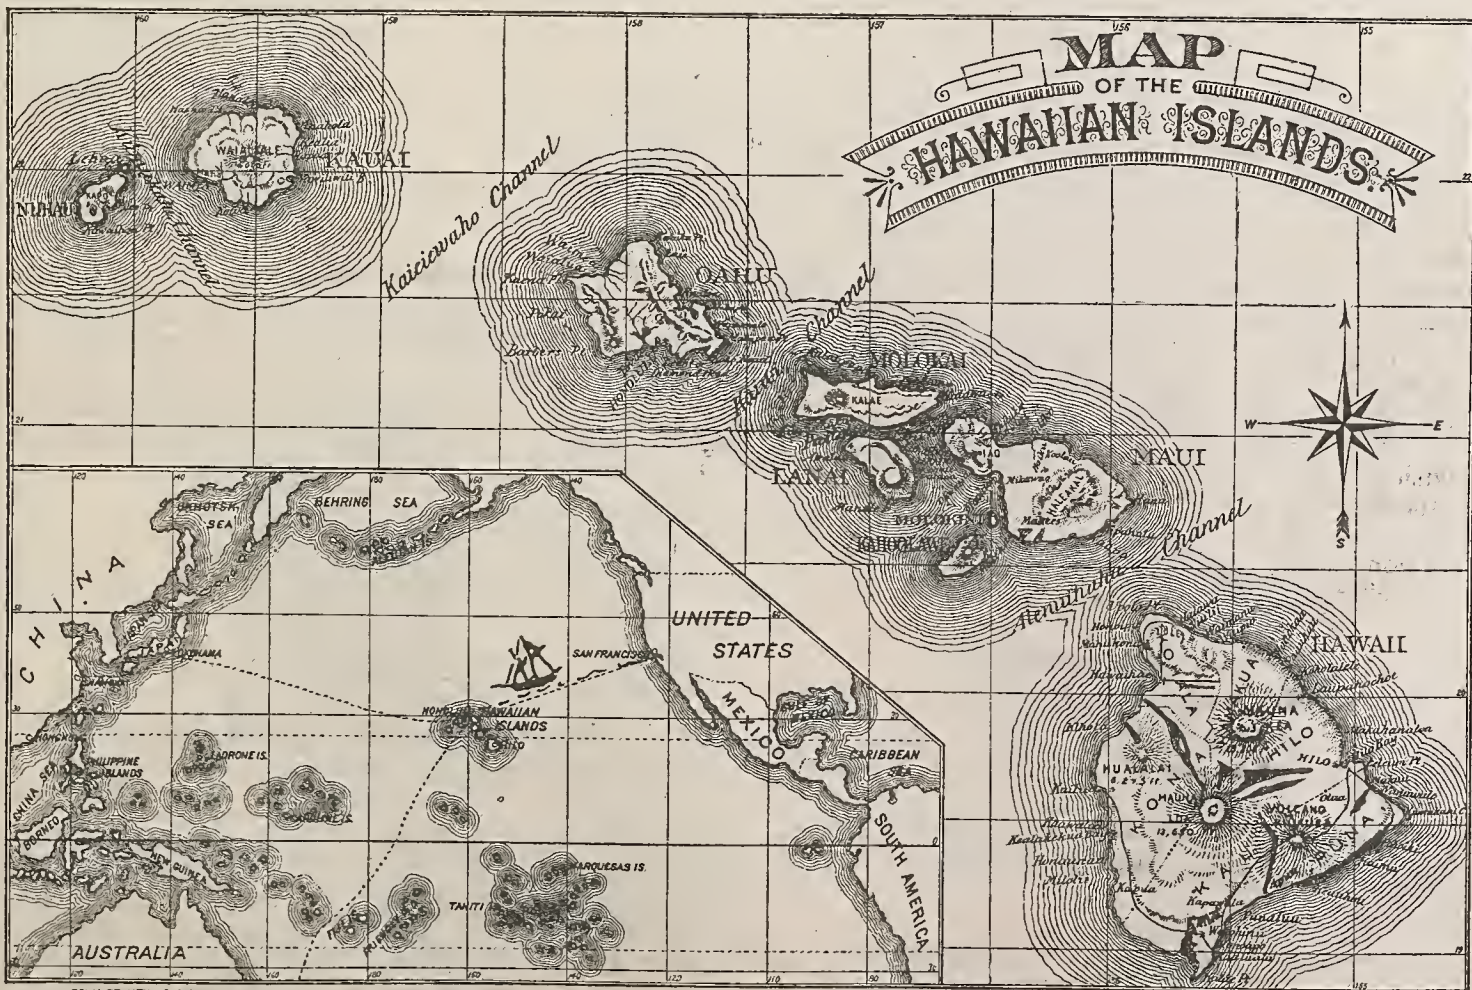

Others gave various guesses, and the riverman turned away with a smile, as he said:

"There is only one rope on that boat and every other boat, my friend, and that is the bucket rope. All the others have names."—Albany Journal.

Hawaii, and then to Tahiti, Samoa and Fiji, making an eight months' voyage. He enjoyed the trip immensely and experienced excellent weather conditions. This was rather unusual, for he left southern California in the month of February, which is a season when storms are likely to worry the mariner; but he made his entire trip without parting a rope's yarn. He has entered his schooner for the event next summer. One of the largest yachts in the islands is the schooner La Paloma, owned by Com. C. W. Macfarlane. She was sailed down from San Francisco a few years ago, and made the trip without mishap, although coming across the Pacific during the boisterous season. She is 48ft. over all. La Paloma may be sailed to San Francisco and enter the race and be a representative yacht from Hawaii.

It is proposed to make the conditions of the race broad and liberal, and adopt a system of handicapping that will give all contestants an equal opportunity of winning. The boats will vary considerably in size. Some of them will be as small as 40ft. over all, and the largest 90ft. Most of the yachts of the Pacific Coast are built heavily and capable of standing such a trip with safety.

The event will take place some time next June, the start being made from San Francisco. The trade winds blow strong and true during the summer months, with very small chance of calms, and the trip should be easily made in twelve to fifteen days. The time of the finish will be taken off Honolulu Harbor. After the arrival of all the yachts, the owners and guests will be taken in charge by the Hawaii Y. C. and entertained. They will be given a typical Hawaiian luau (native feast), which is always an attractive feature with visitors to Hawaii. They will visit the different points of interest about the island of Oahu, on which Honolulu is situated, and local races will be planned in which the Honolulu yachts can participate. A cup will be offered for a race around the island of Oahu, a distance of 120 miles, which course offers running, beating and reaching, and will bring out the points of sailing under these varying conditions. Another favorite course which the island yachts race over is to Lahaina, on the island of Maui. This is a beat up channel for 75 knots, and tests the craft on windward work. At Lahaina another luau will be given the visitors, and they will be shown about this picturesque seaport village,

Map of the Hawaiian Islands and Chart of course to be taken by the competing yachts in race from San Francisco to the Islands.

which was once the scene of much activity during the palmy whaling days. As many as 150 whalers have been anchored off this port at one time. From Lahaina there will be a race to Hilo, on the island of Hawaii, which is the largest in the group, and the town second in size. This is the route to the famous volcano of Kilauea, and the visitors will be taken up to "the burning mountain," which is the largest active volcano in the world, but withal very harmless, although showing great masses of burning lava, explosions of gases in the fire pit, all of which can be safely viewed from the edge of the crater.

The yachts will leave Hilo for home, as this is some 150 miles nearer California than Honolulu. The yachtsmen participating in the race will have one round of pleasure from the time they reach Honolulu until Hilo is sailed from view. The voyage home should be made in from fifteen to twenty days. It is slightly longer, as sailing craft have to sail north until near the latitude of San Francisco, when they meet the westerly winds, which carry them to their destination. At this time of the year they will encounter only delightful weather, and the entire experience will long be pleasantly remembered.

ALBERT DELMAR.

Winners in N. Y. Y. C. Races.

Season 1905.

SPRING CUPS—May 30, 1905.

Table listing winners for Spring Cups: Class H (Mineola), Class Special (Mira), Class N. Y. 30ft. (Dahinda).

ANNUAL REGATTA—June 15, 1905.

Table listing winners for Annual Regatta: Class B (Elmina), Class H (Yankee), Class N (Mimosa III), Class N Y 30ft. (Maid of Meudon).

BENNETT CUPS—June 15, 1905.

Table listing winners for Bennett Cups: Schooners (Katrina), Sloops (Yankee).

GLEN COVE CUPS—July 8, 1905.

Table listing winners for Glen Cove Cups: Class C & D (Katrina), Class H (Mineola), Class N (Mimosa III), Class N. Y. 30ft. (Phryne).

RENDEZVOUS CUPS—Aug. 10, 1905.

Table listing winners for Rendezvous Cups: Class H & J (Mineola), Class N (Mimosa III), Class N. Y. 30ft. (Phryne).

GLEN COVE TO MORRIS COVE—Aug. 11, 1905.

Table listing winners for Glen Cove to Morris Cove: Class N. Y. 30ft. (Dahinda), Class M (Mira), Class K (Doris).

COMMODORE'S CUPS—Aug. 11, 1905.

Table listing winners for Commodore's Cups: Class sloops (Mira), Class Schooners (Venona).

MORRIS COVE TO NEW LONDON—Aug. 12, 1905.

Table listing winners for Morris Cove to New London: Class N. Y. 30ft. (Minx), Class M (Mira), Class K (Doris).

REAR-COMMODORE'S CUPS—Aug. 12, 1905.

Table listing winners for Rear-Commodore's Cups: Class sloops (Mira), Class schooners (Venona).

NEW LONDON TO NEWPORT—Aug. 14, 1905.

Table listing winners for New London to Newport: Class N. Y. 30ft. (Cara Mia), Class M (Mira), Class K (Doris).

COMMODORE'S CUPS—Aug. 14, 1905.

Table listing winners for Commodore's Cups: Class sloops (Mira), Class schooners (Venona).

ROBINSON CUPS—Sept. 28, 1905. 1st Cara Mia

VICE-COMMODORE'S CUP—Sept. 29, 1905. 1st Adelaide II.

1st Dahinda

Several protests were filed during the season. All were acted upon by the Regatta Committee, and decisions have been rendered and cups awarded in each instance.

At the start of the run from New London to Newport, Humma and Shark came together. Shark's owner protested, but the decision was given to Humma.

The owner of the schooner Agatha protested Venona at New London, contending that Venona should rate at the top of the 55ft. class. The Regatta Committee upheld the protest filed by Agatha's owner.

Mira's owner protested all the New York Y. C. one-design 30-footers on the ground that they were not in cruising trim, as defined by Rule IV. of the Racing Rules.

Before the start of the annual cruise, the Regatta Committee had given preference to some of the owners of the special one-design 30ft. class, at their request, to race in the runs and for special cups on the cruise without carrying a boat, as the rules specified. No notices to this effect was given, however, to other owners of sloops that were racing, and all other competitors complied strictly with the rules.

After receiving Mr. C. L. Poor's protest at Newport, the Regatta Committee notified him that they deemed the boats of the one-design class to be in cruising trim, and did not require them to carry boats.

Mr. Poor, claiming that the Regatta Committee had exceeded their authority in suspending or altering the racing rules of the club, appealed to the flag officers of the organization, with the result as announced in the above summary, a copy of the one officially issued by the Regatta Committee—i. e., that the New York Y. C. 30-footers sailed in a class by themselves, and that all the other sloops were pitted against one another when competing for the Commodore's cup.

No other construction could be put on the matter according to these facts, as two first prizes were awarded: one for the New York one-design class and another to the other sloop entries.

As Mira received a first prize, she must have been sailing against the other sloop entries and not against the one-design boats, as a first prize was awarded to these latter craft and it is not possible to give two first prizes in one class.

If Mira was not racing against the New York Y. C. one-design boats—and the way the prizes were awarded plainly shows she was not—it is evident that Mr. Poor has no ground for a protest against any boat in that class, and accordingly his position has been upheld; yet the Regatta Committee has been able to let themselves down easily through the kindness of the Commodore, who offered two cups instead of one, without actually reversing their decision.

This affair has settled a most important question—i. e., the owner's right of appeal to the club over a decision by the Regatta Committee in any case where there is involved a question of the interpretation of a racing rule or in anything other than a question of fact.

Houseboats and Houseboating.

Editor Forest and Stream:

I have just received my copy of "Houseboats and Houseboating," and have had a feast, for like a child I have turned first to the pictures, and I can already (in cool November) see myself afloat next summer in my houseboat No. 3, into which will be worked many of the ideas and devices portrayed in the book you have just issued.

Now to my story or rather the resurrection of some other fellow's story.

In a biography of Robert Fulton, I recently blundered across the following account of a good American houseboat of almost one hundred years ago. Was the Nicholas J. Roosevelt therein mentioned one of the progenitors of our worthy President? They seem made of much the same stuff.

"After demonstrating the feasibility of navigating the Hudson with steamboats, Fulton and Livingston turned their attention to the Mississippi. There was some doubt about the possibility of stemming the powerful current of the great river, and before investing heavily in the enterprise those gentlemen determined to investigate the matter. For this purpose they engaged Nicholas J. Roosevelt, with the understanding that, if his report was favorable, the three men—Livingston, Fulton and Roosevelt—would be jointly interested. In 1809, Roosevelt (who had been recently married) went to Pittsburgh, accompanied by his wife, where he built a flat-boat on which they descended the river. With the exception of about three weeks passed on shore at Louisville, and eight or ten days in a row-boat between Natchez and New Orleans, Mr. and Mrs. Roosevelt lived for six months on this flat-boat. On this voyage the lady wrote as follows:

"The journey in the flat-boat commenced at Pittsburgh, where Mr. Roosevelt had it built. There was a huge box containing a comfortable bed-room, dining-room, pantry, and a room in front for the crew, with a fire-place where the cooking was done. The top of the boat was flat, with seats and an awning. We had on board a pilot, three hands, and a man cook. The rowboat was a large one, in which Mr. Roosevelt went out constantly with two or three of the men to ascertain the rapidity of the ripples or current. It was in this rowboat we went from Natchez to New Orleans with the same crew. We reached New Orleans about the first of December, 1809."

"Once while in the flat-boat on the Mississippi we were aroused in the night by seeing two Indians in our sleeping room, calling for whiskey. Mr. Roosevelt had to get up and give it to them before we could induce them to leave the boat." THE DECKHAND.

TOMPRINSVILLE, Staten Island, Nov. 15.

A. C. A. Membership.

NEW MEMBERS PROPOSED.

Atlantic Division.—William H. Gleaves, Trenton, N. J., by C. L. Hancock; Thomas L. Pryor, New York city, by C. Sparks.

Western Division.—A. E. McKinnon, Detroit, Mich., by W. C. Jupp; Martin Lundgren, Hebron, Ky., by C. F. Wolters.

Rifle Range and Gallery.

New York City Schuetzen Corps.

The feature of the shoot held Nov. 24 on the Zettler ranges was the score of D. H. Brinkmann, who won a fine cut-glass punch bowl with a shot that measured 3 1/2 degrees on the bullseye target. The black is 4 in. in diameter, one shot is allowed each member, and all targets are measured with a device which records the distance from the center of the black to the center of the bullet hole in 64ths of an inch. Very likely this is the record for 75ft. George Ludwig was high on the ring target. The full scores follow:

Table of rifle scores for New York City Schuetzen Corps, including King target, Bullseye target, and Ring target results.

At Walnut Hill.

WALNUT HILL, Mass., Nov. 25.—The Massachusetts Rifle Association's weekly competition had windy weather conditions at the start, which modified to good conditions later. Daniel's score of 47 at 1,000yds. captured first place for the day.

T. Carlson and W. S. Ripley, Jr., tied on 88 for first place at 200yds. A. Niedner was first with 215 on the ring target. E. E. Patridge, among other high scores made four 95s.

The range will be open for an all-day shoot on Thanksgiving Day, with special matches in the various classes, open to all-comers. The scores:

Table of rifle scores for Walnut Hill, including Members' offhand match, Standard American target, Offhand medal match, Long-range rifle match, and Pistol medal match.

Zettler Rifle Club.

The weekly shoot was held Nov. 21. W. A. Tewes was high on the ring target with a total of 2457, while Charles Zettler, Jr., won the bullseye prize with a score of 37 1/2 degrees. The scores at 75ft., offhand, follow:

Table of rifle scores for Zettler Rifle Club, listing names and scores for various matches.

Harlem Independent Schuetzen Corps.

In the regular shoot, held Nov. 22, A. P. Fegert was high man with a total of 474 for 20 shots, at 75ft. offhand. Other scores follow:

Table of rifle scores for Harlem Independent Schuetzen Corps, listing names and scores.

# U. S. AMMUNITION

The proof of the Cartridge is in the shooting. The United States Army, by careful tests, have proven the U. S. Cartridges to be the *most accurate and reliable*.

MANUFACTURED BY

## UNITED STATES CARTRIDGE CO., LOWELL, MASS., U. S. A.

Agencies: 497-503 Pearl St., 35-43 Park St., New York.

114-116 Market St., San Francisco.

### A New Springfield Club.

THE enthusiasts in Springfield, Mass., have put their heads together and organized the Springfield Rifle Club, which will shoot during the winter months on a range that is now being built and equipped according to the latest designs. There are to be five ranges, all 75ft. in length, with the so-called trolleys for moving the paper targets to and from the butts and firing points. There are a number of good shots in and about Springfield, some of whom shoot at 200yds. on the ranges of the Springfield Rod and Gun Club, and these gentlemen feel the need of an indoor range.

### Rifle Notes.

The Preble County Rifle Club, of Eaton, will hold its regular quarterly contest for the club medal and merchandise prizes on Dec. 1. The club event is open to members only, but there will be contests open to all for cash prizes. The shooting will be at 100yds., offhand, two shots each, on the animal and Creedmoor targets.

## Trapshooting.

### Fixtures.

- Nov. 30.—Utica, N. Y.—Riverside G. C., all-day target tournament. E. J. Loughlin, Sec'y.
- Nov. 30.—Utica, N. Y.—Oneida County Shooting Association G. C. Thanksgiving shoot. James W. Brown, Sec'y.
- Dec. 2.—Lowell, Mass., R. and G. C. all day shoot. E. J. Burns, Sec'y.
- Dec. 5-7.—St. Thomas, Ont.—McCall & Emslie's live-bird tournament.
- Dec. 8.—Atglen, Pa.—Christiana-Atglen G. C. all-day shoot. W. R. Ficles, Sec'y.
- Dec. 12-13.—Omaha, Neb.—Interstate team race, between teams of Nebraska, Iowa, Missouri and Kansas. W. D. Townsend, Sec'y.
- Dec. 14.—Travers Island, N. Y.—Amateur championship of America, under auspices of New York Athletic Club. Gus E. Grieff, Chairman, 302 Broadway, New York.
- Dec. 17.—Jersey City, N. J.—Hudson G. C. tournament and outing. J. Hughes, Sec'y.
- Dec. 20.—Phillipsburg, N. J.—Alert G. C. first annual holiday shoot.
- Dec. 28.—Edgewater, N. J.—Palisade G. C. all-day shoot. A. A. Schoverling, Sec'y.

## DRIVERS AND TWISTERS.

The Northside Gun Club, of Paterson, N. J., will hold their Thanksgiving shoot on Saturday of this week.

Secretary A. A. Schoverling, 2 Murray street, New York, informs us that the Palisade Gun Club will hold an all-day shoot on Dec. 28.

The Montclair, N. J., Gun Club announce a silver shoot, to be held on Thanksgiving Day, commencing at 9:30, and closing at 12:30 in the afternoon.

The Sheephead Bay, L. I., Gun Club will hold a shoot for turkeys and special prizes on Nov. 30, commencing at 1:30 o'clock. Every one is welcome.

The Jackson Park Gun Club, of Paterson, N. J., will hold their Thanksgiving shoot on Thursday of this week, commencing at 1:30. Every one welcome.

In the third contest of the Passaic-Bergen County League series, the five-man team of the Jackson Park Gun Club won with a score of 107 to 78, for Mount Pleasant and 77 for the Northsides.

Secretary C. W. Budd writes us that the annual tournament of the Iowa State Sportsmen's Association will be held at Des Moines, on March 14-16, and that \$300 will be added to the programme.

Last Saturday's contests in the series of the Philadelphia Trapshooters' League resulted as follows: The Florists defeated Meadow Springs, 297 to 197. Highland defeated Camden, 200 to 177. Media defeated Narberth, 202 to 181.

The Shooting Committee of the Hudson Gun Club, of Jersey City, N. J., Messrs. Carl Von Lengerke (Dr. Sergeant), and James Hughes, writes us that "At a special meeting held on Nov. 27, Dec. 17 was selected for the Hudson Gun Club's shoot and outing. Nothing other than bad weather will prevent a real good time."

Mr. Alf. Gardiner, of Brenham, Tex., writes us that "The next Sunny South Handicap will be held here, Jan. 22, 23, 24, 25, 26 and 27. We will have \$1,500 in cash added for the amateurs, and are going to try to make this the largest shoot ever held in the South. Programmes will be ready some time in December, and can be had by addressing me, Alf. Gardiner, Mgr."

The Queens County Gun Club, of Long Island City, N. Y., is out of the sport of trapshooting, for the present at least, perhaps permanently. This is consequent to public improvements and the invasion of its grounds for those purposes. This is a regrettable happening, as the club had recently expended an important sum of money for a club house and trap equipments, besides being actively earnest in promoting the sport.

The intercollegiate championship team contest, held at Cambridge, Mass., Nov. 25, was won by Pennsylvania, with a score of 197. Yale was second with 196. Harvard was third with 190. Princeton was fourth with 166. Each team had five men. Mr. C. H. King, of Yale, won the individual collegiate championship with a score of 47 out of 50, a 94 per cent. performance. Yale defeated Harvard in a five-man team contest by a score of 209 to 184.

For their all-day shoot on Dec. 8, at Atglen, Pa., the Christiana-Atglen Gun Club offers a programme of targets and live birds, ten events of the former, at 15 and 20 targets, and three of the latter at 5, 7 and 10 birds respectively, entrance \$2.50, \$3.50 and \$5. Free dinner to shooters. The popular expert manager, Mr. Luther Squier, will assist in the management. Rose system. Mr. Fred Gilbert, who can break targets till the cows come home, will be an honored visitor.

The indefatigable Secretary-Manager of the Interstate Association, Elmer E. Shaner, is taking a much-needed rest in Rain-makers' Camp, with his family. He will remain there through the Thanksgiving season, to enjoy the fresh air, sunshine and sky line free from bricks and mortar. His annual report is completed. By way of further benefits, he took a strenuous journey across the hot sands of the desert, where the Arab patrol was busiest, and is entitled to a good rest.

The new schedule of the Passaic-Bergen County League will take effect on Saturday of this week. "The Jackson Park Club will meet the Mount Pleasants on the Mount Pleasant's grounds, the Northsides laying off on Dec. 9. The Mount Pleasants will go to the Northside's grounds and there meet the Northsides. The Jacksons laying off on Dec. 16, the Northsides will go to the Jackson Park grounds and meet the home club, the Mount Pleasants laying off."

The Thanksgiving Day shoot of the O. C. S. A. Gun Club, at Utica, N. Y., Nov. 30, has a programme of ten target events, of which three, at 20 targets, are merchandise, one of which is a handicap, a Baker Leader hammerless. The totals are 150 targets, \$8.80 entrance and an additional total of \$1.50 for chickens. Shooting will commence at 10 o'clock. Targets one cent. Refreshments on grounds. Guns and ammunition forwarded to the Secretary, James W. Brown, 65 Taylor Ave., Utica, will be delivered on the grounds free.

The Avalon Gun Club, of Catalina Island, California, will hold several live-bird championship and handicap live-bird events. The premiss of the championship is as follows: "With the idea of deciding the question of supremacy among the amateur trapshooters of the United States, the Avalon Gun Club, of Catalina Island, California, will hold several important live-bird shoots at Catalina Island during February and March." In our view, somewhat obscured by distance and provincialism, the idea of holding a championship of the United States is good, but the fact of holding the championship of Catalina Island, extending to its full maritime jurisdiction, is better.

The following is an excerpt from the Shooting Times: "German scientists announce that everything needed to make a man weigh 150lbs. can be found in the whites and yolks of 1,200 hen's eggs. Reduced to a fluid, the average man would yield 98 cubic meters of illuminating gas, and hydrogen enough to fill a balloon capable of lifting 155lbs. The normal human body has in it the iron needed to make seven large nails, the fat for 14lbs. of candles, the carbon for 64 gross of crayons, and phosphorus enough for 820,000 matches. Out of it can be obtained, besides 20 coffee-spoons of salt, 50 lumps of sugar and 42 litres of water." If the learned gentlemen had examined some of the American sportsmen who had the temerity to hunt deer, moose, etc., he would have found a sufficient quantity of lead to make a lump or two.

BERNARD WATERS.

### Sheephead Bay Gun Club.

SHEEPSHEAD BAY, L. I., Nov. 23.—The weather was delightfully pleasant. The shooters, however, were few in number. Scores: Events: 1 2 3 4 5 Events: 1 2 3 4 5 Targets: 25 25 25 25 25 Targets: 25 25 25 25 25 Grieff ..... 24 23 25 23 .. Fransiola ..... 13 13 18 13 .. Jones ..... 16 20 .. .. ### Montclair Gun Club.

MONTCLAIR, N. J., Nov. 25.—Some fourteen men were present to-day at the monthly shoot for the silver cup, at 50 targets, handicap. Messrs. Bush and Foster tied at 47. Bush broke 22 out of 25 in the first string and 25 straight in the second, making a net score of 47. Dr. Foster, with a handicap of 14, scored the same. In the shoot-off at 25 targets, both men tied again, Bush breaking 20 and Foster 13 + 7 handicap, giving him an even score. On account of darkness the shoot-off had to be postponed to another day. Events 1, 2 and 5 were for practice. Handicaps apply in event 3 as added targets:

Events:	1	2	3	4	5	Events:	1	2	3	4	5

WESTERN TRAP.

Cincinnati Gun Club.

THINGS have been dull at the club this week, not a shooter faced the traps on Nov. 24, and on Saturday, the 25th, only ten men shot their scores in the Ackley trophy contest.

Several of the boys have not yet returned from their hunting trips, and this fact may affect the attendance on Thanksgiving.

To-day's scores: Ackley trophy, 50 targets, handicap: Ahlers, 19 .....46 Williams, 19 .....39

Ohio Notes.

The Northern Kentucky Gun Club, of Bellevue, held their regular weekly shoot at the East Newport Ball Park, on Nov. 19, thirty sportsmen being present.

Charles F. Miller, of Dayton, one of the cracks of the Rohrer's Island Gun Club, has had poor luck in hunting since the season opened, and has made up his mind to lay the gun away and quit shooting until he can find sure sport on the Rohrer's Island grounds in March.

The Kuntz brothers, of Dayton, East End, went to Fayette county after quail, but had no success, birds being scarce.

John J. Stoecklein, Dayton, has been hunting in the Millidgeville region, and got a fine bag of birds and rabbits.

James A. Achey, Dayton, has found sport enough in Ross county to keep him in practice.

Witt Martin spent three days hunting on his father's farm in Jackson, and returned home with five dozen quail and thirty-seven rabbits, killed by himself and two friends.

The New Lebanon Gun Club has a turkey shoot arranged. The shoot is open to every one, and the prizes are turkeys, ducks and chickens.

Turkey shoots are being arranged to be held at Phillipsburg and on the old Troy pike, a short distance north of Dayton.

The Dayton and Welfare (N. C. R.) gun clubs will probably hold shoot a little later, giving turkeys, ducks and chickens as prizes.

The Greenville Gun Club will have their usual holiday turkey shoot about Christmas time. The event will probably be held on the rifle range, as last year.

The big game hunters are beginning to return. Uncle Joe Wilson's party brought six bull moose heads as trophies of their month's hunt.

The old veteran John F. Beaver, Dayton, who celebrated his seventy-ninth birthday a few weeks ago, has just returned from a hunt of several weeks in northern Wisconsin, with Daniel Francis and a party of Arcanum hunters.

Dr. N. B. Hartwell, Tom Lyons and W. D. Linder, Dayton, have just returned from a hunting trip in northern Michigan.

J. R. Stocker, Daniel Snyder and Chris. Appenzeller, have just returned to their home in Greenwich, each of them having killed a buck, which they brought home, besides having supplied the camp with plenty of venison.

Henry C. and Chas. E. Hossafous and L. Groneweg, of Dayton, were camped at Mattawamkeag, Maine. Each of the party killed two bucks and smaller game, and brought home a dozen ruffed grouse to help out their Thanksgiving dinner.

A carload of deer and moose arrived in Dayton on Nov. 24, and attracted much attention. The game was killed in Maine by the hunters of Dayton and vicinity.

Claude Weaver and party were located at the J. C. Mitchell camp on the Eagle River road, forty miles northwest of Patten, Me. One morning Weaver, standing in his tent door, saw a fawn, and hastily getting his rifle, killed it for camp supply.

Ed. G. Sander and Wm. T. Brown, Dayton sportsmen, have returned from a few days' rabbit hunt around Bellbrook and Spring Valley and had good success.

In Other Places.

The Bluerock Gun Club, of Ingersoll, Ont., indulged in a little diversion at Irelandsport, Tuesday last.

Members to the number of thirty-six of the Corner Rod and Gun Club, Fort Wayne, Ind., met at their club and Mr. and Mrs. Campbell served an oyster supper.

The Indiana Stock Powder Company has been organized at Huntington, Ind., with Dr. M. W. Strauss as president.

Prizes awarded to the high guns at the Fort Garry Gun Club's traps, Winnipeg, Can., for 1905, are as follows: F. G. Simpson, first trophy, with average of 90 2-9 per cent.

At Titanka, Iowa, a shooting match was to be held on the day preceding Thanksgiving. All shooters were invited, and as a happy wind-up the gun club members had arranged for a dance at the local hall.

A town not much heard from as a shooting center is Royal, Ill.; but the secretary informs the scribe that a shoot for poultry was to be held there on Thanksgiving Day, and all were to enjoy a royal time.

The Media, Pa., Gun Club was on Saturday defeated in a team match by the Meadow Springs Club, 172 to 158. Something went wrong, as this is the very poorest showing made by the club this year.

Gordon McDonald, member of the Hill Rod and Gun Club, Chester, Pa., is spending his vacation at Harper's Ferry, in quest of rabbits, quail, etc.

Members of the Rod and Gun Club, Middlesburg, Pa., returned from Juniata and report catching—cold.

On Thanksgiving Day there is to be held a shoot at Boon, Ia., Gun Club grounds. Turkeys, geese, ducks are the attraction.

A new gun club has been organized at Denison, Texas, with capital stock \$12,500. The incorporators are H. Tone, Jr., E. W. Stuart, W. H. Lingo, H. Brooks, N. L. Decker, J. W. Madden and J. Whitehurst.

It is reported that a number of shooting galleries will be started in various parts of the country for the winter months. This will furnish amusement for the .22 experts, and in the meantime give the young men and boys an opportunity to learn to shoot the small-bore rifle.

Frank Forster, R. T. Bradley, R. S. Griffith, Roy Collins, A. H. Thompson, A. E. Hurley and Clyde Koch, members of the Sugar Run Rod and Gun Club, Braddock, Pa., have returned home after a hunt in the wilds of the Pennsylvania mountains.

Though the game season is on, the members of the gun club at Freeport, Ill., are still holding weekly shoots at Taylor Park.

The weekly shoot on Wednesday of the Rainmakers' Gun Club, Ottawa, Ill., resulted in some very good scores. Kneussel won the Class A medal; Scherzer took the Class B.

The Youngstown, O., Gun Club has chosen the following dates for the contests for their trophy, donated by the powder company: Nov. 25, Dec. 14 and 30.

The Maroa, Ill., Gun Club held a spirited contest at the race-track, Nov. 28.

The Horicon Marsh, near Fond du Lac, Wis., has been leased for another ten years. This will dispose of the project to drain same.

Drumgoole, of Anaconda, Mont., won the Twohy medal, and C. H. Smith, of Butte, and McGroom, of same city, won three points on the Noshos Club's trophy.

The Mission Gun Club, of Yankton, S. D., after a hunt for turkeys for their shoot, gave it up and sent to Minnesota for a hundred of the best birds that could be selected.

The Greenville, O., Gun Club will hold a holiday shoot just after Christmas.

An automatic trap will be installed at the Joliet, Ill., Gun Club grounds, and the club surely starts out promising. There was some fine shooting by the members last Sunday, Whorrie and Dockendorff getting 90 per cent.

An assessment of \$10 per share was made on the stock of the members of the State Gun Club at Salt Lake for the purpose of making improvements, etc.

Members of the Havelock Gun Club, of Lincoln, Neb., held their regular shoot last Saturday, as the bad weather had prevented holding the regular shoot the week previous.

Mr. Harold Money was last heard from at Colorado Springs, where he won a private match with 47 out of 50.

Robert Ewalt was high gun in the team shoot when the Youngstown, O., Club shot against Cleveland, getting 23 out of 25. There was fixed to be held a shoot at San Jose, Ill., on Nov. 28. There were sweepstakes, turkeys, geese and ducks.

Conductor Waddington won the shoot given by the Freeport, Ill., Gun Club by a score of 61 out of 70. He captured all five of the chickens put up as special prizes.

Mr. W. H. Heer has done some good shooting this year, and won a fine meerscham pipe for high average at the Larned, Kans. tournament.

If the wishes of the shooters of Southwest Kansas come to realism, there will be another tournament held at Larned, Kans., during the year 1906.

Members of the Laramie, Wyo., Gun Club held a shoot last Thursday and made some good records.

It is reported that members of the gun club did not do much shooting at Connersville, Ind., on the opening day, but they were going after game with a vengeance on the last day of the month.

The Sac City, Ia., Gun Club held a shoot last Tuesday. There were eighteen events of 10 and 15 targets. The following gentlemen were in the game: Dr. G. T. Cress, Ed. Welch, Jr., Pat Volkerts, F. C. Hoyt, Floyd Weary, J. B. Paxton, H. S. Parker, Adam Teeple, Frank Healey, Bert Staley and William Hennings.

Members of the Smelter Gun Club, of Great Falls, Mont., went to Stockett last Sunday to engage in a turkey shoot.

Members of the Spokane, Wash., Country Club are now contemplating the organization of a gun club. It not only means sport for those of the club who shoot, but it will stimulate the game. There will then be rivalry between the members of the two clubs.

The Corner Rod and Gun Club, Fort Wayne, Ind., at a meeting held Nov. 13, elected officers for the coming year, as follows: President, E. M. Evans; Vice-President, A. H. Witte; Secretary, J. V. Linker; Treasurer, P. I. Stohl; Trustees, A. H. Fenuse and C. W. Meyer. Next year there will be no one admitted to the grounds save members and their families.

There will be a large tournament held next April in connection with the State league. This is the largest club in point of members of any in the State.

Henry Struble will manage a turkey shoot at Caldwell, Kans., at which he will dispose of fifty turkeys, on Nov. 29. A rule was made that only machine loaded shells should be used, and no shot finer than 8 allowed.

One-hundred live-bird races are starting up in Pennsylvania. The George Hansel and J. B. Morrison race will long be remembered with their scores of 97 and 93.

The Clive, Ia., Gun Club is making preparations for a tournament, to be held Thanksgiving Day.

The River Forest Gun Club has been organized at Oak Park, Ill., a suburb of Chicago. Traps and fixtures have arrived. Henry Matthews and Col. W. H. Speer are the prime movers.

There is to be a turkey shoot Thanksgiving Day at Carlisle, Pa. The shooters of Dayton, O., assembled on the gun club grounds Tuesday last and engaged in memorial tree planting, which is intended to perpetuate the names of the members. Each one planted a tree, and the club set out one in deference to the deceased members. Speeches were made suitable to the occasion, and each year the above ceremony will be repeated.

Some very fine scores were made at the special invitation shoot given by C. L. Tutt, at the Colorado Springs, Colo., Gun Club grounds, Saturday last. A pleasant feature was the team shoot, a lady being a contestant upon each team. There were five on a side, each shooting at 25 targets. Result: Mrs. Wm. Cook Daniels 17, C. L. Tutt 19, Butler Williamson 22, C. M. Schley 20, H. N. Todd 9; total 87. Mrs. L. M. Cuthbert 12, H. Money 21, D. Drummond 12, D. Chisholm 17, A. Brabazon 20; total 82. Mrs. Daniels was presented with a handsome trophy by Mr. Tutt. The attendance of guests was appreciated.

Chas. F. Boehmer, the young crack shot, of York Farm, Pa., has arranged a live-bird match at Bull's Head with Mr. Flarety, to shoot at 13 live birds each. The contest will take place Dec. 8, and the purse will be \$300.

Passaic-Bergen Co. League.

PATERSON, N. J., Nov. 25.—This shoot, held to-day on the grounds of the Mount Pleasant Gun Club, was the third of the series of the Passaic-Bergen County League. A large crowd was in attendance. It was the largest gathering ever present on the grounds. The Mount Pleasant Club will make many new improvements in the ground equipment before many days.

Crescent Athletic Club.

BAY RIDGE, L. I., Nov. 25.—The weather was clear, cool and pleasant, an ideal day for outdoor life and for shooting.

A live pig was the first prize in an event which was well contested. Mr. C. E. T. Foster captured the porcine trophy with a full score, after which he colligated a pair of ducks, having, however, to shoot out five others in the tie for them.

Dr. J. J. Keyes, with a score of 22, had legs enough to reduce the November cup to his personal possession.

In the shoot for the Stake trophy, Dr. Frank C. Raynor scored the limit and a win. Shoot for November cup, 25 targets, handicap:

New York Athletic Club.

TRIVERS ISLAND, N. Y., Nov. 25.—The scores made at the shoot of the New York Athletic Club to-day are appended. The contest for the monthly club cup resulted in a tie. Dr. De Wolf won to-day's contest, and he and Dr. Held, each having an equal number of wins on it in the total of the monthly shoots, are tied, and are to shoot off the tie on Thursday of this week.

Event 1, 25 targets, scratch: Grieff .....25 Elias .....17 Crowe .....13 Calhoun .....17

Event 2, 25 targets, handicap: Grieff, 0 .....22 Held, 5 .....21 Elias, 4 .....25 Keller, 4 .....24 Billings, 4 .....25 Hibbard, 6 .....19 Barnes, 4 .....23 Calhoun, 5 .....19 De Wolf, 4 .....25 Vilmar, 7 .....13 Dickerson, 7 .....23 Robinson, 7 .....21 Crowe, 7 .....22 Brown, 6 .....22

Event 5, handicap, 25 targets: Grieff, 0 .....22 Dickerson, 7 .....17 Elias, 4 .....18 Hibbard, 6 .....24 Billings, 4 .....25 Held, 5 .....22 Barnes, 4 .....20 Jacob, 7 .....13 De Wolf, 4 .....22

SIDE LIGHTS OF TRADE.

The G. W. Cole Co., 121 Washington Life Building, New York, inform us that, on Oct. 31, they shipped an entire carload of "3 in One" oil in one consignment, and that it was the biggest single shipment of "3 in One" or any gun or household oil that ever was made. It numbered 66,240 bottles. Circulars, descriptive of its usefulness, will be sent on application to the above-mentioned company.

PUBLISHERS' DEPARTMENT.

The gunner who is getting ready for a fall shooting trip, or who contemplates going south, where he will have much tramping after quail over sandy and briery old fields, needs shoes of the best quality. Such footwear is offered by A. J. Cammeyer, whose advertisement is found in another column, and the product of whose factory is stamped with the concern's name, which in itself is a guarantee of excellence. Cammeyer's hunting shoes have been known for a generation of sportsmen, and have satisfied that generation.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

NEW YORK, SATURDAY, DECEMBER 9, 1903.

VOL. LXV.—No. 24  
No. 346 BROADWAY, NEW YORK.

TERMS, \$4 A YEAR, 10 CTS. A COPY.  
SIX MONTHS, \$2.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

### DUCK SHOOTING, 1905-1906.

UP to the very last days of November, the weather all along the Atlantic seaboard had been so mild and pleasant that there has been little or no wildfowl shooting. Moreover, the unseasonable warmth had detained the fowl far in the north so that the shooting on Southern grounds at the opening of the season in November was somewhat disappointing, though bags of from thirty to fifty birds have been made on the Virginia and North Carolina coast. It is reported that in the Sound country of North and South Carolina the feed this year is not so good as usual; a condition of things likely to result in poor shooting later in the season, when the fowl, having consumed the water plants on which they subsist during the winter, will be obliged to seek other feeding grounds, presumably to the south. This year—as often in recent years—gunners on the coast of North and South Carolina complain greatly of the abundance of the Canada geese, which destroy the food that would otherwise support the ducks.

On the great northern Atlantic coast resting place for good ducks, that is to say, on the Great South Bay and adjacent bodies of water, there is an abundance of birds such as has not been known there for many years. Broadbills and redheads are reported as unusually numerous. Flocks of canvasbacks have been seen, birds which are unusual in any numbers on the waters of Great South Bay, though, of course, scattering birds or even small flocks of them occasionally drop in. Black ducks are reported much more numerous than usual, and as a result of the abundance of the fowl and of the mild weather, point shooting in this vicinity has been very much better than for years past. In fact, except for the illegal night duck shooting, point shooting up to a very few years ago had become almost a forgotten sport on the Great South Bay.

By many gunners the greatly increased quantity of fowl loitering on Great South Bay is believed to be due to the abolition of spring shooting in New York. No doubt this has something to do with the abundance of these fowl, which, on their passage northward last spring, learned that they were comparatively undisturbed on the Great South Bay, and have thus returned there in great numbers and now loiter there in great hordes since the mild, fair weather prevents their being greatly disturbed, and they remain in great beds which give little opportunity for the battery men.

From points about the Great Lakes and in the vast Mississippi drainage, which are in the line of the wildfowls' southward migratory flight, come reports of abundance of birds; and while in many localities, owing to the lack of suitable ducking weather, the shooting has been poor and bags small, nevertheless the birds seem everywhere in great abundance.

It is many years since the FOREST AND STREAM began to agitate the question of the abolition of spring shooting and to point out the necessity for a change in shooting methods. Our forefathers and the older men of this generation shot without thought of the future, and it is only within the last twenty years that people have begun to see to what spring shooting and unlimited bags must ultimately bring us. Within the last few years the change in sentiment has been great. In many of the Northern States and over much of Canada spring shooting has been abolished. In many sections the birds are allowed to rear their young unmolested on their ancient breeding grounds, and this freedom from disturbance shows itself in the increasing numbers which are beginning to return to us in the autumn. It is possible that we have passed the turning point in the diminution of our wildfowl, and that from now on they may increase. To aid in their increase there should be a multitude of reservations—both State and Federal—set aside along the Atlantic coast, in the Mississippi Valley and about the Great Lakes, where

the birds may be always free from molestation. The sportsmen themselves should have enough intelligence to do what the Audubon Societies are now doing; that is, to lease tracts of ground where the wildfowl shall be protected, preserved and propagated and never disturbed. It does not speak well for the lovers of the gun that they must wait to have an example shown them by the Audubon Societies.

The prospects seem favorable for a good duck shooting season this winter. There will be plenty of birds, and if there are plenty of birds, the only things needed to insure good shooting are feed enough to hold the fowl to their feeding grounds and such weather as will break them up into small bunches and make them fly. Predictions about sport are notoriously untrustworthy, yet, it would seem that in the next two months a great many wildfowl should be killed.

### POSSESSION OF FOREIGN GAME.

THE Appellate Division of the Supreme Court has handed down an opinion in the Silz case, in which the point at issue was the right to possess in close season game imported into the State. The prevailing opinion is favorable to Mr. Silz, because it sustains his defense, which was that the State could not constitutionally forbid his possession of property which had been passed through the custom house. The Buffalo fish case was followed as a precedent; the opinion, written by Justice Woodward, adopting its conclusion that "fish imported under the tariff laws and regulations of the United States were not subject to State control." It is worth while noting in this connection the fact brought out by Justice Miller in a dissenting opinion that as to the bearing of the Buffalo fish case on the proposition that the statute offends both the State and Federal Constitutions, "the answer is that it never was authority for any such proposition, and this without regard to the effect of the 'Lacey Act'; three judges only assented to that proposition, three united in a vigorous and logical defense of the constitutionality of the act, and the concurrence of the seventh with the opinion of the majority was expressly limited to the point that the act was not applicable, thereby by implication at least, agreeing with the minority on the constitutional question." And Justice Miller further declares that the statute in question does not in terms or effect prohibit inter-State or foreign commerce.

The full text of the prevailing and dissenting opinions is given in our game columns. We assume that the case will be carried to the higher courts.

### THE NEW ENGLAND SHOOTING.

WITH Thanksgiving Day the shooting season for southern New England came to an end, and we may now look back and consider what it brought us. On the whole, the shooting has been much better than was anticipated.

The past two severe winters and the reports received of quail destruction had taught us that these birds, which in Connecticut and portions of Massachusetts we commonly find our most reliable game bird, had all been winterkilled, and could not be looked for. If by chance a few were left over in any locality, it would be most unwise to kill them off; much better to leave them unmolested this autumn in the hope that a mild winter and a good breeding season next summer might restock our coverts with native birds. For, after all, if they can be had, these New England quail are better for New England than those imported from the South, because they are larger, hardier and far better able to take care of themselves. We know of some places where the best shots of town or village agreed not to kill quail this autumn, and lived up to their agreement.

If few or no quail were killed, the case was quite different with the ruffed grouse—New England's standby among the game birds, and about the best bird that can be shot. The opening of the season—in Connecticut and Massachusetts—on Oct. 1 gives the grouse a little preliminary training, which tends to protect it. Often the weather then is warm and dry, so that the dogs have hard work to find the birds; always the leaves hang heavy on the trees and furnish an effective shield for the swift flying bird, who practices his old game of getting out of sight as soon as possible. At all events, while there was

good shooting through November, there were plenty of partridges left over to breed next year, and in very many sections of New England, at the close of the season, these birds were still plenty.

This fall the woodcock was somewhat more abundant than usual. The native birds were killed off almost at once, and owing to the warm weather the flight birds came on rather late. Such birds as were killed were in good condition and gave excellent sport to the gunner. As the years go by and the woodcock grow fewer, one tries to think of some method by which these splendid and delicate birds may be protected. There are yet in New England and far to the north vast tracts where the woodcock may breed, but further to the south there are still some States that permit the shooting of the birds in summer. The practice ought now to be stopped; the woodcock are growing too few. There are elderly men who still go out shooting three or four times a year who have not seen a live woodcock for ten or fifteen years. Their recent knowledge of the bird has come either from eating woodcock that they buy in the market or looking at stuffed specimens killed many years ago.

WE admire the systematic and business-like methods of the Audubon Society in its work of protecting and preserving the birds. Nothing could be more effective than the plan it has put into operation in different parts of the country of getting control of the breeding grounds, placing them under strict guard, and so assuring permanent immunity. Some of these wild preserves have already been noted in these columns. A recent Audubon transaction was the leasing on Nov. 24 of several islands in the Lake Borgne Levee district, in Louisiana, for a period of ten years. The islands acquired comprise an area of nearly 25,000 acres; and are the natural breeding grounds of many species of wildfowl. A transaction of the same character has just been consummated at Augusta, Me. Old Man's Island, near Machias Bay, has been leased to the National Audubon Society, which has undertaken to police and protect it as a breeding place for gulls and for the eider duck, of which species there is now a colony on the island.

These bird preserving expedients are very practical and efficient. In them we have an illustration of one method of wildfowl protection which should be taken up in a larger way than now by sportsmen's associations and by the States and the Federal Government. The creation of game refuges in the Forest Reserves is rapidly winning popular approval. A conference of the game wardens of Montana, Idaho and Wyoming will be held at Butte on Friday of next week to discuss plans for the setting apart of some 4,000,000 acres in the Bitter Root Mountains as a vast game refuge, to be taken charge of by the National Government. This is one of those projects for which the sentiment of the times is ripe; and the scheme is likely to receive cordial support.

ON two or three occasions we have made a well-intended effort to take from Davy Crockett the coon which does not belong to him, and to restore it to Capt. Martin Scott, to whom it does belong. We now renounce the purpose and abandon the effort, henceforth to content ourselves with a simple recording of the perpetuation and currency of the popular error, as illustrated in the newspapers, that it was Davy Crockett to whom the coon came down. In a report by the New York Times of the mine workers' demonstration in Pennsylvania last week, it is told that one of the banners carried in the procession pictured President George F. Baer, of the Reading Company, as a bear up a tree calling out to John Mitchell, "who was pictured as Davy Crockett. 'Don't shoot. I'll come down.'" And in the very same issue of the Times is printed a letter written by a New York magistrate to an agent in Florida, in which was written: "All of them will be like David Crockett's coon—all you need to do is to point your gun and every high-toned, desirable citizen at Palm Beach may tumble instantly into your basket."

OLDER readers will recall with pleasure the pseudonym Pious Jeems as a familiar signature to sketches of sport in the South; and will be glad to know that we have in hand from that writer for our Christmas week issue a capital story of war times, which is characteristically well told.

## THE SPORTSMAN TOURIST

### In the Lodges of the Blackfeet.

#### The Tragedy of the Marias.

ACCORDING to arrangement, I joined Berry at the end of August, and prepared to accompany him on his winter's trading expedition. He offered me a share in the venture, but I was not yet ready to accept it; I wanted to be absolutely free and independent for a few months more, to go and come as I chose, to hunt, to roam about with the Indians and study their ways. We left Fort Benton early in September with the bull train, creeping slowly up the hill out of the bottom, and scarcely any faster over the level of the now brown and dry plains. Bulls are slow travelers, and these had a heavy load to haul. The quantity and weight of merchandise that could be stowed away in those old-time "prairie schooners" was astonishing. Berry's train now consisted of four eight-yoke teams, drawing twelve wagons in all, loaded with fifty thousand pounds of provisions, alcohol, whiskey, and trade goods. There were four bullwhackers, a night herder who drove the "cavayand"—extra bulls and some saddle horses—a cook, three men who were to build the cabins and help with the trade, with Berry and his wife, and I. Not a very strong party to venture out on the plains in those times, but we were well armed, and, hitched to one of the trail wagons, was a six-pounder cannon, the mere sight or sound of which was calculated to strike terror to any hostiles.

Our destination was a point on the Marias River, some forty-five miles north of Fort Benton. Between that stream and the Missouri, and north of the Marias to the Sweetgrass Hills and beyond, the country was simply dark with buffalo, and moreover, the Marias was a favorite stream with the Blackfeet for their winter encampments, for its wide and by no means deep valley was well timbered. In the shelter of the cottonwood groves their lodges were protected from the occasional north blizzards, there was an ample supply of fuel, and fine grass for the horses. There were also great numbers of deer, elk and mountain sheep in the valley and its breaks, and the skins of these animals were in constant demand; buckskin was largely used for the summer clothing and the footwear of the people.

September on the plains! It was the most perfect month of all the year in that region. The nights were cool, often frosty; but the days were warm, and the clear air was so sweet and bracing that one seemed never to get enough of it. Nor could one tire of the grand, the wondrous extent of plain and mountains, stretching out, looming up in every direction. To the west were the dark Rockies, their sharp peaks standing out sharply against the pale blue sky; northward were the three buttes of the Sweetgrass Hills; eastward dimly loomed the Bear Paws; south, away across the Missouri, the pine-clad Highwood Mountains were in plain sight; and between all these, around, beyond them, was the brown and silent plain, dotted with peculiar flat-topped buttes, deeply seamed with stream valleys and their numerous coulees. Some men love the forest; the deep woods where lone lakes sparkle and dark streams flow slow and silent; and it is true that they have a charm of their own. But not for me, not for me. My choice is the illimitable plain with its distant mountains, its lone buttes, its cañons fantastically rock-walled, its lovely valleys beckoning one to the shelter of shady groves by the side of limpid streams. In the forest one is ever confined to a view of a few yards or rods round about; but on the plains—often I used to climb to the top of a butte, or ridge, and sit by the hour gazing at the immense scope of country extending far, far to the level horizon in all directions except the west, where the Rockies rise so abruptly from the general level of the prairie. And how good one felt to see the buffalo, and the antelope, and the wolves, scattered everywhere about, feeding, resting, playing, roaming about, apparently in as great numbers as they had been centuries before. Little did any of us dream that they were all so soon to disappear.

We were nearly three days traveling the forty-five miles to our destination. We saw no Indians en route, nor any signs of them. On all sides the buffalo

and antelope grazed quietly, and those in our path did not run far to one side before they stopped, and began to crop the short but nutritious grasses. We encamped the second night by a spring at the foot of the Goose Bill, a peculiarly shaped butte not far from the Marias. The wagons were drawn up in the form of a corral, as usual, and in the center of it our lodge was put up, a fine new one of sixteen skins. Berry and his wife, a couple of the men and I slept in it, the others making their beds in the wagons, on the merchandise. We had a good supper, cooked over a fire of buffalo chips, and retired early. The night was very dark. Sometime after midnight we were awakened by a heavy tramping in the corral; something crashed against a wagon on one side of us, and then against another one on the other side. The men in the wagons began to call out, asking one another what was up; Berry told us in the lodge to take our rifles and pile out. But before we could get out of bed something struck our lodge and over it went, the poles snapping and breaking, the lodge skin going on and undulatingly careening about the corral as if it were endowed with life; in the intense darkness we could just see it, dancing round and round, a fiendish dance to a step of its own. At once all was excitement. Mrs. Berry shrieked; we men shouted to one another, and with one accord we all fled to the shelter of the wagons and hurriedly crept under them. Some one fired a shot at the gyrating lodge skin; Berry, who was beside me, followed suit, and then we all began to shoot, rifles cracking on all sides of the corral. For a minute, perhaps, the lodge skin whirled about, and dashed from one end of the corral to the other more madly than ever; and then it stopped and settled down upon the ground in a shapeless heap; from under it we heard several deep, rasping gasps, and then all was still. Berry and I crawled out, walked cautiously over to the dim, white heap and struck a match; and what did we see but the body of a huge buffalo bull, still almost completely enveloped in the now tattered and torn lodge covering. We could never understand how and why the old fellow wandered into the corral, nor why, when he charged the lodge, some of us were not trampled upon. Berry and his wife occupied the back side of the lodge, and he went right over them in his mad career, apparently without even putting a hoof on their bed.

We arrived at the Marias about noon the next day, and went into camp on a fine timbered point. After dinner the men began to cut logs for the cabins, and Berry and I, mounting our horses, rode up the river in quest of meat. We had plenty of fat buffalo cow ribs on hand, but thought that a deer or elk would be good for a change. On our hunt that day we rode up to a point where the "Baker battle" afterward occurred. That is what it is called, "Baker's battle," and the place, Baker's battlefield." But that was no battle; 'twas a dreadful massacre. The way of it was this: The Piegan Blackfeet had been waylaying miners on the trail between Fort Benton and the mines, and they had also killed a man named Malcolm Clark, an old employe of the American Fur Co., who was living with his Indian family near the Bird Tail divide. This man Clark, by the way, was a man of fierce and ungovernable temper, and in a fit of anger had severely beaten a young Piegan who was living with him and herding his horses. Now if you have anything against an Indian, never try to obtain satisfaction by beating him; either get your gun and kill him, or leave him alone, for if you strike him, blood alone will wipe out the disgrace, and sometime or other, when you are least expecting it, he will surely kill you. This is what happened to Clark. The young man got a passing war party to back him, and he murdered Clark. The War Department then concluded that it was time to put a stop to the Piegan depredations, and Col. Baker, stationed at Fort Shaw, was ordered to seek Black Weasel's band and give them a lesson. It was January 23, 1870, at daylight that the command arrived at the bluff overlooking a wooded bottom of the Marias, and there among the trees were pitched eighty lodges of the Piegans, not, however, Black Weasel's band; these were under Chief Bear's Head; but Col. Baker did not know that. Bear's Head's people were, in the main, friendly to the whites.

In a low tone Col. Baker spoke a few words to his men, telling them to keep cool, aim to kill, to spare none of the enemy, and then he gave the command to fire. A terrible scene ensued. On the day previous many of the men of the camp had gone out toward the Sweet Grass Hills on a grand buffalo hunt, so, save for Chief Bear's Head and a few old men, none were there to return the soldiers' fire. Their first volley was aimed low down into the lodges, and many of the sleeping people were killed or wounded in their beds. The rest rushed out, men, children, women, many of the latter with babes in their arms, only to be shot down at the doorways of their lodges. Bear's Head, frantically waving a paper which bore testimony to his good character and friendliness to the white men, ran toward the command on the bluff, shouting to them to cease firing, entreating them to save the women and children; down he also went, with several bullet holes in his body. Of the more than four hundred souls in camp at the time, very few escaped. And when it was all over, when the last wounded woman and child had been put out of misery, the soldiers piled the corpses on overturned lodges, firewood and household property, and set fire to it all.

Several years afterward I was on the ground. Everywhere scattered about in the long grass and brush, just where the wolves and foxes had left them, gleamed the skulls and bones of those who had been so ruthlessly slaughtered. "How could they have done it?" I asked myself, time and time again. "What manner of men were those soldiers who deliberately shot down defenseless women and innocent children?" They had not even the excuse of being drunk; nor was their commanding officer intoxicated; nor were they excited, or in any danger whatever. Deliberately, coolly, with steady and deadly aim, they shot them down, bayoneted the wounded, and then tried to burn the bodies of their victims. But I will say no more about it; think it over yourself and try to find a fit name for men who did this.\*

On our way up the river we saw many doe and fawn deer, a bunch of cow and calf elk, but not a buck nor bull of either species. On our way homeward, however, along toward sunset, the male deer were coming in from the breaks and coulees to water, and we got a large, fat buck mule deer. Madame Berry hung a whole forequarter of it over the lodge fire, and there it turned and slowly roasted for hours; about 11 o'clock she pronounced it done, and although we had eaten heartily at dusk, we could not resist cutting into it, and it was so good that in a short time nothing was left of the feast but the bones. I know of no way of roasting meat equal to this. You must have a lodge, to prevent draughts, a small fire; suspend the roast from a tripod above the blaze, and as it cooks give it an occasional whirl; hours are required to thoroughly roast it, but the result more than repays the labor involved.

The men soon cut and dragged out the required logs, put up the walls of our "fort," and laid on the roof of poles, which was covered with a thick layer of earth. When finished, it formed three sides of a square and contained eight rooms, each about sixteen feet square. There was a trade room, two living rooms, each of which had a rude but servicable fire-place and chimney, built of mud-mortared stones. The other rooms were for storing merchandise and furs and robes. In the partitions of the trade room were numerous small holes, through which rifles could be thrust; at the back end of the square stood the six-pounder. With all these precautions for defense and offense, it was thought that even the most reckless party of braves would think twice before making an attack upon the traders. But, of course, liquor was to be the staple

\*The Baker massacre, which took place Jan. 23, 1870, on the Marias River, was in its day a well-known event. The official reports declare that 173 Indians were killed and 100 women and children captured. Later and more accurate reports led to the belief that 176 people were killed. Of the killed fifteen men were reported as fighting men between the ages of fifteen and thirty-seven, eighteen were middle-aged and old men between thirty-seven and seventy. The women killed numbered ninety, and the children under twelve years of age—many of them infants in arms—fifty-five. When the news of the massacre reached the East, the newspapers took it up, and there was much excitement about it. Gen. Sheridan was bitterly assailed for his action. There never was any question but that the camp which Major Baker attacked was one of friendly Indians; people who had committed no depredations. The village to which the murderers belonged was that of Mountain Chief, which at the time was camped on Belly River in British America. Details of this destruction of life will be found in Manypenny's "Our Indian Wars."

article of trade, and even the most experienced man could never foretell what a crowd of drink-crazed Indians would do.

The fort was barely completed when the Piegan Blackfeet arrived, and pitched their lodges in a long, wide bottom about a mile below us. I passed the greater part of my time down in their camp with a young married man named Weasel Tail, and another who bore a singular name: Talks-with-the-buffalo. These two were inseparable companions, and somehow they took a great liking to me, and I to them. Each one had a fine new lodge, and a pretty young wife. I said to them once: "Since you think so much of each other, I do not understand why you do not live together in one lodge. It would save much packing, much wear of horses when traveling, much labor of gathering fire-wood, of setting up and breaking camp."

Talk-with-the-buffalo laughed heartily. "It is easy to see," he replied, "that you have never been married. Know this, my good friend: Two men will live together in quiet and lasting friendship, but two women never; they will be quarreling about nothing in less than three nights, and will even try to drag their husbands into the row. That is the reason we live separately; to be at peace with our wives. As it is, they love each other even as my friend here and I love each other, and thus, for the good of us all we have two lodges, two fires, two pack outfits, and enduring peace."

Thinking the matter over, I realized that they were right. I knew two sisters once, white women—but that is another story. And after I married, and my wife and I took up our home with a friend and his wife for a time—but that is still another story. Oh, yes, the Indian knew whereof he spoke; neither white nor Indian married women can manage a common household in peace and friendship.

I enjoyed myself hugely in that great camp of seven hundred lodges—some thirty-five hundred people. I learned to gamble with the wheel and arrows, and with the bit of bone concealed in one or the other of the player's hands, and I even mastered the gambling song, which is sung when the latter game is being played around the evening lodge fire. Also, I attended the dances, and even participated in the one that was called "As-sin-ah' pes-ka"—Assinaboine dance. Remember that I was less than twenty years of age, just a boy, but perhaps more foolish—more reckless than most youths.

In this Assinaboine dance, only young unmarried men and women participate. Their elders, their parents and relatives, beat the drums and sing the dance song, which is certainly a lively one, and of rather an abandoned nature. The women sit on one side of the lodge, the men on the other. The song begins, every one joining in. The dancers arise, facing each other, on their tip toes, and then sinking so as to bend the knees. Thus they advance and meet, then retreat, again advance and retreat a number of times, all singing, all smiling and looking coquettishly into each others' eyes. Thus the dance continues, perhaps for several hours, with frequent pauses for rest, or maybe to feast and smoke. But all the fun comes in toward the close of the festivities; the lines of men and women have advanced; suddenly a girl raises her robe or toga, casts it over her own and the head of the youth of her choice, and gives him a hearty kiss. The spectators shout with laughter, the drums are beaten louder than ever, the song increases in intensity. The lines retreat, the favored youth looking very much embarrassed, and all take their seats. For this kiss payment must be made on the morrow. If the young man thinks a great deal of the girl, he may present her with one or two horses; he must give her something, if only a copper bracelet or string of beads. I believe that I was an "easy mark" for those lively and, I fear, mercenary maidens, for I was captured with the toga, and kissed more often than any one else. And the next morning there would be three or four of them at the trading post with their mothers; and one must have numerous yards of bright prints; another some red trade cloth and beads; still another a blanket. They nearly broke me, but still I would join in when another dance was given.

But if I danced, and gambled, and raced horses, my life in the camp was by no means a continual round of foolishness. I spent hours and hours with the medicine men and old warriors, learning their beliefs and traditions, listening to their stories of the gods, their tales of war and the hunt. Also I attended the various religious ceremonies; listened to the pathetic appeals of the medicine men to the Sun as they prayed for health, long life and happiness for the people. It was all exceedingly interesting.

Alas! Alas! why could not this simple life have continued? Why must the railroads, and the swarms of settlers have invaded that wonderful land, and robbed its lords of all that made life worth living. They knew not care, nor hunger, nor want of any kind. From my window here I hear the roar of the great city, and see the crowds hurrying by. The day is bitterly cold,

yet the majority of the passersby, women as well as men, are thinly clad, and their faces are thin, and their eyes express sad thoughts. Many of them have no warm shelter from the storm, know not when they can get a little food, although they would gladly work for it with all their strength. They are "bound to the wheel," and there is no escape from it except by death. And this is civilization! I, for one, maintain that there is no satisfaction, no happiness in it. The Indians of the plains back in those days of which I write, alone knew what was perfect content and happiness, and that, we are told, is the chief end and aim of men, to be free from want, and worry, and care. Civilization will never furnish it, except to the very, very few.

WALTER B. ANDERSON.

[TO BE CONTINUED.]

## Growth of Forestry in Seven Years.

THE annual report of the Secretary of Agriculture, just published, presents a striking resumé of the growth of forestry in the past seven years, and of the part in this growth which has been taken by the Forest Service.

"During the past year," writes the Secretary, "the Government work in forestry entered upon a new phase. Practical work in the actual introduction of forestry began in 1898. But it was not until Feb. 1, 1905, when the care of the National forest reserves was transferred to the Department of Agriculture, that the Forest Service became an administrative organization.

"This transfer was a logical outcome of the recent work of the Service. During the last six or seven years it has passed through a remarkable development, which has followed but not kept pace with its demonstration of capacity for public usefulness. On July 1, 1898, the Division of Forestry employed eleven persons, of whom six filled clerical or other subordinate positions and five belonged to the scientific staff. Of the latter, two were professional foresters.

"At the opening of the present fiscal year the employees of the Forest Service numbered 821, of whom 153 were professional trained foresters. Field work was going on in twenty-seven States and Territories, from the Atlantic to the Pacific and from Canada to Mexico. Over 900,000 acres of private forests were under management recommended by the Service, and applications on file for advice from owners contemplating management covered 2,000,000 acres more. During the year nearly 62,000 letters were sent out from the offices at Washington, the majority of them in reply to requests for information and advice from the public, of a kind which could not be met by printed information.

"This contrast imperfectly indicates the full extent of the change which has taken place and the progress which has been made. Seven years ago there were in the whole United States less than ten professional foresters. Neither a science nor a literature of American forestry was in existence, nor could an education in the subject be obtained in this country. Systematic forestry was in operation on the estate of a single owner, honorably desirous of furnishing an object lesson in an unknown field. Lumbermen and forest owners were skeptical of the success of forest management, and largely hostile to its introduction. Among the public at large a feeling in favor of forest preservation, largely on sentimental grounds, was fairly widespread, but almost wholly uninformed. It confounded use with destruction, shade-tree planting with forestry.

"The real need of forestry was urgent. A time had come which presented at once great opportunity and a dangerous crisis. Forest destruction had reached a point where sagacious men—most of all, sagacious lumbermen—could plainly discern the not distant end. The lumber industry, vital to the nation at large, was rushing to its own extinction, yet with no avenue of escape apparent, until forest management for future crops should be forced by famine prices. Meanwhile, however, the ruin would have been wrought already.

"Timberland owners were selling their holdings or their stumps with little evidence of an understanding of their future value, and lumbermen were compelled by business competition to keep down the cost of operation to the lowest terms, or market their product at a loss.

"Forestry was both an evident economic need and an apparent economic impossibility. Few well-informed persons believed that the obstacles to its introduction could be overcome sufficiently to bring it into common practice among private owners during the lives of the present generation.

"That the whole situation is profoundly altered is directly and chiefly due to the work of the Forest Service. With its offer of practical assistance to forest owners made in the fall of 1898, its field of action shifted from the desk to the woods. The lumberman was met on his own ground. Uncertain speculations were converted into business propositions, and untried theories into practical rules. Actual management for purely commercial ends has been taken up and applied on their own holdings by some of the best-known lumbermen in the country. What lumbermen as a body now think of forestry is illustrated by the recent effective movement in their national association to endow a chair of lumbering at one of the forest schools.

"Public opinion generally has experienced an equal change, and a sound national sentiment has been created. The great and varied interests dependent upon the forest have been awakened to the urgent need of making provision for the future. States have been led to enact wise laws and enter upon a well-considered forest policy.

"Forestry is a matter of immediate interest to every household in the land. Forest destruction is no imaginary danger of a distant future. If it is not speedily checked its effects will sooner or later be left in every industry and every home. To make these facts known is a national duty. The work of education must continue until public opinion will not tolerate heedless waste or injudicious laws."

## When the Sharptail Grouse Were Plentiful.

THE days of the sharptailed grouse and prairie chicken in Minnesota and the Dakotas are drawing to a close. The bags grow smaller year after year, and in fact, some sections, heretofore the best of chicken and grouse ground, yield no returns at all. No more do the wild chickens of the prairie appear among the domestic fowl at feeding time in the barnyard. The day has gone when the farmer can shoot prairie chickens from his front porch. The prairie chicken and grouse are going the way of their former horned and woolly friend of the plains, and in a very short time specimens can be seen only in the museums.

No bird has given the huntsman such royal sport as the prairie chicken and the sharp-tailed grouse. What days those must have been when in August the prairie grass sheltered covey after covey, so close together that the marking down of a flushed or scattered covey was unthought of! These birds in their plentitude impressed one as did the millions of buffalo—extermination was impossible.

Fifteen years ago early in September I went north from St. Paul and crossed over into Canada at Pembina after sharptail grouse. We put up at a wheat farmer's and lived for a few days within a sea of golden stubble.

Great was the shooting. A stroll before breakfast around the confines of the farm fences on the edge of the wheat fields, without even a dog, would yield half a dozen fine birds. Up from the stubble the great birds would flush with a coo-coo-coo, as they sailed away like overgrown quail.

Our banner day came during one afternoon. Ahead of us was a long, narrow patch of stubble perhaps half a mile in length. We could see the birds scattered through this field feeding upon the scattered grain.

Calling the dogs to heel, we spread out across the field, and began to walk them up. The old birds generally flushed before we got within gunshot, but the younger ones remained, flushing perhaps twenty-five to forty yards ahead of us, giving us ideal shooting.

We noticed that the birds which flushed out of gunshot and those that escaped our aim flew straight down the field and pitched into what looked like a brush lot as we neared it. Really it was a patch of wheat, uncut because the weeds and sumach bushes had made too much headway. Affording magnificent cover and feeding opportunities as well, the birds selected this spot as their harbor of refuge. And when we had cleaned up the stubble field, and approaching the cover, hid our dogs in, the fun commenced.

The dogs stood on the edge of the cover and pointed. As a bird flushed and was killed, it flushed others as it lit the ground. And we shot until we felt we had enough, and quit. With the aid of the dogs we found our dead birds and secured the crippled ones.

The nights were cold, and our birds, hung on the north side of the house, were in fine shape when we started for the train. Every bird was fresh and sweet when we arrived at home, and with them we made our friends and neighbors happy.

We did well to wait until September and cooler weather. The opening day of the season, Aug. 15, had been hot and sultry. It was told us that some officers at Fort Pembina had shot over the Ridge, a famous sharptail grouse range, on the opening day. It is said that they killed 900 sharptail grouse. By the time they were ready to send the birds to their friends, only 300 were fit to start for the depot, and when these reached their destination they were too far gone for any use. This story was told in a commonplace way as an ordinary piece of news, and the truth of it I cannot vouch for.

During the night previous to the morning of our departure two or three inches of snow had fallen, and during our early morning long ride over the prairies and across the stubble fields toward the depot, I can remember how much in evidence the birds were. Every grain stack had its quota of birds perched on top, picking away at the grain in the ear. The wheat in the shock, but not yet stacked, was liberally patronized, one or two great plump birds feeding on the top of every shock. Only those quite close to the road would fly away with a coo-coo-coo, as we got close by. But we were through with our shooting. Our shells and guns were stowed away, and we were bent on making time over the sticky, snowy prairie roads, intent on catching our train. So with contented and placid minds we jogged along, enjoying the sight of the feeding grouse at every wheat field we passed, until well within sight of our destination. And nowadays, when one reads of the smallness of the kill and the complaints about the scarcity of the birds, it is a pleasure to look back to the ride across the prairies when each snow-capped stack and shock harbored the hungry birds in plain sight, and many of them, within easy shot from our wagon seat.

CHARLES CRISTADORO.

## "Solid Comfort."

I PRESUME you have little idea how much solid comfort I have got from FOREST AND STREAM during the years I have not been permitted to enjoy field sports. Long acquaintance with it has got me to looking for its arrival as I would for the coming of a most valued friend. While it has from the first number been always a good paper, the last six months have been superb. I note with sorrow the dropping off of the old and valued contributors, but there have new ones come on, all of whose articles are very good and some of them are intensely interesting. "The Log of a Sea Angler" is an account of a trip that has been one of the dreams of my life, and is written in such graphic style that I feel that I have had the trip, and had it without any of the annoyances in the way of mosquitoes and other pests that would be a part of the real trip. I mourn the loss of Cabia Blanco as a friend whom I had never seen but hoped some day to take by the hand and tell him how much pleasure he had given.

O. H. HAMPTON.

# NATURAL HISTORY

## Frightened Animals.

PATERSON, N. J., Nov. 29.—*Editor Forest and Stream:* I do not know that I can shed any light on the question propounded by Mr. Thayer as to how hares act when attacked, but the question recalls three incidents which may or may not assist Mr. Thayer and others in arriving at a conclusion. I was gunning in a marsh through thick brush. I heard a rustling in the brush near me, and looking in that direction, saw a hare. I do not believe the hare saw me first, for he seemed in no hurry to get away; then he caught sight of me, and instead of scudding away, stretched himself out on the ground. I did not know what to make of this action, and before I had time to determine what to do a pheasant flushed and I fired at the bird. It fell dead only a short distance from where the hare was. The hare had given no signs of life, and I determined to investigate. I approached the hare, and was almost near enough to seize him, when suddenly he seemed to remember that he had urgent business elsewhere, and he scudded away in an orthodox manner.

On another occasion two friends and myself were walking along a road leading through a field of stubble and high grass; our dogs were working through the field to the right, and we were walking along, with no attempt to concealing our presence. Suddenly we came upon a flock of quail gathered in a fence corner; there were probably twenty-five birds in the flock, and about twenty of them had formed a ring; the others were apparently not interested in the ring; they were just "moseying." We were within ten feet of the birds before we saw them. They saw us too, for they looked at us; but they evinced neither curiosity at our presence nor fear of us, for they remained for fully five minutes just as unconcerned as they were when we first perceived them. Finally some of them flew away; but we left the rest just where we had discovered them, keeping our dogs away. We did not fire at the birds that had flushed, as the law was not off quail, although it was off partridge.

Some years ago, when I was connected with fish and game protection in an official capacity, two boys came to my house, bringing with them a hen ruffed grouse. I examined the bird and failed to find any wound; its bright eyes and general appearance indicated that it was in good health. The boys told me that they had seen the bird on the branch of a tree some twenty feet or so from the ground. One of the boys climbed the tree and the bird made no attempt to evade capture. So they brought the bird to me. I was puzzled, but presumed that the bird must have been injured in some way, of which no outward evidence was apparent. I put the bird in a large cardboard box and tried to feed it, but it would not eat. It did not show the least indication of fear and made no objection to being handled. It was as pretty a partridge as I have ever seen. On the following day I took the bird in the box to a clump of woods some distance from my house. I opened the box, but the bird acted very much like Poe's raven. I then took it out of the box and placed it on the ground. I walked some distance away, keeping my eyes on the bird. When I retraced my steps the bird suddenly flushed and never stopped in its flight until it was out of sight, plainly indicating to me that it had not been injured and that it was enjoying ordinary health.

Fear evidently actuated the hare—fear such as would follow from the approach of a predatory animal. The ruffed grouse also may have been affected from a similar cause, and I regretted that I could not learn anything about the bird before it was seen in the tree. But in the case of the quail, there was not the slightest trace of fear. Bunny undoubtedly was stunned with fear, and perhaps so too was the ruffed grouse; it took both some time to get over it, the hare a few minutes, the grouse over a day; but when they had recovered from their first paroxysm of fear, they sought safety in flight. My reasoning may be at fault, but does it not seem probable that hare and other animals act differently when pursued by birds or beast of prey, that some simply cower down and permit themselves to be captured, and that others promptly resort to flight, for I do not presume that there is a sportsman of any experience at all who has not seen hare and smaller birds endeavoring to get away from their pursuers. C. A. S.

NEW YORK, Nov. 25.—*Editor Forest and Stream:* I am unable to contribute anything in answer to Mr. Abbott H. Thayer's recent inquiry as to how hares act when threatened by hawks, but I have made some observations as to how they act when suspicious or slightly alarmed.

One often sees a cottontail rabbit concealing itself, just as a game bird conceals itself when sought for by the dog. The rabbit appears to be watching the individual who alarms it, and to take to its heels so soon as it has reason to think it is seen. Game birds do the same thing, remaining immovable, even when one is very close to them, but taking to flight so soon as they catch the eye of the person who looks directly at them.

During many years of riding in the west, I have seen many thousands of jack rabbits and have observed how they act. If one is riding along and comes unexpectedly on one of these hares, feeding or sitting, it is almost sure to gather itself together, lower its ears, flatten itself to the ground and remain motionless. Very frequently, however, a hare which saw me at a little distance would sit up on its haunches with ears held straight up in the air, watch my approach for a moment or two and then dropping its ears would sink to the ground, disappearing so completely that it was difficult to discover it again when one had closely approached. When really frightened this hare runs off at a famous rate, but if only a little alarmed it may lope away to a distance of fifty or sixty yards and there stop on top

of some little knoll, examine the alarming object and then disappear by squatting.

In old times this habit was taken advantage of by the bow and arrow-armed boy hunters among the Indians. Little parties of boys would traverse the prairie, four or five marching abreast at a little distance each from the other, and beating a strip 75 or 100 yards in width. The hares started by the boys would lope off to a little distance, sit up and look at them, and then sink down and disappear. If the hare was near enough, the boys, as soon as it started, shot their arrows at it; but if it was not within bowshot, they stopped until it had looked at them and sunk down. Then, having carefully marked the spot where it was last seen they approached very carefully, and were able to discover the animal on the ground and to shoot it as it crouched there.

On a number of occasions I have seen large buteonine hawks sweep down and pick up young hares from the prairie, but I have never seen a case where I believed that the mammal was caught in flight.

You will thus see that I know nothing whatever about the subject in hand, for which ignorance I offer apologies to you and to Mr. Thayer. RANGE RIDER.

## Leased for Bird Preserves.

THE Louisiana Audubon Society has given a fine exhibition of public spirit by its recent leasing of several islands belonging to the State, which it purposes to use as bird preserves. The final action took place on the afternoon of Nov. 24, when the Lake Borgne Levee District Board met to take action on the proposition. Hon. John Dymond presided and Commissioners Harry McCall, Jr., John Dymond, Jr., and Secretary Fernando Estopinal were present.

At an earlier meeting a resolution had already been passed by the board agreeing to this lease, which is for a period of ten years and involves Brush Island, comprising about 1,000 acres; Martir Island Key, about 20 acres; Sam Holmes Island, about 1,700 acres; six unnamed islands in Morgan's Harbor, about 100 acres; eight unnamed islands in Eloi Bay, about 180 acres.

The consideration expressed is \$45 a year. The right is reserved to both parties to terminate the lease on six months' notice. The lands will be held by the Audubon Society as bird breeding reservations and the lessee agrees not to make such use of the land as will be detrimental to the interests of the Lake Borgne Levee Board or the neighboring oyster interests.

Old Man's Island, on the coast of Maine, has long been known as a great breeding place for gulls. It has often been visited by naturalists and described in various ornithological publications. It is about ten miles long, lies east of Cross Island Life Saving Station, near Machias Bay, and is partially covered with a growth of black spruce trees.

The State Land Agent of the State of Maine, by order of the Governor and Council, has leased Old Man's Island to the National Association of Audubon Societies. The island is to be used as a bird reserve where sea-fowl and other birds shall be protected, preserved and propagated. The Audubon Societies will police the island, and protect the birds at their own expense. It is reported that there is hope that a colony of eider ducks will be maintained on the island.

It has always seemed a more or less astonishing matter that no effort has been made in America to domesticate the eider duck, as has partially been done on the coast of Europe. Here are wild birds, which, with little trouble, might be made to produce annually thousands of dollars' worth of down and eggs and furnish support to a considerable population here, as they do on the coast of far northern Europe; but now this product goes wholly to waste. One would have imagined that the thrifty Canadians would already have taken up a trade such as this, but it has not been done.

The State and National Audubon Societies are to be congratulated on the good work they are doing.

## Snowy Owls and the Winter.

BANGOR, Me., Nov. 25.—*Editor Forest and Stream:* Seldom, if ever, has this State seen such long continued adverse conditions for hunting as during these fall months. The leaves held on unusually long, then they remained dry and deep after falling, so that the slightest movement on the part of the hunter was carried to the listening game. An occasional rainstorm proved insufficient to wet the leaves down effectively, and it was only when snow finally fell that still-hunting became at all feasible, and even then the quick change to colder weather resulted in crusts that have continued since. Thursday of this week the weather moderated so much as to soften the crust, and in those sections where snow still remained, it has been fine tracking for the past two days. As a consequence, the next few days will see some good lots of deer and moose pass through the city.

This week has seen some unusual sights among the game specimens received in this city. One firm of taxidermists received, in a night and morning, eight snowy owls, all in splendid condition, and all but one from the same locality, the exception coming from a point not far from that where the other seven were secured. Those who are looking for signs are certain that the presence of so many of these birds presages a hard winter for New England, but it certainly has held off well thus far, as Maine is enjoying mild, pleasant weather thus far, with the possible exception of a few days when the mercury got away and crept down toward the zero mark for awhile. Yet, it has been cold enough in the woods to make ice, the nights being quite cool, and a party coming out from the head of Pamedumcook Lake Friday,

walked down on the ice the day before, hauling their outfit and the game belonging to a party that preceded them, and was obliged to abandon the trophies temporarily a few days before. In the region tributary to the Vanceboro Division of the Maine Central Railroad, the snow is reported as all gone, but the two or three feet on Mt. Katahdin won't give way to dust for a few months yet.

A singular bear's head was received in Bangor from Millinocket this week with a skin sent down for the attention of the taxidermists. The bear was old enough to be a many times removed grandfather, and the peculiar feature of its head was in the lower jaw, the outer point of which had been almost separated from the rest of the jaw. One of the long fangs was bent down until it stuck straight out, instead of standing upright, and the part was so loose, containing as it did most of the lower teeth, that it was wonderful that the animal could chew anything. No bullet caused the injury, nor could the naturalists in the taxidermy establishment offer any cause for such a strange condition. HERBERT W. ROWE.

## The Linnaean Society Meeting.

A VERY interesting meeting of the Linnaean Society was held at the American Museum of Natural History, in New York, on the evening of Tuesday, Nov. 28, at 8:15. The speaker for the evening was Mr. William L. Finley, of Portland, Oregon, who is especially well known as a student and photographer of Western bird life, and who read several beautifully illustrated papers on this subject before the recent Congress of the American Ornithologists' Union.

After the customary routine business had been transacted, the President, Dr. Jonathan Dwight, Jr., before introducing the principal speaker, called for brief communications from any member.

Mr. William Dutcher, President of the National Audubon Associations, spoke briefly concerning a trip made in the early part of the month by Dr. T. S. Palmer, of Washington, and himself to the Great South Bay of Long Island, the purpose of the visit being to estimate the wildfowl found on these waters and to get some notion as to whether the anti-spring shooting law has or has not increased the number of the fowl. Two days were spent in a naphtha launch on Great South Bay and Moriches Bay going over the ground. Immense beds of broadbills were seen, flocks so large that it would be hard to say how many they contained. Great beds of redheads were observed, estimated to number several thousand birds. Especially interesting was a flock of about 2,000 American coots—the "blue peter" of the South—feeding among the ducks, and two considerable flocks of canvasbacks, birds which commonly occur only singly or in very small numbers on these waters, and which the speaker had never before seen there in life. Mr. Dutcher said that the warm, still weather of the autumn had made the duck shooting very poor, for the birds remained collected in vast flocks and did not break up into small bunches which would come to the gunners. He said that in all his experience in shooting on the waters of Long Island Sound—and this experience went back over a good many years—he had never seen so many ducks, and he believed that this was due largely to the anti-shooting law.

Mr. Wetherill stated very briefly that he had recently taken on Long Island a bird which he believed to be Townsend's solitaire, a Rocky Mountain species. It was suggested that this might be a caged bird, but it appears not to be known that this bird is ever kept in captivity. The specimen will, no doubt, be identified by Mr. Frank M. Chapman.

Mr. Finley, now introduced, gave a most interesting talk on some Oregon birds, illustrated by a great number of marvellous photographs. These wonderful pictures were supplemented by most attractive accounts of the lives of certain birds. Those taken up were the flicker, the redtail hawk, the barn owl, the bushtit, the titmouse, the black-throated gray warbler, and the hummingbird. The charming story told about each had to do largely with the nesting of the bird, the hatching of the young, and their growth to maturity. Each auditor thoroughly enjoyed Mr. Finley's talk, and the members who were not present missed something very interesting.

## The Linnaean Society of New York.

REGULAR meetings of the Society will be held at the American Museum of Natural History, Seventy-seventh street and Eighth avenue, on Tuesday evenings, Dec. 12 and 26, at 8:15 o'clock.

Dec. 12, C. G. Abbott. "The Snipe's Love-Song." Illustrated by sketches and experiments.

Dec. 26, Jonathan Dwight, Jr. "Some interesting plumages of North American Birds." Illustrated with specimens.

Members are especially requested to contribute to the interest of both the above meetings with notes and observations.

## "Sixty Years on the Plains."

Mr. Luther S. Kelly, "Yellowstone Kelly," writes of "Sixty Years on the Plains": "I have just finished reading old Bill's book. Fine, is it not? My regret is that, while near him several times, I never had the pleasure of making his acquaintance. He must have been with Crook at Powder River in 1876, when I first met Miles."

The Cleveland Leader says of the book: "Here's a simple little book; interesting because of its very boldness. It is the story of William T. Hamilton, trapper, scout, Indian fighter and the greatest sign-talker on the plains, whether red man or white. When he dies, the art will probably die, too, for the present-day Indians take no pains to hand their knowledge down to their children. 'My Sixty Years on the Plains' is an unvarnished tale that, to the man who can read between its lines and see its courage, resourcefulness and knowledge of man and beast and nature, makes Mayne Reid look even less than the traditional 'thirty cents.' The progress of 'Uncle Bill' as an Indian fighter is only hinted at in his modest narrative. Those who know what he has done call him one of the greatest of his time."

# GAME BAG AND GUN

## An Official Rabbit Hunt.

RALEIGH, N. C., Nov. 24.—*Editor Forest and Stream:* This month of November, like the October which preceded it, has been a splendid stretch of weather, with barely a break in its beauty. One of the features of each November for years past has been what has come to be termed the "official rabbit hunt," which the writer gives to the Governor and the other heads of the State departments. The hunting is always done with beagles, and these dogs are found to be very reliable and steady at their work. There are two packs in this immediate vicinity, one of eighteen dogs, owned by Mr. William Robbins, and the other of fourteen, owned by Mr. Charles Crawford. This year the hunt was had at the old estate of Mr. Samuel Wilder, known as "Trinity," the building upon which was erected exactly 104 years ago, as the date set in the chimney shows. In those days people built their homes on commanding hills and amid great groves, usually of white oaks, and the house at Trinity commands a view in three directions to a great distance; in fact, as much as twenty miles one way, across a valley which gives an almost mountain air to the landscape, which, on the 23d inst., the date of the hunt, was a beautiful mixture of the deep green of the pines and the glorious autumn tints of the frost-kissed deciduous trees. The morning was marked by a snowy frost, which rested everywhere like a light snow, but, as is the case in this southern Indian summer, the day softened quickly, and by 10 o'clock everything was gentle and warm and really with quite the air of early autumn. This year, by reason of a fire which destroyed a lot of the cotton stored on his premises, Mr. Robbins was unable to bring his fine pack of beagles to the meet and so there were only the beagles owned by Mr. Crawford, that gentleman and his master of hounds, Mr. Sidney Cooper, being present.

The start from Raleigh was made in an ambulance from Capitol square, and in this vehicle there were snugly tucked away Governor Glenn, Secretary of State Grimes, Treasurer Lacy, Auditor Dixon, Secretary Bruner, of the Board of Agriculture; Attorney-General Gilmer, State Superintendent of Public Instruction Joyner, Curator Brimley, of the State Museum; Secretary Brown, of the State Corporation Commission, and the writer. The ride through the city and along the fine road through the charming country was full of interest and zest, Governor Glenn, who was boyish in his high spirits, leading the fun not only then but all day. The Treasurer presented a rather rakish aspect, topped as his head was by a cowboy hat, which he brought from Arizona last spring. The Governor, who weighs 238 pounds, later showed that he had not forgotten how to walk. As he remarked with a smile, he was always a big man; at sixteen years old, when he went to college, having weighed 178 pounds. The Governor showed further that he was a clever shot as well as a good pedestrian, and the country people who later joined in the hunt expressed their very great pleasure at seeing him get across country as he did and use a gun so well. Our route to the place of the meet lay past the grounds of the Agricultural and Mechanical College, and the big new agricultural building there was greatly admired by the party, as was also the far-stretching farm of the college, which now embraces 670 acres. The beautiful colors of the autumn foliage came in for much remark. For some distance the roadway runs alongside railway tracks, and as a train

can creep or sneak. It was not long before there was music in a swamp and the dogs broke out with a fine burst of speed as well as noise, Bob Rabbit using his two legs with a vengeance, and all the party, officials and otherwise, testing their lungs to the utmost. Up hill and down the chase went until presently there was a crack of one of the two guns carried and then there was a very dead rabbit. After this we made quite a swing through the very finest kind of cover, but not a rabbit could be developed. I had a talk with Bob Rabbit about this and he was very sententious, remarking: "Some days dis is de way. De rabbits all 'pears to have gone off somewhar. I don't rightly know whar dey have gone, but it must be some distance." Sidney Cooper laughed and said he thought the rabbits must be attending a convention somewhere. Presently, however, we came near a very nice place indeed, which looked so promising that we decided

THE HOPE OF THE COUNTRY.  
A four-year-old cotton-picker. Seen by the official hunting party. Photographed by H. H. Brimley.

to have our pictures taken, and this was done, the dogs in front, in a peafish with a background of sassafras bushes and other small growth.

After Curator Brimley had taken this picture we went into the promising place mentioned and Governor Glenn was so very sure that a rabbit was therein that he took position at the head of the run and said: "I am going to get him just as soon as he comes out," the Governor having one of the two guns, Mr. Cooper carrying the other. The dogs worked with a vengeance and pretty soon little cries broke out which grew louder and louder as they bustled about in the dense tangle of green brier and blackberries. In a minute or so there was a sharp crack from the Governor's gun and into the edge of the thicket ran Treasurer Lacy, who said that the Governor had not really hit the rabbit, but that the rabbit had died of pure fright. The Governor was not to be bluffed and said he had killed a great many rabbits in his time. To this Treasurer Lacy replied that he did not believe the Governor could hit a barn. He walked away some thirty or forty yards and the Governor said: "I'll show you what I can do. If you will throw up that cowboy hat of yours I'll fill it full of holes." Treasurer Lacy replied: "I know you can't lit it and am perfectly willing to pay you 25 cents for every hole you make in it." At these words up went the hat, bang went the gun, and as the hat dropped to the ground the Treasurer picked it up and with a rueful face turned to the Governor and to the others of the laughing party and said: "I'll be dogged if he hasn't filled it full of holes." Not Don Quixote himself ever wore a longer or a more lugubrious visage than did poor Lacy as he twirled his hat in his hands and looked at the holes. Then he began to say that he must have a new hat, and to quiet him the Governor told him he would give him a \$5 Stetson, but that \$1.25 must be deducted from that figure, Lacy having announced that he had found five big shot holes in the crown of the hat alone, and that it was unfit for use. After this arrangement had been made he faced about and informed the outfit that his wife would be very glad the hat was riddled, as for many months she had tried to get him to quit wearing it. The Governor said this story would not hold water.

We made our way toward the house, the stomach of every one in the party being equal to a clock in announcing that dinner time was at hand, and on the way beat some of the sweet locust pods from a tree and ate a few persimmons on the side. The writer and Attorney-General Gilmer set the table for the dinner, and ah, that dinner! A North Carolina ham, several years old, boiled exactly right and then baked; some home-made sausage with plenty of sage in it; a big tin basin filled with North Carolina potatoes, rich with sugar, not the miserable white and woody things which the unfortunates eat up north; home-made butter of the finest type, and such buttermilk as one never gets except at the best country houses, with plenty of sweet milk to be had for the asking and good bread galore. Twelve of us sat down to the table, and it was fine to see the butter fly and in fact

everything else fly that was eatable. The Governor said grace and everybody fell to with a vim, the Treasurer, who labors under the delusion that he is a dyspeptic, eating so much that he declared it would last him two days, and being assured by the Secretary of State that he must have two stomachs just like a cow. The Treasurer, on his part, was unceasing in his comments on the shooting rig of State Superintendent Joyner. The latter has been quite lately in France, and one of the leading French tailors made up for him a coat which is an exact copy of one which he saw worn by one of the hunting staff of President Loubet, of France. It is safe to say that no other such coat is in the United States. It has the real French cut, and one cannot tell very well whether the wearer of it is going away from you or coming toward you. Mr. Brown, of the Corporation Commission, announced, between drinks of buttermilk, that it was his first holiday since he took office, fourteen years ago. Some of the party were unable to say a word during the meal except to declare that the ham was even better than the sausage and then that the buttermilk was better than either and call for a new deal. After dinner, and after the absence of the owner of Trinity, Mr. Samuel Wilder, had been deplored by all (he and his family having been that very morning called away by the sudden sickness of a relative) we went out in the yard, where the dogs were given a bite and where Bob Rabbit, sitting on a pile of wood, showed that he could eat as fast as he could run rabbits. Curator Brimley took some pictures of us all, but missed one glorious opportunity, that of a view of the genial Governor and the Attorney-General "cutting the pigeon wing," and showing such fancy steps that Bob Rabbit got up, dinner in hand, and stared with eyes as big as those of any rabbit in the world. The Governor showed that he had not forgotten how to dance. Meanwhile your correspondent was furnishing the music for this impromptu dance by doing what the darkies call "patting" with his hands upon his brown canvas trousers. He was patting the good old negro tune of

"Juba dis an' Juba dat,  
Juba roun' de kittie o' fat,"

while the dancers' feet flew in yet more rapid measure as the swift hands beat the correct time. Everybody laughed at this and there was deep regret that Mr. Brimley had been just a moment too late in getting a snap, as both the Governor and Attorney-General refused to repeat the performance for the benefit of the camera.

There were some more jokes, to be added to the fast growing collection of the day, and we started off for the afternoon round. Through the pine woods, with sweet-gums here and there and a fragrance which marks the Southern autumn, we went, along the hillsides and down in the valleys, with partridges whirring like big brown bullets here and there ahead of the dogs and of us, and the Governor cracking away at them when opportunity offered. Presently he got a fine chance at a brace of birds which were flushed beside a stream, and brought one down, while he hit the other hard, both with the one barrel. The dogs seemed to appreciate the shooting, for they began a mighty chase after a rabbit which was "jumped" on a hillside in the edge of a cotton patch. This chase must have covered between two and three miles, but Bob Rabbit, the trusty darkey, never broke his gait, keeping just behind the dogs, and by and by he dashed in among them and lifted up the rabbit, which, as he declared, had "Jus' run hisself ter death." When I asked Bob how that happened he replied: "De dogs wuz too much fer him and he jus' nacherly run all his wind

THE N. C. STATE OFFICERS IN THEIR ANNUAL RABBIT HUNT.  
From left to right: Mr. Charles Crawford, Bob Rabbit (with rabbits), Gov. Glenn, Mr. Cooper, Mr. Joyner, Fred A. Olds, H. C. Brown, Auditor Dixon, Treasurer Lacy, Secretary of State Grimes, T. K. Bruner, Attorney-General Gilmer.

out. He died fore de dogs toch him. He wasn't scairt ter deth, neither; he was jus' run out. His time had come an' he knowed it."

About this time some of the ordinary type of hounds joined the beagles and one of these had a whimper which was very like the cry of a scared rabbit. There were some lively runs after this, but it seemed that the dogs must have eaten the rabbits or else left them somewhere in the swamps, dead. The hunters of rabbits when they hear that sudden stillness of the dogs are quick to say that the catastrophe has happened; namely, that the dogs have killed the game and are either eating it or have dragged it aside and left it. Not infrequently the mouth of a hound is examined to see if there is any hair on it, this sign always making suspicion a certainty.

SOME OF THE BEAGLES IN THE HUNT.  
Governor Glenn is leaning against the Ambulance.

flashed by Treasurer Lacy, who for many years was a locomotive engineer, said he would like to be in the cab again and show what he could do therein.

When we reached Trinity we found the dogs very near the house, being gotten in shape for the day's work. They made a very good appearance indeed, all being pure beagles without any cross; lithe little fellows, their long and pendulous ears and short legs making them look quite different from the ordinary fox and rabbit hounds of this State. Beagles have come into favor here because they are such persevering little dogs. As our darky "beater," whose name, by the way, is "Bob Rabbit," said: "Dese beagles always gits what dey goes atter. Dat's de good pint 'bout dem." It is a fact, and no brier patch or thorn-fringed swamp has any terrors for these little dogs, who in truth are not much bigger than Miss Molly Cottontail herself, and can go wherever that young lady

There really was not a dull moment during the day and there was a steady flow of wit. To this the Attorney-General contributed considerably, telling a very good story how his power as an orator had conferred upon him an Indian name, which was given some years ago by the "head man" of the Eastern Band of Cherokees in North Carolina, his home being very near their reservation. This name, quite a melodious one by the way, is "I-sa-toos-ki."

The hunt was voted by all the participants to be a success in every way, even if we didn't catch as many rabbits as we usually do, but there really could not have been any more fun if we had planned it all beforehand.

FRED. A. OLDS.

Gen. Joseph F. Armfield, a very ardent sportsman, whose home is at Statesville, in the Piedmont section, tells me he and his friends there are having particularly good sport after red foxes. Last year they got 100 of these and turned them loose in that vicinity. When he was asked where they were obtained he said from some point near Hamlet, in this State. He says that about a dozen runs have been made and some foxes killed, while others were not injured by the dogs and saved for future sport. Red foxes are scarce in almost every part of North Carolina, and in fact the grays have become scarce in a number of sections. In the Statesville region it seems there have never been any red. These run straighter and at the same time further than the gray fox, which seems to be a more artificial dodger.

Ex-Congressman Romulus Z. Linney of Wilkes county, tells a good story about a recent fox hunt there in which he took part. The fox seemed to have mysteriously disappeared, and the dogs "treed" at the foot of a scraggy tree of some height and with a good many limbs, half way up which was an old crow's nest. Mr. Linney has a sharp pair of eyes and as he looked up and was about to go away he saw what he felt pretty sure was a tip of the tail of a fox projecting over the edge of the nest. Climbing part way up the tree, with a pole in hand, one of the young men in the party jabbed at the nest and stirred up the fox, who was there, sure enough. The fox did not offer to jump out or climb high, but cried, Mr. Linney says, just like a child; so pitifully, in fact, that the hunters went away and left him where he was, to have another chance for his life. The discovery of his trick must have unnerved the poor beast and made him lose his courage.

F. A. O.

## The Renewing of Youth.

"CHAINED TO BUSINESS" for five years; more years than five since old "Joe," after thirteen years of faithful service and companionship, had gone hunting by himself one snowy day and never come back, and all the years since then the old gun has been standing in the corner. My old limbs felt unequal to tramping through the stubbles and the brush; the neat, up-to-date farming had left little cover to protect the birds; and the winters had been hard ones; quail were reported as practically extinct. No time to spare for shooting, no dog to shoot over, no legs left to tramp with and no birds to shoot. Truly it was a dismal prospect, but in spite of it all the annual attack of "the shooting fever" came on at the usual time of year with such violence that something had to be done. For two or three weeks an effort was made to cure it by remembering and trying to live over again the former days afield, but the fever increased from day to day. Then it was thought that a change of climate might be the thing, and a trip was planned and arranged to a section of country where the quail did not freeze to death in the winter; but the rest of the party could not be ready when the season opened and the fever was raging still higher every day and it was plain that the malady must have immediate treatment, so Henry was consulted.

Now to know who Henry is, the reader should have a description of him. He is a little fellow, an old bachelor, with gray hair and wrinkled face, so quiet in manner and speech that you have to use your eyes to learn whether he is there or not, of an affectionate disposition, and ready always to let a friend have anything he has. In the field he is one of the few men who really delight more over a good shot made by his partner than if he had made the shot himself. He spends most of his days in the hard work of driving iron pipe into the ground for wells, and does but little shooting; but in his younger days he did little else, and he knows every square foot of ground for miles about here. He has a quiet way of talking to the farmer boys about quail, so he knows before the season opens just about where every covey of quail "uses" for miles around.

Henry was consulted about the matter, and said he had a bad attack of "the fever," but as everybody said there were no quail, and he had no dog, all he expected to do was to get out and tramp himself dead tired to get the wire edge worn off a little. He said he had five or six bunches of quail spotted, and knew exactly where they "used," and about how many birds there were in each bunch, and that they were on ground where we would be allowed to shoot them; and if we only had a dog, we could have some sport after a week or two, when he got ahead a little with his well-driving.

Now it began to look as if our "medicine" was going to be good, for on the first two days of the open season a friend of mine, who has a fairly good dog, went with one of his friends for two days and bagged but three birds. They are good shots, but just could not find them. So they quit in disgust, and the dog was put at the writer's disposal. After Henry had showed his quail prospects, he was told about the dog, and in two minutes had grown ten years younger. It is doubtful if he ever hammered pipe so lively as he did for the next week. I, however, could not stand it to see so much fine weather and dog going to waste, and one glorious Indian summer afternoon found me in Will Dormer's stubble field, the dog wild with delight and running at such a rate that he was not doing much hunting. Running and lots of it was good enough for him. A rabbit was walked up and bowled over, and presently another one, a great, big old fellow, that was certainly the fastest runner ever; but a few minutes later the "for sure" fastest rabbit in the world was up and

going. He actually went four jumps after the gun was fired before the shot reached him, and his speed was so nearly as fast as the shot that, although he got the center of the charge, it barely scraped some of the fur off him and didn't hurt him at all. Coming back to town, the dog found a covey of quail in a little cornfield, and after following them up seven shots were had and four of the birds went to bag. It wasn't many birds for the number of shots fired, but when it is considered that the "man behind the gun" was using a full choke L. C. Smith gun and had not shot at a half-dozen quail in the last five years, he felt that he had done well. The old legs had stood the four hours' tramp all right, and things began to look as if the fever might not be a hopeless case.

A few days later Henry got his pipes into the ground, and after dinner we started out as gleeful as two sixteen-year-old boys, and the dog fairly wild with delight. We fully expected to "do business" from the start, but a long and careful exploration of the ground where the first two coveys were reported to live, did not show a feather. The third covey were found in the middle of a big cornfield. The dog trailed them so slowly and so far that Henry said the birds had plenty of time to do their afternoon feeding and get to roost before the dog would come up with them; but at last he did get them, and with the old roar that always does startle the oldest shooter, they boiled up out of the corn and most of them flew straight toward the sun. There was some shooting, but nothing to put in the bag. A part of them were marked at the edge of the corn, and we followed them and sure hit them just right, for in less than seven minutes seven single birds were flushed and all of them killed. We patted ourselves on the back and Henry said that he was glad we came and that we had had sport enough to pay for a whole afternoon of tramping, and the other fellow said he had forgotten all his troubles. Just think of it! A couple of old fellows, more than sixty years old, getting as crazy over it as a boy over the first rabbit his pup caught. They did not find any more birds that day, but they came home in mighty high spirits, and planning for another round with the birds.

Henry said the section boss had several times seen a nice bunch along the track about two miles south of town, so next day these two old boys went after them and found them without trouble. They didn't loosen a feather when the birds flushed, but they were marked down in the woods and along the railroad track. At the end of half an hour's search they had flushed eight of them, killing five, each man missing one bird and one getting away without being shot at. These went back near where they were flushed but were a good deal scattered, but persistent hunting by men and dog finally flushed them all, and all of them were killed, making a total bag of nine. There were not more than three or four of them left, and Henry said that was close enough to kill them off. So the shooters struck out a mile or so to the west where there was some good looking ground. Over there they found a covey of rather small ones and got one when they flushed, but had bad luck with the rest of them, as they only flushed two, missing one and failing to get a shot at the other one. Henry says he has spotted three more bunches and it won't be long before these two old boys will be after them. They go rather sly about it; don't go parading along the street and stopping to tell everybody how many they killed. Henry says everybody says there are no quail, and it won't hurt them to keep on thinking so.

If it had been thirty years ago, these fellows would have been out again early the next morning; but as it was, they didn't go again for three days, and meanwhile somebody had sneaked the dog out and must have had a time with him. He came home so lame and tired that he could scarcely get along. He had got pretty well rested when the two old boys went out with him two days later, but didn't seem to have anything on his mind but to run, and he did for two hours; but at last happened to find a covey of quail in time to point them before they flushed. One bird fell when the covey got up, but the dog seemed to prefer live ones. At any rate he chased them when they flew, and it was almost impossible to get him to hunt the dead one. In fact, he didn't seem to think killing quail was the business in hand; and hunting singles was entirely too slow for him. He seemed to think he was under contract to cover forty acres in forty minutes. Four of the flushed birds were marked down in a clover field and the rest of them, about half a dozen, came down along a bushy old fence row. Four of these were flushed by tramping almost every square foot of the cover along the fence, but persistent tramping failed to get the rest of them. Those that were flushed had to be almost stepped on before they would fly. The four that got up were safely bagged.

Meanwhile the dog was doing his utmost to win his stunt of forty acres in forty minutes and happened to get within eighteen inches of one of the birds in the clover, and held his point till the men got there. It was Henry's turn for a shot, and he doubtless would have killed if his first barrel had not snapped, which rattled him so he missed with the second. The bird went out of sight over the hill with the dog a close second. Then the men made some remarks that were rather derogatory to guns that snapped, and dogs that chased quail clear out of sight. As he was a borrowed dog, they did not feel at liberty to take severe measures to correct him, both of them expressed a desire to own him for just fifteen minutes. Twenty minutes were put in trying to tramp up the other three quail which were known to be in the clover, but could not raise a feather till the dog came back and ran over one about thirty feet behind Henry, who failed to get a shot at it. The finding of any more of these birds seeming hopeless, they went half a mile to a patch of brushy woods which was reported to be the home of two coveys. The dog found a rabbit in a corn shock, roused it and ran a mile, here, there and everywhere. He seemed to think now, that he had finished his forty minutes stunt, and settled down to try to find some birds. He soon found a hot trail and followed it carefully and slowly for more than a hundred yards, then lost it and began circling about in anxious haste, trying to pick up the trail again, but it was no good. It was plain that the birds had taken wing. At the end of half an hour, the dog pointed

in a fallen treetop, lying in a thicket. Henry got two when they came out, but the rest got safely away, scattering badly. There was a large amount of leg energy expended in trying to tramp the scattered ones out of the brush heaps and five were roused, but only three of them were bagged. The cover was too thick for good shooting. It was now nearly sundown and two miles lay between the shooters and home. An effort was made to find something to shoot as they walked for home, but not even a rabbit was seen. On the whole, though, these two old fellows unanimously voted that they had had a great time and decided that about day after to-morrow afternoon they would be at it again.

The bags made have been small, but when it is remembered that they were made in a section where quail are supposed to be practically extinct, and are, in fact, so few that a person not acquainted with the country would hardly find a covey once in two days, they think they did well, and feel that the recreation has been profitable to them. Some others have been benefited, too, for more than half the quail bagged have been given to sick people, and the heartfelt thanks which have been given the donors, leave no doubt about the birds having done the sick ones some good. These two old fellows find that their views on shooting matters have changed considerably since they were real boys. At that period of their lives, the sole thought was to kill, kill; and if there wasn't a lot of killing there wasn't much sport in it. In those days, going shooting was not a release from the cares that burden older people, for there were no cares loading down the boyish mind, but to the man of mature years there is always a load of care and responsibility, which make a burden that must at times be laid off for a rest, or the man finally becomes a mere beast of burden, and for the man who loves the sports of the field, there is nothing that will so completely make him forget his troubles as a tramp afield where there is reasonable expectation of at least some game.

O. H. HAMPTON.

INDIANA.

## Minnesota Moose Woods.

NILWOOD, Ill., Nov. 28.—*Editor Forest and Stream:* November 19 I returned from a two weeks' visit with old hunting companions in Minnesota. The non-resident license law made it impracticable for me to do any hunting, and I would have returned home after a week's visit, but those companions of numerous hunting trips pleaded with me to stay and go with them on the trip they were going to take and act as guide for them in the new country they would hunt in. This I agreed to do, providing they would let me choose the place. This being satisfactory to them, I at once made a prospecting trip and the first day located an abandoned lumber camp, the office building of which was still standing and in good repair, about two miles from Skibo Station on the D. & I. R. R.

I did not take long to satisfy myself that there was game in the immediate vicinity—both moose and deer. Accordingly, on the 7th, S. and myself took the train at Bewabik for Skibo, leaving M. to follow on the 8th. We spent the days until the 10th packing in our stuff, arranging things about the camp and getting plenty of wood for the time we would be there. The evening of the 9th found us all ready to take to the hunting the next morning.

According to orders, I was up and had breakfast for them at 6 A. M., and at 6:30 we left camp. Giving M. general instructions as to direction and the most likely place to find game, I took S. under my wing and, for the first time in my experience as a hunter, hunted without a gun.

We had worked nearly all our territory and were on the way across a rocky ridge to a large spruce swamp, where we intended to try and locate a moose; when about half way up the ridge, we came across the tracks of a moose. They appeared to be fresh, and we concluded to do our best to follow them. This was slow work, as the ground was frozen; but after going about a hundred yards they led into a swampy place, where the tracks showed up plain. We had not gone far in the swamp when we found that there were three moose, and from indications they had gone into the swamp to spend the day. Our progress was necessarily slow, and we were very cautious in our movements, taking great care to make no noise and fully expecting to jump them at any moment. The wind was in our favor, and unless they turned to our right, they would not get scent.

Contrary to our expectations they were not in the swamp, but had gone on through and into a place where the spring fires had deadened a lot of small popples. After they quit the swamp, we abandoned the trail and worked straight up through the popple thicket. When we got to the edge of the thicket we saw a nice young bull moose standing on the top of a little knoll about sixty yards distant. He had no horns to speak of, but as S. afterward remarked, "We wanted meat, not horns," and he immediately fired and got the first moose of the season. The moose did not fall dead, but gave a great bound and stopped, standing with his feet wide apart and breathing with such a great effort that we could plainly hear him. S. prepared to give him another shot, but I advised waiting, as the poor fellow was about "all in" anyway.

While we waited, a full-grown cow and her calf walked out of the brush and stood within fifty yards of us, looking at the dying bull. It was about three minutes before he fell, and when he did the cow and calf walked up to him and stood quite still. We then went straight toward them and were not particular as to the amount of noise we made. They did not seem to notice us until we were within about twenty yards of them, and not then until I spoke and admonished them to leave there before we were tempted beyond our strength. Of course I could do them no damage, but S. said it was all he could do to let that calf go. When I spoke, the cow looked around and saw us coming and trotted away over the knoll into another swamp.

We first measured the great beast and found that he was six feet from the bottom of the hoof to the top of the shoulder, and eight feet from the back of his

## Massachusetts Game Conditions.

Boston, Mass., Dec. 2.—*Editor Forest and Stream:* Although reports of game conditions are not all in, a partial summing up of those on file will no doubt be interesting to your Massachusetts readers. But one town in Barnstable county (a quail region) reports good conditions as to quail. Four reports from Worcester county are good, none from Bristol county, two from Middlesex with eleven reporting fair conditions. Not one report from Plymouth or Norfolk is good. Essex county none good, eight report fair. Of 281 reports covering every county, only eleven are good, fifty fair, sixty-two report no quail, 158 report conditions poor.

So far as the southern counties are concerned, including the Cape, Barnstable, Bristol and Plymouth, the reports are surprisingly bad. From conversation with some of the gunners from different sections I believe many have refrained entirely, or nearly so, from shooting quail, although there have been some cases reported of the clearing up of entire coveys. Several have expressed a regret that November was not made a close time, as well as October, for this year, so that all might have been spared as breeders for next season. By stocking the covers with a few hundred dozen birds, judiciously distributed, and systematic feeding the coming winter, we may reasonably hope for somewhat improved conditions next fall. At the present time, chiefly due to the severity of the last two winters, a large section of the State, which on the Government map is included in the quail zone, is practically destitute of that species. In most of the towns where quail were plentiful two years ago there now remain only a few small coveys and a few stray birds.

In regard to ruffed grouse the reports are more cheering. Whole number received, 272. Of these 102 are good, ninety fair, seventy-five poor and five report none. In Worcester county twenty-three report conditions good, twenty-one report fair, only seven poor. Generally the northern section and the western counties return favorable reports. Poor reports predominate from Barnstable, Plymouth and Essex counties. On the whole, this seems to have been better than an average season for partridges, and it is thought there were a fairly good number of that species left in the covers at the end of the shooting season, which closed Nov. 30, except in Bristol county, where the season ends Dec. 15.

Several suggestions for improving present conditions relate especially to quail. One writer says, provide winter covers for them. Another recommends that towns plant quail, another says "kill all pheasants." Several urge more stocking of the covers, and one says let the State breed quail instead of pheasants. Other remedies for scarcity of birds are named, as a hunters' license, bounties on foxes, hawks, owls and stray cats, restrain bird dogs in summer, put an age limit on boys who shoot, prohibit the use of dogs in hunting, put a tax on worthless dogs "so high as to drive them out of the country." The writer expresses no opinion as to the wisdom of these various suggestions but mentions them simply to show the great variety of views prevailing. Among those who have never given much attention to the subject of game protection, and who are not aware what a small proportion of bird destruction arises from their shooting, it is the most natural thing in the world for them to favor a close time of several years. Such persons do not consider the vast destruction of bird life caused by their natural enemies and by unfavorable weather conditions. That all students of birds and the community generally are giving more and more thought to these subjects year by year is one of the encouraging signs of the times and augurs well for sportsmen's interests in the future.

H. H. KIMBALL.

## Boston and Maine.

Boston, Mass., Dec. 2.—*Editor Forest and Stream:* Lewis Mitchell, a Passamaquoddy Indian, head of the tribe at Oldtown, Me., has recently been before the Municipal Court of Boston on the charge of having in possession 128 breasts of gulls which he brought from Maine to sell. Counsel for Mitchell contends that under the old treaty between Massachusetts and Maine, giving Indians the right to shoot and fish, his client had the right to kill the birds. Bail was furnished and the case put over.

Among women hunters who have recently secured deer in Maine are Mrs. A. E. Spaulding, of Bar Harbor; Mrs. F. A. Johnson and Miss R. L. Tozier, of Bangor. Mr. Clayton Coffin, of Haverhill, Mass., secured a moose and a deer in Washington county.

In Oxford, Me., Game Warden D. W. Stanley recently arrested three Boston hunters for violation of the game laws. They had been hunting several days without having secured the necessary non-resident license. They were fined \$25 and costs each. In Oxford and Paris it is reported that quite a number of New York and Boston gunners have been beating the game laws, and the warden determined to make an example of them.

Shipments of game from Bangor for the week ending Nov. 25 were 724 deer and twenty-three moose. For the corresponding week of 1904 they were 648 deer and forty moose. The shipping laws have been well observed and very few seizures have been made. A party of forty hunters from Ohio took home with them from the Oxbow country some seventy-five deer after a stay of two weeks.

The moose hunting season closed Nov. 30 and only two more weeks remain to the deer hunters. There was a large exodus of hunters returning for Thanksgiving, and the shipments for the past week were 457 deer and twenty-seven moose, as against 287 deer and twenty-seven moose in the corresponding week last year. Shipments for the season to Friday last were 4,134 deer, 206 moose; last year the same number of moose (206), and 3,776 deer. While there will be no more killing of moose legally this season there will be quite a number more brought out that were shot last month in the back woods, whence it is no easy task to bring them out. It is estimated that the revenue to the State from licenses will exceed that of last year by not less than \$5,000, which will enable the commissioners to improve the warden service. It is expected the total of Bangor shipments of deer will be about 4,500 for the season. The largest record ever made was that of 1902, when 5,300 deer were sent out. Commissioner Carleton is reported as favoring some

shortening of the shooting season, giving only one month for moose and two months for deer shooting. Doubtless native hunters kill much big game in December to keep for the winter or sell in the markets.

William T. Farley, of Boston, takes home two deer and a moose. Mr. E. W. Lovejoy, of Lowell, is equally fortunate, while C. H. Randall, of Boston, brings one deer and a moose. Mr. W. H. Billings, of Boston, has secured a moose.

In the Rangeley region B. E. Lambert, C. F. Jones, A. L. Kimball and H. J. Noble, of Boston, have secured their full quota of deer. E. C. Rodgers, of Putnam, and Mr. Spearin, of Boston, each secured an albino deer. Miss Alice R. Platt, of Boston, has been fortunate in getting a fine buck.

Few places of any considerable size in this State that have not had one or more representatives in Maine at some time during November in pursuit of big game, but I doubt if Massachusetts sportsmen have killed more than have the residents of the Pine Tree State. CENTRAL.

## An Oklahoma Wolf Drive.

Lawton, Okla., Correspondence New York Herald.

EIGHT thousand men, women and children and 500 dogs participated in the greatest wolf drive in the history of the Southwest. The scene was the Kiowa-Comanche pasture. About twenty-five wolves were victims of the day's sport. After the hunt a basket dinner was served at the rendezvous in Chattanooga. Then there were racing and athletics, followed by a dance at night. It was a red-letter day in the history of southwest Oklahoma. The era of the cattleman and his vast herds in the pasture is passing. This is their last year. They will give way next month to the farmer, who will plant fields of wheat and corn where herds have been wont to roam. This celebration was held to welcome the coming and to speed the parting guest.

Preparations were in progress for this event for two months. Headed by Col. "Jim" Williams and Capt. J. A. Mangan, of Chattanooga, the farmers living around the borders of the reservation marshaled as great an army of hunters as was ever congregated in the Southwest country. These hosts were augmented by visitors from all parts of Indian Territory, Texas and other States. A special train was run out of Lawton to Chattanooga to carry the throngs that came to join the hunt.

Chattanooga is the gateway to the "big pasture." It is on a high stretch of tableland abutting the north line of the reservation, twenty-five miles southwest of Lawton and ten miles northeast of the spot where President Roosevelt camped during his wolf hunt last spring. The town has a population of about 500, principally cowboys and wolf hunters. The latter are skilled in training dogs for chasing and bagging wolves, and no better dogs at these feats are to be found in the West. The most interesting dog in this hunt was a hound of small proportions, which its master named Carrie Nation. This dog last year outstripped all her fellows in the Thanksgiving hunt, capturing five of the twelve wolves taken. This placed her at the head of the wolf dogs in the country. During her life of four years she has captured more than sixty wolves, and never has been injured. She has a knack of capturing the fierce little coyotes in a manner that puts them out of action immediately and protects herself. But there are other fine dogs. Greyhounds are the best runners and have the longest "winds," but many of them are lacking in the technique of capture. Fox hounds are plentiful and good racers; so are some curs and common stags. More than half a thousand wolfhounds and dogs belong to men of this section, and nearly every one of them was in the race.

The race course was a broad expanse of prairie, unbroken by creeks, deep ravines or timber. Prairie dog holes abound in some parts of the reservation, but few are found here. This was fine for the hunters, for many persons attend these chases who are untutored in horseback riding. To the southward one views the Deep Red River, with its fringes of oak, pecan and hackberry. A little beyond is Red River, with its flat bed, red water and crumbled banks; westward is the town of Frederick, made notable by the President's entrance to the reservation through its main street; to the northward are the Wichita peaks, to the eastward Indian Territory, and northeast is the city of Lawton.

The chase began soon after noon and lasted three hours. The commander and his aids formed the hunters in an immense square, seven miles each way. The square contained nine sections. Cowboys, dog trainers and professional riders were stationed on the east, south and west sides, while those who participated in wagons, buggies and other vehicles formed the north line. After the lines were formed the commander gave the signal at the southeast corner, his aids passed it along and the lines began closing in. This drove the wolves toward the center, and so close were the men to one another that few could escape.

The exciting moment came when the lines had closed sufficiently near one another to give the charging signal. This signal permitted every member of the party to participate in the chase. The wolves by this time were frantically running hither and thither to escape, but were in a pen so closely fenced by humanity that death or capture was inevitable for eight out of ten of them. Men, women and children, shouting and excited to the highest pitch, riding in wagons, buggies, hacks, on horses, bicycles, automobiles and some on foot, combined to make a thrilling scene peculiar to the wolf country.

Guns and pistols were barred, and the kills and captives must be made with clubs, lariats and dogs. Some of the little coyotes were torn to pieces by dogs, others roped by cowboys, trampled under foot by horses, run over by vehicles or died of exhaustion. After it was over came the march back to Chattanooga and a public exhibition of the fruits of the sport. Here cowboys, dog men and others disputed over the credit for the capture of certain coyotes—and some fought—but, at length, a distribution was made, photographs were taken and the day's sport was ended.

Col. "Jim" Williams who organized the hunt, is a typical frontiersman who knows the entire alphabet of cow-punching and wolf chasing. He was reared on a cow ranch and for four years was a lessee of part of the

head to the root of his tail. The antlers were small, having but two points each. While we were dressing him M. and his little boy came up. They had been unsuccessful and were rejoiced at the good start S. had made. We did not hunt more that day, for, as M. said, "There was no one to go out and kill it all in one day."

The afternoon we spent in camp, shooting at target and resting up. During the target practice I got the

prize of my life in regard to the penetrating power of full-jacketed and soft-nosed bullets.

Like myself, uses a .30 Government Winchester box magazine rifle. While we were practicing, I noticed the top bunk of an old logging sleigh lying in the grass. There was a plate of  $\frac{3}{8}$  iron on it where the king bolt went through. I told S. that M.'s gun would shoot through that piece of iron if he used a full jacketed bullet. S. said it could not be done. Thereupon we made a trial and found that the bullet drilled a nice hole through the iron. While discussing the wonderful power of such a small charge, the thought came to me to try a soft-nosed bullet and see what it would do. I took the rifle and fired from about thirty yards distance, and was surprised to see a hole just as neat but a little larger than the full-jacketed bullet had made. Thinking I might have been mistaken and put in a full-jacketed bullet, I tried again with a soft-nose, and the result was the same. Knowing, as I did, that the soft-nose would only penetrate about  $\frac{1}{3}$  what the full jacket would in wood, I was surprised at its penetrating the iron at all, as I fully expected to see it sticking fast in the dent it would make.

The morning of the 11th we all hunted together, I "playing dog," as M. called it. While working over a range of hills next to a spruce swamp, I saw a moose browsing about 300 yards from me, in the edge of the swamp; and I started to get the boys, when the moose saw me and started up the hill away from me, but in the direction the boys had taken when I left them. Following down the ridge, I soon came to S. and told him to get on the next ridge north and keep a good lookout for the moose. He immediately did so, and while making his way along fell in with M. Shortly after this, the moose came in sight, going northeast on the ridge that I was still on. S. had killed his moose the day before and could only stand and watch M. as he fired six shots in quick succession; he afterward told me that it nearly broke his heart to see that moose duck into a little hollow and disappear.

During the firing I kept on in the direction the moose had taken, expecting every minute to come on to him dead, for M. is a good shot. When near where I supposed the moose would be, S. came upon the run and said M. had wounded a fine bull, and that it had kept going, but he was sure that it was hard hit. We at once started for the place where the moose had been when fired on. This was not hard to find as he was on a runway and we soon discovered blood in plenty and followed the trail about a quarter of a mile. M. joined us with the boy, and I took the lead, the boy next behind me learning to trail a moose by the blood he spilled. M. was following close behind the boy, and S. circled around to the right. After going about a hundred yards I saw the big fellow lying down facing us and about twenty yards away. I stopped and, getting the boy in front of me, pointed the moose out to him, then taking M.'s gun, I gave it to the boy and told him to shoot it and to aim at the eye. The little fellow had never fired so heavy a gun and was scared and excited. The gun was too heavy for him, and instead of shooting the game in the eye, he hit the jaw and tore it completely away. M. then took the gun and finished the job. M. now had two nice young moose, with a lot of fine meat but no head fit to preserve. This one had two points on one antler, but the other was a spike.

After dressing the fine fellow, we headed for camp, and after dinner made a trip out to the station for supplies that were to have been shipped to us, returning about 5 o'clock. Thus ended the second day of what promised to be a very successful hunt.

No snow having yet fallen, we had a hard time of it, and do the best we could, we could not sight a deer. I did the "dog" act in every likely place, but could not start a deer. Everything was so dry that the noise made by us when going through the brush was "ferce," and no deer would wait to see what was making it. Finally I concluded to take them into the big swamp and jackpine country north of the Partridge River. There we found fresh moose signs were plentiful, and had they not already killed their moose, we would have done some hunting right there; but finding the jackpine thickets were worse than the country south of the river, we gave up hunting there and returned home. This kind of luck was ours right along. We would get out early and hunt faithfully until about 9 o'clock; then go to where the two moose were dressed and piled up and pack to our cache near the station until dinner time; then get dinner and pack some more. Finally on the 17th we broke camp and finished the hunt for 1905. Although we had been unsuccessful in getting deer, my friends were perfectly satisfied with what they had. We had enjoyed ourselves to the extent and call it a most successful hunt. Although I did no shooting, I enjoyed the hunt as much as any I ever made, and unless the present law is changed to permit a non-resident to take his moose home, I will spend the time next season in the same way, except that I will have my camera with me and take some photographs. What a fine thing a photo of that cow and calf watching the dying bull would have been! I missed my camera then, but will never go without it again. J. P. B.

## Twelve Years a Reader.

*Editor Forest and Stream:*

I have been reading FOREST AND STREAM for twelve years and in all of these years have never missed a dozen copies. I have it sent to me from a local book concern, and my Sunday morning at home would be dull indeed without my FOREST AND STREAM. I have gained some useful knowledge from reading it, and consider it the best paper in this country or any other.

R. S. STREHL.

reservation. One of the most interesting of the participants in the hunt was Miss Clara Sharp, sixteen years old, one of the most beautiful girls in Oklahoma. Born in the East, she has become a devotee of the sports of the West. There are few better riders than Miss Sharp and none who find more real enjoyment in the chase. She was a star attraction of the chase and took as many wolves with her lariat as any man. John Abernethy, a young cowboy, who was with the President during his hunt in April, was commander of the hunt. Nearly all the Indians of the Comanche and Kiowa tribes were at the scene. Quannah Parker, the Comanche chief, took a prominent part in the chase. A few Apaches were on hand, among them Geronimo, who attends the chase every year. Several officers of the Thirteenth Cavalry, stationed at Fort Sill, also took part in the sports.

## The Silz Game Case.

### Full Text of the Opinion.

SUPREME COURT, APPELLATE DIVISION—SECOND JUDICIAL DEPARTMENT.

Hirschberg, P. J.; Woodward, Jenks, Rich and Miller, JJ. The People of the State of New York, on the relation of August Silz, Appellant, against Henry Hesterberg, Sheriff of the County of Kings, Respondent.

Appeal by the relator from an order of the Supreme Court, entered in the office of the Clerk of the County of Kings on the 16th day of June, 1905, quashing a writ of habeas corpus.

Edward Lauterbach (Edward R. Finch and John Burlinson Coleman with him on the brief), for the appellant. Julius M. Mayer, Attorney-General (Alexander T. Mason, Deputy Attorney-General, with him on the brief), for the respondent.

WOODWARD, J.

There is no dispute about the facts in this case. One August Silz, on the 30th day of March, 1905, had in his possession in the County of Kings one imported golden plover which was lawfully taken, killed and captured in England during the open season for such game there, and thereafter sold and consigned to Silz in New York city by a dealer in game in London, England, and at the same time he had in his possession one imported black-cock, a bird lawfully taken and killed in Russia and consigned to the said Silz by the same London dealer. These birds it is conceded were duly imported by Silz in accordance with the provisions of the tariff laws and regulations in force, through the Custom House in New York city, during the open season for plover and grouse in the State of New York. It is admitted that these particular birds are entirely different varieties of game birds from the game birds known as plover and grouse in the State of New York, and from any bird native to the State of New York, or America; that they are different in form, size, color and markings from the game birds known as plover and grouse in the State of New York and from any American bird, and can be easily and readily distinguished from such plover and grouse found in New York State and from any bird native to America, both with their feathers on and after they are plucked.

It is likewise conceded that such birds were and are staple, sound, wholesome and valuable articles of food, and are in constant use as such, and that they are recognized and staple articles of commerce between the different countries of Europe and the United States of America, and were of the fair market value of one dollar and a half. The only question presented upon this appeal is whether the possession of these birds, under these circumstances, constituted a crime under the provisions of Sections 106, 108, 119 and 141 of the Forest, Fish and Game Laws, as amended by Chapter 588 of the laws of 1904.

In principle, the exact question here presented was before the court in *People vs. Buffalo Fish Co.* (39 Misc. 130), and Mr. Justice Lambert, after reviewing the authorities, said: "The principle laid down by the case referred to clearly establishes the right of the defendant to import the fish in question into the State of New York as a purchaser and importer, and in the exercise of such right conferred by the Federal Government, it was not within the power of the Legislature to make the possession of the property thus imported unlawful. Possession is a necessary incident to the right of importation, and to the right of property imported. Possession and the right of sale is the intended consequence of the right of importation. It would as effectually destroy the privilege of importation to make the intended consequence thereof unlawful, as to prohibit importation itself. Applying the rules laid down in the case discussed to the admitted facts, that the fish in question were imported from the Dominion of Canada, and a duty had been paid for such privilege under the Dingley act, some of which were in the hands of the importer for shipment and the remainder in its possession for the purpose of sale, it is clear that the statute of this State making such possession unlawful is in conflict with the general power of Congress to regulate commerce between foreign nations and the several States, and to the extent that it attempts to levy tribute upon the custodians of these fish, whether by means of taxation or a penalty for having them in possession, it is null and void." Continuing a review of authorities, the same learned jurist sums up as follows: "This being the law of the land, that the importer acquires a right, not only to bring the articles into the country, but to mix them with the common mass of property, the fish imported by this defendant, became, by reason of such importation, absolute property in the hands of the importer, as well as all who might take title under them, and it is an abuse of the police power which cannot be justified by any sound process of reasoning to say that the Legislature may make it a crime, and subject the owner of this lawfully acquired property to penalties for merely having the property in his possession. It is conceded, of course, that if these fish were diseased, or had remained exposed to the elements until they were unfit for food, and constituted a menace to the public health, the State would have the right to interpose its police powers, and prevent the sale."

This case was considered by the Appellate Division in the Fourth Department, where it was affirmed on the opinion of the court below (45 App. Div. 631), and was then taken to the Court of Appeals, where it was affirmed by a divided court, O'Brien, J., writing. After

a careful review of the questions submitted, the learned court said: "Admitting, for the purposes of the argument, that the statute in question means just what the plaintiff's counsel claims for it, the important fact still remains that Congress has permitted the defendant to import fresh fish upon payment of certain duties. It has paid the duties and complied with the Federal regulations, but when the article is brought here the State steps in and forbids the defendant to have it in his possession, and, of course, forbids the sale. This creates a direct conflict between the regulations of Congress and those of the State, and, consequently, the latter must yield to the former. The State had no power to extend its police legislation to such a transaction, and, of course, had no power to forbid what Congress had expressly permitted."

It appears to be conceded upon this appeal that the *People vs. Buffalo Fish Co.* (supra) would be controlling, were it not for certain statutory provisions which have been enacted since the decision in that case, and it is contended that the Court of Appeals in *People vs. Bootman* (130 N. Y. 1) has finally determined the question here presented in favor of the respondent. As we read that case, however, it does not appear to question the law of the Buffalo Fish Company case, in so far as it decided that fish brought into this country from foreign lands under the provisions of the custom laws could be possessed and sold without regard to State statutes. In fact, the decision follows the Buffalo Fish Company case, and holds that game birds, grouse, quail, etc., which were not killed in the State of New York, but which were killed in sister States and transported into this State in November, 1900, and which were in the possession of the defendants in June, 1901, were not unlawfully possessed, and that the owners were not, therefore, subject to the penalties attempted to be imposed. After determining the only question then before the court, the learned jurist writing went into a discussion of what the law might be under certain statutory provisions since enacted, and it was pointed out that "It was held by a majority of the learned justices of the Appellate Division that the Legislature has no power to make the possession of imported game unlawful, as it would violate the provisions of our State Constitution relating to the protection of property," and it was this determination of the Appellate Division in the First Department (95 App. Div. 469) which the court disapproved, and not the decision of Mr. Justice Lambert and the Appellate Division in the Fourth Department, that the act was unconstitutional and void as interfering with the commerce clause of the Federal Constitution, in so far as it attempted to deal with articles imported under the provisions of the customs laws of the nation. "While it is our duty," says the court in the *Bootman* case (supra), "to affirm the judgment of the Appellate Division, we have felt constrained to consider the constitutional question discussed by that learned court, lest the conclusion announced should be regarded as a precedent and result in evil."

The legislation under which it is claimed the police powers of the State have been enlarged so as to make it a crime for a man who has lawfully possessed himself of property, having all of the attributes of property outside of this State, and in no wise a menace to the morals or health of the community, to bring it into his possession within this jurisdiction, is found in 31 United States Statutes at Large, Chapter 553, and in Section 141 of the Forest, Fish and Game Law, as amended by Chapter 588 of the laws of 1904. The Federal statute provides in Section 5 that, "all dead bodies, or parts thereof, of any foreign game animals, or game or song birds, the importation of which is prohibited, or the dead bodies, or parts thereof, of any wild game animals, or game or song birds transported into any State or Territory, or remaining therein for use, consumption, sale or storage therein, shall upon arrival in such State or Territory be subject to the operation and effect of the laws of such State or Territory enacted in the exercise of its police powers, to the same extent and in the same manner as though such animals or birds had been produced in such State or Territory, and shall not be exempt therefrom by reason of being introduced therein in original packages or otherwise." The State statute appears to have been designed to be in harmony with this provision of the Federal statute, for it is provided that, "Whenever in this act the possession of fish or game, or the flesh of any animal, bird or fish, is prohibited, reference is had equally to such fish, game or flesh coming from without the State as to that taken within the State."

But what has either of these provisions to do with the conceded facts in the case now before us? Without going into an analysis of the statutes, it is plain that in so far as the Federal statute has any bearing whatever, it must relate to inter-State and not to foreign commerce, and we are dealing with a conceded article of foreign commerce—with an article the importation of which is not prohibited. Articles which may be imported under the customs laws and regulations of the United States are within the exclusive jurisdiction of Congress, and it has not attempted, in the so-called Lacey act, to place them under the police regulations of the States. All game animals or birds, "the importation of which is prohibited" by the customs laws or regulations of the United States, are placed upon the same footing as "the dead bodies or parts thereof of any wild animals, or game or song birds, transported into any State or Territory," the word "transported" being used in the sense of shipped from one State to another, but this by necessary implication excludes from State control those game birds, etc., the importation of which is not prohibited. As to these, Congress has provided for their importation, and, as O'Brien, J., so well said in *People vs. Buffalo Fish Co.* (supra): "The State had no power to extend its police legislation to such a transaction, and, of course, had no power to forbid what Congress had expressly permitted."

Whatever may be our opinion as to the question discussed outside of the scope of the decision made in the *Bootman* case (supra), it certainly does not overrule the Buffalo Fish Company case (supra) in so far as that case held that fish imported under the tariff

laws and regulations of the United States were not subject to State control, except as they might become so by reason of some inherent vice in the fish themselves; and as the case now before us cannot be distinguished in principle from the latter, it follows that there should be a reversal of the order appealed from.

Order appealed from reversed and petitioner discharged.

SUPREME COURT, APPELLATE DIVISION—SECOND JUDICIAL DEPARTMENT.

Hirschberg, P. J.; Woodward, Jenks, Rich and Miller, JJ. The People of the State of New York, on the relation of August Silz, Appellant, against Henry Hesterberg, Sheriff of the County of Kings, Respondent.

Appeal by the relator from an order of the Supreme Court, entered in the office of the Clerk of the county of Kings, on the 16th day of June, 1905, quashing a writ of habeas corpus. Edward Lauterbach (Edward R. Finch and John Burlinson Coleman with him on the brief), for the appellant. Julius M. Mayer, Attorney-General (Alexander T. Mason, Deputy Attorney-General, with him on the brief), for the respondent.

MILLER, J. I dissent.

Evidently the imprisonment which is the subject of inquiry in this proceeding was procured for the purpose of enabling the petitioner to present the legal questions involved upon his own statement of facts, and it is urged that the allegation in the complaint that the plover and grouse in question "can be easily and readily distinguished from such plover and grouse found in the State of New York, and from any American bird, both with their feathers on and after they are plucked and after they are cooked and ready for the table," prevents the application of section 141 of the Forest, Fish and Game law, added by chapter 194 of the laws of 1902, which, so far as material, provides, "Whenever in this act the possession of fish, or game, or the flesh of any animal, bird or fish, is prohibited, reference is had equally to such fish, game or flesh coming from without the State as to that taken within the State," and the contention is that said section applies only to fish and game identical in form, shape, size, color and markings to the fish and game found in this State. By section 28 of the Forest, Fish and Game law (chapter 20, laws of 1900, as amended by chapter 317, laws of 1902) the sale or possession of "grouse" during the close season is prohibited; by section 30 of said law, as amended by chapter 588, laws of 1904, the possession of plover from Jan. 1 to Aug. 15 is prohibited; and by section 140 of said law "grouse" is defined as including "ruffed grouse, partridge and every member of the grouse family"; in effect, therefore, and practically in express terms, the Legislature has prohibited during the times stated the possession of plover and of every member of the grouse family, whether taken within the State or coming from without the State. It is difficult to see how the legislative intent could have been more clearly expressed, for surely it is not necessary for the Legislature to say expressly that it intends to mean just what it says. But the argument is made that, because said section 141 was added after the decision in *People vs. Buffalo Fish Co.* (164 N. Y. 93), which construed the act of 1900 as applying only to fish and game taken within the State, the word "such" in said section 141 should be construed as referring only to fish and game identical in size, etc., to that found in the State. The argument is ingenious rather than convincing. It is perfectly apparent that the amendment of 1902 was declaratory of its previous intention, which the Legislature thought the Court of Appeals had misconceived, and in expressing that intention it must be supposed as intending to mean just what it said. It is matter of common knowledge that it is well nigh impossible to secure even a practical enforcement of laws like the one in question; and although it is said that the closing of our markets to game that can be distinguished from our own does not aid in the protection of our game, I can conceive, even assuming that "black cock" and "golden plover" can be distinguished from our own birds "when cooked," that a very small number of "black cock" and "golden plover" might suffice to supply a very large demand for game in the New York markets. It is not our province to determine what measures should be adopted to secure an enforcement of the law, and the fact that we might regard the measures adopted by the Legislature as unnecessary or as too harsh furnishes no reason for construing the statute, that does not admit of construction, as we think the Legislature ought to have enacted it; it is our duty rather to give effect to the expressed intention of the Legislature unless it contravenes some organic law. The constitutional questions presented were fully considered by the Court of Appeals in *People v. Bootman* (180 N. Y. 1). Judge Vann, speaking for every member of the court, said: "That act" (referring to the so-called Lacey Act, 31 U. S. Statutes at Large, chapter 553) "provides in substance that foreign game when transported into any State shall be subject to the laws of that State, enacted in the exercise of its police powers, to the same extent as if such game had been produced in such State, and shall not be exempt therefrom by reason of importation in original packages. \* \* \* That amendment" (referring to laws of 1902, chapter 194) "when read in connection with the Lacey Act and the decisions of the Federal courts, removes from the region of discussion the questions considered in the Buffalo Fish Company case in relation to the application of the Forest, Fish and Game law to imported game, which was decided, and the effect of the commerce clause of the Federal Constitution, which, although discussed, was not decided." (Italics are my own.) \* \* \* "The action of Congress has taken away all questions of interstate commerce, so that the State can act with entire freedom and can prevent the shipment of game into or out of its territory; and if game is imported it can regulate or prohibit the sale thereof." (Italics are my own.) "Such provisions are warranted by the police power, and are not in conflict with either the State or Federal Constitution." True, this discussion was not necessary to the decision, as the court stated, but grave doubts on the constitutional questions had been created by the discussion in the Buffalo Fish Company case and by the decision of the Appellate Division in the *Bootman* case. To set these doubts at rest and because of the public importance of the question, the Court of Appeals stated its views, and it cannot be assumed that this was done without a full and careful consideration of the subject. It seems to me, therefore, that further discussion in this court is purely academic, and I should

rest my vote on the authority of the Bootman case without further discussion, were it not for the earnestness and ability with which counsel attempted to distinguish that case, and for the fact that we are not agreed on the question.

In the first place it is said that the Buffalo Fish Company case was not overruled by the Bootman case, but that it is still authority for the proposition that the statute offends both the State and Federal Constitutions. The answer is that it never was authority for any such proposition, and this without regard to the effect of the "Lacey Act"; three judges only assented to that proposition, three united in a vigorous and logical defense of the constitutionality of the act, and the concurrence of the seventh with the opinion of the majority was expressly limited to the point that the act was not applicable, thereby, by implication at least, agreeing with the minority on the constitutional question; and while the decision in the Bootman case upon the meaning of the act was controlled by the Buffalo Fish Company case, the court expressly stated that its decision was governed by the rule of *stare decisis*.

Next it is claimed that the peculiar wording of section 5 of the Lacey Act presents a question not considered in the Bootman case, and that, therefore, the admitted facts of this case present a new question for consideration. Said section 5 is as follows: "Section 5.—That all dead bodies or parts thereof, of any foreign game animals, or game or song birds, the importation of which is prohibited, or the dead bodies, or parts thereof, of any wild game animals, or game or song birds transported into any State or Territory, or remaining therein for use, consumption, sale or storage therein, shall, upon arrival in such State or Territory, be subject to the operation and effect of the laws of such State or Territory enacted in the exercise of its police powers, to the same extent and in the same manner as though such animals and birds had been produced in such State or Territory, and shall not be exempt therefrom by reason of being introduced therein in original packages or otherwise. This act shall not prevent the importation, transportation or sale of birds or bird plumage manufactured from the feathers of barnyard fowl."

The argument is that the express reference to "foreign game animals, or game or song birds, the importation of which is prohibited," by necessary implication excludes from the effect of the statute all foreign game animals or birds the importation of which is not prohibited, and that although the words "any wild game animals, or game or song birds," subsequently used in the section, are comprehensive enough to include foreign game animals or birds, the meaning of these words is restricted by the word "transported," which means "shipped," from one State to another, and does not include an import. Reading the section without reference to its context, there seems to be much force in the first of this argument, for it would seem that the foreign game animals or birds referred to were those the importation of which was prohibited by the act, and that, by expressly including them, all others were excluded. The importation of certain living animals and birds is prohibited by section 2 of the act, as follows: "The importation of the mongoose, the so-called 'flying foxes' or friar bats, the English sparrow, the starling, or such other birds or animals as the Secretary of Agriculture may from time to time declare injurious to the interest of agriculture or horticulture, is hereby prohibited." It may be that the words "the importation of which is prohibited," in section 5, should be interpreted as though the phrase read "the importation of which, if living, is prohibited by section 2," and assuming this to be the correct construction of this phrase, the question is presented whether it limits the subsequent general expression so as to exclude therefrom all foreign wild game animals and birds the importation of which is not thus prohibited. Certainly the expression "any wild game animals, or game or song birds," includes foreign animals and birds, and there is no force in the argument based on the use of the word "transported," because that is not a correlative of the word "importation," it relates alike to the phrase "all dead bodies or parts thereof, of any foreign game animals," etc., and to the phrase "all dead bodies, or parts thereof, of any wild game animals," etc., and obviously means "carried," which is comprehensive enough to include both an import and a shipment from one State to another. The office of construction is to determine the legislative intent, and when such intent is apparent, canons of construction, adopted solely to determine what it is, must yield to it. Congress declared in the first section of the act that its purpose was to aid in the preservation, distribution, introduction and restoration of game and other wild birds, and the manner in which it effected this purpose was by supplementing State laws to the extent of removing any question as to their conflict with the commerce clause of the Federal Constitution. It evidently deemed the act an appropriate one by which to prohibit the importation of animals and birds deemed to be injurious to agriculture and horticulture. Our attention is not called to any other Federal statute prohibiting the importation of game animals or birds, and if the application of section 5 is to be limited to the foreign animals and birds the importation of which is prohibited by the act, we shall have difficulty in determining what harm the Congress thought dead mongoose, bats, sparrows and starling might inflict upon agriculture or horticulture, or exactly what aid in the enforcement of local laws would result from making their "dead bodies or parts thereof" subject to the operation and effect of said laws. The construction contended for would entirely defeat the declared purpose of the act. Obviously the sole purpose of making game taken without the State subject to the laws of the State is to prevent the sale of game taken within the State under the guise of game taken from without, and if foreign game can be utilized for the purpose, it would be senseless as well as useless to prohibit game from other States. As the expression "any wild game animals, or game or song birds transported into any State or Territory," includes foreign game, and as that construction gives effect to the declared purpose of the act, while any other defeats such purpose, such construction should be adopted, whatever other parts of the act may be thought to mean.

But even if this statute, passed to accomplish a very beneficial purpose, can be so emasculated as to defeat

such purpose, I should still vote to affirm this order upon the reasoning of Judge Gray in the Buffalo Fish Company case, and of Judge Vann in the Bootman case. One question must certainly be deemed removed from the realm of controversy, viz., that the enactment of laws for the preservation of game is a legitimate exercise of the police power of the States. (Geer v. State of Connecticut, 161 U. S. 519; Phelps v. Racey, 60 N. Y. 10; Lawton v. Steele, 119 N. Y. 226; 152 U. S. 133; Commonwealth v. Savage, 155 Mass. 278; Roth v. State, 51 Ohio, 210; Magner v. People, 97 Ill. 320; Merritt v. People, 48 N. E. 325; Stevens v. People, 89 Md. 669; State v. Randolph, 1 Mo. 15; State v. Judy, 7 Mo. 524; State v. Farrell, 23 Mo. 176; ex parte Maier, 103 Cal. 476; State v. Schuman, 58 Pac. Rep. 661.) All of the cases cited supra except Geer v. State of Connecticut and Lawton v. Steele, upheld the validity of statutes whose prohibition extended alike to game taken without as well as within the State in which the statute was enacted. Having settled the question that the subject is a proper one for the exercise of the police power, the conclusion would seem to be inevitable that the necessity for the exercise of such power and the means of making such exercise effective arc solely for the Legislature, and that in selecting means legitimately tending to accomplish its purpose the Legislature does not offend either the State or Federal Constitution. No one disputes the right of the State to legislate respecting purely internal affairs, and so far as the commerce clause of the Federal Constitution is concerned, this right does not rest upon the police power; it is only when the legislation affects interstate or foreign commerce that it must be sustained if at all by resort to the police power reserved to the States. No one disputes that the individual holds his property subject to the legitimate exercise of the police power, and in this case it may be added that the petitioner acquired the property with the knowledge, with which he was at least chargeable, of the circumstances under which he could possess it. Concededly the subject of this legislation was a proper one for the exercise of the police power, the means adopted certainly tend to accomplish the object in view, and we cannot say that the object of the statute has been lost sight of or that the act in its essentials is anything but an act passed in the exercise of the police power to preserve the game of the State; and the fact that commerce may be remotely affected or that the dominion of an individual over his property may be controlled does not bring the act within the prohibition of either the State or Federal Constitution, unless while asserting the power we are to deny the right to exercise it effectively. As I understand the decisions respecting the commerce clause of the Constitution, the inquiry in each case is whether the particular act is essentially a regulation of commerce, or a legitimate exercise of the police power; if the former, merely calling it an act passed in the exercise of the police power does not save it from the prohibition of the Constitution; if the latter, the mere fact that commerce may be affected does not make the act a regulation of commerce within the meaning of the Constitution. The line of demarcation between the power of the State and the prohibition of the Constitution is of necessity so indefinite that the court must determine in respect to each case as it arises on which side of the line it falls, and there certainly is no case in the Supreme Court of the United States so nearly in point as Geer v. State of Connecticut (supra). The statute there passed upon prohibited the possession for the purpose of transportation beyond the State of Connecticut of birds lawfully killed within the State. The plaintiff in error had become the possessor of the birds in question after they had become an article of commerce. It is true, as pointed out by Judge O'Brien in the Buffalo Fish Company case, that one of the grounds of the decision of the Supreme Court was that wild game belonged to the people in common and that, therefore, the State could qualify the ownership by any person reducing such game to possession, but it is equally true that the court placed its decision upon the distinct ground of the undoubted right of the State in the exercise of its police power to pass laws for the preservation of game even though inter-State commerce was remotely affected, and Mr. Justice White, speaking for a majority of the court, prefaced the discussion of this question with the following statement: "Aside from the authority of the State, derived from the common ownership of game and the trust for the benefit of its people which the State exercises in relation thereto, there is another view of the power of the State in regard to the property in game, which is equally conclusive," and in discussing the question, he said: "The exercise by the State of such power therefore comes directly within the principle of Plumley vs. Massachusetts, 155 U. S. 461, 473," which was a case involving a sale in the original package of oleomargine colored in imitation of butter, in violation of a statute of the State of Massachusetts. In the Geer case the statute in terms prohibited inter-State commerce in game lawfully reduced to possession in the State of Connecticut. The statute in question does not in terms or effect prohibit inter-State or foreign commerce. So far as the facts in the case at bar are concerned, the importation of birds by the petitioner was perfectly lawful and his possession of them would have continued lawful had he observed the statute by giving the bond required. It is claimed that this case is controlled by Leisy vs. Hardin (135 U. S. 100) and that Plumley vs. Massachusetts (155 U. S. 461) is not applicable; even then the facts of this case do not bring it within the prohibition of the commerce clause for the reason that there is no question here of possession in the original package; on the contrary, it must be assumed that these birds had become part of the mass of the property of the State subject to the laws passed by the State in the conduct of its purely internal affairs, because if the petitioner relies upon any exception to save him from the operation of the statute, even assuming that there be such an exception, that is a matter of defense which need not have been negated in the complaint, and Leisy vs. Hardin (supra) goes no further than to hold that it was not competent in that particular case for the State to prohibit the sale in the original package, and such was the case of Schollenberger vs. Pennsylvania (171 U. S. 4), construing an act which was essentially a regulation of commerce. It is said the right to import carries with

it the right to sell, and the right to purchase of the importer must carry a like right to sell, and so on *ad infinitum*, whatever form the property may assume and by whomsoever it may become possessed. Obviously there must come a time when the property introduced into the State becomes so mingled with the mass of property of the State as to be subject to laws passed either for taxation or in the regulation of its purely internal affairs. The line must be drawn somewhere and somewhat arbitrarily, and as drawn by the Supreme Court of the United States it is where the article loses its distinctive character as an import or as an article of inter-State commerce, to wit, when it ceases to retain the form in which it was transported into the State, when the original package is broken. (Brown vs. State of Maryland, 12 Wheaton, 419, and cases cited supra.) I vote to affirm the order.

## Strenuous Game Wardenship.

I READ a dispatch in the morning paper to the effect that J. B. Burnham, game protector, had gone into the Adirondacks with fifteen men bent on razing camps illegally built on State land. That the camp owners were prepared to fire upon the game protector and his henchmen, etc.

When a man puts money into city property he employs counsel to search the records and very frequently uses title insurance in addition, having great regard for the principle as old as the Romans, let the buyer beware.

And now we witness an officer of the State by force and presumably with axes and arms about to remove and destroy buildings on State land that have cost in the aggregate a hundred thousand dollars, conservatively estimated. Some one of these camps has cost perhaps twenty thousand dollars. Now, this being so I am curious, in the light of present facts, as to how far the campers went in finding out whether they were building on their own land or not.

Did these men who put their money into this threatened property, acquire the right to build and occupy through "pull" or by official juggling of any kind? If in acquiring the disputed property, and other than means above board and legitimate were employed, such means as they would take in acquiring a piece of New York city real estate, then certainly they assumed a risk which, at the time remote, has developed into a real and present one, if Mr. Burnham carries out his instructions.

If the lands are State lands and the campers can show no legal authority for the occupation thereof, they certainly become trespassers and their camps, luxurious or humble, as the case may be, are forfeited to the State and are at the mercy of the game protector.

The situation is certainly an interesting one because the dispatch reads that several of the finest camps have been erected by prominent men. If the campers can by armed force hold off the game protector from carrying out his razing plans until with and by injunctions they can throw the matter into the courts, it may turn out eventually that the State may never succeed in ousting the campers. The defect in the title may be cured by legislative process, for such things have been done before.

But on the other hand, if the law is plain and all questions set previously at rest, and if the campers are, in the eye of the law, just plain, everyday squatters, and have been served with notice to that effect, it is then certainly up to Mr. Burnham to remove the camps, even if he has to use a regiment of soldiers in doing so.

I have nothing to go by and from which to make my deductions other than the press dispatch, but to me the situation is an intensely interesting one. All the legal questions may have been threshed out heretofore, and again the fact that these campers are trespassers and subject to ejection may be so plain to the powers that be as to admit of no parley or argument of any kind other than summary ejection by the State.

Provided the State is in the right, what stirs me is how men of the caliber of those who have invested in these expensive camps could fall into the error of building on another man's land without finding it out beforehand?

No doubt we will see the whole situation well ventilated in the columns of FOREST AND STREAM. Personally, I have great sympathy for a man who, having built himself a camp by his favorite lake, sees the same razed by the strong arm of the law. Undoubtedly there are those who have bought from previous owners in absolute good faith; on these ejection will come with a strong sense of injustice. There may be those who by political pull have had granted leases and who have taken the chance and, looking upon disturbance in the future as a thing of the utmost remoteness, have gone ahead and invested. Should the razing programme be carried out so that not even one log remains upon another, these men will have no one to blame but themselves.

But in either case it is not pleasant to think of such camps, as many of these must be, being turned into wood heaps. But the law is the law and all good citizens must submit to it or induce the Legislature to make other laws that will afford relief, which, I imagine, some of these alleged squatters will attempt to do before they stand aside and see the work of destruction carried into effect.

CHARLES CRISTADORO.

## Game Warden Hill.

EDWARD HILL, for fifteen years fish and game warden of Warren county, N. J., committed suicide at Roxbury, N. J., on Saturday night. Three months ago he had a severe attack of pneumonia. For the past week he had been acting queerly and was closely watched.

## Retrieving.

RETRIEVERS AND RETRIEVING, by Major W. G. Eley, is an illustrated work of 145 pages, devoted to the special breed of retrievers, of which there are but a few specimens in America. The dominating system is what is frequently termed the natural method in the United States. Work in the field, and in water in all their minute particulars, is skillfully treated, and a chapter on kennel management abounds with information valuable to owners of all kinds of dogs. Price, \$1.25.

### Connecticut Fall Shooting.

MILFORD, Conn., Dec. 1.—*Editor Forest and Stream:* It seems only a few days since we were looking forward to the opening of the shooting season, and now it has closed. In some respects it has been a good one, in others bad.

The past two hard winters almost exterminated the quail in this part of the State, and when the season opened the persons best informed as to shooting prospects knew of only four or five flocks hereabouts. An agreement was entered into by half a dozen of the best shots in the town by which they pledged themselves not to kill any quail. The few flocks seen have been watched by these good shots, and it is not thought that any considerable number have been killed. Certainly, the men who promised to abstain from shooting them have done so, though they have frequently found them while out shooting.

There was a good flight of woodcock about the middle of the month and quite a number were killed.

There was a fair crop of partridges, and of these a number have been killed, but on the other hand there is an abundance left over for seed for the coming year.

Unless the winter now opening should be a very hard one, next year's shooting will be much better than this one has been.

RAMON.

### Robin Shooting by Wholesale.

STATEN ISLAND, Nov. 22.—*Editor Forest and Stream:* While this correspondence may not be very interesting to some it may be of interest to others. We have had fine robin shooting on the island this fall, on the south side as well as on the north shore some fine bags have been made. It is not altogether the persistency of the Dago that, the results show the score, but almost anybody could have gone out and killed what they desired. During the second week in October I stopped at a Dago's retreat one morning and was admiring the goats, chickens, geese, and other animals that made up the group, and asked the women of the house if the old man did much shooting this fall.

"No," she said, "my husband he no shootet his gun. My boy he good shoot; he bring me home twenty-one robin fore he eat to-day."

That was good for a boy fifteen years old to do before breakfast, so I reported the fact to those who should get acquainted with him, but I suppose he is shooting yet. Staten Island is a queer place. We have any quantity of special game protectors watched over by one State protector. We have magistrates' court and the Court of Special Sessions. But somehow or other the courts and game protectors do not seem to agree or else agree to disagree. There is more shooting of song birds on Staten Island than in any other one county in the State.

If the Audubon Society would put a man here there would be something doing, I think. Every fall I have made it my business to be in the woods and save the lives of as many birds as I could. I have no official standing, but I threaten arrest, and do a little good, but this fall I have been a cripple and am hardly able to write this, but I hope it will reach the eyes of the powers above (say up Albany way, for instance). I am glad to think there is a movement to put J. B. Burnham in a place where he can use his brains to protect nature. To thoughtful people and readers it seems to be a correct move. \*\*\*

### Prizes for Game Heads.

THE FOREST AND STREAM offers three prizes of \$20, \$10 and \$5 respectively for the best moose heads secured in the year 1905 in the hunting grounds of the United States and Canada.

It offers also three prizes of \$15, \$10 and \$5 respectively for the best white-tail deer heads taken in the hunting season of 1905 in the United States or Canada.

The heads will be judged from photographs submitted to the FOREST AND STREAM. In estimating their merits the two qualities of size and symmetry will be taken into consideration. With the photograph of each head must be sent a memorandum of the place and the time of its taking and the name of the person taking it. The competition will be open to amateur hunters only; and with this single restriction it will be open to the world. There are no entrance fees. The photographs submitted will be the property of FOREST AND STREAM. Entries for the competition must be made not later than Jan. 15, 1906.

### Hunters' Lodge.

*Editor Forest and Stream:*

Having just concluded a visit of several weeks' duration to this delightful resort, I am disposed to mention to brother sportsmen the pleasures I have enjoyed. Hunters' Lodge is in eastern North Carolina, a few miles from Lumberton, the county seat of Robeson county. It is easily reached by the Seaboard Air Line to Moss Neck or by the Atlantic Coast Line to Pembroke. It is an old and true proverb that "a man must enjoy and appreciate good things himself before he can provide them for others." Mine host of Hunters' Lodge is an old Confederate soldier, who has held many positions of trust and honor in his native State of Maryland. Fond of hunting and of the comforts of life, for many years he has spent considerable time in different parts of the South seeking the quail, and occasionally enjoying the music of the beagles in pursuit of the cottontails. Five years ago it was my good fortune in his company to

stumble upon the section now graced by Hunters' Lodge. We found level lands, with a sandy soil, rather open country, delightful climate and abundance of quail. It was to the sportsman a virgin country, with freedom to roam where you chose and shoot anything you found in the fields, except a "man or a mule." My friend—and I will give his name, Gen. Frank A. Bond—decided he would buy a plantation, build a house, bring servants and furniture from Maryland, and spend his winters right there. And, my brother, if you are properly recommended and will communicate with him at Lumberton, you may share his pleasures. He is ably seconded by his good lady, and all the comforts and luxuries of home are yours if you are domiciled beneath their hospitable roof. You will find comfortable kennels for your dogs and good and accommodating guides to show you over the country. I have spent the greater part of the four past winters there, and look forward with great pleasure to spending many more in the same place.

WASHINGTON, D. C.

J. H. HUNTER.

### Ye Huntsmen.

Now doth ye cite huntsman  
Take "hunting license" oute,  
And with a brand-new "outfite"  
He goeth forth to scoute  
And seeke ye beastes ferocious  
That haunt ye woodes aboute.

He seeks with zest ye rabbit,  
And eke ye doe and bucke,  
But presently he shooteth  
Ye farmer's gentle duche.  
And as he payeth for litte,  
He darneth of hys lucke!

Anon he tries another,  
Yclept ye "stille-hunting" plan,  
And sneaketh through ye forest  
As softly as he can,  
And suddenly he baggeth  
A costly hired man.

Mary well ye cite huntsman!  
Hys gunne he keeps atte cocke,  
But when a hare he seeth  
Hys knees together knocke—  
And finally his guide doth kille  
Ye rabbit with a rocke!

Beware of ye same huntsman,  
And walk behind hym notte,  
The which of his vicinage  
Is ye moste fearsome spotte—  
For there is where hys comrade  
Most frequently gets shotte!

Meanwhile, observe ye Nymrod—  
He stoppeth for to buy  
A goodly bag of beastes,  
And personally doth lie  
Unto hys trusting wyfe, who  
Just winketh of her eye.

—St. Louis Globe-Democrat.

### The Anglers' Club of New York.

ALTHOUGH anglers are almost as thick in New York city as flies or Jersey mosquitoes, for some reason not easily explained, the only representative organization that gentlemen of the present generation can remember was the National Rod and Reel Association, which at one time held casting tournaments at Madison Square Garden, but which finally died of old age or lack of support—it is not clear which.

Shortly after the Sportsmen's Show last spring a number of enthusiasts met together and took the preliminary steps toward the organization of a fly and bait-casting club, but nothing came of it, although numerous anglers who were anxious to see a club of this sort in existence in this city were willing to give such a club their support.

Recently a few of these gentlemen met together and discussed the subject of the formation of a club, and the first meeting was held the night of Nov. 21. Mr. Robert B. Lawrence was unanimously chosen temporary chairman and Perry D. Frazer temporary secretary. Plans were discussed and a date set for a more representative meeting, and notices were sent out to some twenty-five well-known amateurs. This second meeting was held at the Hotel St. Denis on Tuesday night, Nov. 28. The weather conditions were very unfavorable, the strong wind and rain keeping a number at home who would otherwise have been on hand, but still there were enough anglers present to transact business and discuss ways and means necessary before definite steps were taken.

In calling the meeting to order Mr. Lawrence said, among other things, that there had long existed among anglers of this city a desire for just such an organization as it was proposed to form, and that he believed when other anglers, who were not present, or could not be notified in the usual way, principally because their addresses were not known, should hear of the efforts to organize a club, they would give their support. It seemed to be the desire of all concerned to organize a club on the broadest possible lines, and while all would like to see casting contests held, and these would be held, he believed there was a need for a club whose members could in time secure a comfortable meeting place where they and their friends could gather at stated times to discuss fishing, casting, relate stories, become better acquainted, exchange ideas, exhibit the trophies of their skill (or luck), and, in fact, enjoy themselves as anglers can and do when brought together.

The question of a name being brought up, it was decided to call the new club the Anglers' Club of New York.

Pursuant to a motion, the chair appointed Messrs. Chancellor G. Levison, Edward Cave and G. M. L. LaBranche a committee to draft a constitution and by-laws. On motion, Mr. Lawrence's name was added, making a committee of four.

It was then decided to limit the charter membership to twenty-five. There were fifteen present, and these nominated ten others to fill out the desired number.

The next meeting will be held on the evening of Tuesday, Dec. 12, at the home of Mr. James D. Smith, 51 West Eighty-sixth street, when officers will be elected, committees named, and the constitution and by-laws adopted.

Applications for membership may, before that time, be sent to the temporary secretary, Perry D. Frazer, 501 West 164th street, New York city, who will hand them to the membership committee as soon as it is named. No limit has as yet been decided on, but it is probable that the membership list will be limited to a reasonable number, and there are now nearly fifty names of anglers who can reasonably be counted on to become members, in the hands of the acting secretary. Early application is, therefore, desirable.

So much interest has been taken in bait-casting during the present year by New Yorkers that the first contest of the Anglers' Club will be looked forward to with impatience, and it is probable that bait-casting will attract a great deal of the attention of members, although many of them will stick to their old favorite, the fly-rod.

### Eating Habits of Fishes.

For some years I have followed certain fishes with a kodak endeavoring to photograph them out of their native element. I have a set of views which the critical observer might say have pre-Raphaelite tendencies, as apparently they were taken without regard to the selection of conditions or scenic effect. Some show vessels sliding down hill at frightful angles at full speed; others show parts of the bowsprits of yachts or the cutwaters of steamers. Some show nothing but a waste of waters, and the collection might well challenge attention, so interesting is it. Yet, these remarkable pictures possess a certain value, representing as they do the efforts to photograph at many and varied times the California flying-fish. The fish had always moved on, at least the sharpest eye fails to find it.

My usual point of vantage when photographing, or attempting to photograph the flying-fish, was the fore part of the steamer which plies between San Pedro and the island of Santa Catalina. The channel of this name is a famous locality for these fishes, and by standing in the bow, where they were frequently darting up, one could

snap the camera with apparently a fair chance of success. I have had the flying-fish come directly toward me, and have dodged them successfully, a fish on one occasion passing within a foot of my face. They have repeatedly struck on the outside and inside of my boat when fishing. I can fairly claim to have met the flying-fish under favorable conditions, but the close contacts were generally unexpected or so exciting that the wrong end of the camera was presented, or the instrument had to be dropped to save it.

Besides making these attempts I provided the agent of the steamer with a kodak and encouraged the boatmen to take a camera with them when fishing, and finally an interesting photograph was secured which shows the king of oceanic fishes high in air in its act of feeding upon the illusive flying-fish. The fish, *Thunnus thynnus*, is seen on the return of the leap, which possibly is the most sensational performance enacted by fishes of any waters. This fish in the Atlantic apparently is not at all particular as to its diet—sharks, dogfish and fishes of many kinds having been taken from its stomach, while it is well known as a scavenger, following the boatmen or fishermen, eating dead dogfish, which are thrown over after being despoiled of their liver. On the Pacific coast the fish is more fastidious, and I have never found them to contain anything but squids, flying-fish, sardines and mackerel. The fish appears off the southern California coast the latter part of May or the first of June, coming, apparently, to feed and driving in the schools of flying-fish, which also appear at this time. The tuna is rarely if ever seen within fifteen miles of the mainland, its exploits being at the island mentioned, and, so far as can be learned, only on the northeast coast of that region. The tunas undoubtedly retire to the deep sea or go out into the channel at certain times of the day, but between 3 and 4 o'clock in the morning they begin to feed, coming shoreward in a widely distributed school. Their motion is always rapid; they charge a school and keep it in motion until the victims are exhausted. I have seen flying-fish almost unable to swim, readily crowding under my boat for protection from the insatiable creatures. The tuna habitually swims three or four feet below the surface and comes up under the flying-fish like an animated rocket. Often it misses and rises ten or twelve feet into the air, turning gracefully and coming down head first. It was in this position, fortunately, that the fish was photographed. The tuna was on the return, about entering the water, and the foam masses of many others could be counted in the picture. The latter are what the fishermen term rushes. The tuna has come upon a flying-fish from behind; suddenly, and before it takes to the air, it plunges at its victim for eight or ten feet along the surface, plowing the water into foam and showing the dorsal fin and part of the blue back. I have frequently observed this rush when fishing for tuna. The latter often sees the bait twenty or thirty feet away

and comes along the surface in a magnificent burst of speed, throwing the white foam high in the air.

All the movements of this fish in feeding are remarkable. The flying-fish, to escape, will fly or soar an eighth of a mile, in some instances, in three or four distinct attempts, never sinking into the water, merely lowering its tail to obtain the necessary impetus. Sometimes the tuna leaps and seizes its prey in the air, sending it whirling upward like a pinwheel; but more often it follows within two feet of the flyer directly beneath it, like a hawk or an eagle following every motion. At such times I have seen the flying-fish pass over my boat, and so for a few seconds disappear from the tuna's sight; but the latter was not to be thrown off the track; it kept on like a bloodhound; the fly-fish eventually fell into its mouth.

In striking the flying-fish the tuna undoubtedly aims for the black staring eyes, on the principle that a hunter in shooting on the wing fires in front. I am confident of this for the reason that in numbers of flying-fishes struck by the tuna, and missed, all were damaged in the eye, the tail, which, of course, presented a promising object, being entirely uninjured. The philosophy of this is apparent. The tuna is chasing a rapidly-moving fish and dashes at it from a distance of perhaps ten or twenty feet; if the tail was the objective from the side the fish would be missed, whereas, by aiming at the eye it reaches the entire body.

The appearance of a school of tunas feeding is an exhilarating sight. The ocean, otherwise calm, is lashed into foam as by a storm sweeping over it. Flying-fishes are darting into the air, moving in every direction, and the tunas are bounding like an avenging nemesis, high out of the water or perhaps along the surface, a shower of silvery scales sinking into the blue ocean, marking the tragedy.

An ally of the tuna, the albacore, feeds by making a low jump, barely clearing the water, though the larger individuals, from sixty to 100 pounds, often make tremendous leaps in the pursuit of their prey. The bonito moves along the surface in schools carrying a pronounced ripple before it in diverging lines; darting here and there with almost inconceivable velocity, snapping up small fry of all kinds. The small mackerel found on the Californian coast feed in an exultant fashion on roe, and the newly-hatched smelt and sardines or any young pelagic fish are to their taste. The school seems directed by a leader as they rise to the surface, creating a sound as of falling rain as they snap at their victims, and every few seconds, as though the leader had given a signal, they sound, making a crashing sound, as though a large amount of water had been poured upon the surface.

The great black sea bass of southern Californian waters ranging up to 700 or 800 pounds, feed in shore during the summer months, its principal food being the red or white-fish. In feeding on the bottom I have seen this huge creature standing in a perpendicular position with its tail upward, apparently standing on its head, in its attempts to take its food. Swallowing food alive sometimes has its drawbacks. Darwin relates that a small shark having swallowed a diodon, the latter made its escape by eating through the wall of the stomach. An old resident of the Sound country near Port Royal told me that the piers of the planters along the Sound were often destroyed in a mysterious manner by the giant ray-manta. The food of this fish, at least the major part of it, is clams, shells, oyster and other mollusks and crustaceans when it can obtain them. That they certainly damage the piers and throw down piles is a fact beyond question, singular as it may seem, and it is done, I should judge, in the efforts to detach mussels or oysters from them. Some of these rays weighed several tons and were sixteen or eighteen feet across. It was the theory of the planters that the animals threw their claspers—the two singular organs on either side of the mouth—about the piles and so overturned them.

The yellow-tail—*Seriola dorsalis*—a common fish in southern California, ranging up to 80 pounds, is at times a voracious feeder. It then swims at full speed in schools of from thirty to five hundred or more, sweeps into bays along shore driving everything else before it, feeding on flying-fish, smelt, sardines or squids. But these rushes are the exception, the yellow-tail preferring to take its position beneath a school of small fry and pick off certain ones at leisure. Such fishes appear to be too indolent to fish for themselves, and will take dead sardines when thrown at them, or seize a wounded fish with the greatest avidity, yet refusing to charge the almost solid mass above them.

The southern California barracuda differs from its ally in the Gulf of Mexico by schooling, the waters in June and July often being tinted with their forms, which seem to fill it. When feeding they apparently seek rough water and dart about like a bonito—the antipodes of the Gulf of Mexico form. The latter fish, often six feet in length, is a solitary creature, lying in the deep channels like a tiger waiting for its prey, and springing upon it with a ferocity that brings to mind that animal. Even the small ones in Californian waters take their prey in what might be termed a dignified manner, approaching it very slowly, touching it sometimes to back off or retreat, then lunging at and seizing it between the sharp teeth, gradually taking it in.

The voracity of the shark is an old story. Everything is game to it. I have made many attempts to observe these creatures turn on their backs to eat, after the popular version, and one day towed a dead cow to a famous spot for sharks, presently attracting a swarm of large ones. I drifted near the floating animal and watched the attack, but not a shark turned upon its back; they all ran at the animal and pushed their snouts out of the water, seizing it in this way; then by a violent wriggling motion of the tail, while holding on with their vise-like teeth, tore off great pieces. Sometimes three or four sharks had the creature at the same time and appeared to be shaking the carcass, at times carrying it out of sight.

The most remarkable glutton among the fishes is the black swallower—a deep-sea form, which captures its prey in total darkness or by the aid of the dim phosphorescent light in the abyssal depths of the sea, and swallows fishes three times its own size. The gape of the fish is enormous, while its pouch-like abdomen expands to such dimensions that the swallower appears to draw itself over its prey as a glove is drawn on the hand.

CHARLES F. HOLDER.

## The Leap of the Silver King.

### Tarpon Fishing in Mexico.

FOR many years it has been the annual custom of the piscatorial enthusiast, who is averse to the idea of relinquishing the enjoyment of the pastime during the cold months of the winter to seek his sport on the west coast of Florida in the vicinity of Charlotte Harbor and the Caloosahatchie River, or, perchance, he goes to southern California. At the present time, however, another winter resort for fishermen is open, and rapidly gaining in fame as the true mecca toward which the lover of the magnificent sport of fishing for the gamy tarpon finds his way. This practically new region is situated in the great Panuco River, which flows into the Gulf of Mexico at the port of Tampico, Mexico, and there is more than twenty miles of fishing ground where countless numbers of tarpon and other varieties can be found from December until May. This new fishing ground can be readily reached via the Mexican Central Railroad, which makes connections at El Paso with all southern and western railroads, and from either Monterey or San Luis Potosi it is but a short day's run to reach Tampico. If one has a preference for an ocean trip it is only to step on board one of the comfortable steamboats of the Ward Line at the pier in New York city and enjoy a most delightful journey via Havana over tropic seas, direct to Tampico. The Mexican Steamship Line from either New Orleans or Galveston will also make a change of travel agreeable for the fisherman or tourist from the Middle or Northwestern States. Until last winter but an occasional sportsman had come for the game fish in the Panuco or fished scientifically with rod and reel. Dr. H. W. Howe, of Mexico City, the noted J. A. L. Waddell, Mr. Ross, chief engineer of the famous Custom House Dock at Tampico; O. L. Smith, of Denver, Colo., and E. H. Browne, of Chicago, were those who comprised the first, and their really phenomenal scores made the Panuco River famous.

At the celebrated summer tarpon fishing ground of Corpus Christi Bay and the Aransas Pass, on the Gulf coast of Texas, the fishing season closes at about the time that the sport of this new fishing resort begins, i. e., Dec. 1, proving beyond doubt that the tarpon prefers a warmer temperature for his winter's meanderings, and as the fish are found to be spawning during the last of May, when the Mexico season closes, and are encountered many leagues toward the source of the Panuco at that time, it would appear almost conclusively that this is their natural spawning ground. The captains of river steamboats plying between Tampico and the great sugar plantations of El Higo and the Huasteca, frequently report the tarpon, or, as it is called in Spanish, the savolo, as far as a hundred miles or beyond up the Panuco, and the numberless small branching rivers and connecting lagoons form an immense feeding area which it would hardly strike one could be soon if ever depopulated.

The attention of sportsmen having been directed toward this new field for the angler by articles contributed to FOREST AND STREAM by Mr. J. A. L. Waddell, it became a necessity to provide for the needs of those who came on a tour of inspection, and who did not bring the expensive tackle and outfit required in order to capture this gamy fish. This was done by the proprietor of the only American hotel in Tampico—the Hidalgo—and many stirring scenes occurred in the height of the season at this hostelry.

Mr. Waddell caught as many as fourteen tarpon in one day, the largest being considerably over six feet in length, and Mr. C. R. Howe captured twelve also in the same time. Sir Frederic Johnstone, who fished here for nearly three weeks, made some remarkable scores, his largest tarpon being seven feet in length, with a weight of 180 pounds, and having a girth of 44½ inches. The record fish of the season was caught by Mr. H. W. Wilson, acting British Vice-Consul at Tampico. This tarpon measured 7 ft. 2½ in. and turned the scales at 200 pounds, with a girth of 46 in. There is no doubt that much larger fish than this are in the river, and this season will demonstrate the fact, as there promises to be considerable rivalry. The tarpon fishing headquarters at the Hidalgo shows on its records that the largest number of fish caught the past season was by Dr. Louis Hough, a local physician and surgeon. His score was 147. Mr. O. R. Loomis, of Fort Dodge, Ia., caught thirty-one; Mr. C. R. Hoag, of Newark, N. J., sixty-five; Mr. W. B. Jordan, president of the Miles City National Bank of Montana, thirty-five; Mr. O. L. Smith, of Denver, Colo., thirty-six; Messrs. W. H. Dilg and E. H. Browne, of Chicago, twenty-five each; Mr. U. F. Bender, of New York, twenty-three, etc., making the season's catch in all over a thousand fish; but a small proportion of those were killed, however, the great majority being turned loose to reproduce their species.

Nor was the scaly tribute derived from the Panuco confined to the silver king alone. Mr. Macleod, of New York, captured an enormous jewfish; Mr. O. C. Bond, of London, England, and a number of others brought in jewfish ranging from 150 to 400 pounds, but the climax came when Mr. J. E. Johnson excitedly walked into the hotel office one evening in April saying: "They are bringing up my fish from the dock, and he is a daisy. I want you to weigh him for me, landlord." And presently a large dray was backed up against the sidewalk with a full load consisting of one fish. It took eight stout Mexican peons with gaff-hooks and ropes to get the fish on to the hotel scales, where, in the midst of a chorus of wagers and guesses as to its weight, the fish showed a total of 473 pounds. But in order to make positive assurance doubly sure and settle all wagers satisfactorily, the jewfish was taken to the depot scales of the Mexican Central and found to touch the notch at 465 pounds. Besides jewfish there is the jurel, a fish almost similar to the yellow-tail of California, in countless numbers, that have fighting qualities far out of proportion to their size, averaging three to four feet in length. We have also a fine table fish, the rovallo. Dr. Howe one day in March, while fishing with heavy hand lines, captured three large sawfish, one of 14½ feet in length, and the others respectively 13 and 13½ feet. Sharks are, as in other tropical waters, sometimes in evidence, but on only two occasions last season did they

interfere with sportsmen in handling their tarpon. One case was that of Mr. W. B. Jordan having two-thirds of a six-foot fish cut off and only bringing in the head and a small portion of the body. Another fisherman while playing a large tarpon that had carried him out into the Gulf, beyond the mouth of the river, had his entire fish cut into pieces on the surface by two large sharks, and beat a hasty retreat back to the shelter of the jetties.

The record 7-foot 2½-inch tarpon captured by the British Consul passed through the hands of a taxidermist and was shipped to the office of the Lyland Steamship Company in Liverpool by their agent in Tampico, and as many as twenty-five or more large tarpon were also sent to different points in the United States and England by their successful captors. The tackle used with the best results in the Panuco is as follows: A seven-foot lancewood, niobe, or greenheart rod, with a heavy reel carrying 600 feet of No. 21 to No. 30 line. Many sportsmen like as small as No. 21, others No. 24, while still some prefer a No. 30. A regular Van Vleck hook attached to four feet or more of piano wire and to this added two brass swivels complete an outfit which cannot by any possibility be excelled. Outfits such as this should be brought by visiting fishermen. The boatmen employed are nearly all native Mexicans, who are excellent oarsmen. The bait used consists of a small mullet about four to six inches in length, and is used either fresh or salted, the tarpon, when striking well, seeming to make no discrimination, and the color of the bait remaining the same. All fishing is done by trolling from the stern of a small boat of from fourteen to sixteen feet in length. The length of time used in playing the fish depends on the strength and skill of the angler and the size of his fish, a five-foot tarpon making a much harder fight than the extremely large ones, as the latter, after three or four leaps out of water, settle down to a steady fight, while as many as twelve or fifteen leaps will often be made by a lively 5 or 5½-footer.

There is over twenty miles of fishing ground which has already been proven, and as these giant fish frequently run in schools, they are found at different points, seeming to change their feeding grounds. At one time they may be striking well at La Barra, near the mouth of the Panuco, or later at a famous location known as the Boca de Lagoona Pueblo Viejo, where as many as twenty to thirty tarpon have been seen rolling or sporting on the surface of the river at once. Very often the passengers and crews of the many ocean-going steamers that come and go at the immense Custom House dock, will be in full view of an exciting combat directly off the dock; and a full-sized fish going six or eight feet into the air, shaking his head like an angry dog, and throwing hook and bait a dozen feet away, is not a sight to be quickly forgotten. One hour and seven minutes was the time consumed in landing the six-foot and ten-inch tarpon now in the office of the Hidalgo. This fish was caught on a No. 21 linen line with a lancewood rod, and Mr. Charles P. Shillaber, of South Framingham, Mass., was "the man behind the gun." The weight of this fish was 158 pounds.

It is now proposed to build a club house for tarpon fishermen at La Barra, by the Tarpon Club already formed, and the list is open for subscribing members. For a winter resort, with a tropical climate and fishing unexcelled combined, it bids fair to prove a success. The most important fishing scores of this season, which is just beginning, will be forwarded to the FOREST AND STREAM.

### The Tuna Club.

MR. L. G. MURPHY, of Converse, Ind., has been awarded the first prize that is given annually by the Tuna Club, of Avalon, Santa Catalina Island, Cal., for the fisherman who catches the biggest fish during the season ending on Nov. 1 each year. Mr. Murphy's catch was an enormous sea bass weighing 436 pounds.

As there were no tunas caught that weighed more than 100 pounds during the season, no prizes in that class were awarded. The second prize in the sea bass class was taken by John J. Perkins, of Los Angeles, Cal., his catch weighing 428 pounds.

The prize for the best yellowtail caught went to J. E. Pfueger, of Akron, O., while the prize in the same class for catches made by women was won by Mrs. Harry Knowles, of San Francisco, Cal. Special prizes in the yellow-tail class were won as follows: Eddy Cup, J. Sullivan Cochrane, Boston, 41 pounds; Hunt Cup, J. Arthur Eddy, of Chicago, weight 55 pounds; Albacore Cup, J. C. Pillster, Denver, Colo.; Rock Bass Cup, Ernest Fallon, Los Angeles, Cal., weight 10½ pounds; Sheephead Cup, Dr. D. E. Brown, Larimee, Wyo., weight 22 pounds; Whitefish Cup, Mrs. A. A. Ritter, Denver, Colo., weight 10 pounds.

The prize for the largest tuna ever caught is held by Mrs. E. N. Dickerson, of 64 East Thirty-fourth street, New York city. The fish weighed 216 pounds.

### A Larvated Fish Story.

Editor Forest and Stream:

A very good fish story is hidden in "Love of Life," by Jack London, in McClure's for December, and I hope that it will not be lost to the honest fishermen who read FOREST AND STREAM. The hero of the story, being almost starved, observes a small fish in a pool of water, and in his haste to effect its capture, falls into the pool and is wet to the waist, but gets out again and bails the pool dry with his (dinner) bucket. "Not a cupful of water remained. And there was no fish. He found a hidden crevice among the stones through which it had escaped to the adjoining and larger pool. \* \* \* Had he known of the crevice he could have closed it with a rock at the beginning and the fish would have been his."

Query.—Which end of the fisherman was immersed? How large was the bucket if it took a half hour to empty the pool? Do the laws of gravitation apply above the Arctic Circle? Did the fish, after swimming through the crevice to the larger pool, make itself secure by pulling the crevice in after it?

## Fish and Fishing.

### Mr. Tasker's Experience at Lake St. John.

It is a matter of much regret to me that I was not fortunate enough to have seen Mr. Stephen P. M. Tasker and his friends when they were in Quebec last September, on their way to Lake St. John. I knew at that time of the disorganized condition of affairs in connection with the hotels, steamers and ouananiche fishing generally, partially due to the remarkable want of water, and might have saved them the disappointment they experienced at the lake. I can imagine of no excuse for failure to notify them that the accommodation and the men, which were engaged beforehand, could not be forthcoming, though a poor reason may be found for it in the fact that the entire management were just then finally vacating their charge. I understand that a southern hotel man of considerable experience has been engaged as manager for next year, and that the superintendence of guides, camps, canoes, routes, and of the outfitting of camping parties is to be placed in the hands of Mr. Marcoux, for some time past in charge of the Island House and the Roberval hatchery, who will have his headquarters at the Hotel Roberval, to meet and look after the interests of anglers arriving there. This change should fill a long-needed want.

When I wrote for *FOREST AND STREAM* of Nov. 4 that, "as a rule the fishing at the Discharge cannot be depended upon late in the season, because of the danger of low water there, such as we had in September last," I had not heard of the unfortunate experience of Mr. Tasker and his friends, related by him two weeks later in this paper, and so fully bearing out my statement quoted above. That experience in no manner surprises me, though candor compels me to say that in the matter of low water and the consequent early closing of the ouananiche season, the recent fall was a very exceptional one.

I sincerely hope that Mr. Tasker will make another attempt to reach the ouananiche fishing grounds, and that next time it will be in the height of the season instead of after its close. If he visits the Grand Discharge in the month of June or even in July, or if he tempt the ouananiche later in July and in the month of August in the Ashuapmouchouan River, the Mistassini or Lac a Jim, I am pretty sure that he will revise the statement, "that the place is fished out." No attention is merited by the stories told by certain of the loafing residents of the place, who view with considerable jealousy the taking of fish by non-resident anglers, anxious, as they are, to have them all to themselves. They have so far succeeded, it is true, with the use of nets, in considerably reducing the supply of the fish in the lake itself, opposite to Roberval and Pointe Bleue, that it is scarcely worth while to try the bait-fishing that alone produced any result there. But in the preserved waters of the Grand Discharge and in the rivers already referred to, where alone there is any of the fly-fishing that proves attractive to anglers, it is by no means correct to say that the waters are fished out, as I am quite convinced that Mr. Tasker will be the first to admit, if he succeeds in reaching any of the localities where the ouananiche are successfully sought by the angling community. To attempt to take them with rod and line in the vicinity of Roberval or Pointe Bleue, is something like angling for salmon in the sea.

### The Abolition of Netting.

Perhaps the most promising feature about the outlook for ouananiche in Lake St. John is the promised abolition of the netting privileges. It would scarcely appear possible to some people that those in authority should have become so blind to the future as to deliberately permit the use of nets for the purpose of taking, for commercial purposes, the magnificent game fish which were being propagated and planted at such considerable expense, in the same waters from which they were being taken. Yet this is what has been done at Lake St. John for some time past, with the connivance and at the very request of the member of parliament for the county in which Lake St. John is situated. A short time ago, the Quebec Fish and Game Protective Association attempted to make a test case as to the right of the netters to use seines in Lake St. John for the taking of ouananiche. An officer seized several boxes and barrels of fish which had been shipped from Lake St. John to Quebec, and when they were opened, a large number of very beautiful ouananiche were found, some of which weighed from six to seven pounds each. The court ordered the fish to be returned to the dealer to whom they were addressed, because it was admitted by the government officials that licenses to net the fish had been issued to the man who had taken them as well as to others. There was not even a pretence that the license limited the rights of the netters to the taking of coarse fish. How long this condition of affairs might have continued if a change of government had not occurred this year it is impossible to say, for the member of parliament already referred to publicly proclaimed that the game and fish of the Lake St. John district belonged exclusively to the people of the district, with whose right to take and kill and use them in the manner in which they thought best, it was nobody's business to interfere. It is needless to say that this opinion was not shared by a very large element of the community, including those who profit so largely as guides, etc., by the money expended in the country by visiting anglers. The netters were influential politicians, however, and having the support and backing of the parliamentary representatives for the constituency, must, in a few years have ruined the ouananiche fishing entirely, had they not been stopped in their nefarious work. The end of the netting was reached, however, when the new Minister of Colonization, Mines and Fisheries—the Hon. Mr. Prevost—visited Lake St. John last September. Mr. Prevost has been an enthusiastic angler from his youth, but had never fished for ouananiche before this year. Last September he had all the sport of ouananiche fishing that anybody could desire. He could not reach the fishing grounds of the

Grand Discharge, for the same reasons that prevented Mr. Tasker from going there about the same time. But he spent about a fortnight in visiting some of the best of the rivers flowing into Lake St. John, in which the fish are found at that period of the year, and he and his party took ouananiche on the fly until they were surfeited with the sport, and landed fish after fish, only to replace them in the water. During his stay in the Lake St. John country, Mr. Prevost had splendid sport with the large ouananiche found in Lac a Jim, which is reached by the ascent of the Ashuapmouchouan River; the return being most easily made by way of the Mistassini. This trip, allowing two or three days for fishing en route, takes about ten days to make. Mr. Prevost also inspected the working of the Roberval hatchery, and saw for himself what heavy expenditure had been made for the accommodation of visiting anglers and what large sums of money were annually expended for their sport by these latter, among the people of the country. The iniquity of the netting licenses immediately appealed to the Minister, who despite the protests of the Member of Parliament, promptly notified the netters that their licenses would not be renewed. Several attempts have since been made to create sympathy for the netters, and only a few days ago I was shown a letter from a supposed fishery expert in the United States, who declaimed against the cancellation of the netting licenses, on the ground that it was unfair to prevent the people of the district from taking the coarse fish for food, and also because he thought it was in the interest of the fishing that the netting should be allowed, since with the advance of civilization and the pollution of the streams with mill refuse, etc., the fate of the ouananiche was virtually sealed. There might have been something in these arguments providing none but coarse fish were taken in nets, but unfortunately, as shown when a number of cases containing the netted fish were seized and opened, it is largely the ouananiche that are sought and taken by the netters. Then again the bulk of the settlers never profited by the nets, which belonged to less than a dozen individuals. Nor is there any intention of attempting to prevent the residents from taking what coarse fish they wish for their own use, though they must take them legally, as the visitors do, with rod and line; and there is scarcely any limit to the number of fish that may be so taken, especially with the aid of a troll.

### The Netters at Work.

The netters have too much at stake to sit down quietly at once and submit to Mr. Prevost's decision. A few days ago, the minister presided at a Colonization Congress, to which all those interested in the cause of the settlers in the newer districts of the Province were invited. The netters from Lake St. John were there, and so was their member of parliament. It was the cause of the poorer settlers in the country that was at stake, and not that of sportsmen. But Mr. Prevost, who is Minister of Colonization as well as of Fisheries, knows very well that the causes of the sportsmen and of the colonists, if well understood, are perfectly identical. He invited the undersigned to read a paper before the Congress to illustrate this fact and the invitation was accepted. Mr. Prevost stood to his guns, and by what was practically a unanimous vote, the congress of settlers and colonists and their friends, including a large sprinkling of their parish priests, approved the policy of the Minister in suppressing netting in the inland lakes of the Province.

### The Missisquoi Bay Affair.

Mr. Prevost's policy in this respect naturally includes the termination of the Canadian seining licenses in Missisquoi Bay. The results, in this particular case is a very great and very gratifying victory for our principal international association of sportsmen—the North American Fish and Game Protective Association. For years past this seining has been a burning question for the States of Vermont and New York, and those Canadian sportsmen who have stood loyally by them in this connection. Year after year the leading members of the North American Association worked with a determination that seemed as if it could not fail, to induce the Canadian authorities to render the common justice of refusing to license the netting of the pike-perch of Lake Champlain upon their spawning beds in the Canadian water of Missisquoi Bay. Deputation after deputation came from New York and Vermont to Ottawa and Quebec and Montreal to interview the various Canadian governmental authorities on the subject, and time after time it seemed as if victory was just about to perch upon their banners, when some new device of the netters and their attorneys and political wire-pullers succeeded in preventing the fruition of their good work. It was not very surprising that about a year ago discouragement was so general among the New York and Vermont members of the Association that some of them felt like giving up the fight and ceasing their interest in the international association and its work, fearing that it was unequal to the task which it had undertaken. The Canadian workers in the Association knew that it was up to them to leave nothing undone to evidence their good faith in the movement, and their ability to rightly influence their own government, and though undoubtedly very much discouraged in the matter, they bent themselves, at the last annual meeting in St. John, N. B., to a supreme effort to overcome the baneful political influences opposed to them in this matter. The unanswerably strong petition drawn up by them for presentation to the Minister of Fisheries at Ottawa, which was published at the time in *FOREST AND STREAM*, asking him to prohibit the issue of licenses by the Province of Quebec for netting in Missisquoi Bay, was willingly signed by the Prime Minister of New Brunswick, Hon. Mr. Tweedie, as President of the Association, although a very warm political supporter of the Minister at Ottawa, and when presented, a little later, to the latter, in Montreal, by a deputation of members of the Association, it was evident that Mr. Prefontaine was struck by the justice of the plea, but that political considerations were pulling extremely hard the other way. As Mr. Prefontaine did not act, it was up to Mr. Parent, the head of the department at Quebec to refuse the licenses if he chose to. He did not, how-

ver, and they issued as usual. Yet I may say for myself, and I believe, also, for the other Canadian members of the Association, that we never, amid all our disappointments in this matter, felt otherwise than that we must eventually succeed. It was still more discouraging to find that President Roosevelt's correspondence with the Governor-General of Canada through the British Minister at Washington and the Imperial government produced no effect. The hope that I expressed at the last annual banquet of the Massachusetts State Fish and Game Association, that steps would be taken to close the American market against the fish so netted in Missisquoi Bay, was indeed fulfilled, but still the netting was continued.

However, "all's well that ends well," and I am perfectly sure that none of those who have labored so long and so faithfully for the accomplishment of this object, regret the time and the trouble that they have given to the subject. Not only have they assisted in the righting of a grievous wrong, but they have been instrumental in removing what threatened to become a cause of international dissatisfaction and discord. Mr. Prevost's action in agreeing to issue no more of these licenses will doubtless be always remembered to his credit by American sportsmen and fishery officials, and it is perhaps unnecessary to add that the utility and the *raison d'être* of the North American Association have been established beyond any question of doubt. Its members will be interested in knowing that a copy of the report of its transactions at its last annual convention, containing a full record of its action in this Missisquoi Bay affair was placed in Mr. Prevost's hands as soon as issued, which was even before he assumed office as Minister of Fisheries for the Province of Quebec.

It would be ungenerous not to recall some of those to whose efforts in the past is largely due the happy result now achieved in the affair of Missisquoi Bay. In years gone by, no members of the North American Association labored more assiduously for the cause than ex-President John W. Titcomb, now of Washington and the late Mr. L. Z. Joncas, of Quebec. Premier Tweedie, of New Brunswick; Dr. Finnie, of Montreal; Messrs C. E. E. Ussher and L. O. Armstrong, of the Canadian Pacific Railway; Messrs. H. G. Elliott and H. R. Charlton, of the Grand Trunk Railway System; Mr. D. G. Smith, of New Brunswick; Governor Nelson O. Fisk, H. G. Thomas, F. L. Fish and General Butterfield, of Vermont, and J. Warren Pond, C. H. Wilson, and others, of New York State, have done yeoman's service in the matter.

### Annual Meeting.

I have just received a telegram from Mr. W. S. Hinman, president of the North American Fish and Game Protective Association, informing me that he has selected the 24th and 25th days of January next as the dates for the annual meeting of the Association, which is to be held in the city of Boston. This ought, for various reasons, to be the most successful meeting in the history of the Association.

### Fish and Game Congress.

The new Minister of Fisheries has various other reforms in view, besides the abolition of netting in inland waters, and has issued a number of invitations to Canadian and American sportsmen to meet him in consultation at the Windsor Hotel, Montreal on Dec. 13 and 14. A large gathering is expected, and all interested in the cause will be made welcome, without any further invitation. Suggestions in writing may also be sent to Hon. Mr. Prevost at Quebec, or to the undersigned, who will act as Secretary of the Congress.

E. T. D. CHAMBERS.

## Fish and Game Convention.

QUEBEC, Nov. 27.—*Editor Forest and Stream:* The inclosed letter of invitation, which has been sent out to a number of those interested in the hunting and fishing of the Province of Quebec, and in the preservation of our fish and game life, speaks for itself. In preparing the list of those to whom invitations have been addressed, it is quite possible that some of those who take an interest in fishing and hunting matters may have been overlooked. You are therefore at liberty to announce that the Minister will gladly welcome all such to the coming congress, whether they have received a formal invitation or not.

JEAN PREVOST,

Minister of Colonization, Mines and Fisheries.

MINISTER'S OFFICE, DEPARTMENT OF COLONIZATION, MINES AND FISHERIES, QUEBEC, Nov. 27.—*Dear Sir:* The more extensive knowledge of the value of our wild game and inland fisheries which has come to me during my brief charge—as Minister—of the Department of Colonization, Mines and Fisheries, has confirmed the impression which I had previously formed in regard to the necessity of our fur, fin and feather fauna. My earnest desire is to so improve existing conditions in this respect that sportsmen may always find here the success which is dependent upon an abundant supply of fish and game.

I am more than ever convinced, too, that there is room for quite a large increase in the revenue to be derived by the Province from those who come here to enjoy the sport afforded by the pursuit of the inhabitants of its woods and waters.

Before enacting the reforms which I believe to be desirable, I am anxious to meet and to confer with a number of those who are most interested and most experienced in the angling and the hunting of the Province of Quebec, and with this end in view have resolved to invite them to join me in a fish and game congress, to be held at the Windsor Hotel, Montreal, on the 13th and 14th of December next.

You are therefore cordially invited to attend this convention, and to send to me at my department in Quebec, not later than the 1st of December next, any suggestions that you may propose to offer thereat, in order that the propriety of their consideration may be carefully studied before the preparation of a programme of proceedings.

It is clearly understood, of course, that time will not permit of any important deviation from the programme

of business that will be placed before the congress.

If any of your acquaintances, interested in fish and game matters, wish to attend the convention, I shall be glad to have their names and addresses in order that they may be notified how to take advantage of the specially reduced rates that the railway companies are offering for this occasion.

Awaiting the pleasure of your reply, I have the honor to subscribe myself,

Yours very truly,

JEAN PREVOST,

Minister of Colonization, Mines and Fisheries of the Province of Quebec.

Mr. Charles Stewart Davison, of this city, who is familiar with the salmon situation, has sent to the Minister the following communication:

NEW YORK, Nov. 29.—Hon. Minister of Colonization, Mines and Fisheries of the Province of Quebec: Sir—I acknowledge the receipt of your invitation to attend the Congress of Fish and Game at Montreal on Dec. 13 and 14, and will endeavor to be present.

Answering your request for suggestions to be made to the Congress and appreciating the necessity for brevity and clearness and of the elimination of immaterial matters, I urge upon your attention the primary importance of an increase by one-half inch in length when pulled out of the mesh of salmon nets; with the result of allowing the passage of females large enough to spawn. All females should be allowed a free entrance to the rivers on their first return as salmon from the sea. A female that has reached the spawning age is too large to get through the nets of the present size of mesh. An extra half inch would allow the passage of many females who have that year reached sexual maturity. Not to allow the females to spawn once freely is the most serious detriment to the increase of the salmon. To allow it on the other hand will result in the steady increase of the fish taken in the nets, both in number and in average size. Those who oppose are the selfish ones, who for a pres-

ent small gain exhaust the available supply of a natural commodity; who willfully strip a locality of its natural resources and then bemoaning their hard lot seek government aid. You will find the short-sighted "netters" demanding an even smaller mesh on the ground that the supply is diminished and they must have a smaller mesh or else make less from their nets; when it is their own rapacity which has produced the conditions of which they complain,

Respectfully,

CHARLES STEWART DAVISON.

### The Experiences of a Psychological Professor at a Maine Coast Resort.

Written by T. H. Tibbles for the Springfield Republican.

PROF. HATFIELD taught psychology in the university. He had had a long year of it, and the last week before leaving the city had been very hot and depressing. He was determined to get as nearly as possible away from all mankind and recuperate. He found a fishing village on the coast of Maine, and secured board in the family of a well-to-do fisherman. The next day after his arrival he started out to take a walk. He climbed the hill through the spruce trees for a time, but finding the foliage so dense that he could see nothing two rods distant, he turned his steps toward the sea. There was a long point of land covered with grass. Behind were the spruce trees and the shore—a mass of jagged rocks.

He stood for a long time looking out on the water, and then turned around, intending to go back to his lodging place. At his right and half way to the spruce trees there was a little girl picking strawberries. The professor had just stepped off the rocks on the soft green turf when he saw a herd of cows coming out of the woods. At the head of the herd was a black bull. The professor hastened back upon the jagged rocks. The bull came on, holding his head high, followed closely by the cows. The professor got further out on the rocks

and the bull stopped and gazed at him with flaming eyes. Once in a while the bull would advance a little, still keeping his "flaming eyes" fixed on the professor. Half an hour passed and the bull still stood there gazing at him, while the cows were grazing around to the rear. The situation was getting painful. Dusk was approaching and the professor looked in vain for a way of escape. All of his attention was placed upon that bull, and he did not see the little girl who had been picking strawberries approaching, until she was at the side of the bull. He thought of risking all and rushing to the deliverance of the child, when the little girl put her arm over the bull's neck and pushed him around. Then she picked up a little stick and drove the bull before her toward a house at the other end of the little pasture. When she saw the professor come off the rocks and start toward home, she stopped driving the cattle and began picking strawberries again, and one of the great tragedies of vacation time ended.

### Food for Squirrels.

A CORRESPONDENT of the New York Evening Post writes of the Central Park squirrels: An examination of several of them recently has convinced me that an appeal is necessary to those who feed them, to choose rather hickory, pecan and hazelnuts than the chestnuts and peanuts upon which they are usually fed. The teeth of the squirrel grow very rapidly and they need hard nuts upon which to exercise their gifts. In some cases the teeth have grown so that the little fellows are likely to actually die of starvation, unless they are promptly helped.

Moreover, the fur of many of them shows that they are not getting sufficient salt—a little meat, a chicken bone, or a little salt with the nuts will save many of them from the loss of fur, which is all too apparent in a good many cases, and will furthermore protect the birds' eggs, to which otherwise, in their hunger for salt, they will instinctively turn.

# YACHTING

## The Tale of the Tub.

BY THE DECKHAND.

Captain, son of the Old Man; Cook, the Captain's aunt; Mate, the Captain's mother; Deckhand, the Old Man. Guests, etc., etc.

She is 48 x 11 x 7 x 1, which, being interpreted, means length, 48ft.; breadth, 11ft.; height, 7ft., and draft 1ft.; and we call her the Tub, for she is much the same shape as a bath tub, with about the same means of propulsion—goes where she is towed and stays put. The house is 40ft. long, and gives as much cabin space as a schooner yacht roof. over all. She is not a beauty, but very safe, and we had lots of fun. The picture shows the tub moored in a sheltered cove and everything lovely; the Cook was then lying off in an easy chair on the upper deck; the First Mate was just going marketing (you can see her head above deck on the far side); the Deckhand was lying around loose, and the Captain was off in the small boat taking the picture. We started in August from Canajoharie, on the Erie Canal, some sixty miles west of Albany. Our crew then was the Captain and his chum Sam, the boat builder from whom we bought the Tub, who volunteered to see us fairly started, and yours obediently. The interior fittings of the boat were barely finished, and there was much to be done; but that was part of the pastime and fun of the trip. We hired Abe and his horse and open express wagon to tow us to Albany. The reader may think the wagon was a useless addition to the outfit; but it proved to be an excellent device to relieve the horse of the direct pull of the tow line, and being of good height, served also to keep the rope off the tow path most of the time.

Our first day's trip was delightful, but uneventful. We halted for the night in the roomy barge basin at the canal bridge at Amsterdam, and there the boat builder left us, and the Mate and Cook joined us, both in petticoats and fresh from Gotham. The next morning we bought an ice box, a blue flame oil stove, such kitchen utensils, etc., as we had failed to bring from home, and a plentiful supply of grub and started at midday on the second day of our cruise, which was showery, but otherwise enjoyable, for we could always hunt cover from the wet, and the women soon made themselves felt, putting things to rights and tittivating the interior generally with window curtains, Chinese fans and all the fakements women so well handle; and then a kitchen is hardly a kitchen till you get a woman into it. We moored for the night in the outskirts of Schenectady, foolishly rejecting the advice of a friendly fisherman, who urged us to go a mile or two further, where we would find an excellent inn right alongside the canal, where we could get ice and other supplies, and meals if we wanted any. A fisherman myself, I ought to have trusted that man. We found the haven the next day, and had a good breakfast there. It is two or three miles east of Schenectady and just at the bend where the canal turns sharp to the left to cross on a bridge or aqueduct to the north side of the Mohawk River. All that forenoon was delightful. The river on our right and below our level, brawling along over its shallow bed, with here and there a fishy looking pool and an occasional island. Now and then parties of children, playing on the far shore, returned our hail, and above and beyond rose the steep wooded banks from which cottage or camp peeped out. On our left the rocky bluff was cut away to make our artificial waterway, and showing plainly the strangest and most interesting geologic formations.

Occasionally, when passing through a lock, one of us would jump ashore and keep Abe and his horse company, for our driver was a veteran of the Rebellion and a fisherman; so we never lacked yarns when in his company. Late that Saturday evening we reached Albany and moored in the canal well in the outskirts to have a quiet Sunday.

Monday morning early Sam and the narrator hitched on to the tow line, mule-fashion, and towed that boat right into the town, and there we tied up in the canal basin to fit out. We bought anchors, boat-hooks, ropes and such hardware and lumber as we saw we would need. We already had a full kit of tools on board, and mosquito screens or netting for the ten windows and two doors to protect us again flies by day rather than the pestilence which flyeth by night. Work on the boat and outdoor life gave us splendid twists. Don't know what a twist is? Never read the inscription over the entrance to the old Bull and Mouth Hotel in London?

"Milo of Cretonia an ox slew with his fist,  
Then ate him up at one meal—  
Ye Gods, what a glorious twist."

Tuesday morning we started early in tow of the good boat Pioneer, a small steam canal boat, just suited to our purpose and destination, Catskill; but it was a mean trip—a stiff wind and a cold, driving rain right in our teeth and the tide against us. Our towing boat and our boat had light draft, high freeboard—bad for such weather—and we were all glad enough to drop anchor in the quiet waters of Catskill Creek. There we lay for a week, fitting out and enjoying ourselves generally, working a little and loafing a little, and then repeat; shut up house one day and took the steam cars to the mountains, which all enjoyed immensely. At a boat house we found an old catboat mast about 20ft. long, which we bought and stepped forward quite skillfully, as shown in the picture, and in such a manner that it can be unstepped and stowed flat in a few minutes; but we had no sail, and had still to trust to towing. Our living was of the simplest kind, vegetables and fruit being the chief items. Ice we often got free from the refuse of the ice houses, and close by was a splendid orchard; but the owner was away and we therefore could not pay him for his fruit, and so—well we got the apples, but we only took the windfalls.

At Catskill we lost the Captain and Sam, both being compelled to return to New York for business.

Telephoning to Albany, to the office of the towboat line, they promised that the next tow going down should pick us up. We dropped down to the mouth of the creek and lay there all night, hourly expecting the tow; but it did not come till daylight, and then the helper, or smaller tug of the tow, picked us up and hitched us alongside the big tow, and we had a great day's experience. We hobnobbed with the bargees (Thames parlance for barge men) and replenished our larder from a bumboat, which, seemingly coming from nowhere, attached itself to the fleet, beginning with the three towboats at the head and gradually dropping back, boat by boat (they were four abreast), till she had actually compassed about the sixty barges or more which formed the tow. She was a squatty little propeller, loaded to the gunwales with supplies, peddling for cash such delicacies as milk and newspapers, tomatoes and ice cream, potatoes and cabbages, pies and cookies, eggs, etc., etc. The pilot of the bumboat declared that everything came fresh from Larry's farm on Hudson's banks thereabouts, and that he was Larry. I think he spoke the truth—he looked it, and was a bright, enterprising fellow. I forget the name of his boat, but it ought to be *Multum in Parvo*,

And so we were towed all the lazy summer day, seeing the Hudson as one ought to see it, the ladies knitting or reading or feeding the animals, and all hands delighting in the beautiful wooded shores and noting for future use the pretty coves and sheltered nooks in which we hope to drop our mudhook in times to come when we make another trip and the Tub is equipped to propel herself from place to place.

And so past Saugerties and Tivoli, Kingston and Rhinecliff, Hyde Park and Poughkeepsie, till, after towing for fourteen hours we reached New Hamburg in the dark and a typical Hudson River squall with driving rain. The tug dropped us at the dock, and we made fast for the night. In the morning we pulled the boat around into the cove, which, being open only to the south, is well sheltered from storm or passing steamers; and there we lay as happy as clams for a fortnight. Here we rigged up our awning, mended and amended and painted the tender, and fitted up the Tub generally, lumber, hardware and a good blacksmith being all handy. Having friends in New Hamburg was the reason of our long stay there, and the "boys and the gurls" made the visit very entertaining to us. Sometimes when the Deckhand, the only male member left on board, was called to town (you know, N. Y. city has got a way of calling people), one or other of the boys slept on board, the ladies needed the protection, or thought they did; the lads thought it as good as Robinson Crusoe. Side trips to Wappinger's Falls brought back the women folks loaded with goodies and ferns from the woods. These they deftly planted in strawberry baskets filled with leaf and mold and smothered with moss, and the same thrived exceedingly for the balance of the trip.

The Captain visited us here, bringing his friend Harry, alias Legs. At their advent our girl friends of the village suddenly evinced a liking to take tea under our awning or in the cabin, or escorted the boys to the ball game on Saturday afternoon, where we all rooted vigorously for the village team, which walloped the boys from a neighboring town properly.

But September was at hand and our trip must end soon. An all-night tow took us to Peekskill, where we arrived at sunup, and the helper tug from the tow could not put us within a mile of where we wanted to go because of the shallow water in the big elbow, and so the Deckhand had to take the oars in the small boat and tow the houseboat a mile to the railroad drawbridge, which was duly opened for us, and we were safely moored in Peekskill Creek, a delightful spot for a week's loafing. The women paddled around in the small boat to their hearts' content, gathered arms full of wild flowers and decked our dining table with all. The marshmallows were just in perfection, while branches of bittersweet, with its cheery yellow-red berry, kept company with the Jap fans on the walls.

A week later, having brought a square sail from New York and duly mounted the same on yards, we hoisted it on our stumpy mast and set sail on our own hook and saved our towage. We had only five miles to go to Tompkin's Cove, and we just made it, tying up inside the breakwater and intending to winter at the shipyard there. The walk over the hills back of the Cove is a delight, the views up and down the river are perfect pictures, and the village itself a pleasure because of its picturesqueness and cleanliness. It is one of the dozens of obscure and little known places on the river which need hunting for and are not appreciated till found. But then the Hudson must be seen in detail before you know and feel its real beauties.

In a few days we packed up our duds in sundry boxes

The Tub in the Cove at New Hamburg.

A stretch of the Erie Canal. Narrow portion ahead, aqueduct over a large creek. To the left Abe and his wagon, towing The Tub.

and bundles and came to town; but I changed plans for wintering the Tub. Going up to Tompkin's Cove the last of September, I hired a lad to help me, and after whistling for the wind for a day, we set out to drift or sail or get to New York somehow, but the wind fell off, and after hard towing by the rowboat, we anchored at nightfall in a cove at Haverstraw. Next morning the wind was dead ahead, and we could not move, and after drumming our heels till we chafed at the delay, we rowed off to a goodly schooner, which had just come over Haverstraw Bay and anchored in the offing, and she proved to be the E. H. Taylor, of Chincoteague, Va.

"Ship ahoy!" says I.

"Hello," says he.

"Aren't you a long way from home?" says I.

"Right you are," says he.

"Where bound for?"

"Down the river empty; brought timber to Croton and hoped to get a return load of brick from Haverstraw, but failing, must go to New York empty and get a cargo of coal there."

"Will you tow my houseboat?"

"With pleasure," says he.

"Amen," says I.

So the boy and I towed the Tub out and hitched her on behind the schooner, while the skipper and his crew of two darkies went ashore for grub, leaving the vessel in charge of the captain's boy and girl. Soon we set out. And what a trip! It was the best item of the entire voyage. The light wind soon fell to a dead calm, while the schooners over on the east shore were moving seemingly with a fair wind, but with never a breath stirring in our neighborhood the strong tide threatened to drive us square on to Rockland lighthouse, which is perched on a rock a quarter-mile out in the river; but in the nick of time a light wind came out of the east and the schooner started on a long straight reach, which ended only at Yonkers at sundown; and how the Tub did travel! The wind steadily and quickly freshened till it blew half a gale. The Taylor had doffed her topsails and fairly flew through the whitecaps which now raced and leaped high over the broad bay. I had two towlines out, one on each quarter, but they stretched and shrank so under the strain that I had to shout for another line. A darky passed out a rope to us as thick as a man's arm, and with this securely fastened, we felt safe. The old Tub surely never moved so fast before, and could not have stood the racket but that we were traveling in the smooth wake of the schooner about sixty feet astern. Occasionally a stray sea would give her a lick in the chops, smothering the forward deck with spray; but the boy and I were covered in oil skins and fairly crowded with delight at the exhilaration of the trip.

Next day things went all wrong—wind dead ahead, tide against us, and a great tow in the way, made Spuyten Duyvil hard to reach; but reach it we did, then good-by to our kind Virginia friends, and we floated in smooth water in the creek which the Dutch trumpeter essayed to swim in spite of the Devil, and there the Tub lies in winter quarters, being the end of her cruise and of my tale.

If readers are interested in the interior fittings of the Tub, I may say that the cabin or house is built down into the hull, which is much better, according to my notion, than to build it on deck; a sliding hatch on each end and steps give access from the deck to the interior. The galley is aft, rather small, with shelves arrayed all about the wall, a table consisting of a long wide shelf hinged to a bulkhead, so it can be dropped and everything within reach. Rain water was drained off the roof into an old cylindrical kitchen boiler, which we stowed, upright, in the corner. Next comes a stateroom containing two cots, with a gangway to one side. The balance of the cabin—that is, about two-thirds—forms the living and dining room, with three windows on each side and divided off at night by curtains when privacy is desired. We had three cots in this large room, but it would easily accommodate six, and the cots can readily be laid aside at daytime if they are in the way.

FORTY-FOOTER BABOON SOLD—Mr. Hollis Burgess has sold the famous 40-footer Baboon, owned by Mr. Augustus P. Loring, of Boston, to Mr. Willard Welsh, also of Boston. Baboon is an auxiliary schooner designed by Mr. Edward Burgess and built by Lawley.

## One Sunday.

TEN years ago I was "in the half-deck" of a four-masted bark. We were lying in Cardiff, loading patent fuel for the West coast. There were six of us "in the half-deck." Saving the cook, the steward, the mate, and the old man, we were the only folk aboard. In the daytime on weekdays we bent sails, or hoisted stores aboard, or shifted topsail sheets. In the evenings we went ashore to flaunt our brass buttons in St. Mary street and to eat sweetstuff in the bunshops. Two of us used to drink "rum hot" in a little public house near the docks. One of us made love to a waitress. We all smoked pipes and cocked our caps at an angle. One of us came aboard drunk one night, in a pretty pickle, having fallen into the dock. Another of our number got kicked out of a music hall. Youth has strange ways and strange pleasures.

On Sundays we did no work after we had hoisted the house flag and the red ensign. We were free to go ashore for the day, leaving one of our number aboard to act as boatman. The "old man" always told us to go to church. Sometimes he asked us for the parson's text, when we came aboard again. One of the six, who had been carefully brought up, used to answer for the rest. I think he made up the texts on the spur of the moment. He is dead now, poor fellow. He was a good shipmate.

One Sunday I went ashore with the rest to spend the day in the park playing cricket with a stick and a tennis ball. In the afternoon we went to a little teashop not far from sailor town, a place we patronized. It was up a flight of stairs. It was a long room, with oilcloth on the floor and marble-top tables and wicker chairs and a piano. There was a framed text on the piano top. It was all scrawled over on the unprinted part with messages to Kitty, a tall Welshwoman with but one eye, who acted as waitress. The wall was all scrawled over, too, with pencilled texts, proverbs, maxims, scraps of verses.

On this particular Sunday, when I entered, there were half a dozen other apprentices already seated at their teas. They were all West Coast apprentices—that is, they had been one or two voyages to Chili and Peru in West Coast barks engaged in the carriage of nitrates. They were not a very choice lot, as apprentices go, but they knew the West Coast, which we did not, and one of them, a lad named Parsons, was popular among us. He had a singularly sweet tenor voice. He is dead now, too. His ship was burned off Antofagasta. The boat he was in never came to port.

After we had finished our teas, we sat about in the teashop smoking. One of the third voyagers—he belonged to a little bark called the Cowley—was chaffing Kitty, and, asking her to marry him. The others were yawning, and holding a Dover court. One of them was reciting the story of William and Mabel. Another was singing a song popular at sea. Its chorus ends, "Love is a charming young boy." It is a very pretty song, with a jolly tune. Another was singing "The Sailor's Wives," a very terrible ballad, with a tune which is like a gale of wind. It was regular Reefer's Delight, Dover Court and Seaman's Fancy. That is, there were "all talkers and no hearers," "all singers and no listeners," "all friends and no favor."

Presently, a wild-looking lad, whom his mates called Jimmy, got up from his chair and went to the piano. He began to play a dance tune to which I had often danced in the days long before. He played it with a deal of spirit, partly because he was a good player, partly because the tune moved him, for the same reason that it moved myself. Coming, as it did (on the top of all that silly chatter), with its memories of dead nights, and lit rooms, and pretty women, it fairly ripped the heart out of me. You could see them stirred by it, though one or two of them laughed, and swore at the player for a dancing master. After he had finished his tune, Jimmy came over to me. I thanked him for his music, and complimented him upon his playing.

"Ah," he said, "you're a first-voyager?"

"Yes," I said.

"Then you're like a young bear," he said, "with all your sorrows to come."

I replied with the sea proverb about going to sea for pleasure.

"Where are you bound?" he asked.

"Junin, for orders," I answered.

"I was in Junin my first voyage," he said. "My hat! I was in Junin. I was very near being there still."

"Were you sick?" I asked.

"I was," he said shortly. "I was that. Ah," he went on bitterly, "you're going to sea your first voyage. You don't know what it is. I tell you, I was sick in Junin. I lay in my bunk, with the curtain drawn, and the surf roaring all the time. It never let up, that surf. All the time I was ill it was going on. One long, long roar. I used to lie and pinch myself. I could have screamed out to hear that surf always going. And then there was a patch of sunlight on the deck. It almost drove me mad. She rolled, of course, for she was pretty near light. And that patch kept sliding back and to, back and to, back and to. I would see nothing but that patch all day. It was always yellow, and sliding, and full of dust. You don't know what it is to be sick at sea."

"Shall I tell you what it was made me well? I was lying there in my bunk, and there was a crack ship, one of Farley Brothers'—Ramadan, her name was. She was homeward bound. She was next but one to us in the tier. You don't know about the West Coast? No? Well, when a ship's homeward bound the crowd cheer—cheer every ship in the port; three cheers for the Hardy-Nute, three cheers for the Cornwallis, and the ship cheered answers back one cheer. And when a ship sails all the ships in port cheer her—three cheers for the Ramadan—and she answers back one cheer. One ship at a time, of course. And every ship in port sends a boat aboard her with a couple of hands to help her get her anchor. Well, the Ramadan was sailing, and I was lying in my bunk as sick as a cat. And there they were cheering 'Three cheers for the Ramadan.' And then the one cheer back, 'Hip, hip, huray, hooray.' I tell you it did me good."

"And there I was listening to them, and I thought of how prime they must be feeling to be going home, out of that God-forgotten sandhill. And I thought of how good the cheers must have felt coming across the water. And I thought of them being sleepy in the night watch, the first night out, after having 'all-night-in' so long. And then I thought of how they would be loosing sail soon. You don't know what it was to me."

"And then I heard them at the capstan, heaving in. You know how it is at the capstan? The bass voices seem to get all on one bar, and the tenor voices all on another, and the other voices each to a bar. You hear them one by one as they heave round. Did you never notice it? They were singing 'Amsterdam.' It's the only chanty worth a twopenny. It broke me up not to be heaving round, too."

"And when they come to get under sail, setting the foretopsail and I heard them beginning 'There's a dandy clipper coming down the river,' I lit out a scritch, and I out of my bunk to bear a hand on the rope. I was as weak as water, and I lay where I fell. I was near hand being a goner. The first words I said was 'Blow, bullies, blow.' It was that chanty cured me. I got well after that."

He turned again to the piano and thumped out a thundering sea chorus. The assembled reefers paid their shot and sallied out singing into the windy streets, where the lamps were being lit. As we went we shouted the song of the sea:

A-roving,

A-roving,

Since roving's has been my ru-i-n,

I'll go no more a-ro-ving,

With you, fair maid.

—Manchester Guardian.

## Seafaring Blood.

THE nautical authority of the New York Times recently presented the proposition that in order to develop into a good sailor a man must necessarily have inherited some seafaring blood. This proposition was resented in these columns, and there were had in mind such men as Admiral Dewey, the latest, and Admiral Farragut, the first admiral of the United States Navy. We take it all back now, however, and beg the Times' pardon. An authoritative volume has appeared in regard to the life of Admiral Farragut, and it says that although "he was born in a log cabin on the American frontier, during a period when the frontiersmen depended upon game for their meat," nevertheless "Major George Farragut, the Admiral's father, had a license to operate a ferry at this point"—near Knoxville, Tenn. What a blessed inspiration, that ferry!—Shipping Illustrated.

## Houseboats and Houseboating.

SEATTLE, Wash., Nov. 28.—*Editor Forest and Stream:* For many years I have been devoted to houseboating and have read with great interest the few articles that have appeared in two or three journals on the subject. Residing, as I do, in a part of the country where this delightful means of outdoor life has hardly gained a foothold, Mr. Albert B. Hunt's book on "Houseboats and Houseboating" was a revelation to me, for I little realized to what extent houseboat life was enjoyed in this country.

The book is really superb, and no work that has come into my home circle in many years has afforded us so much real enjoyment. As my means are limited, I have only been able to build houseboats of moderate size, but I find so many suggestions in the houseboat book that I will be able to get far more comfort and pleasure out of my future productions on the same expenditure of money than I did with my old ones.

In my early days I was an enthusiastic yachtsman, but when I found that my wife was not a good sailor and did not care for the excitement of boat sailing, I decided upon the houseboat as the one solution for our problem. By this means we are able to live in our little floating cottage with nearly all the comforts to be had in a residence ashore, and we get all the benefits to be derived from life afloat.

In addition to a launch, which serves as a ferry to bring our guests and ourselves to and from the shore, I have a broad sailing tender which enables me to go for a sail when I am so disposed. Our launch is powerful enough to tow the houseboat from place to place when the water is smooth.

My children are splendid swimmers and they can row and sail a boat as well as I can, so I have no misgivings when I leave them during the day or when I am called away on a business trip.

Our houseboat is a square-ended scow, 42ft. long, and we are all anxious to take up our abode on board of her when the first days of summer come, and we stay till well into the fall.

The book, "Houseboats and Houseboating," will be found not only most satisfying to the old houseboater, but it will enlist thousands of recruits into the sport.

### New Books.

**ON MODERN SCREW PROPELLERS.**—It is seldom one sees so much information combined in a small book as is found in A. E. Potter's new work "On Modern Screw Propellers." Our readers are all familiar with Mr. Potter's writings on the marine gasoline engine, which have appeared in these columns in the past. When the Power Boat News was started Mr. Potter accepted the editorship, and he still holds that position. "Modern Screw Propellers" is the result of Mr. Potter's own wide personal experience in this line, and this, together with much research on the subject, has enabled him to put out a book which is authoritative. This book contains 140 pages and over 100 line diagrams, and is uniform in size and binding with the other "Rudder On Series." Mr. Potter has treated the subject in a broad and comprehensive manner, and the book contains chapters on the measuring of propellers, review of patents since 1890, and excessive slip—its cause and remedy. The price of the book is \$1.00. Rudder Publishing Company, 9 Murray street, New York.

**THE LOG OF THE YACHT DAISY.**—In the winter of 1904 there was built at W. P. Kirk's yard, Tom's River, N. J., the yawl-rigged auxiliary Daisy. The boat was designed by Mr. Henry J. Gielow for Mr. Robert Galloway, of Memphis, Tenn. She is 80ft. over all, 60ft. waterline, 18ft. breadth and 3ft. draft, and is fitted with a 40 horsepower Craig engine. Daisy is unique as a sailing craft, and the owner's quarters are forward, this arrangement being found more desirable in a hot climate, the yacht having been designed for use in Southern waters. The owner, together with a crew of three men and several guests, cruised on Daisy from Tom's River to New Orleans via New England, Bay of Fundy, Northumberland strait, Gulf of St. Lawrence, St. Lawrence River, Lake Ontario, Lake Erie, Lake Huron, Lake Michigan, Green

Bay, Fox River, Lake Winnebago, Wisconsin River and Mississippi River. The distance covered was over 5,500 miles, and all told 161 days were consumed less 50 days spent at Memphis, leaving 111 days for actual cruising. The engine consumed 3,195 gallons of gasoline. A brief account of the trip appears in a little book called the "Log of the Yacht Daisy," which has been published by the boat's owner. The book contains about 50 pages, and in addition to the letter press matter there are several half-tones of Daisy, together with a plan of the cabin arrangement. The log is altogether too brief, and had the owner rounded the log out a most valuable and interesting book would have resulted. However, the log contains many incidents including an account of the bad weather encountered off the Nova Scotia coast and the passage through the Fox and Wisconsin rivers, locations which had been considered unnavigable for years past. It was found necessary in some places to build a coffer dam in order to float her. In another instance, a railroad draw bridge, built over a creek, could only be opened after having the running parts soaked in kerosene for hours, the attendant saying it had not been used for over six years.

**CHICAGO Y. C. ANNUAL MEETING.**—The annual meeting of the Chicago Y. C. was held at the Victoria Hotel on Nov. 28. The following officers were elected: Com., W. L. Baum; Vice-Com., W. F. Cameron; Rear-Com., G. S. Steere; Sec., Robert G. Gould; Treas., L. C. Woodworth; Judge Advocate, George B. Shattuck; Fleet Surg., George W. Webster; Trustees, Charles E. Fox and Charles E. Kremer. James B. Keogh was elected trustee to succeed C. H. Thorne, resigned. The treasurer's report showed the club to be in an excellent condition financially, there being a floating indebtedness of only \$367.19 and a bonded indebtedness of \$12,375.

**STEAM YACHT FOR E. L. FORD.**—The 140ft. steam yacht building at the yards of the Gas Engine & Power Co. and Chas. L. Seabury & Co., Cons., Morris Heights, is for Mr. E. L. Ford, of Detroit, Mich. The boat was fully described in our issue of Nov. 4, 1905.

JUST PUBLISHED.

# HOUSEBOATS AND HOUSEBOATING

BY ALBERT BRADLEE HUNT,

Yachting Editor of Forest and Stream.

A volume devoted to a new outdoor field, which has for its purpose three objects:

**First**—To make known the opportunities American waters afford for enjoyment of houseboating life.

**Second**—To properly present the development which houseboating has attained in this country.

**Third**—To set forth the advantages and pleasures of houseboating in so truthful a manner that others may become interested in the pastime.

Illustration from "Houseboats and Houseboating."

The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and halftone reproductions of plans and exteriors and interiors. A most interesting chapter is devoted to houseboating in England, where the sport is one of the most delightful features of outdoor life.

The book has been carefully prepared by Mr. ALBERT BRADLEE HUNT, a well known authority on the subject.

The work is printed on extra heavy coated paper, and is bound in olive green buckram. The price is \$3.00 net.

(Postage 34 cents.)

The book will make a unique and most attractive holiday gift.

FOREST AND STREAM PUBLISHING CO.,

346 Broadway, New York.

**A 56-Foot Cruising Schooner.**

DURING the winter of 1902-3 there was built, from designs by Messrs. Tams, Lemoine & Crane, at the yards of the George Lawley & Son Corp., South Boston, Mass., a 35ft. waterline cruising sloop. This boat was known as Cossack and her owner was Mr. Henry A. Morss, of Boston. Mr. Morss makes his headquarters at Marblehead, and for three years he has used her constantly. Cossack was not only a very handsome vessel, but she was a fine, comfortable cruiser as well, and she afforded her owner so much comfort and satisfaction that he has had the same designers turn out a new and larger boat for him.

Mr. Morss' new vessel is over 20ft. longer than Cossack and she is to be rigged as a schooner. Mr. Morss knew pretty well what to expect in the way of a schooner from his designers, as the schooner Cygnet, a boat of 46ft. waterline, has laid not far from Cossack in Marblehead Harbor for several years past, and he has had an opportunity to study this vessel carefully.

The schooner designed by Messrs. Tams, Lemoine & Crane for Mr. Morss is, to our minds, one of the finest vessels ever turned out by this firm. That our views regarding this boat coincide with those of a number of practical yachtsmen is shown by the fact that several letters have been received by us from well known men suggesting that we use the plans in FOREST AND STREAM. These gentlemen had seen the boat at Lawley's, where she is being built, and were so impressed with her that they wanted an opportunity of examining her plans at their leisure. We mention this, as it is rather an unusual thing to have so much interest displayed in a boat that has only recently been started, and it shows that Messrs. Tams, Lemoine & Crane have hit the popular fancy in the new Morss schooner.

The boat has a sharp floor, a flaring side and moderately long and well modeled overhangs. With a black side, gold stripe, white boot top over a green bottom and a teak rail she will be one of the handsomest vessels in the country.

The deck is flush and her breadth of 18ft. gives fine room on which to handle sails and move about on. The deck is of white pine and the waterways, rail, cockpit, trim companionways are of teak. The cockpit is 8ft. long and the cockpit coaming is planted on the deck, which is carried in to form the seats. The well is 4ft. 8in. long and 15in. deep. Two fixed rectangular plate glass lights in each side of the cockpit staving allows light to get into the lazarette at all times, a capital arrangement which will help keep this place, that usually is hardly more than a stuffy hole, sweet and light. The wheel and binnacle are located at the forward end of the cockpit. Connecting with the cockpit is a flat topped house 9ft. long. Forward of this house, with about 3ft. of deck space separating them, is the companionway.

The companionway leads to a 12ft. passage from which all the owner's quarters can be reached. At the after end of the passage is a door leading to the ladies' cabin or after stateroom. Aft of this cabin is a toilet room 2ft. 5in. wide by 5ft. 3in. long, and both are under the flat-topped house. There is nearly 7ft. of head room in the after cabin and 6ft. head room in the connecting toilet, which is fitted with a set marble basin and a patent closet. The after cabin is 6ft. 3in. long and extends the full width of the boat. On either side are berths 2ft. 6in. wide with transoms in front. On the starboard side of the forward bulkhead is a bureau 33in. long and 15in. wide. On the port side double doors give access to a roomy hanging closet.

On the port side of the passage leading forward to the main cabin is a single stateroom 7ft. 8in. long which is fitted with a berth 2ft. 6in. wide, a bureau, transom, folding basin and hanging closet. In the side over the berth is a large port hole. Forward of this stateroom is the chart room, 4ft. long. Here there is a chart table with shallow drawers underneath so that the charts can be kept flat, and in front is a seat with a locker below.

On the starboard side of the passage is a toilet room and owner's cabin. The toilet is aft of the companionway and is 3ft. wide. It is equipped with a folding basin and closet back of which is the linen locker. The owner's room is 8ft. 9in. long. The companionway is extended sufficiently far forward to give light and air into this

CRUISING SCHOONER, 56 FEET WATER LINE—SAIL PLAN.  
Designed by Tams, Lemoine & Crane for Henry A. Morss. 1905.

cabin. At the after end of the owner's room is a wardrobe 2ft. 3in. long and a seat. The berth, like all those in the staterooms, is 2ft. 6in. wide. There is also a bureau 16 by 42in. and a folding wash basin. In the side there is a port hole.

Next forward is the main cabin 9ft. 7in. long and running the full width of the boat. On both sides are wide lounges, the one to starboard returning around the after bulkhead forming a good corner in which to place the swinging table. Back of these transoms are lockers and shelves. On either side of the cabin at the forward end are sideboards 2ft. 6in. long, and in the center of the forward partition is a fireplace. A large square skylight overhead makes this cabin very light and attractive.

A door from the main cabin opens into the galley, which is 8ft. 8in. long. Great care has been used in laying out this most important feature of the boat's accommodations with the result that it is well arranged and conveniently laid out. On the starboard side of the galley is the captain's cabin and a large ice-box. The captain's room is 6ft. 3in. long and it is lighted and ventilated by a round port hole in the side.

The forecabin is 13ft. 8in. long and there are comfortable accommodations for six men. The comfort of the men has been considered and they have a water closet, folding wash basin and ample locker and hanging space for their clothes.

Two boats will be carried on davits. The boat will measure to the top of the 55ft. class and her sail area, under the new rule, is 4,800 square feet.

The dimensions are as follows:

Length—	Over all	95ft. 3in.
	L.W.L.	56ft.
Overhang—	Forward	13ft. 10in.
	Aft	15ft. 5in.
Breadth—	Extreme	18ft.
	L. W. L.	16ft.
	At stern	7ft. 10in.
Draft—	Extreme	10ft. 6in.
Freeboard, top of rail—	Forward	6ft. 10in.
	Least	4ft. 6in.
	Aft	4ft. 11in.

**Chicago Y. C. Institutes Medal of Honor.**

At the annual meeting of the Chicago Y. C., held Nov. 28, the following resolutions were unanimously adopted: "Whereas, in the pursuit of the sport of yachting occasions arise where lives can be saved from drowning by the courageous acts of yachtsmen and others, and in order that such acts can be duly recognized and suitably rewarded, therefore, be it

Resolved, That the Chicago Y. C. does hereby institute and establish for all time, a medal of honor, which shall consist of a suitably designed bronze medal, pendant to a strip of club ribbon and bronze clasp, which shall be awarded to any person who shall in a courageous manner save from drowning any one engaged in the sport of yachting on the Great Lakes, and which action shall be duly authenticated and brought to the attention of the Chicago Y. C. and voted on by the members of the club at any regular meeting; be it further

Resolved, That the Board of Directors be and they are hereby instructed to cause such medals to be designed and made."

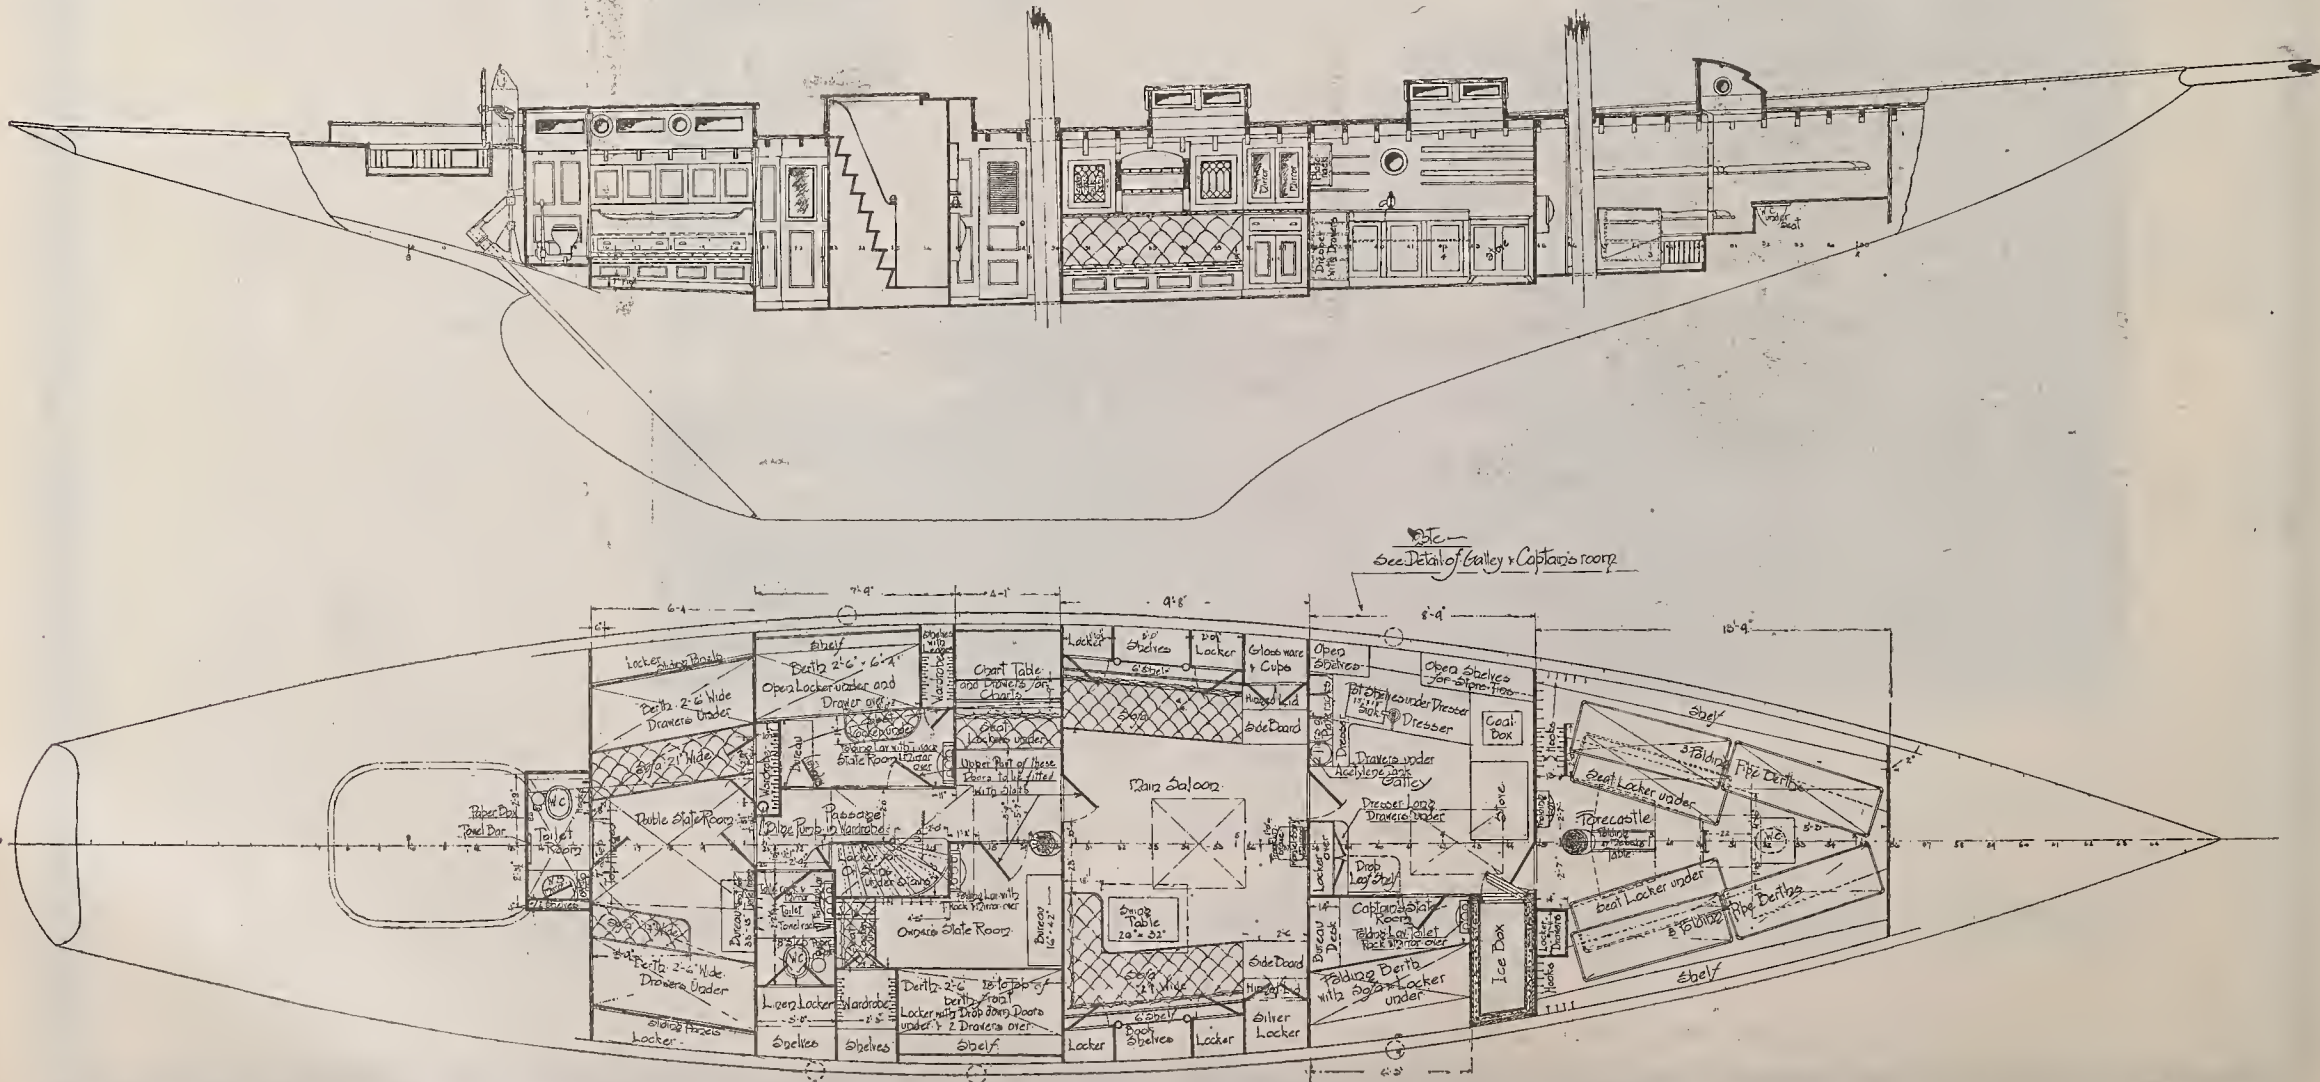

The first of these medals was awarded to Lawrence W. McMasters, the skipper and owner of the yawl Delight, who, during the race to Michigan City on Sept. 2, saved six men who were clinging to the keel of the capsized sloop Yo San in mid lake. They were rescued with extreme difficulty, owing to the heavy wind and sea.

**YACHTING NEWS NOTES.**

For advertising relating to this department see pages ii and iii.

**IRONDEQUOIT TO RACE ON LONG ISLAND SOUND.**—Mr. F. Mason Raborg has purchased the Canada Cup challenger Irondequoit for the Rochester Y. C. syndicate through the agency of Mr. Frank Bowne Jones. Irondequoit is one of the best yachts Mr. William Gardner ever designed, being fast, roomy and able, and she should do well in the Sound racing. She is 65ft. over all, 40ft. waterline, 12ft. 6in. breadth and 9ft. draft. Mr. Frank B. Wood built the boat in his yard at City Island in 1903.

**STEAM LAUNCH FOR USE IN SOUTH AMERICA.**—The Gas Engine & Power Co. and Chas. L. Seabury & Co., Cons., have recently completed a shoal-draft steam launch that

CRUISING SCHOONER 56 FEET WATERLINE—INBOARD PROFILE AND CABIN PLAN—DESIGNED BY TAMS, LEMOINE & CRANE FOR HENRY A. MORSS. 1905.

will be used along the coast and inland waters of Brazil. She is 40ft. over all, 39ft. gin. waterline, roft. breadth and 1ft. draft. The frames, stem, keel, etc., are of white oak and the planking is of yellow pine. The fastenings are of copper throughout. The boat's deck is flush and she is fitted with a standing roof top and canvas side curtains. Aft there is a small house which contains a toilet and a galley. The boat is steered from the forward deck. She has a very flat floor and aft the stern is tunneled out. This keeps the draft down yet permits a fairly large wheel to be used. The boat is fitted with a Seabury fore and aft compound engine and a Seabury safety water-tube boiler. A speed of 10 miles is looked for. The boat will be sent to South America on the deck of a steamer.

SCHOONER EMERALD SOLD TO F. L. CLARK.—The schooner Emerald has been sold by Mr. William E. Iselin to Mr. F. Lewis Clark, Eastern Y. C., through the agency of Mr. Frank Bowne Jones. Emerald was designed by Mr. Henry C. Winteringham for Mr. J. Rogers Maxwell and built in 1893 by Messrs. S. L. Moore & Sons, at Elizabeth, N. J. She originally had a clipper bow, but in 1894 she was lengthened and a spoon bow replaced the old one. These changes improved the boat, and in 1903 her centerboard was removed and she was made a keel boat. Emerald has been used entirely for cruising, and she will replace Mr. Clark's old schooner Undercliff. Emerald is 117ft. over all, 85ft. waterline, 21ft. 7in. breadth and 14ft. draft. Mr. Clark is considering the advisability of converting Emerald into an auxiliary.

WOODBURY KANE, a prominent member of the New York Y. C., and one of the best known and most popular of New York sportsmen, died at his home in this city Dec. 5, after an illness of only three days. Mr. Kane was in his forty-sixth year.

### Rifle Range and Gallery.

#### Fixtures.

March 12-17.—New York.—One hundred shot indoor championship.

#### At Providence.

THE Cranston range, near Providence, R. I., will be a rallying point for riflemen. The programme provides events at 25 and 50yds. for .22 rifles, and events at 20 and 50yds. for revolvers. The matter of building an indoor range for the club will be settled at a meeting in the near future. A committee will be appointed to arrange for the annual meeting in February. From the Journal we take the following:

Action will be taken on the By-Laws presented by the National Board for the Promotion of Rifle Practice, and membership secured in the National Rifle Association, so that the club members may have an opportunity to take up the interesting work of shooting the military Krag at 200, 300 and 500yds. The National Board stands back of the club movement, and also some of the prominent Brigade officers. It is probable that many of the military shooters will enter the club under this division to secure the benefits of annual membership in the National Rifle Association at the minimum expense. Since the abolition of annual individual membership by the National, many of the military shooters are barred from its privileges, which the club's affiliation will restore. Applications should be made early to the secretary, in order that the club list may go to Washington at an early date. The membership of the club has increased by three recently, H. Powell, William H. Tibbetts and Dr. James H. Lorah having been elected by the executive committee, and several applications now on file for action.

It is probable that one of the interesting features of the Thanksgiving Day shoot will be a combination team match, sides being chosen from among the members present for both teams, and the shooting to be done with both rifle and revolver; ten shots with each by each man. As many of the revolver shooters have not done any rifle shooting in some time, and several of the expert riflemen are equally unfamiliar with the revolver, the results will be interesting.

The following scores have been recorded:

German ring target, 200yds.:  
Coulters .....162 181 186—529 Beach .....154 164 178—496  
Revolver, 50yds., Standard target:  
Wm. Almy, .38 officer's model, \*87, 83, 82, \*86, 86, 93, \*82, 86, \*84, \*84; A. C. Hurlburt, .38 officer's model, 77; Lieut. H. C. Miller, .38 officer's model, 75.  
\*Medal scores.  
Revolver, 50yds., military count: Almy 49, 46, 46; Hurlburt 46, 45, 44.  
Rifle, 50yds., Standard target: H. Powell, 89, 84, 83, 83; B. Norman 79.  
Revolver, 20yds., Standard reduced: A. C. Hurlburt 75; Maj. William F. Eddy, 73, 79.

#### Providence, R. I., Revolver Club.

THE informal Thanksgiving Day shoot was well attended both by members and their friends.

The 200yd. rifle match was withdrawn because of the gale of wind which swept over the range, the men preferring the shelter of the well-warmed shooting house, and devoting their attention to the miniature rifles at short range. The revolver shooters were badly handicapped, the sudden and strong gusts of wind blowing the sights in every direction but the bullseye, and as a consequence very few scores were turned in, and those were exceedingly low. The riflemen fared better, being enabled to steady their guns more against the wind, and standing further back from the windows, some very fine shooting was done.

The most interesting event of the day was the "surprise match," sprung at the opening of the range. One of the enthusiasts appeared with a bundle, which he explained was to be the center of attraction, and consisted of prizes worth the skill of the best men. The plan was soon arranged to shoot rifles at 25yds. on the reduced German ring target and revolvers at 20yds. on reduced Standard, three shots per string, with a possible of 75 points for rifles, and 30 points for revolvers, best three scores to count; prizes to remain unknown until close of shoot.

The members entered the contest with much enthusiasm, and the three short ranges were kept busy. The competitors gradually narrowed down to half a dozen, and late in the afternoon was nip-and-tuck between four of the men as to who would take highest honors for the day. Luther had three scores of 74 with a total of 222, Beach a three-string total of 221, Coulters following close with 17, when Gardiner picked up, shooting one "possible" and a 74, tying with 222 for first place, with Luther, and winning out by his next best score, a 73 to Luther's 72.

The following were the only scores turned in for recording:  
Rifle, 25yds., German ring target, 3 shots, possible 75:

Table with 2 columns: Name and Score. Includes entries for W B Gardiner, S K Luther, C L Beach, A B Coulters, H Edmundson, and Revolver scores for Wm. F. Eddy, Major Wm. F. Eddy, and Revolver scores for Almy, Hurlburt, and Miller.

#### Rifle at Shell Mound.

SAN FRANCISCO, Cal., Nov. 27.—Yesterday was turkey day at Shell Mound range, and a large delegation of shooters was present. The weather conditions were good, and in the Schuetzen Verein re-entry contest some good scoring was done. One rifleman made 74 and 73 out of 75 possible in three shots.

After twenty-six years' most successful management of the park and shooting range, Capt. Louis Siebe has passed the keys to his son William, who will continue the efficient methods of his father.

Some scores of the day:  
San Francisco Schuetzen Verein competition shoot: J. D. Heise 74, 70, 71, 70, 70, 73; F. P. Schuster 70, 66, 68, 71; L. Bendel 69, 68, 71, 71, 70; H. Bornholdt 70, 69; O. A. Bremer 71, 70, 70, 70; Herman Huber 70, Otto Lemcke 72, Adam Schaefer 70.

Golden Gate Rifle and Pistol Club monthly competition, gold medal, H. Wobber, 198, 185; silver medal, M. J. White, 200; F. J. Klatzl 185, 174; medal bars, J. F. Bridges 191. Re-entry match: W. F. Blasse 221; A. C. Gehret 221; E. Hammond 220, 218, 216, 206, 204; M. F. Blasse 218, 208, 205; L. Durham 214, 211; Max Kolander 202; H. O. Nelson 195, 194.

Annual turkey shoot: A. C. Gehret 71, Adolph Streckler 68, D. W. McLaughlin 66, W. F. Blasse 64, Otto A. Bremer 64, M. F. Blasse 63, J. F. Bridges 63, A. J. Brannagan 63, Max Kolander 61, E. Hammond 60.

Flags: M. F. Blasse 5, E. Hammond 4, A. C. Gehret 3, L. Durham 4, Max Kolander 1, W. F. Blasse 1. Pistol scores: Bronze medal, T. Lewis 67, 65; re-entry match, F. V. Kington 88, 87, 84; Capt. Ord 88, 80; T. Lewis 61, 60, 67, 54; revolver re-entry match, A. J. Brannagan 92, 88, 83, 81.

The following competitors won from one to three birds each in the Capt. Siebe annual turkey contest: C. M. Henderson, Louis Bendel, A. C. Gehret, William F. Garms, William C. Morken, W. Schulz, D. W. McLaughlin, K. Wertheimer, M. F. Hartter, A. L. Ott, A. Nichol, Max Kolander, L. Wille, Adolph Streckler, J. Westphal, J. Dorrall, W. F. Blasse, Fred Brandt, John Gefken, H. Bornholdt, C. F. Thierbach, Fritz Koch, D. A. Huntemann, C. Peach, G. W. Bridges, M. F. Blasse, John Peters, C. Schilling, O. A. Bremer. Best bullseye, Louis Bendel; last bullseye, Fritz Koch.

#### Zettler Rifle Club.

DESPITE the heavy rain and wind, thirteen members took part in the weekly shoot held the night of Nov. 28. Arthur Hubalek, of Brooklyn, was high with a total of 2440 points in 100 shots at 75ft., offhand, and he had the highest 50-shot score, 1231 points, while Charles Zettler, Jr., won the prize on the bullseye target. The scores:

Table with 2 columns: Name and Score. Includes entries for Ring target (Arthur Hubalek, Louis C. Buss, T H Keller, Jr., Owen Smith, Arthur Hubalek, W A Tewes, A Moser, C Zettler, Jr., H D Muller, Louis Maurer, C G Zettler, Barney Zettler, T H Keller, G Bernius) and Bullseye target (Charles Zettler, Jr., 28).

#### Harlem Independent Schuetzen Corps.

THE regular shoot was held Nov. 29, at 75ft., offhand. A. P. Fegert was high man with 477 for his best two scores. The totals follow:

Table with 2 columns: Name and Score. Includes entries for A P Fegert, H Koch, G Thomas, J H Blumenberg, Dr A Muller, E Nadersohn, Bruno Eusner, C Thibauth, F Horn, Jacob Martin, Phil Zuegner.

Richard Gute, who came so near winning the 100-shot indoor championship match last March, has temporarily retired from business and is living on his farm in Sullivan county, New York. Last week Barney Zettler shipped a complete target outfit to Mr. Gute, who intends to equip a private rifle range he has fitted up on his farm with target trolleys. It is 75ft. long and Mr. Gute intends to practice diligently during the winter and get into the best possible form for the next indoor championship match, which will be held March 12-17, inclusive, 1906.

#### Ohio Rifle Notes.

The regular medal shoot of the Lewisburg Rifle Club was held on Nov. 25, 100yds., offhand, 4 shots, possible 48. T. H. Parks won the medal with 44, Gerreth 42, Matthews' 42, Hoffman 34, Trissel 34, Keserling 23, Bruner 21. In the 10-shot match, same conditions, possible 120, Garreth won first money with 118, Parks second, 108, Matthews third, 105, Hoffman 97, Bruner 65, Trissel 64. The 20-shot match, 100yds., offhand, possible 240, was won by Parks with 208. Matthews was second with 207.

The Twin Valley Rifle Club held its November medal contest at W. Alexander, on Nov. 25. In addition to the medal, prizes of cash and poultry were given. The medal shoot was at 100yds., offhand, 4 shots, possible 48. A. N. Clemmer won the medal and money prize with 11, 12, 11, 10—44; J. Johnson 12, 11, 9, 11—43; Lee Conarroe 9, 11, 12, 11—43. Five events of 4 shots each were then shot; total of 20 shots, possible 240. Johnson won with 43, 43, 47, 43, 46—222; Clemmer 44, 39, 45, 40, 46—214; Conarroe 43, 40, 44, 38, 47—212. Johnson won four chickens, Clemmer two and Conarroe two.

#### Lady Zettler Rifle Club.

MISS FANNIE EUSNER made the best bullseye at the shoot held the night of Nov. 25, while Mrs. Fenwirth was high with a total of 486 out of the possible 500 points on the ring target. Among the men who shot along with the members, V. Muller had the best bullseye and C. Folcke was high on the ring target. The scores at 75ft., with .22cal. rifles:

Table with 2 columns: Name and Score. Includes entries for Mrs Fenwirth, Miss Ludwig, Miss B Ludwlg, Mrs Nosch, Miss Fannie Muller, Miss Anna Scheu, Miss Fannie Eusner, Best bullseye, Miss Eusner, C Folcke, G Hart, G Ludwig, V Muller, Best bullseye, V. Muller.

#### Independent New York Schuetzen Corps.

THE regular practice shoot was held on the Zettler ranges Dec. 1, at 75ft. off-hand. Gus Zimmermann was high with 487 out of the possible 500 points on his best two targets. The totals follow:  
Gus Zimmermann.....487 Jacob Billocher .....456  
August Begerow .....480 Bruno Eusner .....451  
G W Ludwig.....478 John Facklam .....440  
Frank A Young.....476 Arthur Namak .....433  
F Liegibel .....472 Henry J Behrens .....425  
William Soell .....471 F C Halbe .....413  
George T Zimmermann.....457

#### A Duel Avoided.

The elder Dumas, the eminent French novelist, was not spared the severe criticisms which attack a famous name, but, like all wise men, he was content to treat these attacks with dignified silence. Not so his son. Exasperated by the particularly severe criticisms of a noted journalist, the young man—then in his college days—took upon himself to right the wrongs of his father, and sent two chums to arrange for a duel with the offender.

Calmly the journalist listened to what they had to say. When they had concluded he called a servant, directing him to tell his son to come to the study.

"Gentlemen," he said, "as this appears to be an affair of sons, and not of fathers, etiquette would seem to demand that you should arrange your matter with my son. He will be here directly, and no doubt will give you all the satisfaction you wish."

So saying, he left the room, and a moment later the journalist's son entered—a child of three years, in the arms of his nurse.—Harper's Round Table.

## Trapshooting.

If you want your shoot to be announced here send a notice like the following:

#### Fixtures.

- Dec. 5-7.—St. Thomas, Ont.—McCall & Emslie's live-bird tournament.  
Dec. 8.—Atglen, Pa.—Christiana-Atglen G. C. all-day shoot. W. R. Fieles, Sec'y.  
Dec. 12-13.—Omaha, Neb.—Interstate team race, between teams of Nebraska, Iowa, Missouri and Kansas. W. D. Townsend, Sec'y.  
Dec. 14.—Travers Island, N. Y.—Amateur championship of America, under auspices of New York Athletic Club. Gus E. Grieff, Chairman, 302 Broadway, New York.  
Dec. 17.—Jersey City, N. J.—Hudson G. C. tournament and outing. J. Hughes, Sec'y.  
Dec. 20.—Phillipsburg, N. J.—Alert G. C. first annual holiday shoot.  
Dec. 28.—Edgewater, N. J.—Palisade G. C. all-day shoot. A. A. Schoverling, Sec'y.  
1906.  
Jan. 1.—Mount Kisco, N. Y., G. C. all-day shoot. A. Betti, Capt.  
Jan. 1.—Brooklyn, N. Y.—Bergen Beach G. C.  
Jan. 2.—Killarney, Man.—Live-bird championship of Canada.  
Jan. 16-19.—Hamilton, Ont., G. C. annual winter tournament. Ralph C. Ripley, Sec'y.  
Feb. 22.—Brooklyn, N. Y., G. C. all-day tournament. A. A. Schoverling, Mgr.  
Jan. 22-27.—Brenham, Tex.—Sunny South Handicap; \$1,500 added for amateurs. Alf Gardiner, Mgr.  
March 14-16.—Iowa State Sportsmen's Association annual tournament. C. W. Budd, Sec'y.  
May 16-17.—Auburn, N. Y., tournament. Knox & Knapp, Mgrs.  
May 24-25.—Montreal, Can.—Canadian Indians' first annual tournament. Thomas A. Duff, High Scribe.  
Dec. 25.—Brooklyn, N. Y., G. C. all-day shoot. A. A. Schoverling, Mgr.

## DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Sheepshead Bay, L. I., Gun Club will hold a holiday shoot on Christmas Day.

Thanksgiving Day in the East was a day of blustering, high winds, bad for high guns at the traps, but excellent for high knives and divides indoors.

The Mount Kisco, N. Y., Rod and Gun Club will hold an all-day tournament on Jan. 1. The programmes will be ready for distribution early next week. For further particulars, address Capt. A. Betti, Mount Kisco.

The holiday cup, at the shoot of the Crescent Athletic Club, held on Thanksgiving Day, at Bay Ridge, L. I., was won by Mr. A. E. Hendrickson, with a score of 22. A cold, blustering wind, almost a gale in force, was a detriment to good scores.

Mr. Irby Bennett moved from the Post-Graduate Hospital to the Grand Hotel, New York, on Friday of last week, and is convalescing with gratifying rapidity. He will soon be up and about again, and his legion of friends will heartily rejoice thereat.

Twelve events are provided by the programme of the Alert Gun Club, of Phillipsburg, N. J., Dec. 20. Totals, 180 targets, \$9.50 entrance. Targets, 1½ cent. High amateur averages, \$6, \$3, \$2 and \$1. Programme will begin at 10 o'clock. Class shooting. The Secretary is George Stubblebine.

An unusually large number of trapshoots throughout the States on Thanksgiving Day had programmes which talked turkey in a most liberal and beneficent manner. Of still greater beneficence was the pocketbook which enabled a shooter to pay for targets and talk personal turkey independently of goose eggs.

An all-day shoot of the Brooklyn, N. Y., Gun Club will be held on their grounds at Crescent street, Brooklyn, on Christmas Day, Dec. 25, and one on Washington's Birthday, Feb. 22. Shooting of each begins at 11 A.M. Added money, etc., and sliding handicap on Feb. 22. A. A. Schoverling, Manager, 2 Murray street, New York.

At the shoot of the Fairmont, W. Va., Gun Club, held on Thanksgiving Day, Mr. Fred Gilbert was high average with 190 out of 200, and Mr. H. H. Stevens was second with 163 in the professional class. Mr. W. A. Wiedebush was high amateur with 171. Stormy weather, high winds and furies of snow, added to the thankfulness of the day.

Mr. A. F. Richardson, challenger, of Dover, Del., and Mr. Wm. M. Foord, holder, of Wilmington, Del., contested for the championship of Delaware, on Dec. 2. The contest took place on the grounds of the Wawaset Gun Club. Each shot at 100 targets, and tied on 91. The shoot-off, at 25, resulted in another tie on 20. The final shoot-off resulted in a victory for Richardson by a score of 24 to 20.

The manager, Mr. A. A. Schoverling, writes us that "Owing to the success of the many tournaments held by the Palisade Gun Club, of Edgewater, N. J., and feeling that there is a field for further tournaments of like character, we have made arrangements with the Brooklyn Gun Club, of Brooklyn, N. Y., to hold regular bi-weekly shoots on the first day of the week, and tournaments on all holidays and on dates not conflicting with other gun clubs. These shoots will be announced in the columns of your paper and to the shooters."

The championship contest of the New York Athletic Club, to be held at Travers Island, Dec. 14, has every prospect of a perfect success. All amateurs of the United States are eligible. The conditions are: 100 targets, entrance, price of targets. A sterling silver trophy goes to the winner. Mr. Gus E. Grieff, Chairman of the Committee, 302 Broadway, New York, will furnish all information.

Elmer E. Shaner, Secretary-Manager, under date of Dec. 2, from Pittsburg, writes us that "The annual meeting of the stockholders of the Interstate Association will be held Thursday, Dec. 14, at 10 A. M., at Oakland, Bergen county, N. J. The meeting will be held in proper form and adjourned to the afternoon of the same day, when the adjourned annual meeting will be held at the Grand Hotel, Broadway and Thirty-first street, New York city, at 1:30 P. M."

At the Thanksgiving Day shoot of the Baltimore, Md., Shooting Association, Mr. Hood Waters captured two turkey gobblers with the ease and grace which mark ever his worthy skill. Some of the other experts were victors also, but to the extent of a single fowl only, while others again, of the class who are always with us, hid home turkeyless, so far as the externals of the shoot were concerned. But, then, there are a lot more Thanksgivings coming, and everything comes to him who waits—perhaps.

Mr. C. L. Burtch, Winnipeg, Man., informs us that "On Tuesday, Jan. 2, 1906, there will be held in Killarney, Man., a live-bird tournament, when the championship of Canada will be contested for. This tournament promises to be the best live-bird shoot ever held in western Canada, and representatives are looked for from all parts of the west, and are cordially invited to participate. The tournament will be under the efficient management of the two well-known Killarney trapshoots, Mr. Jack Saunders, of individual international championship fame (1905), and Mr. O. G. Rutledge. Already over a thousand birds have been collected, with a bright prospect for several hundred more. This will prove to be somewhat of a change to many, who are lovers of the scatter bore, as heretofore it has been almost impossible to find sufficient birds to hold a successful tournament of any size, and no doubt this event will be looked forward to by many and a good crowd is anticipated."

BERNARD WATERS.

Shooting Form.

Editor Forest and Stream:

I have just passed through an ordeal, the outcome of which may be of interest to other trapshooters who are having, or have had, similar experience. Some doubtless have become disgusted with themselves and have quit the game altogether. I must confess that after discouraging days of experimenting and practice, I have resolved a dozen times to put up my trap gun for good, satisfied that I would never get back to any kind of form; but I stuck it out. During 1902 and 1903 I maintained an average of 89 per cent, and had no unaccountable bad days. Early in 1904, I commenced to go bad. From almost 90 per cent, I dropped to 80 per cent, then 75 per cent., and finally got down to about 65 per cent., being able to do as well with my gun to the left shoulder as with the right. I attributed my poor form to changing guns, having sold my pet gun to take up a fine little gun of another make I had won at the New York State shoot of 1903. Often I would get as low as 12 and 13 and 14 out of 25, and would go home from the traps so ugly and discouraged that I wondered my family did not run me out. Finally I got down to the experimental stage, and made up my mind that I would find out what I was doing. From January, 1905, to July, I shot away 6,000 shells trying all sorts of ways to remedy the fault. Finally a plan was suggested by a friend, which gave me an inkling as to the reason of my bad stump. I got a lot of big sheets of paper, tacked them upon a fence at different distances, and snapped some loads at them. After fifty trials, I was satisfied that I was shooting low to the left. A gun expert told me to get a gun with a stock cast off 1/4 to 3/8 in., and 1/2 in. straighter at the heel, which I did. I am now gradually getting back in shape, have shot better than 90 per cent. on several occasions lately, and think that I will soon get my speed back.

Speed and confidence mean about the same thing in trap-shooting. Now and then I "stop in the swing," which will doubtless be remedied by the return of speed.

If you get one of these "off" streaks, don't give in to it—fight it out, and you will find that by an unconscious change of attitude you have changed your point of sight, and must start and learn all over again, so as to conform with the new order of things. Be it known, I have never been any more than a fair shot, so can therefore imagine how harrowing it must be to an expert when he gets an "off" period. Upon his skill hangs his bread and butter, besides the humiliation of being beaten by a lot of "dubs." They are good sports, these paid experts, and only by their scores can you find that they are shooting poorly.

A GUN BUC.

Hudson Gun Club.

JERSEY CITY, N. J., Nov. 27.—In response to a very unique notice sent out by Secretary James Hughes for a special meeting of the house committee and special shooting committee of the Hudson Gun Club, especially appointed to take charge of the coming big shoot, a full quorum responded. It being a joint meeting, President Whitley in the chair, by request opened up proceedings with, "What have you done?"

Mr. J. Hughes, of the shooting committee, who with Mr. C. Von Lengerke (Dr. Sargeant), reported that the coming shoot had been liberally advertised, and that they had received inquiries which assured him of a successful shoot.

Dec. 17 was decided on as the date. The club shoots will be held as usual on Dec. 10 and 24, and it is expected that on the 10th we will have a good attendance to "try-out" the new (and old) traps, etc., and get ready for what we expect to be the biggest shoot we have ever held.

Nine prizes were decided on, and the shooting committee, in reply to Chairman Whitley's inquiry as to how much money these were to cost, answered him like a unit, "We'll do the buying, and you can rest assured that those who win one of the prizes will not be ashamed to take it home."

Several members then expressed themselves as being able, they thought, to secure a few merchandise prizes from the trade. While it was not the sense of the meeting to "sponge" on the trade—in fact, the idea was at once "jumped on"—but when the circumstances were explained, it was agreed that it would not be good policy to insult a cheerful giver by refusing a present from him to be shot for. It is therefore safe to say that, besides the nine handsome prizes (the nature of which will be announced in these columns later), that there will be other prizes to be shot for.

The house committee reported that they attended the last shoot (yesterday) in a body, and arranged to repair the damage in time for the big shoot on Dec. 17. Like the shooting committee, they have among them "loyal stock," who cheerfully volunteered to advance all necessary expenses.

The chairman expressed himself well satisfied with the work so far done by both committees, and gave them kind words of encouragement.

The meeting adjourned at 11:30, to meet again on Dec. 4 at the regular monthly meeting of the club, when we hope for a good attendance.

Table with 2 columns of Events and Targets, listing names and scores for the Hudson Gun Club.

Narberth Gun Club.

Dec. 2.—On the Narberth, Pa., Gun Club grounds a nine-man team race resulted as follows:

Table with 2 columns of names and scores, listing participants in the Narberth Gun Club team race.

Recreation Rod and Gun Club.

MORGANTOWN, W. Va., Nov. 29.—The Recreation Rod and Gun Club, of this city, held a shoot to-day in honor of Messrs. Fred Gilbert and Luther J. Squier, and despite the very inclement weather, a most enjoyable day was passed and a programme of 200 targets completed.

Most of the shooting was done during a pretty stiff rain storm with occasional snow flurries, and as a result long runs were very scarce, Mr. Gilbert getting one of 52 targets.

Mr. Gilbert shot out the programme of 200 targets with the very creditable score of 185 breaks, with Mr. H. H. Stevens, of the U. M. C. Co., second, with 180 to his credit, Mr. Miller following closely as high amateur with 177 breaks, shooting throughout the day very evenly, although he was unlucky in not being able to land a straight in any one event.

The club entertained all the shooters and their visitors at the Hotel Madera at a 7 o'clock wild turkey dinner, where thirty-five covers were laid, with President Sivey presiding at the head of the table in his usual graceful and dignified manner.

Over the coffee and cigars, several of the guests and members responded to toasts, Messrs. Gilbert, Squier, Stevens, Taylor and Loyd making notably happy hits.

That we may have the pleasure of entertaining this bunch of good fellows again in the near future, is the unanimous sentiment of the club. The scores:

Table with 2 columns of Events and Targets, listing names and scores for the Recreation Rod and Gun Club.

Extra, 2 man team race, 25 targets per man: E H Taylor 18 F M Coburn 22 E F Jacobs 20-38 W M Sivey 21-43 ELMER F. JACOBS, Sec'y.

Fairmont Gun Club.

FAIRMONT, W. Va., Nov. 30.—The Fairmont Gun Club's Thanksgiving Day shoot just closed was a success, despite the cold weather and snow flurries, which interfered greatly with the shooting and made good scores impossible, the half snow-covered hill background making extremely difficult shooting for all except the experts. The club entertained Mr. Fred Gilbert, Mr. Luther J. Squier and Mr. H. H. Stevens, Mr. Gilbert getting high average with 190 out of 200, and Mr. Stevens second with 163 out of 200.

Mr. W. A. Wiedebusch was high amateur with 174 breaks out of 200 to his credit.

Following the shoot and the traditional Thanksgiving "Tom and Jerry" in the evening, the club entertained all shooters at the Hotel Jackson at a course turkey dinner, where forty covers were laid and all spent a very enjoyable two hours. The scores:

Table with 2 columns of Events and Targets, listing names and scores for the Fairmont Gun Club.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Dec. 2.—Shooting was very hard on account of a strong wind, which made the targets jump a great deal. Griff won the first leg on the December cup. Two other trophies were shot for during the afternoon, and won by Mr. Billings and Robinson.

Table with 2 columns of names and scores, listing participants in the New York Athletic Club event 1.

Table with 2 columns of names and scores, listing participants in the New York Athletic Club event 2.

Table with 2 columns of names and scores, listing participants in the New York Athletic Club event 3.

Table with 2 columns of names and scores, listing participants in the New York Athletic Club team shoot.

Table with 2 columns of names and scores, listing participants in the New York Athletic Club team shoot.

Entries for the amateur championship event are coming in. This event seems to be a popular one.

Highland Gun Club.

PHILADELPHIA, Pa., Dec. 2.—Turkeys, geese and chickens were the satisfying prizes at the shoot of the Highland Gun Club, at Edge Kill, to-day. A goose supper and bright speeches closed the day's activities very pleasantly. The speeches were made by D. Meyers, J. Franklin and Mr. Bisbing. Vocal music was rendered by the Highland Male Quartet. Scores:

Table with 2 columns of Events and Targets, listing names and scores for the Highland Gun Club.

Lowell Rod and Gun Club.

LOWELL, Mass., Dec. 2.—The Lowell Rod and Gun Club's Laffin & Rand trophy shoot was held to-day with a fair attendance. Poor light and hard-breaking targets kept the scores far below the average.

The cup was won by Edwards, with 78 breaks, Roy being close up with 76. Dickey, of Boston, scored 79, but being a professional, shot for targets only from the 18yd. line. Climax, also a professional, voluntarily shot from the 21yd. mark.

High general average for the day went to Dickey with 145 to his credit. Edwards, second, with 131.

Events 5 to 9 inclusive, cup race, handicaps 16 to 21yds.:

IN NEW JERSEY.

Montclair Gun Club.

MONTCLAIR, N. J., Nov. 30.—The conditions were not favorable for the silver shoot, Thanksgiving Day. With the thermometer below the freezing point, and the wind blowing a gale from the northwest, high scores were the exception. Many of the targets described a half-circle, traveling fast and far.

In event 1, Moffett won first prize, with Holloway second, while in event 2, Moffett was again successful, with Wallace second. In event 3 Moffett was again the fortunate one, with Wallace second.

In event 4 the winners were Moffett, Winslow and Cockefair. At the annual meeting of the club, officers elected for the ensuing year were: President, Geo. Batten; Secretary, Edward Winslow; Treasurer, E. H. Holmes; Field Captains, C. L. Bush and P. H. Cockefair.

Table with 2 columns of Events and Targets, listing names and scores for the Montclair Gun Club.

Bound Brook Gun Club.

BOUND BROOK, N. J., Nov. 30.—Twenty free prizes brought out ten members to-day in the wind and cold to take part in our Thanksgiving shoot. Every one won a prize.

The wind took the targets so high that some of the missed ones were carried back to the shooter's feet. Rev. Roberson was trying his new L. C. Smith for the first time. The trapper would come in from the trap house to get warm every other event. One said, "You oughter have a stove in that ere thing out there." In one event all prizes were scarfpins. Every one got stuck on one.

Table with 2 columns of Events and Targets, listing names and scores for the Bound Brook Gun Club.

Duquesne Gun Club.

DUQUESNE, Pa., Nov. 30.—The Duquesne Gun Club held its first Thanksgiving Day shoot on Nov. 30, at which time there was a fair attendance considering the inclement weather. The Handicap Committee introduced a modern improved handicap which worked very satisfactorily, as almost every shooter went away with a broad smile and a nice turkey. The best shooting was done by Mr. Westley Hale. Following are the scores:

Table with 2 columns of names and scores, listing participants in the Duquesne Gun Club shoot.

At Point Breeze.

PHILADELPHIA, Pa., Dec. 2.—The live-bird shoot, at the Point Breeze Race Track to-day, had a programme of two events, one at 10 birds, \$5 entrance, two moneys, and one at 5 birds, \$3 entrance, two moneys. The scores follow:

Table with 2 columns of names and scores, listing participants in the Point Breeze event 1.

Table with 2 columns of names and scores, listing participants in the Point Breeze event 2.

What Happened to the Jackie.

Former Secretary of the Navy Moody tells of the account of an explosion of one of the big guns on the Massachusetts a year ago, which was given by a sailor injured by the explosion.

"Well, sir," replied the jackie, to his questioner, "I reely can't say that I knows very much about it. I was standin', you see, with me back to the gun, a-facin' the port side. All of a sudden I hears a noise; then, sir, the ship physician he says, 'Set up and take this.'"—Boston Herald.

The managing editor wheeled his chair around and pushed a button in the wall. The person wanted entered. "Here," said the editor, "are a number of directions from outsiders as to the best way to run a newspaper. See that they are all carried out." And the office boy, gathering them all into a large waste-basket, did so.—Washington Life.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

# U. S. AMMUNITION

The proof of the Cartridge is in the shooting. The United States Army, by careful tests, have proven the U. S. Cartridges to be the most accurate and reliable.

### WESTERN TRAP.

LAcon, Ill., Nov. 30.—About six weeks ago there was a "Tramp" in town. He was walking along the branch line of the Alton Railroad, and being footsore, he tarried at this town, as it was the end of the "tie path." He lingered thereabouts, and by the time of his departure, had got the "ball to rolling" in the minds of the mighty duck hunters of the town, with the result that some twenty-five of them put their names down as prospective members of a gun club.

With a view of getting the enthusiasm aroused, a shoot was planned for the day we set apart to devour all the turkeys that the United States can produce.

There were those who could not omit their morning rabbit, quail and duck hunt, and many others who would not miss their turkey and cranberry sauce at the noon hour, hence the shoot was not started until about 2 P.M. From that time until dark there was such a banging of guns as never before was heard in the town of Lacon. Ye old gray-headed shooters should have been there, and you would have been reminded of thirty years ago. Never were there such an array of old-time shooting irons brought together.

There were a few good hammerless guns and a pump or two, and then came the cheapest of hammer guns—all grades and sizes. One gun had shot through at least forty years, having lost one hammer, and belched a load of four drams of old FFG; and such a noise and such a smoke—oh, my!

But a good time was had, and there was a shoot seldom chronicled wherein the misses equalled the hits.

Your attention was called to guns, and now the shells come in next. Only one man had a regular trap load; most of the others used about a three-dram load and one ounce of soft shot, ranging from 8's to 4's. One man used 3½ drams smokeless and No. 6 shot.

There was a good opening here for a traveling shooter, but none were present. The next thing to it was a missionary for one of the shell companies, and he was showing a first-class cheap trap gun and explained to them that what they wanted was a 3-dram load of smokeless with 1½ ounces of 7½ chilled shot. There will be a decided improvement in the next shoot held by these enthusiastic game shooters.

Lacon would be a good point to hold a tournament, as there are other towns close by having some old shooters who can assist in making the attendance such as is needed for a success.

Possibly the readers will wonder why the scores are so very low. Well, besides the quality of the guns and the shells, you can imagine what effect a turkey dinner would have on a shooter. Eating and shooting do not go together, and the wonder is that managers of tournaments do not cut out dinners. Most all traveling men eat a late breakfast, and they do not want a dinner at noon, and yet when served on the ground, they are compelled to eat just for the sake of being a good fellow. Nothing more than a cup of coffee should be served, together with a sandwich. And besides all strong drinks should be banished from all shooting parks. The scores:

Events:	1	2	3	4	5	6	Shot	Broke.
Targets:	10	10	10	10	10	10	at.	45
Newell	8	5	8	7	8	9	60	44

### At Joliet.

Joliet, Ill., Turkey Day.—This town has had its "ups and downs" like most all other Illinois towns, when it comes to the art of trapshooting. The various shooting organizations have come and gone, and yet there remains that feeling that never dies, that longing to hear the "boom" of the scatter gun, within the many breasts of the enthusiasts.

W. D. Whorrie, the old trapshooting promoter, who was the mainstay in one of the old Chicago clubs, now a resident of this city, has again come forth as the president of the new gun club with a title so big as to include not only the Joliet shooters, but those of all the surrounding towns, viz.: the Will County Gun Club.

The other officers are workers, and the crowd of shooters on this day assembled shows that T. F. Pell, secretary, and Robert Bruce, treasurer, and C. M. Stoll financial secretary, were well selected men for the promoters of such enterprises.

This was the first effort of this new club, and with forty shooters present, it shows that the location is O.K., and that with the proper encouragement from the Joliet and Chicago street railway, a prominent shooting organization will be the result.

Shooting has been at a standstill throughout northern Illinois for some time, and it is now the opportune time for a revival all along the line.

Many of the cities are now connected with the interurban lines, and these furnish the facilities for having a shooting park outside of the corporate limits where shooting can be carried on any day in the year without in any way encroaching on the rights of other people. Joliet has two such lines, one connecting the Windy City; the other Aurora, Elgin and many other Fox River cities.

It is not a hard matter to convince the management of these lines that it pays them to establish parks and fit up buildings for the use of the gun clubs, and the nickels they will gather in during the year will fully repay the outlay with big interest on the investment.

While the writer is pleased to note the prospects of a permanent home being fitted up for the Will County Club, he is not to omit the fact that there is another and a rival club, which will locate on the Aurora line, with permanent improvements at Electric Park. When both clubs are fully organized and the "robins nest again," then there will be some team shooting that will be stimulating to both clubs, and some time they will draw the attention of the shooters from all parts of the State.

There is much uncertainty connected with promoting a shoot at this time of the year, as the storms of winter are now seasonable. Tuesday was like unto a May day. Wednesday was a corker, in so far as opposite weather could be, as the tail-end of the great storm that visited the Northern lakes struck here, and as the snowflakes fell and the wind howled, the thermometer fell at least forty-five degrees, and that was enough to cause the "oldest shooting crank" to warm his shins by his red-hot stove rather than freeze his fingers pulling the trigger. When the "thankful" morning arrived, and being a holiday, those bent on going to the shoot were thankful that during the night the clouds had drifted away and the wind had died down until the day was pleasant, and this accounted for the large number of shooters present on this occasion. There were many who took in the shoot also as spectators, and they were well repaid, as the exhibition of shooting was first class. True, Riehl and Stannard did not start off with the right foot in front, but Riehl made good, as from the sixth to the eleventh event he made a score of 83 straight, which shows that the days are not too cold nor too hot for this sturdy son of the West. Thus Riehl was high professional; Stannard second and Fitzsimmons third.

Now, sir, there was something doing along the amateur line. Many of those competing were among the best who follow the great art of busting mud pies.

Fox Lake sent her quota in the Dunnell and Graham brothers. Bert was going some; for one who shoots as little as he does, he must be ranked among the best. Only in 25-target event did he fall below second money, and he finished strong with 161 out of 175. Chicago sent down that good quartet, Young, Barto, Winesberg and Deal. Mr. Young came second with 158. Harry Dunnell third, 154. Barto fourth, 148. In the first four events Barto and Young broke an equal number, and to show how good they are in a long race, in the 25-target event Young broke 25, Barto 24. When you put Barto into a long, hard race, handicap or whatever there be, that calls for the test of nerve, just you watch him "smoke 'em out." Harry Dunnell was in good form also. And then Ed. Graham and Tom Graham were there for that family of shooters. Mr. Knussell represented Ottawa, as did Jim Groves, Jacksonville. "Happy Hooligan" was there with his "smile that won't come off." There were so many Joliet men present that they must excuse us for omitting their names, but the scores will show them. So here they are:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Shot	Broke.
Targets:	10	15	20	10	20	10	15	10	25	15	10	15	at.	164
Riehl	9	12	18	10	19	9	15	10	25	15	9	13	175	158
Young	10	13	17	9	16	10	12	9	25	15	8	9	175	148
Barto	10	13	17	9	15	8	14	8	24	13	6	11	175	148
Stannard	7	9	17	10	18	10	14	8	22	15	8	10	175	153

### In Other Places.

On Thanksgiving Day the members of the old Elmwood, Ind., Gun Club met at their former grounds and enjoyed the good appointments there, which are said to be second to none in the State. An interesting feature was that of the Jack Rabbit system of money divisions, that of giving each shooter 5 cents for each target broken.

Sixty Pekin ducks and twenty-five Talu geese were the attraction at the Tremont, Ill., Gun Club grounds Nov. 29.

The ladies were invited to take part in the rifle shoot at the Canon City, Colo., Gun Club grounds, Thanksgiving Day. The prizes were the most liberal ever offered for a similar occasion. A full history of the contest will be furnished in the next issue.

A farmers' gun club is about to be organized at Carlisle, Pa. Among other things that are proposed is to get together a team

to contest for the State. There will be clay target contests every Saturday, and then a business meeting will be held at which the bettering of the game laws will be the subject. A. J. Rudd is being urged to accept the presidency.

Any one bringing ten birds and \$5 could get into the big shoot at the Bunker Hill shooting grounds, Shamokin, Pa., on Nov. 30. The 25-bird county championship race was declared off.

The Larned, Kans., Gun Club held their shoot last Monday. Roy Ainsworth was high with 169 out of 200. Walter Hugg was second, 163. Elton Gregory and Paul Gano, third, 157. There were eleven events, and about thirty men were on the grounds. Those from abroad were: Henry Webster, Rozel, Kans.; Paul Gano, Pawnee Rock; Everet Taylor, P. H. Moliter, Henry Draut and Sherman Leonard, Kinsley. The club came out ahead on the shoot, as did the ladies, who served the lunch.

### Cincinnati Gun Club.

There was a large gathering at the grounds on Nov. 26, over one hundred spectators being present. The cause of this crowd was the announcement in the daily papers that the famous Fred Gilbert would be present. A number of the members shot their weekly score in the Ackley contest. The day was a delightful one for out-door sport, and good scores were the rule. In the Ackley contest, Gilbert headed the list with 48. Maynard second with 47. Bonser and Dick third with 46 each. Lutie Gambell, young son of Supt. Gambell, did fine work in a team match, breaking 44, which was only 5 less than his partner, Gilbert, accounted for. They defeated their opponents, Gambell and Squier, 93 to 87. Williams made good in the practice events, breaking 91 out of his first 100.

Ackley trophy, 50 targets, handicap:

Gilbert, 16	48	Gambell, 16	43
Maynard, 18	47	Ahlers, 20	41
Bonser, 18	46	Barker, 16	41
Dick, 16	46	Bullerdick, 18	39
Bleh, 20	45	Miss F Altherr, 16	38
Randall, 16	45	Squier, 16	35
Williams, 16	45	Miles, 16	29

Messrs. Gilbert, Maynard, Williams, Ahlers and Miles did not compete.

Team match, 50 targets:

Gambell	22	25-47	Gilbert	24	25-49
Squier	21	19-40	L Gambell	21	23-44
	43	44-87		46	47-98

Team match, 50 targets:

Gilbert	15	15	18-48	Gambell	14	11	18-43
Miss F Altherr	11	11	16-38	Squier	12	12	11-35
	26	26	34-86		26	23	29-78

The club held its usual shoot on Thanksgiving Day, but there was a poor attendance, many of the members taking advantage of the holiday for a day's hunt in nearby localities. Some very good scores were made.

There were six events at 25 targets, one at 15, and one at 10 on the day's programme. Keplinger broke 82 out of his first 100, finishing high man with 119 out of 150. Williams was second with 111. Gambell 82 and Bonser 81 out of 100. The day was cold, with quite a flurry of snow in the morning, but clear in the afternoon, with a strong wind.

Holiday shoot:

Events:	1	2	3	4	5	6	7	8	Shot	Broke.
Targets:	25	25	25	25	25	25	15	10	at.	119
Keplinger	21	19	23	19	21	16	..	..	150	111
Williams	20	16	23	19	17	16	..	..	100	82
Gambell	20	23	19	20	..	..	..	..	100	81
Bonser	20	20	21	20	..	..	..	..	100	73
Andrews	15	18	14	..	..	9	7	..	75	68
Ahlers	24	24	20	..	..	..	..	..	100	61
Meininger</										

Hogen, 50; Rattle, 40 out of 60; Wallace, 43 out of 50. These watch fobs will be shot for in ten contests. All members are handicapped, their handicap being determined by the club record. Shooters not participating in the past year's shoots and new members will be handicapped by the committee. Each contest at 50 targets, entrance, including targets, 65 cents. The three contestants getting the greatest number of points will receive the prizes. In order to gain a point, the contestant must break a specified number. If he breaks this number or more, he scores a point; if less than the number he receives nothing. Ties will be shot off under same conditions as the regular events. The rules or handicaps may be changed by the committee at any time.

The Columbus, O., Gun Club held a turkey shoot on Nov. 27. There was a big crowd present, and twenty-four shooters took part in one or more of the events. The programme called for a total of 200 targets, with turkeys as prizes for the successful ones. The weather man handed out about as poor a brand of his stock as he had, and when it was raining it looked so threatening that the boys were kept busy wondering if there was anything worse coming. The sport began at 9:30, and was kept up until 1 o'clock, when a recess was taken and a turkey dinner served. Not one of the shooters missed this event, and they all made clean scores. After dinner Nichols brought out his rifle, and a match for a turkey was shot. The entries were: Rhoads, Gross, Shattuck, Nichols, Fink, Fosh, Darby, Holman, Lacey and Fisinger. Fink and Shattuck tied, and Fink won the shoot-off. Turkeys were won by Rhoads, Fisher, Cumberland, Gross; J. H. Smith, Fosh, Jennings, Bassell, G. M. Smith, Darby, Lacey, Hinkle and Fink. Eleven men shot through the programme. R. S. Rhoads headed the list, as usual, scoring 177, Lou Fisher 163, Cumberland 163, Jennings 160, Fisinger 155, Gross 149, Shattuck 145, J. H. Smith 145, Bassell 141, Wells 139, Fosh 136, G. M. Smith 31 out of 60; Lacey, 51 out of 110; Hinkle, 34 out of 40; Fink, 19 out of 30.

Abner Rhoades, Dayton, is back from a hunt in upper Michigan. He was gone about three weeks, and killed a big buck. Sheriff Frank Smith, Dr. Hostetter and party, of Greenville, have returned from a month's hunt in Maine, where they killed five deer, Sheriff Smith getting two of them.

Adolph Sander and William Sonders, of Dayton, will spend this month hunting quail about ten miles from Huntsville, Ala., where they will be the guests of Lou Miller, who formerly lived on a farm on the Xenia pike, east of Dayton. Mr. Miller invited them to spend the month with him and enjoy all the quail shooting they wanted on "the best quail grounds in the world." Sander will have his prize-winning pointer, Topsy S., and Sonders will have an imported German dog.

E. A. Pierce and Harry George were hunting near Lancaster, and relate a curious incident. George was new at hunting and was therefore allowed to carry the game, which Pierce should. After some time spent in hunting without getting any birds, George vaulted over a fence, and landed in the midst of a bevy, killing four of them. This was the only game killed on the day.

Here's another yarn most as good. Engineer Collins, of the Big Four, states that on his trip when between Tiffin and Watson, he ran into a bevy of quail on the wing. The birds struck the headlight with sufficient force to break the glass, and when repairs were made, two dead quail were found within the headlight.

Representative Earle Stewart, of Clark county, proposes to introduce a bill in the next Legislature providing that no quail shall be killed for a period of three years. He believes that the bill will receive a large support, and feels that this is the only way to prevent the extermination of quail in the State. Hunters in different parts of the State report quail unusually scarce this season, and such a bill would probably receive the support of very many sportsmen.

The Cleveland, O., Gun Club held a shoot on Thanksgiving Day, fifteen members being present. The day was cold, snowy and blustery, not at all ideal for trapshooting. The programme called for ten 15-target events, and eleven men went through in spite of the weather. Geo. Burns and Sheldon tied for high gun on 133. J. S. 125, Doolittle 121, Allyn 120, Hogen 119, Ledgett 116, Hopkins 111, Tamblin 109, Kramer 106, Rice 104. The club will hold a tournament on New Year's Day.

Baltimore Shooting Association.

THE Baltimore, Md., Shooting Association gave its first Thanksgiving shoot at the club grounds on Thursday. The prizes were turkeys.

A very high wind made shooting difficult, and in the events many of the targets were not broken until they "hit" the ground. The turkey events were 15 targets each. Mr. Hood Waters won high honors and fowls. He secured two fine gobblers, and there were no other experts who won more than a single bird.

Scores made in the five events by those winning turkeys were as follows:

Table with 2 columns: Name and Score. Waters 13 13 14 10 14, German 13 13 13 14 12, etc.

Others who shot were: J. R. Malone, Thompson, King, France, etc.

In the shoot at "white flyers," sweeps of 8 birds, \$3 entrance each, results were as follows:

Table with 2 columns: Name and Score. J. R. Malone 8, France 7, German 6, Waters 6, Moxley 7, Baskerville 7, Biddle 7, Mears 6.

Mr. Lester German, of Aberdeen, Md., a member of the Baltimore Shooting Association, is to captain a team of trapshooters from Perryman, Md., in a team match of ten men each, against a team from the B. S. A., captained by Mr. J. R. Malone. The match will be shot at Perryman, and each man is to shoot 50 targets. The New Perryman Club has well appointed grounds, and much interest will be taken in the shoot.

A SOCIAL TRAMP.

Sheepshead Bay Gun Club.

SHEEPSHEAD BAY, L. I., Nov. 30.—A good crowd filling the club house to the limit was present to enjoy the competition either as contestants or spectators. It was a good shoot. There was a plenty of wind to help the targets in the way of accelerated and erratic flights. Mr. Every Wingate, son of Mr. Chas Wingate, of Dean Richmond Cup fame, was present and shot along.

Messrs. J. A. R. Elliott and H. S. Welles represented the trade.

Table with 2 columns: Name and Score. Events: 1 2 3 4 5 6 7, Targets: 15 15 15 15 15 15, Schorty 12 11 11 11 12, etc.

Northern Kentucky Gun Club.

BELLEVUE, Ky., Nov. 26.—The doings of the Northern Kentucky Gun Club comprised that Henry Riley was appointed deputy sheriff to insure order at the grounds. This club contemplates a live-bird shoot in the near future. Announcement of it will be made later. We are rapidly getting the grounds in first-class order. Many members being out hunting accounts for the small attendance. The election of officers at our last meeting was as follows: President, Geo. Dameron; Vice-President, Barney Forstner; Secretary, Geo. W. Frost; Treasurer, C. E. Cunningham; Alfred Gowling, Captain at Grounds. Committee: Alfred Gowling, Chas. Cunningham and Dr. J. P. Gould.

Our endeavor shall be to make this club second to none in this vicinity. Scores, 50 targets:

Table with 2 columns: Name and Score. R. Trimble 48, E. Trimble 46, Gosters 45, Kline 42, Forstner 42, Frost 42, Gould 41, Dameron 39, Walker 36, Back 36, Steinfeld 35, Dr Hill 34, Williams 29, Myers 26, Cunningham 23, Geo. W. Frost, Sec'y.

cleans out powder residue. Lubricates, never gums; 2oz. bottle, 10c. —Adv.

Crescent Athletic Club.

BAY RIDGE, L. I., Nov. 30.—The Thanksgiving Day shoot of the Crescent Athletic Club was well attended, notwithstanding that the weather was cold and that a raw, blustering wind, almost a gale at times, prevailed throughout the day. Fourteen events were contested, and about 2,500 targets were thrown. The main contest was for the holiday-cup, and eighteen shooters participated. The victor was Mr. A. E. Hendrickson, who scored 22, his four handicap allowance being of winning value. Mr. A. G. Southworth, a scratch man, scored 23, and with him three others, Messrs. H. B. Vanderveer, W. C. Damron and C. E. T. Foster tied for second.

Mr. O. C. Grinnell, Jr., was first in the Stake trophy contest with a score of 22.

In a team race, Messrs. A. G. Southworth and Frank Stephenson were captains, and Southworth's team won by a total of 78 to 70. The scores follow:

Table with 3 columns: Name, Hdp., Brk., Tot'l. A. E. Hendricks 18 22, A. G. Southworth 20 20, H. B. Vanderveer 17 20, etc.

Turkey shoot, 25 targets, handicap: Jere Lott 23, A. G. Southworth 22, F. B. Stephenson 20, O. C. Grinnell, Jr., 20, J. H. Ernst 20, A. E. Hendrickson 19, J. P. Fairchild 16, H. B. Vanderveer 16, George Brewer 14, L. C. Hopkins 12.

Table with 3 columns: Name, Hdp., Brk., Tot'l. O. C. Grinnell, Jr. 21 21, Dr. Keyes 20 21, W. C. Damron 17 21, etc.

Team shoot, 15 targets, scratch: Stephenson (captain) 8, Grinnell 12, Hopkins 9, Vanderveer 7, George Brower 10, Fairchild 7, Brown 7, E. C. Brower 1; total, 70.

Southworth (captain) 12, Hendrickson 7, Lockwood 10, Bissing 11, Ernst 5, Damron 11, Marshall 12, Bennett 10; total, 78.

Trophy shoot, 15 targets, handicaps in parentheses: Stephenson (0) 13, Hendrickson (2) 12, Ernst (4) 12, Vanderveer (1) 10, Fairchild (3) 10, G. Brower (3) 8, Grinnell (0) 9.

Trophy shoot, 15 targets, handicap: Grinnell (0) 14, G. Brower (3) 14, Fairchild (3) 11, Ernst (4) 10, Stephenson (0) 10, Vanderveer (1) 10, J. Lott (0) 9, Southworth (0) 9, Hendrickson (2) 8.

Shoot-off, same conditions: G. Brower (3) 12, Grinnell (0) 8.

Trophy shoot, 15 targets, handicap: Marshall (2) 12, Bissing (1) 12, Southworth (0) 11, Lockwood (1) 11, Foster (0) 10, Vanderveer (1) 10, Hopkins (1) 9, Ernst (4) 9, Keyes (0) 9, Hendrickson (2) 8, Burnett (1) 8, Grinnell (0) 7, Stephenson (0) 6, Damron (2) 6.

Shoot-off, same conditions: Bissing (1) 10, Marshall (2) 8.

Trophy shoot, 15 targets, handicap: G. Brower (3) 13, Hopkins (1) 13, Stephenson (0) 12, Vanderveer (1) 11, Bennett (1) 11, Browne (4) 10, Damron (2) 9, Hendrickson (2) 9, Lockwood (0) 9, Grinnell (0) 8, Bissing (1) 8, E. Brower (4) 8, Marshall (2) 7, Ernst (4) 7.

Shoot-off, same conditions: Hopkins (1) 11, G. Brower (3) 8.

Trophy shoot, 15 targets, handicap: Damron (2) 15, Marshall (2) 15, Southworth (0) 13, Foster (1) 13, Stephenson (0) 12, Grinnell (0) 10, Lockwood (0) 10, Bissing (1) 9, Fairchild (3) 7.

Shoot-off, same conditions: Damron (2) 13, Marshall (2) 11.

Trophy shoot, 15 targets, handicap: Southworth (0) 14, Grinnell (0) 13, G. Brower (3) 13, Damron (2) 13, Stephenson (0) 12, Bennett (1) 12, Marshall (2) 11, Foster (0) 11, Hopkins (1) 11, Hendrickson (2) 10, Lockwood (0) 9, Bissing (1) 9, Keyes (0) 9, Ernst (4) 7.

Trophy shoot, 15 targets, handicap: Southworth (0) 14, Hopkins (1) 12, Hendrickson (2) 11, Grinnell (0) 10, Marshall (2) 10, Lockwood (0) 10, Foster (0) 9, Keyes (0) 7.

Trophy shoot, 15 targets, handicap: Southworth (0) 12, Grinnell (0) 11, E. Brower (4) 11, Stephenson (0) 10, Fairchild (3) 10, Ernst (4) 9, Vanderveer (1) 9, Hendrickson (2) 8, Palmer (0) 8.

The first of the December contests of the Crescent Athletic Club took place Dec. 2. Mr. D. C. Bennett scored a win on the December cup, with a full score of 25, handicap allowance included. A murky sky caused a dull light. Mr. Lowell M. Palmer won a number of prizes. Scores:

Stake trophy, 25 targets, handicap: A. G. Southworth (0) 22, F. B. Stephenson (0) 22, L. M. Palmer (0) 23, W. W. Marshall (3) 16, W. C. Damron (4) 19, J. N. Teeter (4) 19, L. C. Hopkins (3) 25, D. C. Bennett (2) 23, S. P. Hopkins (4) 24, J. J. Keyes (1) 21, J. H. Ernst (7) 25, H. B. Vanderveer (3) 17, F. C. Raynor (4) 23.

Shoot-off: L. C. Hopkins 25, Ernst 21.

December cup, 25 targets, handicap: A. G. Southworth (0) 21, F. B. Stephenson (0) 19, W. C. McConville (2) 16, L. M. Palmer (0) 22, W. W. Marshall (3) 15, W. C. Damron (4) 17, J. N. Teeter (4) 17, L. C. Hopkins (3) 21, D. C. Bennett (2) 25, S. P. Hopkins (4) 19, C. A. Lockwood (1) 22, J. H. Ernst (7) 16, H. B. Vanderveer (3) 12, F. C. Raynor (4) 20.

Two-man team shoot, 25 targets, handicap: L. M. Palmer (0) 20, L. C. Hopkins (3) 24; total 44.

A. G. Southworth (0) 21, W. W. Marshall (3) 16; total 37.

J. J. Keyes (1) 20, J. N. Teeter (4) 17; total 37.

A. E. Hendrickson (4) 14, C. A. Lockwood (1) 20; total 34.

Team shoot, 15 targets, scratch: A. G. Southworth (captain) 15, J. J. Keyes 12, C. A. Lockwood 11, W. W. Marshall 10, W. C. Damron 9, H. B. Vanderveer 10, A. E. Hendrickson 12; total 79.

L. M. Palmer (captain) 15, D. C. Bennett 14, L. C. Hopkins 8, F. C. Raynor 13, S. P. Hopkins 10, J. N. Teeter 11, J. H. Ernst 8; total 79.

Shoot-off: Captain Palmer 14, Captain Southworth 11.

Trophy shoot, 15 targets, handicap: A. G. Southworth (0) 11, F. B. Stephenson (0) 12, W. J. McConville (2) 12, W. C. Damron (2) 10, J. N. Teeter (2) 9, L. C. Hopkins (1) 4, D. C. Bennett (1) 13, W. W. Marshall (2) 13, S. P. Hopkins (2) 13, C. A. Lockwood (0) 13, J. H. Ernst (4) 15. Won by Ernst.

Trophy shoot, 15 targets, handicap: A. G. Southworth (0) 12, F. B. Stephenson (0) 10, W. J. McConville (2) 11, L. M. Palmer (0) 14, W. C. Damron (2) 10, J. N. Teeter (2) 11, L. C. Hopkins (1) 11, D. C. Bennett (1) 10, S. P. Hopkins (2) 9, C. A. Lockwood (0) 10, J. H. Ernst (4) 10. Won by Palmer.

Trophy shoot, 15 targets, handicap: A. G. Southworth (0) 13, F. B. Stephenson (0) 14, W. J. McConville (2) 8, L. M. Palmer (0) 15, W. W. Marshall (2) 15, W. C. Damron (2) 10, J. N. Teeter (2) 8, F. C. Raynor (2) 14, S. P. Hopkins (2) 10, C. A. Lockwood (0) 12, J. H. Ernst (4) 14.

Shoot-off: Palmer 14, Marshall 10.

Trophy shoot, 15 targets, handicap: A. G. Southworth (0) 14, L. M. Palmer (0) 13, C. A. Lockwood (0) 11, W. W. Marshall (2) 12, W. C. Damron (2) 11, S. P. Hopkins (2) 9.

Shoot-off: Southworth 11, Bennett 10.

Trophy shoot, 15 targets, handicap: A. G. Southworth (0) 11, L. M. Palmer (0) 14, W. W. Marshall (2) 9, W. C. Damron (2) 8, A. E. Hendrickson (2) 10, C. A. Lockwood (0) 10, L. C. Hopkins (1) 8, D. C. Bennett (1) 10.

Trophy shoot, 15 targets, handicap: A. G. Southworth (0) 11, L. M. Palmer (0) 14, W. W. Marshall (2) 9, D. C. Bennett (1) 10, A. G. Hendrickson (2) 10, C. A. Lockwood (0) 10, L. C. Hopkins (1) 8. Won by Palmer.

Trophy shoot, 15 targets, handicap: A. G. Southworth (0) 14, F. B. Stephenson (0) 12, W. J. McConville (2) 10, J. N. Teeter (2) 10, W. C. Damron (2) 8, D. C. Bennett (1) 11. Won by Southworth.

The December handicaps of the Crescent Athletic Club shooters were materially changed from those of November. The list of shooters is strong in number and skill, and is increasing at a pleasing rate, seventy-nine being on the list at present. The first row contains the handicaps in 25-target events; the second row, 15 target events, and the third row, in doubles:

Table with 3 columns: Name, Hdp., Brk., Tot'l. H. M. Brigham 0 0 0, D. C. Bennett 2 1 2, H. S. Bissing 2 1 2, etc.

Table with 3 columns: Name, Hdp., Brk., Tot'l. W. H. Cornell 8 5 5, E. A. Cruikshank 7 4 4, E. F. Driggs 6 3 4, etc.

Ossining Gun Club.

OSSINING, N. Y., Nov. 25.—At the annual meeting of the Ossining Gun Club, at the Weskora Hotel, 22d inst., the following officers were elected for 1906: Franklin Brandreth, President; Edw. McDonald, Vice-President; Gaylord B. Hubbell, Secretary; Amos Bedell, Treasurer; Chas. G. Blandford, Financial Secretary and Captain; John T. Hyland, Compiler of Scores and Game Warden.

There was a slim attendance at the regular bi-monthly shoot of the Ossining Gun Club to-day. Those who came out had a good time, and the weather conditions were all that could be desired. Mr. Harry Persons Taber, the well-known author, was with us as a spectator, and as he wouldn't shoot, he had to score, which he did willingly.

Events 4 and 6 were from 20yds., use of both barrels allowed. Events 7 and 8 were "sniping" events, shooters walking diagonally from the field toward the traps, gun below elbow; one barrel; targets thrown by puller any time, between 25 and 16yds. This was heaps of fun. Messrs. Mead and Hyland were shooting strange guns.

Table with 2 columns: Name and Score. Targets: J. T. Hyland 10 10 10 10 10 10 5 5 25, Edw. McDonald 5 5 4 4 5 5 2 2, etc.

Nov. 31.—There was plenty of sport at the Thanksgiving Day poultry shoot of the Ossining Gun Club. The shooting did not start till 2 P.M., and as it was quite dark at 5, things had to be hustled considerably. Mr. B. S. White, who hails all the way from West Va., but who is at present situated in New York city, came up to look on, and was beguiled into trying one event, in which he did well with a strange gun. We will be glad to see him up this way at any time.

We used a sort of sliding distance handicap to-day. The main object was to give every one a chance at a fowl, and if the handicaps proved a little severe for some, they did not bother Ray Hendricks, who got two ducks and two turkeys to lug home.

There was a strong, cutting wind blowing across the traps, which caused the bunches of "goose eggs" recorded. J. T. Hyland got a 19 out of 20, which was the nearest to a straight made in the 20-target events, though Hendricks and Clark both knocked out a straight in the preliminary (10) target events. Targets were thrown at one cent each, and the poultry went at cost, so that no profits accrued to the club.

Table with 2 columns: Name and Score. Targets: J. C. Barlow 10 10 10 10 20 20 20 20, Ray Hendricks 6, A. L. Burns 7, etc.

The sixth prize event was drawn for, as it was too dark to see the targets. A. Aitchison won the turkey; Tillitson won the duck and D. Connors got the chicken.

The winners of the poultry were as follows:

Table with 2 columns: Name and Score. Turkeys, Ducks, Chi'k'ns. Hendricks 2 2, Hyland 1, Clark 1, Blandford 1, Bedell 1, Connor 1, Smith 1, Hubbell 1.

Ft. Garry Gun Club.

FT. GARRY, Man.—The prizes won by the high guns in the competition of the Ft. Garry Gun Club for the season of 1905 were: First, Mr. F. G. Simpson, won trophy donated by Lieut.-Gov. Sir D. H. McMillan, with the high aggregate of 90 2-9 per cent.; second, Mr. Thos. Brodie, with 87 3-19 per cent., wins trophy donated by the J. H. Ashdown Hardware Co.; third, Mr. P. Johnston, with 86 3-4 per cent. The averages for the season were:

Table with 2 columns: Name and Per Cent. F. G. Simpson 90 2-9, Thos. Brodie 87 3-19, Paul Johnston 86 3-4, etc.

A trophy awarded by Mr. J. McLeod Holiday to the man making the highest score in any eight shoots of 25 targets each, was won by Mr. Paul Johnston, he breaking 185 targets out of 200.

A prize presented by Mr. J. A. Lindsay to the man in Class B scoring the nearest and under 50 per cent., which was won by Mr. Thos. Cull with 44 1-3 per cent.

Class B: First, Mr. Scott Griffin won trophy donated by the president of the club, Mr. I. Pitblado, with 62 14-23; second, T. Potter, 58 1/2 per cent.; third, F. H. Telfer, 56 4-11 per cent.

New England Kennel Club.

BRAINTREE, Mass., Nov. 25.—The great football game between Yale and Harvard was an attraction which lessened the attendance of the shoot. The only contest held was that for the club cup, a leg on which was won by Mr. A. Hollis White, who broke 20, which, with his allowance of 4, made a total of 24.

SIDE LIGHTS OF TRADE.

"Rifle Practice, Arranged for the Beginner" is a work for gallery and range, specially adapted for schools and colleges, by James E. Bell, Major and Inspector-General of Rifle Practice, District of Columbia Militia. It contains 100 pages of instructive matter, with illustrations of targets, loading implements, positions for different ranges, marking and signalling, sub-skirmish loads, etc. For copy send three cents postage to the publishers, E. I. du Pont Co., Wilmington, Del. Rarely indeed is such a valuable work free to applicants.

No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

**The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.**

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

### THE SMALL BOY'S WEST.

THE frequent accounts in the daily press of small boys who desert their homes in various sections of the country indifferently, to trudge to the Far West for the slaughter of Indians and buffalos, are a true index of the pernicious effects of the "blood and thunder" fiction on the juvenile mind. This class of literature is so prevalent and abundant that it is available for perusal everywhere. It does much to establish false standards of boyish ethics, ambitions and actions. It fosters discontent with home life and its surroundings. It incites to mimetic attempts, with the supernatural boy hero as a model. Frequently it incites to running away from home, and is the genesis of the boy wonder of real life.

The average boy is romantic and visionary. The marvels of adventure appeal strongly to his imagination. The world of fiction is so different from the hum-drum affairs of home life that the latter in time are viewed as being the wasted life for a lad of wit and spirit, who aspires to great deeds of valor, to high place in the affairs of Government, or to position of great wealth and trust in the world of finance. For his success he needs no assurance. His fitness for greatness is vouched for by his own knowledge of his own genius, an attribute so potent that none but that dull creature, a father, could be insensible to its existence.

Under the best of home conditions the average lad at some stage of his boyhood is prone to believe that he is unappreciated and oppressed, that his parents undervalue his high intrinsic worth, and that he is much more capable of managing the family affairs in their social and business aspects than is the old foggy redundancy whom he addresses as father to his face, but flippantly as "the old man" at other times. Indeed, one of his greatest misfortunes is that the accident of life endowed him with such a slow lay figure for a father.

Yet, the office of sonhood is not entirely devoid of compensations. There is always the saving grace that the mother appreciates the son at his true worth. To her he is ever beautiful, witty, noble and destined for great glory and high trusts in the affairs of mankind. Though all others may look upon him as an intolerable cub, composed chiefly of appetite, legs and stomach, to her he is a prince. But over this beneficence there is ever the shadow of the truculent father, the chief enemy to the recognition of the boy wonder. Were there not such a hindrance as a father, to what great heights might he not attain forthwith? Has he not the pertinent authority in his trashy novels for every impossibility?

The marvelous of literature profoundly impress the beliefs of the callow boy, and incites him to seek wealth and glory in the fields depicted in his novels, where boys are appreciated. In his mind, such fields are not within the bounds of home life. He therefore resolves to run away.

The mind of small boys under like conditions seems to work much alike everywhere. In a note to his mother he sets forth the lack of appreciation by those who should take the lead in making much of him, he sheds a tear of sympathy for himself, he adds to his non-ledger account such portion of the family cash as is available, takes the family pistol for armament, sneaks forth in the darkness, and trudges toward the West where Indians and buffalos abound, and where he, mounted on a wild horse, without saddle or bridle, will in due time gallop through the Indian camp, a pistol in each hand, firing right and left, dealing out death with each shot

while you wait. As a side line to the slaughter of the noble red man, he will discover a cave of gold. He tacks on a climax to his career composed of benevolence and self-vindication. He, in his mind's picture, sees himself grown to be an Apollo, rich and famous, arriving at the *porte cochère* of the old farmhouse, with a wheelbarrow loaded with scalps and golden nuggets, attesting to his valor and success. Thus will be brought home to the father full proof of his parental obtuseness, and rich rewards to the mother, whose acumen enabled her to perceive the rare worth of so good a son. Such is the day dream.

The inglorious ending, the fact, takes place soon in some nearby city, where son, pistol and what is left of the non-ledger account, are taken into custody by some obese officer. In due time, son is returned to the parental roof, to be again subjected to the tyranny of frequent gourmandizing, sleeping, frolicking and idling.

Most boys who are habitually bad, or who are disposed to run away from home, have had their minds perverted by the cheap "blood and thunder" literature which is so prevalent. If parents would realize its harm, and interdict the reading of it, the boy's mind would be kept free from a mass of pernicious rubbish, his sentiments would be kept at a wholesome and normal stage, and the Indians and buffalos, though few and far away, would be freed from the dangers which have their origin and ending in the small boy's mind.

### THE FOREST RESERVES.

IN the pages of his annual report which treat of the Yellowstone Park, Secretary Hitchcock renewed his recommendation that this reservation shall be so enlarged as to include the Yellowstone Timber Land Reserve, a portion of the Teton Forest Reserve, and one or two other small bodies of land; a total aggregating about 2,200 square miles. The recommendation is not new, for Mr. Hitchcock long ago recognized the importance of the matter and has urged it upon Congress in each of his annual reports for several years past. It has been recommended by many superintendents, and everyone familiar with the situation in the Park—including President Roosevelt—agrees that it ought to be done.

Sportsmen and nature lovers feel that this action is necessary in order to protect from destruction the large wild animals which in summer range in the Yellowstone Park, but in autumn migrate from the high mountains within the Park to lower ground without its borders in search of a winter range where food is not buried beneath the snow. While they are in the lower country great numbers of these animals perish; many being killed for their heads, hides, teeth or meat; or, if they are not slaughtered for such purposes, the country to which they migrate in certain directions is now so full of settlement and so barred by fences, that the game cannot travel about, and in many cases either starves to death or is forced by hunger to break down the settlers' fences and plunder his haystacks.

The practical economist offers other reasons why the Park area should be increased. Within the two forest reserves that ought to be added to it are great bodies of timber, valuable in themselves, but still more valuable in the services which they perform as protections to the water supply of the heads of streams now used, or likely soon to be used, for irrigating the dry plains country below. The addition of these reserves to the Yellowstone Park would place them under the charge of the Superintendent of the Park, whose regular cavalry is far more efficient as a patrol and far swifter to move about than are civil forest officers or State game wardens.

It is essential that as soon as possible all reasonable steps should be taken to protect the Park from danger and to increase its usefulness and beauty. Of the dangers that threaten it one of the greatest is that from forest fires; but the system of fire patrol in the Park is so perfectly organized that while small fires occasionally occur through the carelessness of campers, it is years since any fire has gained sufficient headway to work any great damage to the Park.

Year by year, as the Yellowstone Park becomes better known, its value to the country at large, and especially to visitors from afar and to persons residing near it, becomes more highly appreciated. There is a steady increase in the number of persons who visit it, so that

during the last season this number was more than six times greater than when Fort Yellowstone was established in 1892. The Park is at last coming to be valued at its true worth, and for the sake of the general public and of the resident population about the Park, legislation recommended providing for the increased area should be enacted.

### THE ALASKAN REINDEER.

PRIMITIVE man is a hunter and fisherman. He subsists on the game and the fish. His occupation is to hunt game and to catch fish. When these two sources of supply are taken away from him he is confronted with the problem of finding other means of subsistence. For most races of men the change from the hunting and fishing life to that of pastoral and agricultural is very gradual, the slow change of generations to which the race adapts itself without difficulty. To some people, on the contrary, as to certain tribes of American Indians, the transition comes with cruel suddenness and leaves no interval for preparation and adaptation to the new conditions.

This is precisely the situation of the natives of Alaska. They subsisted by hunting and fishing. The white man came, and, as always where the white man comes, the game was destroyed and the fish were taken in vast quantities by netting; and the result has been that the old tribal life of the Alaskan is no longer possible. To provide a new means of subsistence, the Government has introduced the reindeer into the peninsula, and has undertaken the task of teaching the natives how to use it. The reindeer answers three purposes, transportation, food and clothing. It is the horse of the arctic, its flesh supplies meat, and the hide gives the best of clothing. A reindeer can travel from fifty to one hundred miles in a day, drawing a man on a sledge; eight or ten tandem will draw a ton of freight twenty or thirty miles a day. In herding the reindeer for food and clothing and in employing it for freighting, the Alaskan native has found a means of livelihood. For him the problem of subsistence under the new conditions thrust upon him has, in a large measure, at last been solved.

WHAT may be done for the big game of this continent when its protection is undertaken on a large scale by the Government is admirably illustrated in the report of the Acting Superintendent of the Yellowstone National Park on the game conditions in that reservation.

It is a record of increasing game in this preserve, which has been provided in the midst of a country where the story is all of diminution. We shall not rightly appreciate the report and what it means, unless we shall reflect upon what the conditions would have been respecting these elk and deer and antelope and mountain sheep, had there not been for them through the last ten years this harbor of refuge. What has been done in the Yellowstone for the preservation of American big game species may be done in the Government reservations. Make game preserves in the forest reserves suited to the purpose. Utilize the opportunities ready to hand to perpetuate for the generations which are to follow some of the primitive plentitude of wild life which our fathers found here and which we have enjoyed.

It was not so long ago that we printed a reminiscent paper written by one of the older generation of sportsmen, who made their favorite headquarters at Barnegat, in which the writer deplored the passing of the ancient order and the glorious opportunities of the past. And now comes another correspondent, who writes with the most genuine satisfaction of the sport to be had on the Barnegat of to-day, and reciting that he has found the fowl there in goodly supply for himself and for all who will follow his example.

THE organization of the American Bison Society, which has been formed for the purpose of devising ways and means to perpetuate the buffalo, is a most gratifying and encouraging event. The Society is an outgrowth of the agitation of the subject by Mr. Ernest Harold Baynes, who is to be congratulated on having drawn to the cause such a substantial support as is indicated in the list of those who have associated themselves with him. The purpose is one which should appeal, and we believe does appeal to this whole country; and the American Bison Society will have cordial support.

## THE SPORTSMAN TOURIST

### In the Lodges of the Blackfeet.

for Horses.

(Continued from page 467.)

The young and middle-aged men of the tribe were constantly setting out for, or returning from war, in parties of from a dozen to fifty or more. That was their recreation, to raid the surrounding tribes who preyed upon their vast hunting ground, drive off their horses, and take scalps if they could. It was an inspiring sight to witness the return of a party which had been successful. A few miles back from camp they would don their picturesque war clothes, paint their faces, decorate their horses with eagle plumes and paint, and then ride quietly to the brow of the valley overlooking the village. There they would begin the war song, whip their horses into a mad run, and, fringing guns and driving the animals they had taken before them, charge swiftly down the hill into the bottom. Long before they arrived, the camp would be in an uproar of excitement, and the women, dropping whatever work they had in hand, would rush to meet them, followed more slowly and sedately by the men. How the women would embrace and hang on to their loved ones safely returned; and presently they could be heard chanting the praises of husband, or son, or brother. "Fox Head has returned!" one would cry. "Oh, Ai! Fox Head, the brave one, has returned, driving before him ten of the enemies' herd. Also, he brings the scalp of an enemy whom he killed in battle. Oh, the brave one! He brings the weapons of this enemy he killed; brave Fox Head!"

And so it would go on, each woman praising the valor of her particular relative; and then the returned warriors, tired, hungry, thirsty, but proud of their success and glad to be once more at home, would retire to their lodges, and their faithful women folk, mother and wife, and sister, would hasten to prepare for them a soft couch, and bring cool water, and set out a feast of the choicest meat and pemmican and dried berries. They were so happy and so proud, that they could not sit still; and every now and then one of them would go out and walk about among the lodges, again chanting praise of the loved one.

No sooner did one of these parties return than others, incited by their success and anxious to emulate it, would form a party and start out against the Crows, or the Assinaboines, or perhaps the Crees, or some of the tribes on the far side of the Back-bone-of-the-world, as the Rockies were called. Therefore, I was not surprised one morning to be told that they were about to start on a raid against the Assinaboines. "And you can go with us if you wish to," Talks-with-the-buffalo concluded. "You helped your friend to steal a girl, and you might as well try your hand at stealing horses."

"I will," I replied. "I'll go with you; it is just what I have been longing to do."

When I told Berry of my intention, both he and his wife protested strongly against it. "You have no right to risk your life," he said, "for a few cayuses." "Think how your people would mourn," said his wife, "if anything should happen to you."

But my mind was made up; I was determined to go, and I did; but not for the intrinsic value of any horses or other plunder that I might obtain; it was the excitement and the novelty of the thing which attracted me. There were to be thirty of us, and Heavy Breast, a grim and experienced warrior of some forty years, was to be our partisan or leader. He himself was the owner of a medicine pipe, which was considered to have great power. He had carried it on many an expedition, and it had always brought him and his parties good luck, taken them through various conflicts unharmed. But for all this, we had to get an old medicine man to pray with us in the sacred sweat lodge before we started, and to pray for us daily during our absence. Old Lone Elk was chosen for this responsible position; his medicine was of great power and had found favor with the Sun these many years. The sweat lodge was not large enough to accommodate us all, so half of the party went in at a time, I remaining with my two friends and going in with the last division. At the entrance of the sweat lodge we dropped our robes or blankets, our only cov-

ering, and creeping in at the low doorway, sat around the interior in silence while the red hot stones were passed in and dropped in a hole in the center. Lone Elk began to sprinkle them with a buffalo tail dipped in water, and as the stifling hot steam enveloped us, he started a song of supplication to the Sun, in which all joined. After that the old man prayed long and earnestly, beseeching the Sun to pity us; to carry us safely through the dangers which would beset our way, and to give us success in our undertaking. Then the medicine pipe was filled, lighted with a coal which was passed in, and as it was passed around, each one, after blowing a whiff of smoke toward the heavens and the earth, made a short prayer to the Sun, to Old Man and mother earth. And when my turn came, I also made the prayer, audibly like the rest, and to the best of my ability. No one smiled; my companions believed that I was sincere in my avowal to be one of them in word, thought and deed. I wanted to know these people; to know them thoroughly; and I considered that the only way to do so was for a time to live their life in every particular in order to win their entire confidence. And so I made an earnest prayer to the Sun, and I thought of something I had learned in other days in a far-away country: "Thou shalt have none other gods before Me," etc. I believed all that once, and listened to a blue Presbyterian preacher of a Sunday threatening us with hell's fire and brimstone, and the terrible anger of a vengeful God. Why, after hearing one of those sermons I was afraid to go to bed, lest in my sleep I should be snatched into purgatory. But all that was now past; I had no more faith, nor fear, nor hope, having concluded that one can only say, "I do not know." So I prayed to the Sun with right good will in the furtherance of my plan.

It was getting late in the season, and the Assinaboines were thought to be a long way from us, somewhere near the mouth of the Little River, as the Blackfeet named the stream we call Milk River. So it was decided that we should set out on horseback instead of afoot. The latter was the favorite way of making a raid, for a party traveling in that manner left no trail, and could effectually conceal themselves during the daytime.

So one evening, led by our partisan, we set forth and traveled southeastward over the dark plain, paralleling the river. My companions were not the befringed and beaded and painted and eagle plume decked warriors one reads about and sees pictured. They wore their plain, every-day leggings and shirt and moccasins and either the blanket or the cowskin toga. But tied to their saddles were their beautiful war clothes, and in a small parfleche cylinder their eagle plume or horn and weasel skin head dresses. When going into battle, if there was time, these would be donned; if not, they would be carried into the fray, for they were considered to be great medicine, the shirt especially, upon which was painted its owner's dream, some animal or star or bird, which had appeared to him during the long fast he made ere he changed from careless youth to responsible warrior.

We rode hard that night, and morning found us within a short distance of the mouth of Marias River. In all directions buffalo and antelope were to be seen quietly resting or grazing; evidently there were no other persons than us anywhere in the vicinity. "It will not be necessary to hide ourselves this day," said Heavy Breast, and detailing one of the party to remain on the edge of the bluff for a lookout, he led us down into the valley, where we unsaddled and turned our horses out by the stream—all but Weasel Tail and I; we were told to get some meat. A charge of powder and a ball meant much to an Indian, and as I had plenty of cartridges for my Henry rifle, and could get plenty more, it fell to me to furnish the meat—a pleasant task. We had not far to go to find it. Less than half a mile away we saw a fine band of antelope coming into the valley for water, and by keeping behind various clumps of sarvis and cherry brush, I managed to get within a hundred yards of them, and shot two, both bucks, in good order. We took the meat, the tongues, liver and tripe and returned to camp, and every one was soon busily roasting his favorite portion over the fire, every one except Heavy Breast. To him fell always the best meat, or a tongue if he wanted it, and a youth who was taking his first lesson on the war trail

cooked it for him, brought him water, cared for his horse, was, in fact, his servant. A partisan was a man of dignity, and about as unapproachable as an army general. While the rest chatted and joked, and told yarns around the camp-fire, he sat apart by himself, and by a separate fire if he wished it. He passed much time in prayer, and in speculating regarding the portent of his dreams. It often happened that when far from home and almost upon the point of entering an enemy's village, a partisan's dream would turn the party back without their making any attempt to accomplish this object. The Blackfeet were very superstitious.

After leaving the Marias, we were careful to conceal ourselves and our horses as well as possible during the daytime. We skirted the eastern slope of the Bear's Paw Mountains, the eastern edge of the Little Rockies—in Blackfoot, Mah-kwi' is-stuk-iz: Wolf Mountains. We expected to find the Gros Ventres encamped somewhere along here—it will be remembered that they were at this time at peace with the Blackfeet—but we saw no signs of them less than four or five months old, and we concluded that they were still down on the Missouri River. Wherever we camped, one or more sentinels were kept posted in a position overlooking the plains and mountains roundabout, and every evening they would report that the game was quiet, and that there was no sign of any persons except ourselves in all that vast region.

One morning at daylight we found ourselves at the foot of a very high butte just east of the Little Rockies, which I was told was the Hairy Cap, and well was it named, for its entire upper portion was covered with a dense growth of pine. We went into camp at the foot of it, close to a spring and in a fine grassy glade entirely surrounded by brush. Talks-with-the-buffalo and I were told to ascend to the summit of the butte and remain there until the middle of the day, when others would take our place. We had both saved a large piece of roast buffalo ribs from the meal of the previous evening, so, drinking all the water we could hold and lugging our roast, we climbed upward on a broad game trail running through the pines, and finally reached the summit. We found several war houses here, lodges made of poles, brush, pieces of rotten logs so closely laid that not a glimmer of a fire could shine through them. It was the way war parties of all tribes had of building a fire for cooking or to warm themselves without betraying their presence to any passing enemy. We saw six of these shelters, some of them quite recently built, and there were probably more in the vicinity. My companion pointed out one which he had helped build two summers before, and he said that the butte was frequented by war parties from all the tribes of the plains, because it commanded such an extended view of the country. Indeed it did. Northward we could see the course of Milk River and the plains beyond it. To the south was visible all the plain lying between us and the Missouri, and beyond the river there was still more plain, the distant Snowy and Moccasin mountains and the dark breaks of the Musselshell. Eastward was a succession of rolling hills and ridges clear to the horizon.

We sat down and ate our roast meat, and then Talks-with-the-buffalo filled and lighted his black stone pipe and we smoked. After a little I became very drowsy. "You sleep," said Talks-with-the-buffalo, "and I will keep watch." So I lay down under a tree and was soon in dreamland.

It was about 10 o'clock when he awoke me. "Look! Look!" he cried excitedly, pointing toward the Missouri. "A war party coming this way."

Rubbing my eyes, I gazed in the direction indicated, and saw bands of buffalo skurrying to the east, the west and northward toward us, and then I saw a compact herd of horses coming swiftly toward the butte, driven by a number of riders. "They are either Crees or Assinaboines," said my companion; "they have raided the Crows or the Gros Ventres, and fearing pursuit, are hurrying homeward as fast as they can ride."

Running, leaping, how we did speed down the side of that butte. It seemed but a moment ere we were among our companions, giving our news. Then what a rush there was to saddle horses, don war clothes and head dresses and strip off shield coverings. And now Heavy Breast himself ascended the side of the butte

until he could get a view of the oncoming party, while I waited for him at its base. He stood there, perhaps a hundred yards from us, looking, looking out over the plain, and we began to get nervous; at least I did. I thought that he never would come down and give us his plan. I must confess that, now the time was at hand when I was to engage in an assault, I dreaded it, and would have been mightily glad at that moment to have safely with Berry away up on the Marias. But there could be no retreat; I must go with the rest and do my share, and I longed to have it all over with.

After a wait of five or ten minutes, Heavy Breast joined us. "They will pass some distance east of here," he said. "We will ride down this coulée and meet them." It wasn't much of a coulée, just a low, wide depression in the plain, but deep enough to conceal us. Every little way our leader would cautiously ride up to the edge of it and look out southward, and finally he called a halt. "We are now right in their path," he said. "As soon as we can hear the beat of their horses' hoofs we will dash up out of here at them."

How my heart did thump, my throat felt dry; I was certainly scared. Like one in a daze, I heard Heavy Breast give the command, and up we went out of the coulée, our leader shouting, "Take courage; take courage! Let us wipe them out!"

The enemy and the herd they were driving were not more than a hundred yards distant when we got up on a level with them, and our appearance was so sudden that their horses were stampeded, some running off to the east and some to the west. For a moment they tried to round them in again, and then we were among them, and they did their best to check our advance, firing their guns and arrows. Some were armed only with the bow. One after another I saw four of them tumble from their horses to the ground, and the rest turned and fled in all directions, our party close after them. They outnumbered us, but they seemed to have little courage. Perhaps our sudden and unexpected onslaught had demoralized them at the start. Somehow, the moment I rode out of the coulée and saw them, I felt no more fear, but instead became excited and anxious to be right at the front. I fired at several of them, but of course could not tell if they fell to my shots or those of our party. When they turned and fled I singled out one of them, a fellow riding a big strawberry pinto, and took after him. He made straight for Hairy Cap and its sheltering pines, and I saw at once that he had the better horse and would get away unless I could stop him with a bullet; and how I did try to do so, firing shot after shot, each time thinking "This time I must certainly hit him." But I didn't. Three times he loaded his flint lock and shot back at me. His aim must have been as bad as mine, for I never even heard the whizz of the bullets, nor saw them strike. On, on he went, putting more distance between us all the time. He had now reached the foot of the butte, and urged the horse up its steep side, soon reaching a point where it was so nearly perpendicular that the animal could carry him no further. He jumped off and scrambled on up, leaving the horse. I also dismounted, knelt down, and taking deliberate aim, fired three shots before he reached the pines. I saw the bullets strike, and not one of them was within ten feet of the fleeing mark. It was about the worst shooting I ever did.

Of course, I was not foolish enough to try to hunt the Indian in those thick pines, where he would have every advantage of me. His horse had run down the hill and out on the plain. I took after it, and soon captured it. Riding back to the place where we had charged out of the coulée, I could see members of our party coming in from all directions, driving more or less horses before them, and soon we were all together again. We had not lost a man, and only one was wounded, a youth named Tail-feathers; an arrow had fearfully lacerated his right cheek, and he was puffed up with pride. Nine of the enemy had fallen, and sixty-three of their horses had been taken. Every one was jubilant over the result. Every one was talking at once, telling in detail what he had done. I managed to attract Heavy Breast's attention. "Who were they?" I asked.

"They were Crees."

"How could you tell that they were?"

"Why, I understood some of the words they shouted," he replied. "But even if they had not uttered a sound, I would still have recognized them by their mean faces any by their dress."

I rode over to one of them lying on the ground nearby. He had been scalped, but I could see that his countenance was quite different from a Blackfoot's face. Besides, there were three blue tattooed marks on his chin, and his moccasins and garments were unlike anything I had seen before.

We changed horses and turned homeward, plodding along steadily all that afternoon. The excitement was over, and the more I thought of it, the more pleased I was that I had not killed the Cree I chased into the pines. But the others; those I had fired at and seen

drop; I succeeded in convincing myself that they were not my bullets that had caused them to fall. Had I not fired as many as twenty shots at the man I chased and each one had sped wide of the mark? Of course, it was not I who laid them low. I had captured a fine horse, one stronger and more swift than my own good mount, and I was satisfied.

We got home in the course of four or five days, and you may well believe that there was great excitement over our arrival, and many a dance with the scalps by those who had at one time or another lost dear ones at the hands of the Crees. Hands and faces and moccasins painted black, bearing the scalps on a willow stick, little parties would go from one part of the village to another, sing the sad song of the dead, and dance in step to its slow time. I thought it a very impressive ceremony, and wish I could remember the song, just for the sake of old times.

Dear old Berry and his wife killed the fatted calf over my safe return; at least we had, besides choice meats and bread and beans, three dried apple pies and a plum (raisin) duff for dinner. And I will remark that the two latter courses were a rare treat in those days in that country. I was glad, glad to get back to the fort. How cheerful was the blaze in the wide fireplace of my sleeping room; how soft my couch of buffalo robes and blankets! I stayed pretty close to them for a time, and did nothing but sleep and eat and smoke; it seemed as if I would never get enough sleep.

WALTER B. ANDERSON.

[TO BE CONTINUED.]

## On Getting Lost.

Editor *Forest and Stream*:

In his article, "On Not Getting Lost in the Woods," Mr. Manly Hardy is rather severe on those "would-be instructors" who assume to teach how to keep from getting lost in the woods. He lumps all such together as novices who could not themselves practice the expedients that they recommend. A sorry bunch of humbugs, truly!

I think that the trouble with some of those writers is in making sweeping generalizations from facts observed in limited areas. For example, in a certain region, perhaps not five miles square, the moss grows thickest on the north or northwest side of the trunks of straight trees, in a majority of instances. From this a hasty observer deduces the rule: "Moss always grows thickest on the north side of a tree." Of course, this is not true. Moss favors that side of a tree which catches and holds the most moisture and at the same time receives plenty of air. Consequently it is thickest on the top of a prostrate log, on the upper side of a leaning trunk, and, usually, but not always, on the most shaded side of a straight trunk, where the woods are thin enough to admit light freely. Where there is a heavy stand of timber the moss grows pretty evenly all around, or its growth may be erratic. If the man who believes unreservedly in the moss theory should rely upon it in the big woods of the Mississippi bottoms, he would find the south looking down upon him from the mid-day sun, for the moss grows evenly up to the level of last spring's overflow.

However, there is such a thing as making too sweeping generalizations in a negative way, and I fear that Mr. Hardy himself has fallen into this error. If I understand him correctly—and his words seem plain enough—he contends that there is no use at all in looking for natural signs of direction in any forest; that experienced men never place any reliance on them; that "a good woodsman finds his way, just as an animal does, by a certain kind of instinct"; that it is useless to offer novices any counsel as to how to find their way out of the woods, because a lost man is an insane man anyway; and that the only advice worth giving is that "you had better never get lost." To each and to all of these conclusions I respectfully demur. They may hold good in some cases; but not, by any means, in a majority of cases.

Mr. Hardy's article seems to have been called out by Mr. E. A. Spears' note on the prevailing easterly inclination of the feathery tip of the hemlock, as observed in the Adirondacks, and by my own corroboration of this habit among the hemlocks of the southern Appalachian forest. Now, Mr. Spears and I were simply reporting facts observed in given localities. Neither of us assumed to base upon them a general law. The hemlocks of Maine may point toward the zenith or the nadir without impugning the reliability of our individual observations.

To make my own position in this matter clear, permit me to quote from an article that I published elsewhere: "No general rule can be established from such signs as the growth of moss on trees, the preponderance of branches on the south side of a tree, or the prevailing direction in which the tips of tall saplings point; although in a given locality such signs may be fairly constant." I then went on to mention a few natural signs of direction that I believed to be fairly constant, such as the thickness of bark and width of annual rings of wood growth in old trees (usually greatest on the north and northeast sides\*), the building habits of certain animals, and especially the habit of the compass-plant and the prairie dock, which, in a majority of cases present the edges of their leaves north and south. My recent note on the hemlock's feather pointing toward the rising sun was by way of illustration of the fact that, in one locality known to me, this is a reasonably true sign of direction. I do not believe that there is

\*This matter was carefully tested some years ago by the New York State Forestry Commission, and the result published in one of their annual reports. I cannot cite volume and page, as my library here in the wilderness is not what you would call extensive.

any one sign which, taken by itself and observed in only a few isolated trees or plants, is worthy of a traveler's confidence; but I do know that many expert woodsmen often steer their course, when the sky is obscured, by observing a great number of the signs which nature places in the forest, and by averaging the results.

To be explicit: Here, where I live now, in the Great Smoky Mountains, is the finest forest of mixed hardwoods and softwoods that remains untouched in America. It contains a greater variety of trees and shrubs than can be found in any one forest outside of these southern Appalachians. The stand, as a rule, is heavy. The country is very rough, the mountains being steep, and rising from three to four thousand feet above their valleys. Some of the summits are higher than Mt. Washington; but there is no tree-limit, save as the beech and birch and buckeye peter out where the balsam begins. Naked rocks of any considerable size are seldom seen. The soil is good to the tops of the highest peaks. A few mountains, known as "balds," are crowned with natural meadows of blue grass, where stock ranges wild through nine months of the year; but everywhere else there is dense forest, matted by luxuriant undergrowth. Greenbriar, dog-hobble, blackberry vines, and other thorny or trippy shrubs, and fallen timber, make travel laborious where there is no trail; but these are nothing compared to the "slicks" of rhododendron which appear in patches of hundreds of acres on many of the abutting ridges and along the headwaters of nearly all of the mountain streams. (Rhododendron is called "laurel" by the natives; we also have plenty of the real mountain laurel, here called "ivy," which grows to a trunk diameter of a foot or more, but it is not so hard to traverse as the other, being larger and growing further apart.) These "slicks" are so called because little if any timber grows in them, and they have a sleek appearance when seen from a distance. Small patches are variously called "wooly-heads," "lettuce beds," "yaller patches," and large ones, especially where they cover cliffs and other impediments, are known as "hells"—well deserving the epithet. The upper mountain region is quite uninhabited.

Now our hunting trips, which are mostly for bears, are in the high mountains. We rendezvous at some hut that herdsman use in summer, perched on the summit of the main divide (the Hall Cabin, for example, straddles the State line, half in North Carolina and half in Tennessee). Our "standers" are picketed for several miles along the divide, at 4,000 to 6,000 feet, and along its abutting ridges, on the various crossings; for the bears mostly den on the bleak and abrupt Tennessee slope and come over to feed on the abundant mast of the gentler and sunnier Carolina slope. The drivers start with the dogs from the creek valleys below.

We are out in all sorts of weather, in rain and snow as well as on clear days, and the chase may continue from dawn until long after dark, the bear perhaps running for ten or fifteen miles through the roughest of all this rough country. When the drivers get into a "slick" so low and dense that they cannot crawl through it nor force a passage, they flounder somehow over the top. It is worse than any canebrake.

Well, the point that I am coming to (although now tempted to run off into a bear story) is this: Of all our difficulties, fog is the worst. Our mountains are called the Great Smoky Range because of the dreamy haze of impalpable mist in which they are always wrapped excepting when hidden in clouds. The latter is often the case. When we are in the clouds we call them "fog." The clouds may descend upon us, or ascend from below, at any time, suddenly, and the fog is sometimes so thick that a man cannot see thirty feet in any direction. It is a very common experience for us to be caught in the fog. It may lift within five minutes, or it may continue for a day, two days, three days—there is no foretelling. It may be accompanied by drenching rain, or by a keen wind, so that we cannot sit around waiting on the chance of its rising. Below the balsam zone, the leaves in autumn lie very thinly upon the ground, so that a scurry of wind may at any moment obliterate the trail for some distance. When the fog settles upon the mountain, a man hurrying along to get into the valley before nightfall, and overconfident, perhaps, of his bearings, may easily miss the trail and find himself on the wrong ridge—where? Once off the trail, there are no blazes to guide him, and the going, at best, is damnable. If one could only see out, he would not hesitate; but he cannot see a tree two rods away. The devil himself might get tangled up here if he ever came so high up in the mountains. (Walt Proctor, who used to live in the "last house," says that he does not—says that Old Nick is "kept too busy down in the settlements.")

It is of serious import for a man, in such case, to decide, rather promptly, on what particular ridge he may have straggled; for many of these ridges are very thickety, some of them lead into "hells," and on others one's progress is impeded by cliffs. To descend immediately into a creek valley would be the worst thing he could do, for the headwaters generally rise in almost impenetrable laurel and their beds are rough and steep.

Now, what does a mountaineer do in such dilemma? Trust to instinct? Not a bit of it. There is not a man in these mountains (nor elsewhere, according to my belief) who is endowed with the homing instinct. Our lost man might not be able to explain his process, he would probably not even be conscious of the infinitude of details involved, but this is what he would do: First, he would scan the trees and shrubs, closely observing their prevailing habit of growth; then he would examine the ground itself; he would move about like a dog scenting for a trail; presently he would find evidence, not single, but collective—gathered from many sources—which his memory and reasoning powers would combine into a theory of locality, and, four times out of five, his theory would prove correct. I have known mountaineers, on a pitch-dark night, to identify the ridge they were on by feeling the trees; and there were no blazes on those trees, either. They did not

learn their woodcraft in the pages of St. Nicholas, nor did their humble pupil, the writer. We depend more often upon natural signs of direction here than we do upon the compass—in fact, I never knew a native mountaineer who had a compass.

It is a common, and perhaps pardonable, weakness of sportsmen to claim great things for their favorite guides. "Incomparable trailers! The best woodsmen I have ever known!" and so forth. Why should they not be, on their own home hunting-grounds? I claim nothing superhuman for my companions in the Smokies; but I do claim that they know the peculiarities of their own grounds most thoroughly, so far as they relate to the hunter's and herdsman's crafts, and that from this intimate local knowledge they have gained certain general signs of direction that are fairly reliable throughout all these mountains, so that they have not the least hesitation about traveling into unknown parts without a compass, even though they may get into fog so thick that, as they quaintly say, "You could stick your butcher-knife into it and hang up your shot-pouch."

But there is no dog-like or pigeon-like instinct about this. I can take one of these same men to the city of Boston and get him thoroughly lost within half a mile of his hotel. If he had the homing instinct he could find his own way back on the city streets; but he has not the ghost of such endowment. He is bewildered by the maze of things new to him, as a city man is in the forest. His attention is attracted by other things than signs of direction. So he goes astray like a child.

Mr. Hardy's advice to "never get lost" is equivalent to saying, "Never let go of your guide's coat-tail." There are men who need it. Most of us prefer to be more independent. We would rather risk getting lost once in a while than miss those joys of real wilderness faring that are only felt when one is alone in the woods with his life in his own keeping. My advice is, "Learn how to bivouac, how to rustle; then, if you do get lost, keep your shirt on." I know all about the panic fear that seizes a man when, for the first time in his life, there comes to him the thudding consciousness that he is alone and lost in the great forest. But I have been in much worse fixes than that, and I say that sensible instruction about what to do when you are lost can arm a novice pretty well against horror and stampede. There are just two situations in which an able-bodied man's case, from losing his direction, is really desperate, namely, to be lost in a blizzard on a treeless plain, or to be lost in a cavern and without a light. Otherwise, if one will keep his wits about him, he always has a good fighting chance. HORACE KEPHART.

MEDLIN, N. C.

## A Fourth of July on the Plains.

Editor Forest and Stream:

We had been out across the staked plains all summer in 1872, going first as far west as old Fort Sumner, then up and down the Pecos River, looking for a band of Indians that we could not find just then. We found them later in the season, though, in a different part of the country. Then, after we had visited Fort Bascom for supplies, we headed east again, and the 3d of July found us in camp on a small pond of good water, something that is not found every day in that country.

Here the commanding officer, General Makenzie, turned the command over to the senior captain, and taking one troop as an escort, went off somewhere. This old captain, who was now in command, was Gen. Napoleon B. McLaughlin. He was quite a character in his way. He had entered the army as a private just before the Mexican War, and had been in it ever since. He was at this time over sixty years of age, and was retired a few years after this; he died only a year or two ago. He was generally called "Maginniss" by the men, not when he was close enough to hear them, though. He dressed in a uniform that looked as if he had first put it on about the close of the war and was trying to see how long he could keep it on. When out on the field he lived on just what we did—coffee, bread and bacon, with generally buffalo roasted, three times a day, if we eat that often; he said that the officer who could not eat what his men did ought to go home and stay there; "they never found him hunting Indians with a pack mule loaded with canned goods." Then he would give one of his peculiar laughs.

When the War of the Rebellion began his regiment was in Texas, and his officers went over to the Confederacy and gave the men who wanted to follow them permission to do so. Those who refused were to be sent north, but they would have to turn in their arms first. McLaughlin was his company's first sergeant then, and when the company was paraded one morning to turn in their arms, he stepped out and taking his musket by the barrel, smashed the stock of it, then throwing it at his captain's feet said, saluting him, "I turn in my gun, sir."

He was sent north and in a short time was given a commission, and at the close of the war commanded a brigade of infantry. He was now only captain in Troop I, the white horse troop of our regiment.

While at breakfast this morning, the Fourth of July, several of our men announced their intention of going hunting to-day, "that is, if Maginniss would let them, but he probably would not."

I wanted to go myself, and thought he would let me; he had never refused me any request I made; but I knew how to go about asking for it.

The old fellow was a brevet brigadier general, and if a man addressed him as general he got what he wanted. If he called him captain he got his head snapped off, and was a marked man. After that he need not ask for anything; he would not get it.

One of the men who wanted to do this hunting to-day had been a school teacher in civil life; he called himself Professor Smith; I had given him his title, and it had stuck to him. He spelled his name Smythe, but much to his disgust could not get the company clerk to spell it that way; he made it Smith. This troop of ours seemed to get about all the representatives of the learned professions, who found their field of active service restricted—by the police in most cases—in the East and had come out here to hunt Indians. We had several lawyers, or rather young men who had begun the study

of law, but had dropped it on the advice of the last old police judge they had been given an interview with, I always thought, and had gone West to fight Indians.

We had doctors; several of them were doctors in fact as well as in name, but we never had a minister; we had his son, though, his father was a noted minister of the Protestant Episcopal Church in London, the son was so worthless that he left us after five years, carrying a bob-tail discharge, one with the character cut off.

Another man that we had was both a chemist and a civil engineer; he had made a fortune out of a stomach bitters that he invented; it was one of the best known of any thirty years ago; he had lost all his money now. Another young fellow, the son of a railroad president, had entered college and had graduated in three months without a diploma; then had run away from home to prevent being again graduated by his father with a cane. He kept on fighting Indians up to the beginning of the Spanish War, then got a commission; he has it yet out in the Philippines, if the Moros have not killed him. If he should see this, he may remember the time that he and I went into a civilized Indian's big cornfield down near Caddo, and started to draw an extra feed of corn for our horses that they did not need very bad, but just missed drawing a load of buckshot that the Indian sent after us.

I told Smith after breakfast to go up and see if the general wanted any hunting done to-day; and taking his carbine he went; but came back in a few minutes wearing a face a yard long and said: "He don't need any hunting from us; we don't belong to Troop I, you know."

"What did he say to you?"

"He told me to go back to where I came from and stay there."

I thought I knew what was wrong. Smith had either called him captain, or what was nearly but not quite as bad, had not called him anything. I took my rifle now and went next, taking care to address him as general. He told me to go, but to keep a good lookout for Indians while out. "It is true, we can't find any here," he said, "but it has been my experience that just when we don't want to find them they find us." And he gave one of his peculiar laughs.

There was a small cañon off to the left of camp, about a mile south of it, that I wanted to explore. It was a box cañon, as I found out next day when I went clear to the head of it. We were still in New Mexico, I knew; but I thought we must be close to the Texas line now, and if so, then there should be a monument, a round pile of loose stone, built somewhere on the edge of this cañon to mark the boundary line. I found it next day at the head of the cañon. The cañon was less than one hundred yards wide here, and a small stream of water stood in pools—there was not enough of it now to run—right in the middle of the cañon.

I followed up close to the edge of the stream. I knew that there were both deer and antelope in the country, and I might meet a bear; we had seen one yesterday when coming in here, but had not been given a chance to go after him. The Indians I did not keep any lookout for. The ones we were after would be sure to get as far from us as possible now, and keep just that far off until we had left the country. We had been after them for years now; and they knew by this time about how long we would keep hunting them here; then when we quit, they would come in here again. I expected that if we found them at all, it would be up in the Texas Panhandle; and that was where we did find them two months after this.

I had gone about two miles up the cañon, when I saw where some animals had come to drink lately; the stones were still wet where they had splashed the water on them; and as soon as I found their trail I saw that they were either deer or antelope. The trail led up the right wall of the cañon, that was here overgrown with bushes, or I hardly could have climbed it and carried a gun.

When I had got to the top, I raised my head slowly above the edge of the bank and now saw the antelope. There was a large bunch of them, but they were half a mile away.

There was not a breath of air stirring; but I did not want to walk across the prairie in plain sight of the antelope, and it was too hot to crawl over it. When coming up the cañon I had noticed another small one coming into it from the right, and thought that it might head close to where the antelope were. Getting down to the floor of the cañon again, I went down to the small one, and started up it; this one was only a ravine. When I thought I had gone far enough up, I climbed up again and found the antelope still about where I had left them and not over two hundred yards away.

Still keeping below the bank, I rested the gun on top of it and had two shots fired before the antelope had begun to move. Then standing up, I kept on shooting until they had got out of range; then going over I began to count the ones that had stopped here. I had four; two of them had been hit before they had begun to run, another had fallen one hundred yards away, and the last one lay about that much further off, or four hundred yards from where I stood to shoot; but I had a .45-90 Marlin rifle, and when one of these big balls did hit an antelope he quit right there.

I had next to drag them to the bank, one at a time, still holding on to my gun; there might be no Indians about, but if any were in the country this shooting would bring them. After getting all the antelope down into the ravine, I next had to get them up into trees to keep them out of reach of the wolves, which were about; and now it was near dinner time and I did not want to miss mine to-day. It would be a little better than usual to-day; this would be the only difference here between this and any other day. Had we been at home we could have celebrated it with a horse race in the forenoon (I had one I could enter), then divide the afternoon between a ball game and a target match.

After dinner I got my horse and a good pack mule, and going out again found my antelope just where I had left them. The wolves out here had not learned to climb trees yet, though when I came in sight I saw several of them, waiting for the trees to fall down on them, I suppose.

I left one of the antelope with the General's cook, he had a mess here composed of officers, who, like the General, did not "hunt Indians with a pack mule loaded with canned stuff."

CABIA BLANCO.

## Future of the Mississippi River.

The Effect that Destruction of Forests will have upon its Headwaters.

CHARLES CRISTADORO, IN "FORESTRY AND IRRIGATION."

The forests have been looked upon by the settler both as an enemy and a friend. Unless the land was cleared of trees, no crops could be raised, and so with ax and saw he felled them. Yet, they gave him the lumber for his house and kept his fireside alight and warm during the long winter days and nights. So fared the giant black walnuts of Indiana in the early days when the massive logs were split and hewed into fence rails, those remaining in excess of the winter's need for fuel piled high afield and burned, as one would to-day in clearing a field of so much brush.

The great Michigan forests of white pine, that nodded to the summer's breeze and swayed before the winter's blasts; appeared not many years ago as inexhaustible and limitless, yet they in time disappeared and vanished as snow upon the yet warm earth, before the ax and saw of the settler and lumberman would make the lumber operators of the present day bankrupt were they to follow them.

As the millions of buffalo disappeared from the face of the earth so have gone the forests of white pine that stood in a continuous, unbroken chain for hundreds of miles.

The forests were made for man to use, says the practical lumberman. 'Tis true, but only in a measure. They were made for man to use and for the use of man. So were the rivers. The water sources, trace them as you may, will be found in the forest. There the spring gives forth its swelling flow that makes the brook, that makes the stream and finally the river as it flows toward and empties itself into the ocean.

Remove the water protecting trees and you interfere with the supply that the springs give forth. In other words, history the world around reveals the fact that with the timber removed from a river's headwaters, so has the death knell of the river been sounded. Examples of this kind can be shown in all countries.

We must have water, whether it comes from subterranean or surface rivers or flowing springs and rippling brooks; it matters not, water we must have, without it we cannot live. To secure this commodity of nature, the great cities spend millions of dollars to follow it to its source, store and lead it to the cities for consumption. The ancient Romans left us a lesson in aqueducts that has been a speaking example.

With the destruction of the timber along the water courses, floods and drouths have followed. Many localities once blessed with abundant flowing water are to-day, at times, through drouth, absolutely deprived of it, because of the denudation of the timber on the sources of the river. Each State has suffered from the encroachment upon its lumber forests and, in some cases, before it was too late, the Legislature has stepped in to save the timber.

When Michigan was being rapidly divested of her great white pine forests, Wisconsin was being entered by the lumberman as a fresh field for lumber exploitation. Minnesota's pine giants were yet untouched. But the day came when the lumbermen cleared Michigan and were swarming like bees into the pine of Wisconsin and then Minnesota's turn came. And now the end of Minnesota's timber is in sight, so much so, that those who have made millions through and by means of her pine forests are to-day investing them in the great fir, spruce and redwood lands on the Pacific coast. The days of the white pine trees are numbered in Minnesota. And during these years one spot in the State of Minnesota has been kept sacred from the ax. It was the Chippewa Reservation covering 800,000 acres, 200,000 of which is water. From this spot the strong arm of the Government held back the lumberman. The pines were sacred and under their branches the Indians lived undisturbed.

Many were the covetous eyes cast upon this reservation as the pines beyond its borders became fewer and fewer. Many were the efforts to secure this land from the control of the Indians. Treaties were made, and, as has been the case with all Indian treaties from the days of Columbus to date, broken.

Then an argument was put forth that the timber in many cases was dead and that windfalls were frequent and that such could be saved and the money given to the Indians, could the trees be cut and removed from the reservation. It was called "dead and down timber," the very name of which is so tainted with fraud, perjury and downright theft that it stinks in the nostrils of every man acquainted with its significance. But a law permitting the removal of the "dead and down timber" went through Congress, and it is stated for every actually "dead and down" tree a thousand thrifty, growing white pine giants were laid low and removed. It grew into such a nauseating, scandalous steal that the very man who fathered the "dead and down" bill, although I will say his intentions were good, was ashamed of its workings.

An effort was successfully made through the Secretary of the Interior to stop this outrage. Then an attempt was made to have the Government protect and shield for the people, this beautiful sylvan paradise, for all time, like the Yellowstone Park, for never did a person visit this region, but that he returned with but one wish and one sentiment, can it not be preserved for all time for the people?

Here is practically the headwaters of the Mississippi, although the river actually springs from Lake Itasca. But these are its headwaters, for here are the three great lakes of Leech, Cass and Winnebigoosh, with seventy smaller lakes, the infant Mississippi connecting them all and meandering among them, making one great checkerboard of stream and lake.

The picture of the giant pines growing even to the water's edge, the wild rice mantling the crystal stream and the phantom-like passing of an Indian-laden birch bark canoe made a picture that took one back to the days

of Fenimore Cooper and made one glad that such a primitive spot yet rested upon God's footstool. With the growth of pine properly cared for under forestry rules this great watershed gave promise of feeding the Father of Waters for all time.

But two billion feet of standing timber was a great temptation to the lumberman and town-site operators, anxious to "skim the cream," and therefore the Morris bill was passed and this great woodland paradise was thrown open to settlement, and the will and wishes of the lumberman and the land speculator.

And now what has happened? The Panama Canal is to be. The whole Mississippi Valley wakes up and looks at the map and cries, "We must now see that our river is deepened. We must profit by the Panama Canal, and we must have a navigable highway, and Congress must help us." Suppose it does take \$50,000,000 to deepen the channels of this great river, they say it's worth it, and they want it done. And while the knocking for this \$50,000,000 appropriation is heard upon the doors of Congress, so too is heard at the same time at this river's headwaters the chug, chug, chug of the keen ax, the rasping of the saw and the crash of the falling giants as they topple daily to the earth in thousands.

The headwaters are being cut out, the very headwaters whence this mighty river is draining her supplies, and the people of the Mississippi Valley, oblivious to what is going on, are beseeching Congress to deepen the river. Cut out and dry up the river's headwaters first and then spend \$50,000,000, yes, \$100,000,000 fruitlessly, to deepen the channel.

## A Kaleidoscopic Sea.

*Editor Forest and Stream:*

One of your contributors, Mr. Charles Cristadoro, has recently called attention to a marvellous marine phenomenon which I have not seen before alluded to by any writer, and which he portrays in the following beautifully descriptive language. The passage appears in the body of an article on "Southern California," as I quote it:

"Gazing out upon the surface of the Pacific when but a slight breeze stirred its surface I there saw reflected in brilliant patches, every color of the rainbow. Upon its gorgeous surface was here a patch of velvety green, there royal purple, pink some other place, deep red, yellow and delicate grays, the changing breeze shifting and graduating these colors until the surface of the ocean at times seemed to be one great rainbow sheet of color. We now and then hear that color photography is an accomplished fact, and after gazing upon the kaleidoscopic-hued surface of the ocean I wondered whether the water, acting as a lens, was not in some way responsible for the fixing of the colors on its surface in the shells of the abalone. The coloring of the abalone shells is one of nature's mysteries, explainable of course, but yet unexplained."

I have myself often noticed these prismatic "abalone colors" along the southern Pacific coast from the heights of Avalon and Point Loma, and wondered at their variety and combination, as well as at the play of light upon their graduated and changing hues; and my observation has discovered that they are imparted to some extent by the floating beds of amber-hued kelp which reflect the chromatic rays of the sunlit atmosphere, as is seen in a mirage, or even in the dancing heat waves on the surface of a furnace. These show the rainbow colors to a perceptible degree. Plausibility is given to this theory by the fact that these results obtain only in a still, warm, sunny atmosphere. There may be other causes such as those which give color to the blue waters of Geneva Lake and the Mediterranean, the greens of Niagara and Lake Michigan, the blacks of Lake Superior and the Saguenay, and the whitish greens of coastwise shoals. Changes of temperature have to do with changes of coloration. The phenomenon of shadows falling on a lake from an overhanging mountain or cliff increasing the transparency of the water by cooling the surface is familiar; but these illustrations do not fully explain the "abalone colors," the patches of "velvety green, the royal purple, the pink, deep red, yellow and delicate grays," and their changing features. The whole subject is not only intensely interesting

but highly poetical, as well as scientific. It presents an ideal theme and an opportunity for poetasters seldom offered or even dreamed of. Will some ambitious muse make an attempt to dye the abalone by lights reflected from the rainbow sheet of colors? CHARLES HALLOCK.

## Cabio Blanco's Writings.

NEW YORK, Nov. 30.—*Editor Forest and Stream:* It is certain that in recent times you have had no writer whose articles appealed to your public so strongly as those written by Cabio Blanco, a name which—to most of us, I think—seems to fit our friend much better than that which was given him in baptism. You have published many enthusiastic letters about his writings, and of these letters not a few have suggested that you should publish a book containing the more important sketches from his pen. No special notice, however, seems to have been taken of these suggestions, and it may be that such a volume would not be commercially profitable. About that you can probably judge better than I.

Might it not be practicable, however, for you to print this book by subscription; that is to say, that you would print it provided a sufficient number of readers agreed to take copies of the book, at whatever price you might see fit to establish. For my part, I should be very glad, indeed, to take five copies at \$2 each, for I am sure that I could dispose of four to the great profit and pleasure of the men I might send them to, while one I should wish to keep for myself.

As has often been said, there was a singular quality about Cabio Blanco's writings and this was their apparent verity. No one ever suggested, in my hearing, that any story told by this man had been in any degree exaggerated. He told his tale and told it with so much force that it was believed. If he did not write what in Boston would be called "literature," he at least told stories so that people were interested in them, believed them and wanted more of them. It seems melancholy that he should have left us. ADMIRER.

# NATURAL HISTORY

## The Crow in Winter.

CHERRYVALE, Kan., Dec. 7.—*Editor Forest and Stream:* The column given to the crow in last week's paper carried me back to the "days befoh de wah," before I made my entrance into Uncle Sam's ranks, to the fall and winter of 1861, when the crows came from some place and gathered in untold hosts, on the farmers' fields along Cayuga Lake, in Tompkins county, N. Y. Where they came from no one knew, but they selected for a roost a body of young second growth oak and hickory timber on the west side of the lake, four miles north from the head of the lake, and about one mile from my father's farmhouse.

In the mornings and evenings they would settle upon the corn shocks in such numbers as to hide the color of the shock, and for the protection of the corn all of the farmer's boys were sent to the fields to drive the crows away and keep them from destroying the corn. It was a great joy to the boy who had one of those old-style single barrel shotguns, to hide in a corn shock and shoot the hungry crows in the mornings and evenings, and we used to have much pride as we carried our trophies home. After two weeks of this work, and after a heavy frost had caused the leaves to fall, the fathers took up the warfare on moonlight nights, shooting at the crows upon their roost, and a week's shooting broke up the roost. But while the crows made a migration elsewhere, all the barns in our section had one side embellished with dead crows fastened on the side with a nail driven through the head, keeping them to scatter on the cornfields the next spring to keep the crows from pulling up the corn.

In this southern section of Kansas the farmer never speaks of him in terms of respect, but generally as "the scussed thieving crows." While the crow may go hungry in the Eastern States in the winter season, he always is sure of a good square meal in this country. As the most of the farmers of this section are cattle feeders they raise immense fields of Kaffir corn, Milo maize, or Jerusalem corn, and the common field corn, which is cut and shocked in the fields, and left standing, until fed out to the stock in wagon loads, and all fed unhusked or unthreshed.

While the Eastern crow may not be an epicure, the Western one is, and scorns the common field corn and acts as if the Kaffir corn and Milo maize, with their round white juicy seeds were as pleasing to his palate as terrapin and canvasbacks are to the Eastern gourmards. So in the fall they gather in this section by thousands and feed in the middle of the day for four or five hours, and then leave for their roosting place, which is unknown to their farmer enemies here.

Two weeks ago, while upon a railway train winding its way through the Flint Hills, which may be termed the rock backbone of the State of Kansas, as they extend from the northern line of the State clear across, rising higher as they extend south, until they unite with the Kiomeche and other mountains of the Indian Territory, as the train was passing up a ravine leading toward the crest of the hills, I noticed in a sheltered nook of the ravine about sixty acres covered with a growth of jack oak timber, that the trees were covered with crows. Look as I might in any direction the air was darkened by the flying crows, slowly winging their way, just at nightfall, to this roost, which they settled upon, to my surprise, without any circling in the air, which may have been caused by their location, so far from any house, that they have not been molested, and so have changed their usual manner of alighting upon the roost.

As this is the only roost known in this part of the

State, the crows that feed upon the grain in the fields of this section have to make a daily flight of over sixty miles coming from and the same distance returning to the roost, and the selection of their roosting place so far from the field of their depredations is only an instance of their sagacity, equalled by the selection of the roost away from all settlement, and in a nook sheltered from the winds from the north and west, as well as the south.

W. F. R.

## Rattlesnakes and Crows.

ST. AUGUSTINE, Fla., Dec. 6.—*Editor Forest and Stream:* Your correspondent who tells "another snake story" in this issue (Dec. 2), only tells what is commonly known in Florida, viz., the spitting, as it is called, of the venom of the rattlesnake when he is aroused to anger and yet is too far away to make the fatal strike. Rattlesnakes confined in boxes with a wire netting have been known to do it. Of course, usually no harm results, as the venom does not reach the object or is caught upon the clothing or upon unbroken skin. The hog, usually considered almost immune and making a meal of every rattler he meets, sometimes seems to have a mistaken confidence, as a short time since a hog in New Augustine (a suburb of our city), jumping on a rattler was bitten and died in a few minutes. The following, coming with the authority of the "Journal of the American Medical Association," will, I am sure, be of interest as showing such accidents are not always fatal. Dr. W. A. Gresham, of Russellville, Ala., records in the Journal:

"A man was bitten Aug. 14 by a very large rattlesnake. For about thirty hours it seemed that he was about to succumb at any time, but he suddenly began to improve. He suffered intensely for twenty-four hours. There was only a little sloughing at the point of injection of the poison, but the man was incapacitated for work about thirty days. As to treatment, the arm was corded tightly, an abundance of whisky was given, and hypodermic injections of strychnin, 1-40 grain every forty-five minutes. He has gone to work and has a good arm."

As to the "Crow in Winter," in same issue, it is a wonder to me that all intelligent crows don't emigrate to Florida, where persecution on account of previous reputation is unknown, and where all little peccadillos are freely forgiven. The Florida crow in either winter or summer has rather an enviable existence, for no man's hand is raised against him. Even as I write a hundred or so are just across the street in the tops of the tall cabbage palmettos that adorn the lawn of the Ponce de Leon. When I opened the door on the porch just now, rather suddenly, a group of them, numbering at least twenty-five who were holding a close conference in the top of a palmetto, were rather surprised and flew away to join their comrades in another part of the lawn. In the fig season about a dozen of them think they are entitled to an early breakfast on their way from their roosting place on Anastasia Island to the country, and announcing their presence by the occasional "caw" of the watchman who sits on the top of a nearby China berry tree. As this is usually about 4 o'clock of a late June morning, they are not often disturbed, and as only figs are taken from the top limbs of the trees, no one begrudges them their early meal. While his wary nature clings to him in Florida yet, as he is never disturbed any more than the buzzard, he is usually quite approachable.

The following from to-day's Record, our local paper, while having nothing to do with snakes or crows, I am sure will be of interest. It comes with the authority of our genial and fearless sheriff:

"Not long ago a Record representative overheard Sheriff Perry relate an experience in turkey hunting in the southwestern part of the State. He and a friend, tempted by the high prices offered for alligator hides, went prepared to clean out the saurians where they were thickest, and they established camp in a spot where hunting promised to be profitable. 'In those days,' said the sheriff, 'turkeys were plentiful and we feasted on them during our stay in camp. One morning, as usual, I went out to get a gobbler for breakfast and saw a flock on a small plain not far from camp. Crawling behind a clump of bushes I resorted to the old trick of calling by imitating the challenge of a gobbler. I saw the leader of the flock throw his head up and I repeated the call. This time the turkey strutted forward a few feet and answered the challenge. He approached a few feet closer when I again repeated the call, and eventually I worked him until he was near enough for a sure shot. I raised the gun to take aim when, without the slightest warning, a huge catanout dashed through the bushes and his head and mine came together in a terrific collision. The beast evidently thought a turkey dinner was waiting for him in the bushes, and approached so stealthily that I had not the slightest idea of his presence. When he made the rush to secure what he supposed was a turkey he struck me with such force that I went over backwards, and he must have bounced a few feet. As to which sustained the greater scare it is impossible to say. The varmint, however, lost no time in apologies, and his retreat was as rapid, if not more rapid, than his rush. Did I get the turkey? No. I think I forgot what I came after. I don't remember what we had for breakfast that morning.'"

DEWITT WEBB.

## The Killing of Bird Warden Bradley.

THE Key West, Fla., Grand Jury, which investigated the killing of the Audubon Society's warden, Guy Bradley, by Walter Smith at Flamingo several months ago, deemed the evidence of the State insufficient to bring the accused to trial. The killing of young Bradley was made an event of general importance, so much so that the National Audubon Society, of which he was a representative as game warden of Monroe county, and while in the discharge of which duty he was killed, took the matter up and employed Col. J. T. Sanders, of Miami, to go to Key West and assist in the prosecution of his slayer.

The Miami Metropolis of Dec. 6 reports: Colonel Sanders, in conversation with a Metropolis reporter, stated that the State made out a very weak case. He found but little interest manifested in the trial when he arrived in Key West, and had to send to the Keys for witnesses. They were secured with much difficulty, and after being gotten could give testimony of no importance to the State in making a case against Walter Smith, the accused, and the grand jury, after thoroughly probing the matter, found no true bill, and Smith was released from prison, where he had been since arrested.

The killing of Bradley occurred on Smith's boat at Flamingo, where Bradley had gone to remonstrate with him about a son killing birds at one of the rookeries in the keys. Bad blood existed between Bradley and Smith, and, after a heated passage of words, both men shot and Bradley was killed, Smith remaining unharmed. Smith, Colonel Sanders says, presented a strong defense in that all his witnesses, those who were on the boat with him at the time Bradley was shot, swearing that Bradley shot first, Smith shooting in self-defense. No others saw the tragedy and consequently the State failed in the prosecution.

## Treatment of Snake Bite.

HOQUIAM, Wash., Dec. 5.—*Editor Forest and Stream:* Some more snake talk. Having just read "The Sang Digger" in the Dec. 2 issue of FOREST AND STREAM, the incident of the rattlesnake that bit him, and the reference to his cutting open and sucking the wound. If he had cut the wound deep enough and then had sucked the wound long enough he would have felt no ill-effects from the snake bite. To have such treatment effective it should be done immediately, and the cutting must go deeper than the snake's fangs had penetrated. After cutting the wound open insert the point of the knife to the bottom of the wound and twist it around several times to cause as great a flow of blood as possible, and be sure and cut across each fang mark; and, if they are cross-cut, it is much better, as that will cause it to gape open more; and, if a mud application is used (which, by the way, is very good), it will have a chance to do more good.

I am not writing from hearsay, for I have treated rattlesnake bite in this manner. I was not the person bitten, but twice I have treated other people that were, and they were both struck in the leg below the knee and well down on the calf of the leg, where it would have been well-nigh impossible for them to have got at the wound to suck it. But I, knowing that such poison is not stomach poison, did not hesitate a moment to apply the treatment, and after the wound was cut (and I cross-cut each of them) I grabbed the leg with both hands around the thigh, and, keeping a strong grip on the leg, pressed them downward to the wound, thus causing a greater flow of blood through the wound, which would wash out much of the poison, and then I sucked the wound for ten or fifteen minutes and then applied a handful of mud and bound it on with a handkerchief. One of the men had to walk two miles to a house, and there I washed the mud out of the wound with hot water and then I tamped it full of powdered alum and then sewed it up. It healed in a short time and he felt no ill-effects from it at any time. The other case was treated in the same way, only the treatment stopped with the application of the mud, which was left on until it was as dry as a brick, it being three days before it was removed. Then the wound was washed with warm water, and, after being dried, a plaster was applied (Brant's plaster) and the leg was bandaged to keep the plaster in place and it healed with no difficulty.

The other person's leg was handaged after it was sewed up, but merely to keep it from being chafed and irritated by his clothing. The alum treatment is not supposed to have any effect on the snake poison, but was applied to insure its healing readily.

W. A. LINKLETTER.

## A Rantankerous Buck.

BARRE, Vt.—*Editor Forest and Stream:* After reading the article in FOREST AND STREAM of Nov. 25, under the heading, "The Deer Park on the Farm," I believe the inclosed clipping just published in a local paper might be interesting, as well as a warning, to some of your readers who now have deer, or may be contemplating establishing a deer park.

I knew old "Ben" and had watched the development of his antlers during the past summer. I drove past the park the day before he met his untimely death. I saw him proudly standing on a little elevation overlooking the highway and he watched me out of sight.

B. A. E.

The report sent by our correspondent follows:

Attacked by an infuriated buck deer, Fred O'Brien, of South Barre, narrowly escaped being stamped and gored to death yesterday, and Charles Marr, owner of the animal, was also knocked down and trampled on, while the animal, in his struggle with seven men, was killed. Either his neck was broken or he was strangled to death. The buck was a beautiful creature, weighing 225 pounds and having a fine pair of antlers. He was one of a herd of six deer, which have been kept by Mr. Marr in a large enclosure at South Barre. The old ones of the herd were caught several years ago while young. The State Commissioner gave Mr. Marr permission to keep them. The family has grown since then until there are now four young deer. The animals have been very tame, but this fall "Ben," the old buck, developed a bad case of temper. Still it was not thought that he would attack their keeper, Mr. O'Brien.

Mr. O'Brien went to the inclosure yesterday with a bushel of beets and potatoes, the usual meal of the animals, and opened the gate. "Faun," the mother of the herd, is always the first one to eat. She took one nibble out of the basket, and "Ben" charged her and Mr. O'Brien in the open gate. The attack was so unexpected that both the doe and Mr. O'Brien were unable to get out of the way. The collision sent the doe floundering against the keeper and knocked him down. The buck then rushed out of the pen and charged the prostrate man, goring him repeatedly. Mrs. O'Brien, who lives close by, was attracted by the noise, and she hastily summoned a neighbor, Mr. Owen. It was none too soon, for Mr. O'Brien would have been killed in a short time. He was finally pulled away from the infuriated animal.

With the aid of several others, "Ben" was forced into the pen. Mr. Marr was called up from this city, and the doe was captured and put back. Thinking that the buck might have gotten over his anger, Mr. Marr stepped inside the gate and walked in for a short distance. As soon as the buck saw him he charged and bowled Mr. Marr over like a nine-pin. But there was plenty of help present then. In fact, almost the entire village of South Barre had been attracted to the place. Mr. Marr was pulled out from under the animal. Thus robbed of his victim, "Ben" made a mad rush against the gate, which gave way before him, allowing him his liberty once more.

Ropes were brought and by the combined strength of seven men "Ben" was finally secured. But he struggled so hard that it broke his neck or strangled him. The animal was five years old, and weighed, dressed, 160 pounds.

Mr. O'Brien's injuries were attended to by a physician. He was not hurt bad enough to confine him to bed, but his escape was remarkable.

## Wild Pigeon Redivivus.

OUR morning paper gives the menus served at the principal hotels in town on Thanksgiving Day. One most prominent hotel, not to be outdone by the lesser important hostelry, includes in its bill of fare "wild pigeon à la Julienne." This is put into the menu as a sort of pièce de résistance.

What first-class hotel thirty of forty years ago would have even made a note on Thanksgiving Day of wild pigeon upon its menu? Wild pigeon that could be bought in the open market for a few shillings per dozen!

But what a change has come about! To-day wild pigeon leads all the rest. But then hotel menus, like other things, must be taken with salt. After having carp served to you under the guise and sauce of "blue-fish à la maitre d'hotel," you can look for anything from a hotel kitchen. But where did the wild pigeon on that bill of fare come from? Thousands of people have asked where did the wild pigeons go—now with me it is, "Where did those wild pigeons come from?" If any pigeon roosts near town had been invaded and the slaughter of old with pole and fusee repeated, certainly we would have heard of it.

I rang up Sam Fullerton, our game commissioner, thinking he might know, but he said he hadn't seen a wild pigeon on his rounds for many, many moons and, like myself, he's wondering, too, where the wild pigeons came from. We are all wishing for a return of the swift flying plenteous birds, and there isn't a right-feeling one of us but who would do his utmost to see them legislated into security until they got a real good start and then be willing to have the bag (it used to be the wagonload) limited to so many and a prohibitive fine imposed for disturbing the roosts.

It's a good sign when wild pigeons, à la any old way, once more appear on the bills of fare—even if they were reared in some hayloft. There may be a few of the original birds left in the country in some out of the way nook, and who knows but some of us may live to see them in their migratory flight again darken the heavens and eclipse the sun. The hide hunter may be held responsible for the disappearance of the buffalo, but he had nothing to do with the vanishing of the wild pigeons.

The buffalos grew less and less year after year, but the wild pigeon vanished in a body off the face of the earth. Until a more plausible explanation of the disappearance of the wild pigeon is given, I am afraid we will have to accept the one of their being caught in an equinoctial storm and carried into the sea and were drowned by the millions. It is the most plausible theory of any that has been advanced as yet.

However, the same master hand that turned blue-fish into carp has again put wild pigeons on our bill of fare. So let us treat this as a harbinger of hope and look once more for the coming of the wild pigeon, and if he does come we'll do our best to keep him with us this time and treat him as kindly as the game laws will permit.

CHARLES CRISTADORO.

## Seashore Life.

*Seashore Life: The Invertebrates of the New York Coast, by Alfred G. Mayer, Director of the Maine Biological Laboratory of the Carnegie Institution at Tortugas, Florida.*

THIS is a book of 181 pages about the size of the Century Magazine, with 119 illustrations, almost faultlessly printed on excellent paper. It forms number one of the New York Aquarium Nature Series, and in the advertisement signed by Mr. C. H. Townsend, the Director of the Aquarium, it is stated that the book is a gift of the author to the New York Zoological Society, and that the proceeds from its sale are devoted to the increase of the collections of the Aquarium.

The title tells but part of the truth, for while Dr. Mayer keeps the invertebrates of the New York coast always before him, he has supplemented them by other invertebrates from all over the seas, so that in truth he has given us a very full list of typical seashore forms. The result is excellent, for instead of leading a novice to suppose or infer that the invertebrates of the New York coast are the only ones to be found, he leads him to a well rounded idea of the marine invertebrates as a whole.

The most striking feature of the work noticed at the first glance is the fidelity and novelty of the illustrations. Of the 119 figures, 111 are derived from photographs by the author, of living or dead specimens, and eight from hitherto unpublished paintings and drawings. This is an almost unprecedented showing in these days of "borrowing" from other books. Moreover, all the pictures are clear and characteristic, and this is sufficient comment for any one who is familiar with the time, skill and patience necessary to make good photographs in this field. Many of them excel the best possible drawings in the wealth of detail and lifelike appearance. Take, for example the picture of the milky-disk jelly fish; or the star coral, showing living polyps. Dr. Mayer brings to the work a long and varied training. He is no closet naturalist, but has traveled widely on zoological expeditions, and the text reflects this first-hand knowledge of the animals in their homes. Throughout the book we discern the enthusiasm of the old-time naturalists and never lose sight of the careful student.

The book is essentially a book of the "Nature Study" sort and is in no sense a text book of Zoology. Says the preface: "The work is intended for readers who may be unfamiliar with the technical terms in use among specialists, and consequently such terms have been avoided whenever a simple English equivalent could be substituted." Dr. Mayer has succeeded admirably in carrying out this idea and the book will offer no difficulties of this sort to the reader. In doing this, the author has avoided the opposite difficulty of "writing down." The book appeals equally to adults and to children of the upper grammar grades. It is equally interesting to read, on the beach with specimens at

hand, or in the home of a winter night.

The introduction (10 pages) presents a summary of many of the broad principles that underlie the study of animal life, e. g., evolution, distribution, embryology, etc., and concludes with a short list of books on the subject.

In the ten chapters following, the animals are brought together in their natural groups as follows: Sponges, Jellyfishes and Hydroids, Sea Anemones and Corals, Starfishes, Worms, Brachiopods, Moss Animals and Corallines, Crustaceans, Mollusks, Tunicates. Each chapter opens with a general description of the group, after which come the detailed descriptions. In these the common name of the animal takes precedence; its economic value to man is always stated, interesting peculiarities are described, the life history and habits are fully presented, and the localities in which it occurs are named. Following the body of the book are five pages of references to books descriptive of the species mentioned in the text, and a good index.

The great merit of the book lies in the skillful selection from the great mass of facts and theories such as will give the reader clear ideas without taxing his patience. Between the text and the photographs the novice may not only identify nearly all the specimens he may find at the seashore, but gain a good notion of the place they occupy in the animal kingdom, as well as a fair understanding of the general principles of zoology. The book is for sale at the New York Aquarium and by A. S. Barnes & Co., publishers. The price is \$1.20.

## The Rattlesnake's Reproduction.

TACOMA, Wash.—*Editor Forest and Stream:* As such an event as seeing a snake born is a rare one, and as I have never heard of anyone assisting at such an affair in a rattler's family, I will relate the matter for the benefit of your readers.

During last September I was camped with my family on the eastern slope of the Cascade Mountains, near Ellensburg, Wash. As is my usual custom, I amused myself by gathering in a few rattlers to nail their hides up on my barn door.

One of them, which was killed late one afternoon (too late to skin that day), was hung on a tree near camp until I could find time to do the work properly. The next morning there was a protuberance sticking out of a wound in the snake's belly, about the size of a small hen's egg. We thought it was only the snake's "innards" exposed, and even when I ripped her open this was cast aside with the entrails. One of my boys is a born surgeon, and critically examines every bug, insect or animal, to find out "why." So he was critically inspecting the off-cast to see just what this snake had eaten last, when he came across the sac and shouted, "Why, that is something the snake has just swallowed, and it is still alive!" I then looked at it more carefully and decided it must be a small rattler which the old snake had swallowed to protect it from harm. I got out my better tools and separated the sac from the other matter and discovered it was a true placenta and concealed therein was a young rattler. I ripped the sac open without extra care and placed the body on a piece of absorbent cloth, without any thought of his being alive, because the mother had been dead over sixteen hours. To our amazement the youngster began to quiver, and in a few moments expanded his lungs and tried to coil. But he, too, had been bruised in the killing of his mother; and after a few drops of blood flowed out on to the cloth he succumbed. By dint of great care I managed to skin him, and now have his hide as one of my trophies.

It had always been my idea, heretofore, that rattlers were hatched from eggs. But this was proof positive to the contrary, which I have added to by investigating many other females. Also, I have been repeatedly told that young ones appear only in June. From what I saw I am led to believe that they come at almost any time (except perhaps when the females are hibernating). The measurements of this young snake were: Length, over all, 8½ inches; circumference, 1½ inches; head, from tip of nose to back of jawbone, ½ inch; width at back of jawbone, ⅜ inch; button (which was fairly hard, even at birth), a triangular arch, which was ⅜ inch wide and ⅛ inch long.

A. MCL. HAWKS.

## The American Bison Society.

AS AN outgrowth of the activity of Mr. Ernest Harold Baynes, who for two years has been advocating the formation of a society to provide for the preservation of the buffalo, the American Bison Society was organized on Friday of last week in the office of William T. Hornaday, director of the New York Zoological Gardens in Bronx Park. Among those who have expressed a warm interest in the movement is President Roosevelt, who was named as honorary president of the Society, and a message was received by him from the White House accepting the office. The officers elected were: President, William T. Hornaday; Vice-Presidents, Dr. Chas. S. Minot, of Harvard University, and A. A. Anderson, president of the Camp Fire Club of America; Treasurer, Edmond Seymour, of New York; Secretary, Ernest Harold Baynes, of Meriden, N. H. An Advisory Board was chosen, including the following: Prof. Franklin W. Hooper, of the Brooklyn Institute of Arts and Sciences; Prof. David Starr Jordan, of Leland Stanford University; Prof. Morton J. Elrod, of the University of Montana; Prof. L. L. Dyche, of the University of Kansas; Prof. John J. Gerould, of Dartmouth College; William Lyman Underwood, of the Massachusetts Institute of Technology, and Ernest Thompson-Seton.

The Society will distribute literature on the subject and in every way strive to awaken public interest and support, to the end that concerted action may be had to insure the preservation of the bison. At the convenience of President Roosevelt, an early meeting of the Society will be held at the White House.

One specific purpose will be to induce the Government to acquire the several small herds of bison now owned in different parts of the country and to provide for their transfer to such national preserves as may be provided for them.

### The Yellowstone Park in 1870.

MR. NATHANIEL P. LANGFORD, of St. Paul, sometimes known as the Father of the Yellowstone Park, has just given to the public an extremely interesting original document, pertaining to the history of that national playground.

It is remembered that Mr. Langford was one of the first party entering the mysterious region, afterward the National Park, that had a due appreciation of its wonders and that took steps to impress upon the people of the United States a knowledge of these wonders. During the whole trip Mr. Langford kept a full diary of the happenings of each day, and it was on this diary that he relied for the articles that he wrote, the lectures that he delivered, and the information that he conveyed to Congress and to various officials at Washington, the whole finally leading up to legislation which, in March, 1872, set aside the National Park as we know it to-day. After thirty-five years Mr. Langford has at last published this diary just as it was written, and it forms a document of extreme interest not only to all who have visited the Yellowstone Park, but to every student of Western history. Here are set forth the varying points of view taken by these early travelers in that wonderland, and is traced the growth of their astonishment and enthusiasm for the marvellous country through which they were passing, and here we note that at last they return to the towns from which they started, to be laughed at and disbelieved when they told their tales of wonder, just as old Jim Bridges, and before him old John Colter, used to be laughed at for the stories they told of the wilderness.

The diary is prefaced by a very interesting historical introduction which brings the Park down from 1870, through the strenuous twenty years that followed, to the present time. While saying comparatively little about his own share in setting aside and preserving for the nation the Yellowstone Park, Mr. Langford is careful to give due credit to many other men, each of whom had

some part in the good work. Among these may be especially mentioned in early days Assistant Secretary of the Interior R. B. Cowen, and, far better known, Senator George G. Vest and William Hallett Phillips, and in later times Major H. M. Chittenden, long the engineer of the Park, and the author of most interesting volumes on the West.

The book is illustrated by a number of portraits of men connected with the work and with a number of antique sketches, which are interesting. It will be for sale. Price, \$1.

### Frightened Animals.

CHERRYVALE, Kan.—*Editor Forest and Stream:* Two weeks ago a correspondent asked for reports on the action of small game in dodging the assault of hawks and other birds of prey.

Some years ago two of us were hunting quail and rabbits in the northern part of Kansas, and were walking along the railroad track when we came to a section gang, and inquiring of the foreman if he could direct us where the other party could get a jack rabbit to take to his home in Chicago, he pointed to an adjoining field, and stated "there was a large one that lived in the field, if a hawk, that had been after him for two weeks, had not got him." While talking he pointed to a large hawk in the distance and said: "If he comes this way we can soon tell if he has yet caught the jack." The hawk came sailing on and when over the field made a swoop down upon the ground, and as he rose in the air a jack rabbit darted out of the stubble and ran in our direction and the hawk made two darts at the jack in plain sight of us. As it would near the jack he would flatten himself out upon the ground, and as the hawk passed over him he would spring up and run toward us. Thus eluding the hawk he came quite near us, trying to get into some very tall rank grass and weeds by the side of the railroad. As the hawk was making his fourth dive a

load of No. 4 shot from my 12-gauge Parker ended the destruction of game by that field robber, and before I could object my friend had killed the jack.

We noticed that the jack would squeal whenever the hawk darted at him, but a close examination of the back and ears of the jack showed that he had not been touched by the talons of the hawk.

This being the only time that I was ever close enough to carefully note the action of the hunted, I look forward with anticipation to the reports of other brothers of the field, who have had more and better opportunities to note the acts of self-defense on the part of the hunted.

W. F. R.

### Food of the Ruffed Grouse.

A FEW days ago Mr. Carl Von Lengerke, the New York agent for the Polk Miller Drug Company, gave us a quantity of leaves and acorns taken from the craw of a ruffed grouse, which he had recently killed in Sullivan county, N. Y., asking that they might be identified. The specimens being sent to the New York Botanical Garden, in Bronx Park, New York city, were there determined to represent five species as follows: Some hair moss (*Catharinea augustata* Brid.), leaf buds of the black birch (*Betula lenta* L.), leaves of the hemlock (*Tsuga canadensis* Carr.), leaves of the false mitrewort (*Tiwella cordifolia* L.) and fruit of the black oak (*Quercus velutina* Lam.).

While acorns seem to be rather large for a ruffed grouse to swallow, yet we know very well that these are a favorite food for many gallinaceous birds, as turkeys, grouse and quail. We have all frequently seen the craw of the ruffed grouse stuffed with beech nuts or with chestnuts, and know that nuts or mast form a large part of the autumn food of these birds, just as in old times similar mast used to nourish the vast hordes of passenger pigeons whose wonderful flights over the country are now but a memory.

## GAME BAG AND GUN

### Game in the Yellowstone.

REGARDING the game in the park, their habits, condition, variety, number, their treatment and the results thereof, the acting superintendent gives the following interesting account:

"The proper time to see and study the wild animals of the park is during the winter, or after the snow has fallen on the mountains to such a depth as to drive them down into the lower country. Up to the present time there have been no proper accommodations in the park during the winter for taking care of those who would like to come in at that season, but in the near future it is probable that this trouble will be remedied by the building of a suitable hotel at Mammoth Hot Springs, within five miles of the main entrance of the park. After the snow has fallen it is not necessary to go any further into the park than this point in order to see all of the wild animals that are to be found within its limits at any season, with the exception of the bear. It has been only within the last two or three years that these animals could be seen in such close proximity to the Mammoth Hot Springs, and the reasons for this fact are due to a few simple changes in the park management, as follows:

"First. No dogs are allowed to run at large in the park, and when they are brought in by campers or others passing through they must be carried in wagons and kept tied up when in camp. It is a fact that any kind of a dog running at large, while he will probably do no harm to the game, will run it all out the section where it is ranging.

"Second. A fence about four miles long has been built along the northern line of the park, which excludes all stock that for a number of years has grazed within the limits of the park and completely used up the grass, which is now preserved for the wild animals. No stock of any kind is now permitted to run at large in the vicinity of the Mammoth Hot Springs, and where they formerly grazed during the summer elk and deer can now be seen feeding during the winter.

"In order to be successful in keeping wild game on any reserve, it is absolutely necessary either to preserve their natural feed for them or to supply them with hay, and even where the natural supply of feed is preserved, it is well to have a supply of hay on hand, in order to help out the weaker animals each spring, for there is always a period when the old grass is nearly all gone and before the new grass is ready for use which is very trying for all wild animals. It is for this reason that an effort has been made to a limited extent in the park to feed certain kinds of game each spring. The animals so fed are the sheep, the deer, and the antelope, and the results have been remarkable in at least two ways—it has rendered them exceedingly tame and caused them to recognize man as their friend instead of an enemy; and while they will not permit one to touch them, they can be approached within a reasonable distance at any time without their showing the least sign of fear. It has also resulted in a great improvement in their physical condition, and starts them off in the spring, when the females are about to have their young, in such good shape that few are lost from any cause.

"Three years ago a deer was seldom seen anywhere about the Mammoth Hot Springs, and only occasionally a few tracks could be seen in the snow, showing where they had crossed over the parade ground of Fort Yellowstone during the night. As a matter of experiment, and with a hope that some of these animals which passed through the post might be induced to come

around where they could be seen, a few bales of alfalfa hay were scattered about the parade ground. The result was remarkable, for on the second day after the hay had been put out about a dozen blacktail deer appeared. The next day this number was doubled, and from day to day the number increased, until finally they numbered considerably over 100. It was extremely interesting to see how quickly these animals lost all fear of human beings, and even when the evening gun is fired within 100 yards of them they pay little or no attention to it, but show much interest in the lowering of the flag from the staff, which is located in the center of the feeding ground.

"The mountain sheep, which are supposed to be the wildest of all of our western animals, have also shown the same friendly disposition under the same conditions and have become even tamer and more fearless than the deer. These animals are becoming very rare and are difficult to find in any section of the country. It is therefore desirable that the few in the park should be carefully preserved, and their number increased as rapidly as possible. There are now about 100 of these animals that make their home at all times entirely within the limits of the park.

"Next to the mountain sheep the antelope are probably the most interesting and attractive animals that we have in the park, and, like the sheep, they are rapidly disappearing throughout the West. The park herd consists of about 1,500 animals, and seems to be increasing in numbers quite rapidly. This increase is due to the fact that they are protected not only in the park, but throughout the State of Montana. The summer range for the antelope is well up on the Yellowstone River and entirely within the park, and in old days their winter range extended far down the Yellowstone, and they seldom remained in this section after the first heavy fall of snow. The valley of the Yellowstone north of the park is now completely taken up by ranchers, and their wire fences running in every direction have completely shut off the old winter range of the antelope, and they are now compelled to remain at all times entirely within the limits of the park or very close to its borders. Last fall 800 antelope were counted upon the alfalfa field near Gardiner, and at the same time a number of smaller bands could be seen in the foothills above the field and on the slopes of Mount Everts, on the opposite side of the Gardiner River.

"The elk are by far the most numerous of all the large game and it is a very difficult matter to determine exactly, or even approximately, how many there are. During the summer nearly all of the elk pertaining to the neighboring sections of Wyoming, Idaho, and Montana, range entirely within the limits of the park; but during the winter it is probable that at least one-half of this number goes out into the neighboring States, but, owing to the rapid settlement of the country and the consequent decrease in the amount of feed, their outside or winter range is decreasing from year to year, and each year they show a greater inclination to remain within or near the borders of the park.

"Few people know or realize that each year the bull elk shed their wonderful antlers. Many of these shed antlers have been collected from time to time and are used as fences for protecting the lawns about the Mammoth Hot Springs, but their use for such purposes has been discouraged for the reason that the average tourist, seeing them lying about in such numbers, imagines that there has been a terrible slaughter of elk in the park. The bull elk begin shedding their horns usually about the first of March, but sometimes

they lose them much earlier, and others carry them until sometime in May. During the period when they are shedding and while the new horns are growing, the bulls are usually found in bands of various sizes, separated entirely from the cows and living peaceably among themselves. Later on, when their horns become fully developed, which is about the last of September, a change comes over their peaceful natures; they separate and are ready for a fight at any time. This is the beginning of the rutting season, and each bull makes an effort to gather into a herd all of the cows that he can persuade to stay with him, and it is the most interesting period during which to study the habits of the elk. The bulls are easily located at this season by their whistling. This is a peculiarly weird sound, which commences with a high, shrill whistle and ends with a roar. It is apparently used as a call for his band of cows or a challenge to other bulls. It is frequently answered by the younger bulls, which roam about some distance away from the herd of cows, but the challenge to fight is seldom accepted.

"A large band of elk, some 400 or 500 in number, makes its winter home close to the Mammoth Hot Springs. As long as the condition of the snow will permit, they remain on the south side of the ridge just back of the Mammoth Hot Springs Hotel, but occasionally they can be seen trooping down from this ridge, passing within a few hundred yards of the hotel, on their way to a lower feeding ground, and whenever this happens, it is said, you can look out for a big snowstorm. In passing from one feeding ground to another the elk encounter very deep snow, and this they pass through in single file, the strongest of the bulls taking the lead so as to break the trail, the leaders falling out one after another as they become exhausted.

"There are a number of moose in the park, but they are seldom seen, as they range chiefly along the upper Yellowstone River and in the southeastern corner of the park, which is a very inaccessible country at present, owing to the lack of roads or trails. The killing of these animals is now prohibited in the State of Wyoming, and it is hoped that they will rapidly increase in numbers and also move further up into the park.

"When the park was first set aside as a Government reserve there was quite a large herd of buffalo within its limits, but as there was no law or regulation prohibiting hunting for a number of years after its establishment, this herd was soon reduced to a very small one, and what was left of it was driven back into the most inaccessible part of the park and into an exceedingly unfavorable country for buffalo to winter in. There are now about thirty of these animals left, and they have been located for a number of years on the head of Pelican Creek. The only way that they can keep alive during the winter is by grazing on the few places kept open by the hot springs, for their range is very high and snow falls there very deep and remains until late in the spring. They could be driven out of that locality and possibly a few of them caught up, but it is more than likely that a greater part of them would be killed in the attempt. Instead of attempting to catch up the old ones, men are sent out early in the spring for the purpose of capturing the young calves, which are brought into Mammoth Hot Springs, raised by a domestic cow, and then turned out in an inclosure with the tame herd. With a view to preventing the buffalo from becoming extinct, in the year 1902 Congress appropriated \$15,000 for the purpose of starting a new herd in the park. With this fund a herd of twenty-one animals was purchased and the necessary inclosures in which to keep them were constructed. The herd pur-

chased consisted of three bulls from the Goodnight herd of Texas and eighteen cows from the Allard herd of Montana. One of the bulls was turned out with the wild herd on Pelican Creek with a view to introducing new blood in that herd, but he wandered away from them last winter and died on the edge of Yellowstone Lake near the Thumb Station. The increase in this new herd has been exceedingly encouraging, and, including the three calves which have been caught up from the wild herd, it now consists of forty-four animals, which is more than double the number with which we started.

"The beavers are certainly increasing rapidly throughout the park, and to-day the signs of their work can be seen along every stream. These exceedingly interesting and valuable little fur-bearing animals have become almost extinct in the greater part of the United States, and should it ever become desirable to restock any section a sufficient number of these animals can, with the permission of the Interior Department, be provided for the purpose.

"The bears are about the only animals that the summer tourist cannot fail to see, and they are always a great source of amusement and interest to them. It is a difficult matter to make some of the tourists realize that the bears in the park are wild, and that it is a dangerous matter to trifle with them. The black and the brown bear are exceedingly afraid of the grizzly, and with good cause, for they will kill and eat the young of the black and the brown whenever they can get hold of them. It is said the grizzly will also eat its own cubs, and for this reason the females always desert the males when they have their young and keep away until the cubs are large enough to take care of themselves."

## New York League.

### Annual Meeting of State Organization of Sportsmen and Incorporated Clubs.

ONE hundred and twenty-nine delegates, chiefly representing clubs incorporated for the protection of fish and game, attended the annual convention at Syracuse on Dec. 7. Most of the delegates gathered the night before, and much of the preliminary work was done at that time. Forest, Fish and Game Commissioner James S. Whipple attended the business session and was warmly welcomed. This is the first time in years that the Commission has been represented by anybody but the secretary, Mr. Whish, who is an individual member of the League, and the event was highly gratifying to the men who are honestly trying to preserve the fish and game of the State from destruction. A number of well known scientific men and sportsmen from various parts of the State joined the League at this meeting and took part in the proceedings. New York city was represented by Professor Hornaday, the Curator of Bronx Park, President Anderson, of the Camp-Fire Club; Robert B. Lawrence and John Christopher O'Connor, each of whom took an active part.

The keynote of the meeting was struck by President Hiram K. Wicker in his opening address to the delegates. "We are assembled," he said, "to consider what is best for the sportsmen of the State and for the people." He asserted that the game law, although now in the best shape it has been in years, has nevertheless too many exceptions and should be made a general law. He advocated fast steam launches for the protection of the upper Niagara and the St. Lawrence rivers, and more protectors to look after the enforcement of the laws.

Commissioner Whipple, whose method of speech is straight from the shoulder and much resembles President Roosevelt in this respect, gave an off-hand ten-minute address that fairly electrified the convention. He was not only given an unanimous vote of thanks for his address but was also made an honorary member of the League and received a pledge of the hearty support of the members in his efforts to remedy existing evils. The motion to make him an honorary member was made by Mr. Mowry, of Syracuse, who said that the sportsmen of the State are to be congratulated in at last having a Commissioner who is in accord with their purposes.

The address of Commissioner Whipple was certainly strong enough to warrant all that was said and done by the delegates after hearing it. He declared it most important that the Forest, Fish and Game Commissioner should make the personal acquaintance of every man who is interested in the preservation of the forests and the protection of fish and game. He asserted that no Commissioner could hope to be successful in the administration of his office unless the hearty support of organizations such as those making up the League is given him. He urged the organization of protective clubs wherever any now are lacking, and the incorporation of such clubs and their final affiliation with the League, to the end that concerted action may be had on legislation. "Intelligent newspaper support," he said, "is most necessary in order that the people may be rightly advised and that public opinion may back up such efforts." He expressed the earnest belief that the majority of our people are deeply interested in such work as the incorporated fish and game clubs are doing. Speaking on this line he said: "I intend to act on this belief that the people want forest, fish and game preservation, and to follow it all through my official life. I mean to give the people a square deal." He concluded by pointing out the evils arising from squatters on State land and from trespasses, and pledged himself to get rid of the one and put a stop to the other. His remarks were very frequently interrupted by applause.

An important feature of the meeting was the report of the Committee on Law and Legislation, which was made by the chairman, Mr. C. H. Mowry, of Syracuse. He said the committee had been very successful in preventing the passage of bad legislation but had not been able to get as much good legislation as was desired. He advised concerted action to get proper men on the fish and game committees in the coming Legislature. In conclusion he roundly denounced Maj. J. W. Pond, the former Chief Game Protector, for playing double with the League and secretly opposing bills which he had voted to support in the meeting previous to the session. The bill for additional protectors and the bill to give certain special protectors the right of search were beaten

through Maj. Pond's connivance, Mr. Mowry asserted; and he offered written and other evidence in proof of it. Former Assemblyman F. C. Wood, of Fulton and Hamilton county, was classed as Major Pond's associate in defeating legislation favored by the sportsmen of the State.

Considerable time was devoted to threshing out the bills which the League is to urge in the coming session of the Legislature. The Law Committee reported again those of last session calling for ten additional protectors; for fast power boats for the protection of the St. Lawrence and the upper Niagara rivers; for the right of search to be given to special protectors employed by incorporated clubs or by boards of supervisors; for prohibiting the possession or sale of grouse and woodcock during the close season, except for the first ten days of December in order to let dealers dispose of their stock. There was no debate over these measures, and they will be again urged. Other legislation favored by the League was as follows:

Providing that wildfowl shall not be sold or offered for sale during the close season: This was offered by Mr. J. C. O'Connor, of New York city, who asserted that the law is openly violated on Long Island where ducks are shot and hawked about the streets without regard to the statute. Mr. R. B. Lawrence, of New York city, opposed the proposition on the ground that the law is a dead letter and that it would be better to extend the open season to March 1 for ducks. In his remarks Mr. O'Connor charged Senator Allds with having held up his anti-cold storage bill, after it passed the Assembly, and thus preventing action on it in the Senate.

Prohibiting the use of repeating shotguns. This was repudiated by the League last year and its reintroduction stirred up the sportsmen. The measure was vigorously assailed by Mr. Mowry, of Syracuse, who urged the League not to go on record as opposing improvements in firearms. He favored limiting the shooting season and the number of birds to be taken, but said, "Don't let us try to limit the efficiency of the guns we use." Mr. W. T. Hornaday said that Mr. R. B. Lawrence, of New York city, who proposed the bill, had anticipated him, as he was about to offer something of the kind himself. He defended Mr. G. O. Shields, who had been attacked as the father of the measure, which it was said he used to get even with certain manufacturers who refused him advertising. Mr. Hornaday said the friends of bird life believe the time has come to limit the effectiveness of guns used in its destruction. Mr. J. H. Foray, of Syracuse, said he believed the Legislature can provide how game shall be taken, but he questioned the wisdom of such action as the League was being urged to take. Personally, he favored setting a limit to the bore of the guns to be used. President C. R. Skinner, of the St. Lawrence River Anglers' Association, feared the League would lose the respect of very many sportsmen if it took such action as was proposed. In spite of all the opposition the majority in favor of the law was large.

Repealing the law permitting netting in Cayuga Lake. The reason is that the fishermen take all the fish they catch, without regard to the law. There was considerable discussion of the netting evil and Mr. Foray, of Syracuse, wanted legislation to make the possession of a net on or near the shores of waters where netting is prohibited presumptive evidence of intention to violate the law. His idea was to have the net thus found destroyed at once. Acting Chief Protector Worts warned the members that such legislation would meet hot opposition in the Legislature and said that when Monroe county got such a law the lawyers held it was unconstitutional. Mr. R. P. Grant, of Clayton, said the United States Supreme Court has decided that a protector may seize and destroy such a net, and the matter was then dropped.

Game preserves were briefly discussed and the League adopted a resolution offered by Professor Hornaday, requesting the representatives in Congress to favor the appropriation needed to fence in the Wichita Reservation so that it may be safe for the herd of buffalo which the New York Zoological Garden has offered to the Government in the hope of preventing the extinction of the animal. It was asserted that President Roosevelt favors the proposition. Another resolution adopted was offered by Mr. A. A. Anderson, who was for five years superintendent of Yellowstone Park. It favors in the same way the creation by the President of game refuges in all the preserves owned by the Government.

The League finally took up the suggestion as to enlarging its membership and usefulness. An aggressive committee on organization was finally appointed and instructed to hustle. It was also decided to have the next convention end with a banquet. Proposed improvements in the fish and game laws were discussed informally with Commissioner Whipple, who pledged his support to the League and received its pledge of support in return. It was agreed that there are too many special laws and that a uniform law would be better if it could be had. It was recognized, however, that the law, as it stands, has grown up gradually and that many decisions have been rendered by the courts affecting it. For these reasons any general revision will have to be undertaken carefully.

The officers elected and committees appointed at the close of the session were as follows:

President—Hiram K. Wicker, of Lockport.  
Vice-President—J. H. Considine, of Elmira.  
Secretary—Ernest G. Gould, of Seneca Falls.  
Treasurer—A. C. Cornwall, of Alexandria Bay.  
Legislative and Law Committee—C. H. Mowry, of Syracuse; W. S. Gavitt, of Lyons; R. P. Grant, of Clayton; J. R. Fanning, of Rochester; J. P. Rapalje, of Buffalo.

Organization Committee—R. B. Lawrence, of New York city; J. H. Forey, of Syracuse; E. A. Bowman, of Medina; W. H. Thompson, of Alexandria Bay; Llewellyn Legge, of Binghamton; John D. Whish, of Albany; J. P. Rapalje, of Buffalo.

Mr. Aaron Mather, of Bridgewater, was retained as head of the Auditing Committee, and Mr. James Annin, Jr., as head of the Committee on Biology. WATCHER.

In introducing Commissioner Whipple, President Wicker said that the presence of such an official was not only a most unusual but a most welcome innovation. Commissioner Whipple replied:

"If my presence is an innovation at this convention, I am glad of it, because in the business in which I am

now engaged unusual things must be done if we want to succeed in the work. (Applause.)

"I am glad to be here. It was difficult to get away from Albany at this time because of a highly important meeting of the River Improvement Commission, but an adjournment was secured and I came. I deem it very important for the Forest, Fish and Game Commissioner to make the personal acquaintance of as many men in the State as he can who are interested in the protection of our forests, our fish and our game. It is much better to know who you are working with than to work without such an acquaintance, and no Commissioner can be successful, in my judgment, unless he has the hearty support of such men as you who make up this convention. (Applause.) It seems to me that there are two elements which alone will make my department the success I wish it to be. These are the backing of the honest sportsmen of the State, men like the delegates here from the incorporated clubs to protect fish and game throughout the State, and the intelligent support of the newspapers. The newspapers, if they act intelligently, can render very great service, but it is a terribly bad thing to have them spread a false impression abroad. Public sentiment is everything, and no matter how good a law is, if public sentiment is against it, then it is a nullity. That is why newspaper reports should be accurate. Take a case in hand, the Raquette Lake matter, where one squatter is to be ejected from State land. Through erroneous reports of the situation the public mind has been entirely misled as to the true facts. In a paper to-day I have just read a communication from a citizen who asserts that I ought to do exactly what the Constitution of the State says I can't do, and nobody must do—that is, grant leases. The papers say we are removing twenty-five squatters when the fact is we are ejecting but one, and his case is so flagrant that a Commissioner would not be fit to hold office unless he took cognizance of it." (Applause.)

Commissioner Whipple then gave a running sketch of the trespass cases and of the suits brought under former commissions, and said that the case of Carlin was so aggravated that but one thing could be done. "Carlin built his largest building in defiance of an injunction forbidding it," he continued, "and his contempt of court encouraged every squatter in the woods. It was my plain duty to tell him to get off, and I did it. The sheriff of Hamilton county was called upon to eject the man, and that is all there is to the case, yet erroneous newspaper reports have created a sentiment among the people that is decidedly harmful to their best interests. I believe that the people of the State to-day are deeply interested in the preservation of our forests, our fish and our game, and I intend to act on this belief all through my official career. (Applause.) The Governor wanted me to hold this place under his administration and appointed me to it. Once in the business I mean to do a good job. (Applause.) I may make mistakes, my ideas may not agree with those of other people, but I mean to do the best I can. (Applause.) I know the value of the work of such a body as this League. Stop such work for ten years, and strike our protective laws from the statute books, and you would not have a deer, a food fish or a game fish left. There would not be a single animal or bird to hunt either for food or pleasure. There would not be a fish left worth mentioning. From a commercial standpoint, it would be disastrous.

"But even such a disaster would be insignificant in comparison with the destruction of the forests of the State. Destroy plant life and animal life will have to go, water courses will dry up and great hardships will prevail. People do not yet realize the immense value of our forests. But when you consider that 800,000,000 feet of timber was legitimately cut in our State forests last year—more than all that was imported from all of Canada—you can see what is coming and how necessary it is to stop all illegal cutting. It stands the people in hand to buy every acre of forest land they can get (applause) and it is an imperative necessity to keep what we have left. The man who wilfully cuts a tree belonging to the State is as great a criminal as the man who holds you up on the highway with a revolver. (Applause.) You may think this is a strong statement, but if you do you will change your minds in years to come. (Applause.)

"If trespassers have not stopped cutting timber yet, they must stop it. You will hear it said that a trespass was caused by mistaking the line and cutting just over it. In my administration cutting over the line will mean getting into State's prison. I honestly believe we have stopped this illegal cutting down of our forests, and I mean to keep it stopped. (Applause.) I mean to see that the people get a square deal. (Applause.) At the same time individuals must have fair treatment. Understand me, we are not after the poor man who chops up a dead tree to get wood to warm his cabin, even if that tree is on State land. I have every sympathy for such a man, and we are not after him. The fellow we want is the rich man who violates the law, cuts the State timber for commercial purposes and then defends his trespass with a lawsuit. In all these cases we try not to be technical. We try to use common horse sense, just as we would in matters concerning our own property. I don't pretend to be an expert on all the matters connected with my department, but I do pretend to be a reasonable man with a disposition to do right. (Applause.) All we want is an application of plain common sense to the administration of public office. (Applause.)

"I know the value of the woods, for I have lived in them and my good health, at my age, is due to that fact. My advice to men who would live long is to get into the forest, go hunting and fishing. It will not only make them physically well but it will make them better citizens. As I said before, I come here to get acquainted. I believe in organizations such as this. I wish every county had its incorporated club to protect fish and game and the forests, and that all such clubs could meet in convention like this. Then the legitimate demands of the true sportsmen would meet with the attention they deserve, and all the people would be better for it."

At the conclusion of his address Commissioner Whipple was given an unanimous vote of thanks by the League and made an honorary member as an evidence of the appreciation of the delegates.

## North Carolina Shooting.

RALEIGH, N. C., Dec. 11.—Mention has been made of the fact that the deer hunting in eastern Carolina is especially good this season. This news is confirmed by that which comes from a hunting party in Jones county last week, which in two days got twenty-nine deer. Unquestionably, game of all kinds is now increasing in North Carolina. Protection is doing a great deal for it and the general sympathy shown by the public, particularly people in the country, in the work of the Audubon Society, is a sign that even better things are to be in the future.

There will probably be more sportsmen in the State this winter than there were last. In certain counties last season there were many, but they have a habit of going in a sort of beaten track, thinking that most of the birds are west of Greensboro, while there are probably as many, if not more, east of it. Very good bags are being made and the best hunting is coming on now, rains and frosts having taken the edge off the weeds and also made the cover less thick. There is a world of bird-food everywhere, and a great many peas are left uncleaned.

There are many birds at Pinehurst, not only in the preserves, but in the outlying fields which come under the jurisdiction of the estate by lease of hunting privileges, etc. North of Raleigh there is good shooting all the way to the Virginia line.

The winter has been open so far, with only one or two cold snaps and a few morning freezes, and the fishing has been quite good, particularly in the ponds. A car of fish arrived here last week, for use in stocking ponds in this vicinity. The black bass is the favorite fish, nothing being considered to equal it. Here it is always called by the local people, "chub."

News from the club-houses on the North Carolina sounds is that they will be well filled during the season. As yet the duck shooting in that section has not amounted to much, because of the fact that the weather has been too open and fine, and several parties of hunters who went there have been disappointed. The very strictest efforts are to be made to keep down fire-lighting, and orders have been given to make arrests of every offender. The swift patrol boats will be able to do good work, though there are some men in that part of the State who have long defied the law in regard to this matter and who will have to be sternly repressed. The game warden on Currituck Sound is one of the most determined men in the State, with twenty-five years' experience as a deputy sheriff, and never loses his nerve or fails to do his duty.

John P. Sousa, the great band leader, has been hunting in Vance county, about forty miles north of Raleigh, several members of his family being with him, and has had fine sport among the partridges. Both Vance and Cranville counties are excellent shooting places, as some northern men have already discovered. William H. Vanderbilt and Mr. Mackay have been for some days on their preserves near High Point, and have had very good shooting indeed. All the partridges are now grown. Not many woodcock have been killed this season. They are not shot in this State in the summer at all. There was a small fall flight of snipe, and a few yet linger here and there in the marshes, but none were killed.

FRED. A. OLDS.

## The Massachusetts Association.

BOSTON, Mass., Dec. 12.—*Editor Forest and Stream:* At the meeting of the board of management of the Massachusetts Fish and Game Protective Association on Nov. 9 it was voted that a committee of five be appointed with full powers to arrange to meet the delegates to the convention of the North American Fish and Game Protective Association, to be held in Boston in January, 1906. Ex-President George W. Wiggin, ex-President B. C. Clark, Dr. George H. Payne and Mr. A. D. Thayer were appointed as the committee, to which the name of President Hinman was added. At the meeting of the board on Dec. 8 Chairman Wiggin submitted a report of his committee setting forth that inasmuch as it appears that the North American Association is one having aims and purposes similar to our own, and that during its sessions in January addresses are to be made and members of our Association and other similar organizations are to be admitted to the meetings, the committee is of the opinion that at some time during their stay in Boston it would be an act of courtesy on the part of the Massachusetts Fish and Game Protective Association to invite the members of the North American Association to a banquet to be given by our Association, and the committee therefore recommends that the State Association extend to members of the North American Association a cordial invitation to dine with us while in Boston. The committee also recommend that a similar invitation be extended to the presidents of the various kindred associations in Massachusetts to be present on the above named occasion. The committee further recommended that measures be taken at once to raise the necessary funds to defray the expenses of the banquet.

It having been announced that the time for the meeting of the North American Association had been fixed for Jan. 24 and 25, on motion of Dr. George H. Payne it was voted that the date of the annual dinner of the State Association be Jan. 25, so that the banquet to be given the North American shall also be the annual dinner of the Massachusetts Fish and Game Protective Association.

It was also voted that the president be authorized to increase the existing committee to a limit of eleven members and that the committee itself have power to add to its membership, and that it have full powers to arrange all the details in preparation for the banquet. Later in the evening it was voted that Col. C. W. Dimick, as chairman of the bird committee, be authorized to make necessary arrangements for the purchase, shipment and distribution of live quail. The success which has attended the December planting of quail by Mr. Taft in southern Worcester county, and the fact that the Association was unable to secure birds in the latter part of winter last year has induced many clubs to resort to December planting this year. The further fact that of 281 reports from Massachusetts towns, as stated in my letter

of last week, only eleven pronounce the conditions good, has stimulated many individuals and clubs to put out birds as soon as they can be obtained, and to arrange for providing them with food during the winter.

Calls for birds are already in from Gloucester, Sutton, Rockland, Reading, Whitman, Middleton, Brockton, Bridgewater and several other localities, although no general announcement has been made of the fact that the Association has perfected its plans for securing the birds. We have come to the conclusion that the only way to make sure of birds is to get them when they are to be had, and are governing ourselves accordingly.

H. H. KIMBALL.

## New England Deer.

BOSTON, Mass., Dec. 12.—*Editor Forest and Stream:* Commissioner Wentworth writes that hunters of deer in New Hampshire have had a remarkable season. He says he was informed by a railroad official that on one train forty-two deer were brought down from Colebrook. The official report of the Bangor & Aroostook Railway shows the shipment for November of 2,187 deer, eighty-six moose and fifteen bear. For October and November, 3,728 deer as against 2,904 last year, 167 moose as against 163 last year, and twenty-nine bear, as compared with twenty last year.

The receipts of deer at Bangor on Wednesday, Dec. 6, were light, only numbering forty-five. Among Boston hunters with deer were Messrs. F. Crockett, R. K. Pratt, H. L. Cates and G. L. Hamilton.

Shipments for the week at Bangor were 229 deer and eight moose. For the season, up to Friday, 3,363 deer and 214 moose. To the same dates in 1904 shipments were 4,014 deer and 213 moose. For the entire season of 1904, 4,271 deer and 220 moose. So it will be seen that this year's record to the present time is in excess of the entire shipments of last year. The few days remaining to the 15th will make further additions to the deer record for the present season. It is said to be the opinion of not a few of those interested in the protection of big game that the season should be shortened, or the taking out of more than one deer should be prohibited.

Mr. Edward Lawrence, of Boston, has just returned with a fine buck and a moose. In the vicinity of Franklin five big bull moose were killed the last week of the moose season.

Dr. Styles, of New Britain, Conn., recently returned from the Rangeley region with a large moose, a fine buck and a doe. His companion, Dr. Johnston, of the same place, secured two deer. George E. Howe, Esq., of Boston, brought out two deer. Mr. and Mrs. D. C. Pierce, of Boston, got two deer each. Mr. and Mrs. Arthur W. Robinson, of Boston, who have a camp at Chain of Ponds on the Megantic Preserve, have just returned from their annual trip. Mrs. Robinson shot two bucks and a cub bear, a record no other lady has made this year.

A sad shooting accident occurred Dec. 6 at Jerry Pond, sixteen miles from Patten, Mr. Sylvanus Hussey, of that town, being mistaken for a deer and shot by his brother-in-law, Frank Leavitt, of Sherman.

Theodore Roosevelt, Jr., had the good fortune to bring down a large elk in Corbin Park to-day. He was accompanied by a classmate, Harold Edgell, and the famous guide of the Park, Mr. George Brown. CENTRAL.

## The Maine Season.

BANGOR, Me., Dec. 9.—*Editor Forest and Stream:* The big game season in Maine is not yet ended, but it is so nearly at its final day that one may determine the practical results from the figures now at hand. There remain but five days during which one may legally knock over a deer, and the season for moose hunting closed with the last day of November, after one of the most extensive lists of results ever known in Maine's history.

During the month of November there were handled, on the trains centering in Bangor, 2,519 deer, ninety-five moose and fourteen bears, which, together with the 1,663 deer, 106 moose and twenty bears handled by the same express messengers in October, and a further list of 256 deer, eight moose and three bears in the first eight days of this month, makes the great total of 4,684 pieces of game handled on the trains of the eastern and northern Maine railroads. This is increased by a large number of partridges, which were not included in the records, the privilege of taking home a string of ten birds being appreciated by the visiting sportsmen, who, by a peculiar mistake in the office of the State Fish and Game Commission, were granted an increase in this privilege to twelve birds, although so scarce were the biddies that but few passed through the city with the full allowance of twelve grouse. One man only was seen at the Bangor station during the season with a considerable string of woodcock, and he had all the law allowed, which was his chief incentive for coming here to hunt. It seems he got the idea somewhere that he could ship ten or twelve of the birds for each of the bird coupons on his license, and was joyfully sending home the first installment of the newly-granted privilege. It was one of the finest strings of woodcock seen in the hands of an individual hunter around Bangor in a long time, and it fairly made the mouths of other sportsmen who were present water for a few samples of the birds.

There are various explanations put forth as to the great record of game killed in a season when conditions have, almost throughout the season, been untoward. Some claim that it is due to an increase of at least twenty-five per cent. in the number of visiting sportsmen, others say it is due to a great increase in the number of deer, others yet say that the long drought has driven the game to the water, where the hunter could sit in his canoe and shoot at his leisure. Whatever may have been the causes, it is certain that the months of October and November have exceeded in deer shipments any two months ever known since a record was kept of the game shipments through this city.

After the awful list of casualties with which the hunting season was ushered in it was sincerely hoped that no further accidents might occur to mar the rest of the season, but this was evidently too much to hope. During the past week another fatality has been added to the

dreadful list which blots the game season of 1905, and S. P. Hussey, a business man of Patten, was shot and instantly killed by his hunting companion. From reports it appears that Mr. Hussey saw and shot, from a kneeling position, at a deer. His companion was only a short distance to his rear, and after he had fired the latter fired right over his head at the same deer, just as Mr. Hussey arose to his feet, and the ball struck him in the back of the head. It was an awful thing, and reopens the entire question of what can be done to reduce this horror list, which is added to with each succeeding season, instead of decreasing as the years go by.

The thirteenth annual meeting of the Maine Sportsmen's Fish and Game Association is to be held at the Penobscot Exchange Hotel, in this city, on Jan. 2. The meeting will be called to order at 4 o'clock in the afternoon for routine business, and after a supper adjournment will be had to a convenient room where discussion of various important questions will be held. Among the questions to be discussed, according to the announcement just issued by Secretary E. S. Farrington, of Augusta, are the following: "Are any regulations needed regarding the carrying of firearms into the hunting sections of the State, during close time?" "Ought non-residents be allowed to carry firearms into the woods in open season without having first procured a permit, or a license to hunt birds or other game?" "What, if any, changes are necessary in the close time for fish and game?" Every one interested is invited to attend the meeting, whether members of the Association or not. HERBERT W. ROWE.

## Good Times at Barnegat.

PHILADELPHIA, Pa., Dec. 5.—*Editor Forest and Stream:* Barnegat Bay is at present alive with brant and ducks; geese just arriving. There seems to be any amount of young brant that stool very well, although the black duck and broadbill in flocks are shy. There are enough of stray ones that will come to make a fair bag. A good caller seems more important in getting geese than the decoys, although, of course, they are necessary. Remarkably good bags are being secured by sportsmen from Barnegat—just plain Barnegat, sometimes called Old Barnegat or Barnegat Village, where there are several small but comfortable hotels, among them the Mullen House. Good accommodations can be had there for \$2 per day, and meals are furnished at all hours; also a bus to take you to and from the water front without cost. A few guides, among many others that I can recommend, are W. H. and Charles Ridgway. A line written to the above house or else to the men will engage them. Their charges are very reasonable, being \$2.50 per day, for which they furnish decoys and two first-class sneak boxes. They will also do shooting for you, charging only for the ammunition used. I believe better bags are being made from their vicinity than elsewhere in the bay at present, there being numerous good points, islands and seaweed that is almost covered by water at high tide.

Anyone wanting a few days' shooting for brant at a minimum of expense cannot do much better than by going there. No license is required, and all the wildfowl can be taken out of the State. The Pennsylvania Railroad from Philadelphia at 4 P. M. and a train from New York arrive in the early evening. Leaving in the afternoon or early morning give one little if any wasted time on the outing. Would advise novices to take plenty of warm clothing and some wind-proof overalls, either of canvas or leather, and be sure the color is buff, likewise that of the hat. Invariably men I have met have suffered on such trips with cold feet, even when perfectly warm otherwise, and it seems to be one of the most difficult things to keep the feet warm if you are not walking. Leather or rubber shoes with any amount of socks will contract cold, and the most satisfactory furnishing I have found is the regular soft moccasin with four to six pairs of socks. But you must keep them dry.

Besides the good shooting one is likely to find, the sail to and from the ground is a great part of the fun. Large guns are the favorite with the natives, almost all using eight bores with corresponding large sized shot, but a good shot with a twelve gauge, using No. 5 or 6, seem to get almost if not just as many.

STEPHEN P. M. TASKER.

## What is a Minnow?

JACKSON, Tenn., Nov. 15.—*Editor Forest and Stream:* With several of my associates I have had a very heated discussion as to what constitutes a minnow. We have decided to ask you to kindly answer the question. I will be pleased to have you explain whether or not the young of larger fish are correctly called minnows, and also what the United States fisheries term a minnow?

Y. M. R.

[Minnow—sometimes spelled minow—is a general term meaning a small fish; and while sometimes applied to any small fish, even the young of larger species, the best usage does not sanction this. The word is allied to the word minute, small.

Strictly the term minnow is applied to a small European cyprinoid fish of the genus *Phoxinus*. In this country there are a multitude of small fish known as minnows, chubs, shiners and dace, most of which never attain a greater length than six inches; and most of them have no value as food. On the other hand, they furnish the greater part of the food of our carnivorous fishes, such as bass, perch, trout and pike. There are a few species which reach a considerable size, and so may become food fish, but in all cases the flesh lacks flavor and is full of small bones.

The carp, which is a cyprinoid, of course, grows to a large size and has a certain value as a food fish.]

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

## A Morning's Bluefishing.

BY WILLIS BRUCE DOWD.

THE season of 1905 was a very poor one for bluefish in the vicinity of New York. Old fishermen said they had not known anything like it in twenty years. At last, however, in the early days of October, word got around that the blues were running off Sandy Hook, and fishermen flocked in that direction day after day. One boat that put out from Sheepshead Bay came back with eighty blues, and although they were small, 2 and 3-pounders, this was enough to tempt other persons to try their luck at the royal sport of the sea.

One party consisted of four—Yentzen, who owned the Perry Belmont, an old but sturdy single-master that was doubtless christened when the young man of that name represented a Long Island district in Congress back in the eighties; Fred Bundy, a youth of eighteen, whose life had been spent around his father's fish and oyster dock, and who was an able seaman; Joe Black, a sleepy individual, with three days' growth of light hair on his dirty face, and one other, who shall be nameless. They were at Yentzen's restaurant, having breakfast of bread, raspberry jam, butter and coffee, at 3:30 in the morning, and they enjoyed that meal. Yentzen said they would get no more to eat until their return. The weather was cool but clear, and there was only a fairish breeze blowing. Never did the stars shine so brightly; Venus, Jupiter and other planets shone like lustrous diamonds among the myriad of smaller lights which dotted the firmament.

At 3:45 the party were aboard the Perry Belmont, which lay in the channel of Sheepshead Bay, and the small boat in which they had rowed out from the dock was moored to a floating buoy. They did not take a trailer that day. A few seconds later Yentzen got his naphtha engine going, and the boat pointed toward the inlet, for the open sea and the fish.

To the astonishment of at least one of the party Yentzen expressed considerable anxiety as to his ability to get out without running aground. The tide was going out, but it seemed to the "other one" that there was ample water for the craft, which did not draw over three feet. So he expressed surprise, but Yentzen came back at him with the remark that it was hard to steer in the dark, and that there were some shallow places ahead which were dangerous.

"Pshaw!" said the "nameless one," "I know this channel so well I could steer it blindfolded."

"Maybe," replied Yentzen, "but you and Fred look sharp and pass the word back to me every second or so, or we'll be aground."

Now, Fred and the "other one" were standing forward at the foot of the mast, and they were saying to each other what an easy thing it was to follow that channel; so they smiled when they heard Yentzen's outcry against a possible mishap. Every few minutes they agreed as to the next course and one of the other sang out, "Keep her off!" or "A little inshore!" as the case required.

At length they came to the inlet, and the narrowest part of the channel, where the outlook saw that Yentzen was steering too close inshore. Then both simultaneously cried out "Keep her off!" but it was too late; the boat's bottom scraped something; her bow mounted up, and she was fast on the bar.

"There!" shouted Yentzen, shutting off his power, "I told you we might have trouble. Now we've got it. Be quick with the poles for a shove off, for the tide is fast going out, and she'll be harder to move every minute."

There were a few minutes of intense action, poles shoved into the sand, grunts, pushes, positions changed, but all to no purpose.

"We are stuck," Yentzen said in despair. "It's no use, we are stuck."

"O, I don't know," said the "other one," "I am no sailor, but I'll bet we'll get off."

His courage seemed to stimulate the brains of the boys, who pulled off their shoes and stockings and were over the boat's bow into the water in less than a minute. There was not over a foot and a half of water where they stood, but five feet away, and under the boat's middle and stern, there were fathoms. All knew that, and "Nameless" reasoned that the pressure of the tide at the rear was equal to a lot of horsepower. So at his suggestion Yentzen and he put the poles over the port side and pushed with all their might, while the boys gave a lift with their brawny arms, and the Belmont was off.

"Lookout, there, boys," Yentzen said, "get aboard quick. You'll be in three fathoms of water in another second."

So they clambered aboard with the agility of monkeys, and after a few more soundings with the poles they helped Yentzen get the boat into the ocean water, and the party were at last fairly started on their journey to the Jersey coast. The wind freshened from the west after they arrived outside, so that they made poor headway with the naphtha engine alone. The mainsail was run up when they reached a point opposite the Manhattan Hotel, and, looking at his watch at that moment "Nameless" noticed that it was 5 o'clock.

He was surprised to find that at this hour the sun was not up. Day was breaking, however, and soon a bright orange color illumined the east, foretelling the rising of the sun, and a golden sheen glimmered on the rolling ocean. It was a beautiful sight. And when at length a big blood red globe seemed to emerge from the waters in the far horizon "Nameless" remarked to Yentzen, "That looks more like a balloon than the sun." So it did, but not for long. The bright rays soon came flashing toward the boat, the stars all disappeared, and the miracle of the creation of another day had been wrought before their eyes.

They headed for the Atlantic Highlands, across Ged-

ney's Channel, but the wind from the west had grown so strong and the sea so rough by this time that the craft began to roll uncomfortably and progress was not good. Besides, the outrunning tide was so swift that it made the steering difficult. At length Yentzen determined to set a bobjib to steady the boat and send her forward. He did so, and then she sped on her way delightfully.

Soon they caught sight of two schooners far to windward, but heading across the Belmont's bow. Their sails looked charming in the early morning light.

"What are they, Yent?" asked Fred Bundy, who was at the helm.

"Fire Island boats," said Yentzen, who did not seem to notice the familiar abbreviation of his name by the boy. "Nameless" noticed it, however, and Yentzen saw that he did.

"I've known that boy since the day he was born," Yentzen said in explanation. "In fact, I won a cigar on him when he was born—by his coming a boy—and I brought him up. You're one of my boys, ain't you, Fred?"

"Guess I am, Yent," said Fred, rather dryly. He was a solemn chap.

They kept a straight course, almost directly south, across the channel where they saw three Government dredging vessels at work, making a deeper passageway for the ocean liners, and they saw also many vessels, steamers, schooners and one full-rigged ship going to or coming from the great harbor of New York. Then they ran afoul of a line of tugs towing scows, going seaward, and they had to change their course, and run westward close to a towline, until they found a chance to go between a scow and the next approaching tug. This accomplished, they headed again south, and by 7 o'clock they had traversed eighteen miles and arrived at the appointed place. They were now in the shelter of the Highlands of New Jersey, and the water was quieter but still there was enough chop to make the men aboard realize that they were not on a pond.

"Is this a good sea for the fish?" "Nameless" asked Yentzen.

"Fine," he said, "we'll get 'em, sure."

To the surprise of the other men, Yentzen "fished" out some bottles, one of which contained about a gill of whiskey, and the others sarsaparilla.

"Better take a little," he said, "to keep the chill off." The boys took only sarsaparilla, but the captain and the "other one" took a little rye with sarsaparilla for a "chaser," and the "medicine" was good.

Yentzen now fixed a trolling pole on each side of the boat, and attached lines and squids, and ran two other lines over the stern, and so the party were ready for their sport.

"Look sharp for gulls, now," said Yentzen; "we likely won't get any fish till we find the gulls."

"What have gulls to do with bluefish?" asked "Nameless" of him.

"A whole lot," he answered, "Nature is a wonderful system of things going together. The big fish chase the little ones, and these go to the surface trying to escape, and then the gulls get them."

"It sounds reasonable," Black said. It was the only time he spoke during the trip. His unshaven face made him shy.

"It is a fact," Yentzen added; "of course, you can sometimes make a catch without the gulls, but the best sport is where the birds are."

They spied a considerable number of gulls hovering over the water two miles north of the Highlands light-house and about two miles north of the Highlands light-house; so they headed for them.

"No good," said Yentzen, when they approached them; "they don't act right."

"How should they act?" Fred Bundy asked.

"Go up and down, feeding," he said. "They are simply loafing, waiting for something to turn up."

This was discouraging, but they sailed up and down the coast for several miles without any better encouragement. They saw two rowboats come up the coast, from the direction of Seabright, and cast anchor not far from where the gulls were hovering when they first discovered them.

"Those fellows are going to net for the fish," said Yentzen. "They are regular fishermen, and they know the fish are here." Still, Yentzen's party caught nothing, and they saw only a few gulls every now and then which were as often sitting idly on the water as otherwise, waiting for something to turn up. The monotony of sailing up and down was broken by the appearance of more boats on the horizon. Yentzen soon recognized the first one that appeared, although she was a full mile away.

"That's Ike Willard," he cried; "he's after the blues, too; heard about 'em yesterday."

Sure enough, it was Ike Willard. He hove down upon the Belmont and inquired what luck, as others did by and by, and when Yentzen replied "none," he began tacking in and out, up and down, as others were doing, in quest of the fish.

The eyesight of "Nameless" had always been particularly good, and he got a glimpse, as they sailed northward, of a vast number of gulls far ahead of the Belmont. He told Yentzen about it, and although neither he nor the boys could see the birds at first, he held on in the direction of them, and soon saw them.

"There are the fish," he said. Indeed, if his sign meant anything the fish were certainly there, for the number of gulls was legion, and they were acting "right" into the bargain. Anybody could tell that they were feeding.

"Sport ahead, boys," said Yentzen. But somehow, he seemed disappointed, he kept looking and looking,

first on one side, and then the other, then ahead, for some sign or token which did not appear. At length, however, he shoved the helm hard apart, and said in bated breath, "Gee whiz! Look at them fish!"

Close on the starboard side was a sight to baffle description, something the like of which "Nameless" never saw or heard of before. For as much space as a hundred yards square the surface of the water seemed to be converted into a fountain. The fish were so numerous, and were splashing so furiously that they gave the water that appearance. The men were amazed and greatly wrought up by the spectacle.

In another moment, they were among them, and Ike Willard not far off; there was quick tugging at the squids, and when the four hauled in their lines, they had one blue and two bonitos. One blue escaped.

"Now jig," said Yentzen. So they stood on deck, jerking the lines and the bright squids at the end of them, through the water, and in a moment more they were hauling up weakfish, weighing from six to eight pounds each. The water was alive with them; one could see them plainly, and they were as hungry and as daring as wolves. It was afterward discovered that those caught had not fed that morning. In five minutes enough fish were caught to satisfy the most ambitious amateurs, and a variety very unusual in one school. Even Yentzen said he had never known bluefish, bonitos and weaks to be traveling together in that fashion. That five minutes was the limit of their catching except that they picked up two more small blues half an hour later, while trolling. But they had, all told, a fine catch; and, by a strange coincidence, as they learned afterward, Ike Willard and his men got the same number as themselves.

After the time of excitement and catching, Yentzen surprised his fellow sportsmen by producing some ham and cheese sandwiches and more liquors. When reminded that he had said in the early morning that there would be no more to eat till the party's return, he grinned and said that a fisherman could fib, fish and have fun all in one day.

It being now about noon, and no more fish appearing, the Belmont was headed toward Sandy Hook, where more gulls seemed to be hovering. The party aboard then got a fine illustration of the skill of the gunners of our army. They were target practicing at the Sandy Hook barracks. Every few minutes a shell went shrieking through the air—an explosion was heard, and almost simultaneously a spout of water shot up from the ocean showing where the missile had struck. Each shell was fired close inshore, safely out of reach of any boat, but the distance was several miles, and Fred Bundy said that as the Belmont was not armored, and as there was no guarantee the gunners might not shoot wild, he thought the path of prudence lay toward home. "All right," said Yentzen, "as there ain't any more fish, we might's well have no trouble."

So he headed for home, arriving at 2 P. M.

## The Dominating Carp.

Fourth Paper.

EVANSTON, Ill., Dec. 7.—*Editor Forest and Stream:* Subjoined I present an excerpt taken from the Chicago Daily News of the 6th inst., which I am positive will prove an item of interest to those interested in preventing the entire destruction of our magnificent game and edible fishes in the great lakes of the Northwest. The article, which was a special telegram, says:

"Two fleets of fishing boats, carryiny between 85,000 pounds of fresh-water fish, nearly all carp, marketed their catch in Tazewell county this week. The big increase in the fisheries industry of Illinois is demonstrated by the enormous catches recorded weekly.

"A Bloomington firm of professional fishermen who make a comfortable living from the waters of the Illinois River, brought in 45,000 pounds of the catch, getting this immense weight in a single haul. They received \$600 from a wholesale dealer for the entire catch, a profitable return for three days' work for six men. The catch was made near Henry, Ill. One shipment of six carloads left Tazewell county for the east this week, the bulk of the fish going to the New York market. The fish were packed in ice alive and sent out in freight cars.

"Veteran fishermen say that the carp can not be exterminated, and despite the enormous amount taken out of the Illinois river each year they are said to be increasing in numbers. The people of central Illinois are too fastidious to enjoy carp and not many of the fish are eaten here. Bass and croppy are the favorites in this section, but in the east the demand for carp appears to outweigh that of the salt-water fish.

"The catch of carp in 1905 promises to break all previous records. In a few weeks the principal dealers will prepare an estimate for the information of the Illinois fish commission, giving the amount they paid out to the fishermen along the Illinois River. In 1904 the amount was slightly in excess of \$1,000,000. It is believed that the figure for this year will be fully one-third greater at least. Two thousand five hundred persons make their living by fishing along the Illinois River and their catch will aggregate about 4,000,000 pounds for the year, of which seven-eighths is carp."

The above is emphatic evidence which way the carp is singing its lullabies on the fluvial highway of the Illinois. They are so multitudinous that they crowd that river like the salmon did the Columbia a decade or two ago. Its banks at that time during the spawning season were crowded with the dying, and the dead

being those which had spawned. The carp is so remarkably reproductive that despite the immense number already taken out they are largely on the increase each year. It simply proves my table of mathematics presented in my last paper on the carp, viz., that from 1,000,000 carp as the original figure that in twenty years in compounding that sum the amount will reach the grand total of 1,181,276,000—carp enough to feed the entire world, with sufficient remaining to accommodate the inhabitants of other planets. But as plentiful and as cheap as they are, the dwellers on the Illinois and nearby care not a fig for the carp which is sometimes called "The poor man's fish."

They know a "hawk from a hershaw," or handsaw, for that matter, as some commentators of Shakespeare have it. They can realize on the fragrance of a rose the same as on the fragrance of a superior fish. Brillat Savarin, the famous epicure, says, "The destiny of nations depends upon the manner in which they feed themselves." Now if that doctrine prevails and we think it sound, I say, God help this country if it turns out to be a nation of carp eaters, and to that end the degenerate carp are being propagated everywhere.

We do not wish to be a Caligula or a Marcus Aurelius on this subject, as despotism in any form is not to be encouraged; but we do say that society cannot exist unless a controlling power upon will and appetite be placed somewhere. Because a few fishermen are coining money in dealing in carp, are we to give way to this greed? Let us do that which will bring most good to the largest number. The introduction of carp, ay! the cursed carp has only the most infinitesimal minority for its advocacy. However, if we must have carp eaters, let us present a recipe of "How to cook a carp," which we take from a pamphlet by Mr. Edward Harris, of Toronto, entitled, "Our Great Lake Fisheries a Vanishing Heritage." He says: "When fishing, if you catch a German carp, clean it and hang it out in the sun six weeks to dry. Then nail it to a pine board and cover it thoroughly with salt and mud. Let it stand two months longer, and then bake it two days. Remove the nails, throw the carp over the back fence and eat the board."

"Notwithstanding the above recipe, a baked carp heavily stuffed with onions and garlic, and eaten with sauerkraut, makes a good meal. This is the substitute the 'foreign element wise in their generation' have given to the people who have destroyed and are still destroying what once were the finest fresh-water fisheries in the world."

ALEX. STARBUCK.

## Pennsylvania's Good Showing.

At the quarterly meeting of the Department of Fisheries of Pennsylvania a report was read by the Commissioner of Fisheries, W. E. Meehan, showing the fish-cultural and fish protective work for the calendar year. The following is an abstract:

Total number of fish hatched and distributed, 141,527,128, of which 16,873,771 were game fish; 124,653,357 were food fish. Among the game fish were: Brook trout, 7,420,805; cut-throat trout, 70,000; lake trout, 1,000,000; black bass, 24,186; other game fish, 8,358,480, including 8,350,600 pickerel. Among the food fish are included 90,900 frogs. The principal food fish hatched were: Whitefish, 34,489,999; lake herring, 22,840,000; wall-eyed pike, 51,300,000; blue pike, 9,450,000; shad, 3,790,000; white perch, 2,125,000; yellow perch, 174,750.

The appropriation available for the year was \$20,000. The number of hatcheries in full or in partial operation on Dec. 1, six. The number turning out the fish enumerated above, five. Number of hatcheries located but not built, two. Total, eight. Total number authorized by the Legislature, nine. Number of acres actually acquired for hatchery purposes, 133, including the two sites not yet occupied. Number of hatching houses, eight. Number of batteries, five. Number of jars available, 1,224—760 McDonald, 252 Downing, 212 Meehan. Total number of hatchery troughs for eggs and fry, 540—414 inside and 126 outside. Also eleven nursery ponds each with a capacity of four times a single outside trough. Total capacity of hatchery troughs for brook trout from 12,000,000 to 15,000,000. Number of breeding ponds in the hatcheries, 117.

On Dec. 1, for the first time in the history of fish-culture in Pennsylvania, all the hatching houses contained eggs. The total number is 67,101,000, or beyond 7,000,000 in excess of the same time last year. Of the eggs in the hatcheries, 11,545,000 are brook trout.

During the year the fish wardens made 530 arrests for violation of the fish laws. They secured 430 convictions before the Justices of the Peace and the imposition of \$11,992.50 in fines. Of the 430 convictions, 89 defendants took appeals, and of the 100 cases discharged by the Justices of the Peace, the Department took five appeals. The wardens making the above arrests numbered 59 regular and specials.

Warden J. Criswell leads with 82 arrests and 67 convictions; C. H. Nesley with 56 arrests and 49 convictions; C. S. Lowery, who ranks ninth on the list in the number of arrests, ranks first in the amount of fines imposed, the same being \$1,490. He made 22 arrests and secured 19 convictions. Warden Criswell secured the imposition of fines to the amount of \$1,395. C. H. Nesley was third with \$1,110. M. F. Albert, fourth, \$1,090. W. E. Shoemaker, sixth, with \$1,080. Mr. Shoemaker made 48 arrests and 43 convictions.

During the year three cases relating to illegal fishing were decided by the Supreme Court, the Department of Fisheries winning two and losing one, the last being purely on a technical point.

The Department of Fisheries of Pennsylvania has just constructed a fishway in a dam on Pine Creek, Potter county. It is of the Cail pattern, thirty-nine feet long and five feet wide, inside measurement, with five compartments. The contract price was \$1,750, and this amount was paid for out of the unexpended balances of the State treasury. This fishway makes the fifth built at the expense of the State since the summer of 1904. The other being one in the Venango River at Franklin, Pa., and the other three in Clark's Ferry dam on the Susquehanna, just above the mouth of the Juniata.

Fish Warden Criswell, of Pennsylvania, on Tuesday, Nov. 28, arrested Captain Maher, of the tug boat Hingston, and four members of the crew on a charge of fishing in Lake Erie within the jurisdiction of Pennsylvania since the beginning of the close season. The boat contained four tons of fish, these together with the boat, which is worth at least \$3,000, was taken possession of by the warden, pending a settlement of the case before Alderman Cole.

The Department of Fisheries of Pennsylvania has added another hatchery site to those which have already been located or in operation, making eight now in possession of the Department of Fisheries.

The new hatchery contains at least thirty acres and is on Spruce Creek, in Huntingdon county. Besides a trout stream of about 10,000 gallons of water a minute which flows through the property, there is a spring which flows about 1,000 gallons of water. The hatchery will be devoted principally to the propagation of black bass and kindred fishes with a few million brook trout on the side. Mr. William Haas, at present first assistant at the Corry hatchery, has been appointed superintendent of the new hatchery. Work will not begin until next spring.

## Freshwater Fishing in Japan.

CONSIDERING the geographical position it occupies, and its natural features, Japan ought to be an ideal fishing country from a fly-fisher's point of view, but unfortunately this is not the case, and the reason is not far to seek, for, except in certain remote districts, so excessively netted are her rivers and lakes that fish which might otherwise grow to a decent size and breed decent sized fish in their turn seldom get the chance of doing either. The consequence is that what fly-fishing and spinning is procurable in Japan is only so in places far removed from her centers of civilization, or, in other words, of her population, and as accommodation is generally sadly lacking in such places, the game, so far as an ordinary mortal is concerned, is scarce worth the candle. But on the other hand, no one need experience any great difficulty in getting first-class sea-fishing there, and very often, too, with quite superior native accommodation lying close at hand.

If bent upon enjoying fly-fishing in Japan a fisherman must hit himself away to Yezo, the most northerly of the four great islands that go to make up Japan proper, and though he will find the means of communication and accommodation there by no means entrancing, he will, on the other hand, find plenty of streams and lakes abounding in salmon and trout. The Yurap and Shiribetsu are generally considered the best salmon rivers in the island, and while the first flows eastward into the Pacific, the other flows westward into the Sea of Japan. In the lakes of Yezo, too, of which there are quite a number, *ao-masu* and *ami-masu* may be caught. The first is a pink-fleshed lake trout, and the second a white-fleshed one. Both take the fly readily, and are caught up to 3 and more pounds in weight. The best time of the year for a fly-fisher to visit Yezo is during the months of June, July and August. Unfortunately, however, those are the very months when mosquitoes and horse-flies, the pest of the island, are in full vigor and activity.

The two species of salmon found in the River Yezo are the *shake*, much like the ordinary salmon of Scotland in general appearance, and the *masu*, or *Salmo japonicus*. The first, though growing to a good size, up to 30 pounds in weight and more, will seldom look at a fly or spinning bait of any kind whatsoever, but the second is a decidedly sporting fish, and though never weighing much more than 10 or 12 pounds, yet it always is a game and hard fighter. The *masu* having only to be considered the fisherman need never take other than medium-sized flies with him, but what he does take should have plenty of color about them, orange and yellow, and be of a stiffer and more brittle make than the salmon-flies he would use in the home waters. And then he must not forget to drown his flies well, for a *masu* rarely looks at a fly on the surface, by which it may very rightly be inferred that spinning or trolling with live and artificial baits are most useful and killing baits with him.

Coming south of Yezo, to Nippon, the main island, a keen fly-fisher can get very fair trout fishing in its extreme northerly provinces, and though it is not quite so good as that obtainable in Yezo, it is, on the other hand, much more get-at-able. This is a very important point, indeed, and perhaps more especially so in Japan than in any other country, for camp life there is not to be hankered after for many and very obvious reasons. The Japanese are great and most painstaking cultivators, and wherever there exists a few square yards of fairly level country it is either highly cultivated, and it may here be added—as highly manured, or reserved for some purpose sufficiently preventive of its being turned into a camping ground. And even supposing one did get permission to pitch a tent anywhere, in the courtyard of a temple, for instance, the chances are the whole countryside would immediately take a holiday for the purpose of viewing that tent, and what that would mean for its occupant may be easily imagined, for though our Far Eastern allies are most ceremonious in their manner, yet they are far too often considerably lacking in thoughtfulness for others when their curiosity is aroused.

Some hundreds of miles south of the northerly provinces of Nippon comes Lake Chuzenji, and though the intervening country teems with brooks and streams that ought to shelter trout, yet they do not. Chuzenji and another lake, Biwa, were some few years back stocked with lake trout from Yezo, but only those in the former will rise to a fly. This is curious, for both lakes were stocked from the same source and with the same species of trout, and so it must be that the warm waters of Biwa have destroyed the sporting instincts of the trout turned into it, for while it lies almost on a level with the sea, Chuzenji shelters enormous quantities of *iwana*, a small species of white trout, delicious from a gourmet's point of view, but utterly worthless from that of a fly-fisher's. The accommodation at Chuzenji is first-class, the village there being a great summer resort for members of the diplomatic corps at Tokio.

Though there is such an extraordinary absence of sporting fishes from the rivers of Japan, yet it must not be supposed there are not other fishes in them. The *ai*

and *yamame* are both small species of trout, and are found in all the rivers running through the warmer parts of the empire. The *haya* is a sort of carp, found mostly in mountain streams, and can be caught with a rod and line, though never with a fly. All these three fishes, as well as the koi (*Cyprinus hamotopterus*) and the funa (*Carassius langardorffii*), and others of lesser note, afford the Japanese no end of fine fun and sport, from their point of view. The *ai* and *yamame*, if taken by the rod, are generally foul hooked, and the manner in which it is done is as follows: Armed with a long bamboo rod and a silken line, with about six feet of stout and stiffened and weighted cord fastened to the end of it, and with six or eight hooks attached to this at intervals of a foot or so, the fisher casts his line up stream. The line is then allowed to be carried down by the current, and when this has been done sufficiently far, the fisher draws it up stream and across such places he thinks the *ai* and *yamame* are swimming about in shoals. An expert at this poaching-like method of fishing will often, if he knows his waters well, hook two or three fishes at each cast. The *haya* are angled for in the usual way, the hook being baited with boiled sweet potato. The *koi* and *funa* are also caught in very much the same way, though some Japanese anglers bait for the first with worms, grasshoppers, cockchafers, etc. The warm months of the year are the best for *ai*, *yamame* and *haya* fishing, and the cold for *koi* and *funa*, which, it may here be added, are fonder of sluggish and still waters than brawling streams. The native rods and tackle are often exceedingly well got up; the hooks being the weakest part among them. The rods are invariably of bamboo, their socket ends are bound with silk, and are as often as not lacquered. The lines are generally made of the best silk procurable, and are dyed a rich red brown with *kaki shibu*, or persimmon juice. The floats are of all shapes and sizes, and not unlike those in use in English waters. The Japanese reels were, until the last eight or ten years, the most primitive affairs imaginable, but the native makers are now fast copying Occidental methods in this, as they are in so many other matters.

Among younger and robusiter men the casting net is generally in more favor among the Japanese than the rod and line, and it must be admitted they stand unrivalled in the use of it. The net is very often made of silk, and a really first-class one costs a lot of money. When opened out it may measure anything from ten to twenty feet in diameter, and around its circumference are attached pieces of lead to make it spread out flat when cast and sink rapidly. To the center of the net is fastened a thin cord, some three to five yards in length, one end of which, when the net is in use, is looped round the left wrist of the fisherman. Upon the net being arranged in order it is hung over the fisherman's left forearm, and a part of its outer edge being opened out, he takes it lightly in his right hand. Before casting he will make sure that his feet are firmly planted, and then, turning his body from the hips upward, so as to face the left rear of his position, he will, when ready, swing round sharply and strongly to his front, and, with a heaving sort of motion, send the net over his right shoulder on to the spot aimed at. If properly cast the net opens out to its fullest extent, and, falling upon the water, sinks rapidly, imprisoning at the same time any fish that may happen to be beneath it. The fisherman then proceeds to carefully draw the net toward himself until the further part of the circumference has met the nearer part, and then carefully lifting the net out of the water he will remove all the fishes that may be entangled in its meshes. Ground baiting is sometimes used for attracting fishes to certain advantageous spots, and quite big hauls are often made under such circumstances.

The poorer class of Japanese, those who fish for a livelihood, employ all sorts of cunning and extraordinary artifices and traps to catch trout, *ai*, *yamame*, etc. They will sometimes build a rough dam or weir across a mountain stream, and erect upon this a bamboo platform pointing down stream and inclined upward at an angle of about fifteen degrees. The current in forcing the water up this platform carries the fish trying to go down stream with it, and any fish caught are left stranded at the top. A man on the lookout then catches them before they can flap their way over or back again into the stream, and, imprisoning them in specially made baskets for the purpose, keeps them alive and wholesome for days or weeks at a stretch. The *yotsu-de ami*, or four-armed net, is in constant use in the lakes, creeks and more sluggish streams of Japan. It is a square net, and may be of any size, from what a child can handle to a huge affair requiring pulleys and two or three men to manage it. It is stretched square by the help of two bamboos bent in the form of a cross at right angles, and fastened together at their center. This cross of four arms, or *yatsute*, is then attached by its center to the end of a strong bamboo or pole, which is itself again pivoted upon a short post fixed upright, either upon the side of a boat or driven into the ground on the bank. The net is lowered into the water until it nearly touches the bottom, and after remaining immersed for some time it is raised as quietly and quickly as possible, and whatever fish may have been passing over it are taken. Large nets of this sort are much used at night, torches being lit and held over them when immersed in order to attract the fish. The *yeri* is a kind of maze made of small bamboos driven into the ground at the bottom of shallow lakes and slow-running streams. The fish enter, pass on, and eventually lose themselves in the intricacies of the maze, and remain swimming around until removed by hand nets. The *koi* do is a bamboo cage, or basket, with a semi-circular opening at one end by which the fish enter. This opening is furnished with a hinged door made of bamboo spikes and hung in the same slanting manner as is that of the common wire mouse-trap so much in use all over the world. The trap is baited, and a fish desirous of entering, gropes his way in under the slanting door, and once in the trap must stop until the fisherman removes it. Such traps are weighted and sunk to the bottom of lakes, ponds and sluggish streams, and seldom other than mud-groping fish are caught through their instrumentality. The *nama-dzu do* is a long cone-shaped basket, about ten feet in length and about two feet in diameter at its larger end. After being crammed with straw and brushwood, it is weighted, sunk, and left at the bottom of rivers and ponds for days at a stretch, during the spawn-

ing season. It is most destructive to fish life, great quantities of spawn being destroyed each time it is taken out of the water, and the fish that are caught by its means are generally worthless as food for man. Beside the nets and fish traps here described there are many others in use among the Japanese, some being modifications of them and others not unlike those in use with our own fishermen and poaching fraternity.

The *unagi*, or Japanese eel, is quite one of the most important fishes in Japan, as well from a culinary point of view as from the fact that its capture and sale gives constant employment to, perhaps, hundreds of thousands of Japanese. Besides being largely taken in traps and nets, it is groped for in the mud of rivers and lakes by the aid of various spears and hooks. The highest priced *unagi* are mostly caught at the mouth of tidal rivers, and the instrument most commonly used for its capture is a sort of hook-spear, called *unagi kaki*. The spear end of this is shaped somewhat on the same lines as is a pastoral staff, though in miniature, and without its too decided curves. The hook is tipped with steel, and is flattened and sharpened to admit of an easy and quick passage through the mud. To the inner side of the hook are welded a number of small steel spikes about an inch in length. Having a long wooden handle, or haft, the *unagi kaki* can be used either from a boat or by a man wading. If used from the former then the gunwale of a boat forms a fulcrum, and if by the latter then the fisherman's foot or knee serves for the same purpose. The hook is plunged deep into the mud and carried forward and upward, and should an eel have the bad luck to get in its way the chances are it will quickly find itself transfixed on one of the spikes mentioned. Lifting the hook out of the mud, the fisherman frees it of all matter adhering to it by a sharp tap or two on the edge of a basket or tub carried for the purpose, and into which will necessarily drop any eel that may have been captured. The eels caught are then alive and hearty, and are sometimes so kept for weeks at a stretch by proprietors of native restaurants specially devoted to the preparation of *unagi meshi*, or broiled eels upon rice. A particularly rich, though withal a remarkably toothsome and satisfying dish, and the wonder is it is not introduced into England, for it would be a perfect godsend to our poorer classes there can be no doubt, as both rice and eels are cheap.

On some of the rivers of Japan the *ai* is taken with the aid of cormorants, and though many people declare this is a sport peculiar to Japan, I beg to differ from them, for the Chinese have used cormorants for fishing purposes for centuries, and what is more, their birds are far better trained than are those of their island neighbors. Both people put rings round the necks of their cormorants to prevent them from swallowing any marketable fish, but, unlike the Japanese, the Chinese do not harness their birds. The Chinaman's bird swims and dives unfettered excepting for the ring round his neck, and when he has caught a fish he cannot possibly swallow, he at once makes for his master's boat of his own free will, and after being lifted in is relieved of his catch. The Chinese and Japanese, however, act alike in rewarding their birds after a successful dive. But to return to the subject. The cormorants are caught young, and when trained and accustomed to their master's voice and presence, the Japanese rig them out with a sort of harness. From the center of this, and over the middle of their backs, projects a short piece of extra pliable cane, to which they fasten a restraining line twenty to thirty feet in length. A first-class fisherman handles no less than a dozen birds, and considering they are all diving and swimming about at the same time, it will be realized how very careful and smart he must be to prevent a general entanglement of the lines holding them. Unlike the Chinese, who make their birds work whenever a chance offers of making a good catch of fish, the Japanese work their birds only during summer nights, and then with lighted torches in attendance, in order to attract the *ai*. Having copied the system from the Chinese, the Japanese have added to it all sorts of curious ceremonies, and which, I think, points to the likelihood of its having been introduced into Japan for the delectation of some mighty potentate. At any rate, they are so Japanese, that little wonder people have jumped to the conclusion the whole system is of purely Japanese origin. Under favorable circumstances the cormorants will work until they are twenty years of age, but by the greater number of them suffer severely from rheumatism and vermin, and die long before that.—F. J. Norman, in London Field.

## Fish and Fishing.

### Fish and Game Preserves in Canada.

THE Minister at the head of the Fish and Game Department of the Province of Quebec has plenty of difficulties looming up before him, not the least of which is the movement now taking shape against the perpetuation of leases of public lands for fish and game purposes, and, as a matter of course, against the issue of any more of such leases in the future. There are, of course, two sides to this question, and the rival and contending interests in the matter are pretty much in evidence at the present time. So many of the existing leases are held by American sportsmen and so many more of these latter are members of Canadian fish and game clubs holding similar leases that the present crusade against the continuance of these private preserves on public property is of serious import to many of the readers of FOREST AND STREAM. Among those who take the strongest ground against the perpetuation of the present system are some of the railways. Not all of them take this view of the matter, and the general manager of the Quebec & Lake St. John Railway, Mr. J. G. Scott, for instance, alongside of whose line of railway there are so many clubs holding leases from the Government, is strongly opposed to any interference with them. The railways which are unfavorable to the leasing system are actuated by the fact that private ownership of the fish and game upon public lands shuts the door of large tracts of the best hunting and fishing territory in the Province to railway, sporting and tourist traffic. Of course this objection vanishes except where the leasing system has been overdone. That there are localities in which nearly all the available territory in

which fish or game are to be found has been locked up by lease in private lands cannot be denied. At the recent colonization congress in St. Jerome, Mr. L. O. Armstrong, of the Canadian Pacific Railway, produced a map showing where the entire country containing game, adjacent to the line of his railway in one part of the Ottawa district, was closed to the public. This operates quite naturally against the bringing of sportsmen to those sections of the Province, and when this particular case was pointed out to him the Minister at the head of the Fish and Game Department at once declared that he would do whatever lay in his power to put an end to such conditions. It is very wrong, however, to suppose that they are at all general. Hundreds of square miles of territory, it is quite true, are controlled by fish and game clubs or private individuals, but at the same time, the whole of such territory forms but an insignificant proportion of those sections of the Province containing abundance of both fish and game, which are open to lovers of fishing and hunting. One disadvantage of the leasing policy is undoubtedly the fact that it furnishes rival Provinces and States with an excuse for advertising that all their public lands are open to hunters and fishermen, while many of the best of those in the Province of Quebec are in private hands. Yet, the fact remains that even in this Province there are so many wild lands open to sportsmen that there is no possible chance for overcrowding in them, for many years to come.

To the credit of the private fish and game preserves of the Province must be largely attributed the gratifying increase in the game fish and big game in many parts of the country. But for their existence and work during the last few years many of the best fish and game districts of the Province would now be practically denuded of their fish and game. Especially is this true of the country traversed by the Quebec & Lake St. John country. Experience has proved over and over again in Canada that nothing cleans the fish and game out of a given district in shorter time than the operations of a gang of men engaged in building a line of railway through it, or the Sunday fishing and hunting of the members of lumbering camps which so quickly follow the construction of railways. In the country through which the Quebec & Lake St. John Railway runs, much of this work of destruction was prevented by the lease of a number of sections of territory as soon as the railway reached them, and in some cases even before they were reached by the construction gangs, to fish and game clubs, which both from interested motives and also because they were constituted as protective associations by the terms of their incorporation, were strictly required to enforce the provisions of the fish and game laws in the territory leased to them. Many of these club limits, which contained scarcely any big game at all ten or fifteen years ago, are now fairly swarming with moose and caribou. It stands to reason that the protection of the fish and game within such circumscribed areas protects also, by means of its overflow of big game, and the alertness of the clubs and their officials, the game of the entire surrounding country. It is a notorious fact that Government protection of fish and game has been nothing but a huge farce in the Province of Quebec. Such protection as has been worthy of the name has only been accomplished by the Government, by proxy, so to say. The Fish and Game Department has subsidized the fish and game protective associations of Montreal and Quebec, whose good work is well done and worthy of all commendation, and it has also constituted into protective associations all the members of the clubs to which leases of fishing or hunting territories have been accorded. Apart from the amounts collected as rentals for salmon rivers the sums received by the Government from fishing and hunting leases are comparatively small, and while the amounts paid by American lessees are about the same as Canadians pay for similar privileges—many clubs containing Americans and Canadians—the fact of belonging to such a club relieves American members from the payment of the ordinary license fee exacted from non-residents of the Province. As the Government is casting about at present for means to pay for a better system of fish and game protection, it is by no means improbable that instead of increasing the rental of fish and game rights it may exact license fees from all American, Ontario or New Brunswick residents alike, irrespective of whether or not they may be lessees of Government hunting or fishing rights, on the ground that they already receive value for their money, just as residents of the Province do when they pay rental for such rights.

It will be found that quite a number of important reforms will be urged upon the Government at the Fish and Game Congress, which is being held in Montreal as this number of FOREST AND STREAM goes to press. The present bounty of \$5 per head upon wolves is practically useless, and is scarcely ever claimed, though the number of wolves is so much on the increase in the northern parts of the Province as to be driving the red deer out into the settlements in many instances. It is claimed that this bounty should be increased to at least \$15.

There is also an agitation for a complete change in the system of Government fish and game protection. At present small salaries of from \$50 to \$150 are paid to a hundred or more so-called fish and game wardens, who never think of doing anything in return for the money so received, regarding it for the most part as a pleasant little piece of Government patronage, for which it is their duty to be good party men and duly thankful to the men in power. The new Minister is to be urged to do away with the services of these men and to appoint eight or ten good guardians with decent salaries and place each of them in charge of a district of country comprising a group of contiguous counties. The Government undoubtedly requires more money to properly protect its fish and game, and is now casting about for the means of obtaining it. The railways say that the revenue of the Government would be larger if it leased no territories at all for fishing and hunting, but left the country open to everybody, simply charging a license fee to all non-residents of the Province whether Americans or people from the other Canadian Provinces.

It is only fair to say that no proposal to make any large increase in the rentals paid by the fish and game clubs, will find favor with the people living in the neighborhood of these clubs' territories. To these the expenditure of the clubs means much. A large number of families are

more than half supported by one of these clubs. The clubs in the St. Maurice district spent over \$15,000 this year for guides alone. One of these clubs has constructed no less than twenty miles of carriage roads, 150 miles of portages and thirty-five buildings, two of which cost \$5,000 each. Many such instances might be given. One thing is quite certain. The agitation on the part of the railway companies to do away with all these clubs finds but scant favor with their poorer neighbors.

E. T. D. CHAMBERS.

### New York Commission Fish Distribution.

THESE figures represent the work of the Commission for the year ending on Sept. 30, 1905. In addition the Commission distributed for the United States Commission a total of 4,787,965 fry, chiefly of the pike-perch variety, and gave away fish at the State Fair to the number of ninety-six, making a total for the year of 171,759,998, as compared with a total of 111,667,830 for the previous year.

Brook trout	966,364
Brown trout	1,862,693
Lake trout	3,350,976
Rainbow trout	316,407
Other trout	45,010

Total trout	6,541,450
Total trout distributed in 1904	5,044,914

Increase in 1905	1,496,536
------------------	-----------

Frostfish	1,100,000
Maskinongé	2,025,000
Pike-perch	68,510,525
Yellow perch	31,011
Shad	2,361,900
Smelt	25,300,000
Tomcod	30,600,000
Whitefish	30,500,000
Miscellaneous	2,051

Total in 1904	166,971,937
	108,663,329

Increase	58,308,608

### Prospecting for Black Bass.

CHERRYVALE, Kan., Dec. 5.—*Editor Forest and Stream:* Some weeks ago I promised that I would soon go and take a day with the bronzebacks and make report of my success, but the season has passed and all of our ponds and lakes are covered with ice, none of them containing more than a half hundred acres of surface, and none over ten to twenty feet in depth, so that the bass are safe until another season, unless we have a warm spell, which we usually have, until about the holidays, and those who know where the bass have congregated in the deepest holes in the rivers and ponds, on bright sunny days can have fair sport with minnows. I had a boat ride of two hours on the Walnut River at Winfield last week with the Santa Fe agent there, Mr. Samuel Miller. We were without bait of any kind and just went prospecting over two miles of the stream near the city; and it was a delightful trip, even if we did not wet a line. Along the south bank of the river a land slide occurred during high water two years ago, and when the river was frozen over all of the trees were cut off at the top of the ice, and there were the stumps along a half-mile of bank just rising above the surface of the water, furnishing such lurking places as the bass love, in a pool where the water averaged about twenty feet in depth. As we passed one big stump after another and, by the eye of faith, could see the 4 and 5-pounders waiting for the minnow or crawfish, and in fancy had them hooked to a suitable split bamboo, and waging a battle for self-preservation, we derived as much if not more pleasure than we could possibly have had if at the end of our two hours' ride we had had a dozen or more captives astern of the boat fastened with bait chains.

Truly an experience of this kind proves the wisdom of shrewd Izaak Walton's maxim, "It is not all of fishing to catch fish." W. F. RIGHTMIRE.

### Fishing at Lake Erie.

CONSUL HARVEY, of Fort Erie, Ont., furnishes the following on fishing in Lake Erie:

"The Canadian government issues fish licenses to parties all along the north shore of Lake Erie. I recently visited a Fort Erie man who has a lease of six miles of the shore between Port Colborne and Dunnville, for which he pays \$600. He has six nets extending from the shore one and one-half miles out into the lake. The nets are deep enough to allow the lead line to rest on the bottom and the cork on the surface of the water, the outer end being forty-feet in depth. Each net has two or more cribs. The fish follow along the net until they come to the crib, which is about thirty feet square, the bottom and sides composed of small meshed netting that holds a fish of one-fourth pound weight.

"When the nets are lifted they contain from 500 to 2,000 pounds of fish which are dipped out with a scoop net, except the sturgeon, which are lifted with a gaff hook. The law requires the black bass to be returned to the water, but as there is seldom any inspector present the law is not enforced. The 100 or more black bass I saw taken would not average more than a pound in weight, while a few years ago the average run was three pounds.

"If the two governments would join and prohibit net fishing in Lake Erie for four years fish would become plentiful and of good size. Net fishing is not allowed in Niagara River, but the net fishing on both sides of the lake prevents fish from getting down the river, and Buffalo anglers have to go to Canadian lakes for their sport. The fish caught in the lake are sorted, packed in 100-pound boxes, and expressed to Buffalo or New York, where they are sold to the consumer for 10 cents per pound."

# YACHTING

## A Very Ancient Egyptian Boat.

ABOUT twenty-five years since there was disinterred and brought to light on the coast of Norway a vessel which excited much interest at that time and ever since, and on it and the things found in and about it much study and erudition have been bestowed. The Antiquarian Society of Norway took the investigation in hand, and a book published with the title "The Viking Ship," beautifully and very fully illustrated, gives a very minute account of every article included in the find. These illustrations include a well executed drawing of the vessel herself, showing the lines and details of construction. The vessel is supposed to have been built somewhere between nine and eleven hundred years since, and considering this, was in a remarkably well preserved state. The vessel is of surprisingly good and symmetrical form, and it will be remembered that a fac-simile of her was in 1893 sailed across the Atlantic and exhibited at the Chicago fair. Some years since, the sailing master of a schooner yacht told me that one of the small boats with which the yacht was equipped had been built from the lines of the Viking Ship, and was the fastest rowing boat belonging to her.

The writer was in Egypt last March and saw in the museum at Cairo two boats prominent among the exhibits. These were ascribed to a period 2,300 years B.C. They were therefore four times or more older than the Viking craft, more interesting consequently in this one matter of age, and not less so in some other features. The ends of the stem and stern were jagged and broken off, and in the one of which I took measurements the keel was partly gone, six or seven feet of the upper strake on the port side was broken away, but the form was otherwise well preserved. In an interview with the courteous curator, I was shown a book, printed in German, which gave an account of these boats, with an illustration (a perspective view), but was told that nothing had appeared which would accurately give the form of the boat. I noticed at once that the underwater bodies of these two boats had, in conspicuous degree, the essential features which have been commonly introduced into modern yachts only within the last fifteen years; and with the cordial assent of the gentleman in charge of the exhibits (Emile Brugsch, Bey), I engaged to take off the lines, which are herewith exhibited. The boat was, I was told, originally employed to convey to its destination a mummified body, and was then treated as a sacred vessel, and buried beneath the sands of the desert, from which it was disinterred about eleven years ago. I was informed that Mr. Carnegie had purchased one of these boats, and had it sent to this country, and that it was on exhibition somewhere—Chicago, I think.

The construction is peculiar; there are no frames, the planks are about 8in. at greatest width, of sycamore, 2 1/2 in. thick, fastened together by flat dowels driven edgewise through one plank into another, and again by flat dovetail pieces of the form illustrated let into the inner side of the planking. There are eleven thwarts (5 x 2in.) in the boat, each one let into the top of the second strake.

The boat, it will be seen, has a form very easy for propulsion, and a very small wetted surface. The curve of areas shows a nicely graduated under-water body, somewhat fuller in the forebody than accords with modern practice, but scarcely admitting of amendment in the after end. Given a different sheer, and a finish to the stern somewhat conventionalized, you have an up-to-date looking boat, and with or without these changes, if you put on a boat of this form a bulbed fin, such as came into use in 1891, you have at once a promising racer for this date, in a form conceived and built to over four thousand years ago. With the bulbed fin admitted, few men of competent judgment will, I think, be found to question that we have here for racing purposes a form superior to anything existing in modern times previous to 1890.

In this connection it may be stated incidentally, that by the recently adopted racing rules, the little vessel would have a permitted draught of 5ft. 5 1/2 in.

To further carry out the idea of adaptation to racing,

it may be stated that such a boat would, by the rule, be allowed to carry 408 sq. ft. of sail in the 18ft. class, or 555ft. if sailed in the 21ft. class.

Her dimensions are:

Length—	
Extreme, to the broken ends.....	32ft. 2in.
L.W.L., as drawn.....	21ft. 2in.
"L" as per racing rule.....	20ft. 4in.
Breadth—	
extreme .....	7ft.
L.W.L. ....	6ft. 4in.
Draft as shown.....	1ft. 3 1/2 in.
Displacement .....	71 1/2 cu. ft.

JOHN HYSLOP.

## Boston Letter.

GERMAN-AMERICAN RACE.—The communication of the Kaiserlicher Y. C. has been received by the Eastern Y. C. and, as had been expected, it had to do with a challenge for the first series of races to be held at Marblehead. In greater part, however it treated of conditions to govern the holding of the trophy, and to the several clauses in the agreement between the clubs of both countries. The conditions were first proposed by the Eastern Y. C., some of which were accepted by the Kaiserlicher Y. C. and suggestions were made in regard to others by the German club. In the main the two clubs agree, although there are some other points which will receive further consideration. It is thought that by the first of the year all conditions will be settled upon, when a deed of gift for the cup may be drawn up, under which a challenge may be accepted.

DOUGLAS SCHOONER TO BE LAUNCHED.—The 50ft. waterline schooner, which has been built at Lawley's for Rear Commodore Alfred Douglas, of the Boston Y. C., was launched from the east shop last Tuesday morning. The new schooner is a well-turned, wholesome looking craft, and has good accommodations for cruising.

KIOWA SOLD.—Mr. B. B. Crowninshield has sold the 35-footer Kiowa for Mr. Charles L. Eaton, of the Boston Y. C., to Mr. W. H. Bradbury, of the same club.

KATHERINE II. SOLD.—Former Governor Frank W. Rollins, of New Hampshire, has sold his 46ft. waterline auxiliary yawl Katherine II. to Mr. Joseph J. Tootle, of St. Joseph, Mo. Katherine II. was formerly Alborak, one of the 46-footers brought out in 1891. She was designed by the late Dr. John B. Paine for Gen. Charles J. Paine.

NEW BOATS.—There is building at Lawley's, from designs of Mr. Fred. D. Lawley, a 102ft. cruising power yacht for Mr. H. F. Hanson, for whom the cruising power yacht Elkhorn was built a year ago. The new boat will be 102ft. over all, 94ft. waterline, 13ft. 6in. breadth and 5ft. draft. She will be propelled by a six-cylinder Standard engine of 300 horsepower, and her gasoline tank will have a capacity for thirty-four barrels, which will give her a cruising radius of about 1,000 miles at full speed. It is expected that she will show 16 miles an hour. This boat in outline is much like Elkhorn, except that there is more sweep to the bow. There is a deck house forward, which is used for a dining room and the crew's quarters run underneath this. The galley is next aft, and then comes the engine room. The tank is placed in a compartment formed by two water-tight steel bulkheads. Aft is the main saloon, forward of which is the owner's room. There is a double stateroom in the after part of the boat, below the after deck, in which the head room is 4ft. 9in.

There is also building at the same yard a fast cruising launch for Mr. Ernest B. Dane. This boat will be named Needle. She is of the Scout and Mirage type, having a low trunk, which is broken forward, the helmsman standing in the deck. She will be equipped with a Standard engine of 100 horsepower, which will give her a speed of 15 miles an hour.

In the same shop the keel is set up for an auxiliary yawl for Mr. J. H. Cromwell, of New York. This boat will be 84ft. over all, 57ft. waterline, 20ft. breadth and 4ft. draft. She will be equipped with a 30 horsepower engine.

## British Letter.

FIXTURES FOR 1906.—It is satisfactory to know that the fixture list for British regattas will be on a more satisfactory basis next year. The proposal of Mr. W. P. Burton, owner of the 52-footer Britomart, that the season should open with the Clyde Fortnight instead of with the Thames and East Coast races has been agreed to by the Clyde clubs, and a list has been drawn up which should prove far more satisfactory than any we have had of recent years. To commence with the Clyde means the saving of a fortnight, and this just makes all the difference in relieving the strain which has been put upon owners and crews by jamming up the fixtures so close as they were before and yet having idle time in June and part of July for those yachts which did not go to Kiel or the Clyde. In the present fixture list Kiel regatta is ignored—and rightly so, as the Germans have quite enough boats to run their own races now, independent of outside help. Ostend and Antwerp are included, but they are really British fixtures, as they are almost entirely run by British yachts. The chief thing about the new list of fixtures is that it permits of the yachts working the coast in a much more systematic method than hitherto. Starting with the Clyde on June 2, they then go on to Belfast, Kingstown and Plymouth; thence on to Dover, the Thames and Harwich. On July 14 the Royal Thames has its annual races from the Nore to Dover, after which follow Ostend and Antwerp. The rest of the season follows the ordinary routine, Ramsgate, the Solent and the West of England regattas. The new arrangement should prove a great success.

FIRST-CLASS RACING.—There is but little doubt that an attempt will be made next season to form a big class to sail under Y. R. A. rules and time allowances out of such boats as we have already, together with the cutter building at Gosport. It will certainly be a mixed class, as it will be chiefly composed of yachts which have been sailing under handicap conditions, and many of them are widely separated in years and tonnage. The following have been mentioned as the most suitable vessels: Kariad, Navahoe, Bona and Susanne, all bona fide racers when they were built; the Nicholson cutter and the fast cruisers Cicely and White Heather. Whether such a class would prove a success on Y. R. A. time instead of handicap remains to be proved. Bona and White Heather would sail on level terms, but nobody who knows the boats could doubt that Bona, although ten years old, is more than a match for the Fife yawl. Kariad is an unknown quantity, and the new cutter can hardly be called a first-class yacht as she is building to Lloyd's requirements. However, owners seem to be tired of handicap racing, and anything in the direction of a return to class racing would be more than welcome. The schooners would not have much of a look in except on odd days and the bulk of the prizes would probably go to Kariad, Navahoe and Bona. There is some talk of converting White Heather from a yawl to a cutter, but nothing is yet settled, neither is it known whether Bona, Kariad or Cicely will be in commission. It is a pity such fine vessels are kept hauled up when they would be such valuable additions to the racing fleet. The last news of Bona was that her owner was trying to sell her, and that people had been to inspect her with a view to purchase. It is to be hoped that Mr. Donaldson may change his mind when he finds there is a prospect of class racing and fit out once more the boat he has raced so many seasons with such conspicuous success. The experiment of forming a class under Y. R. A. allowance is certainly well worth trying, and will be almost sure to lead to others building to the class when it becomes more stable, although nothing much will be done that way until the new rating rule is finally decided upon.

LINES AND BODY PLANS OF ANCIENT EGYPTIAN BOAT ON EXHIBITION IN THE MUSEUM AT CAIRO, EGYPT. LINES TAKEN OFF BY JOHN HYSLOP.

CRUISING LAUNCH—OUTBOARD PROFILE, INBOARD PROFILE AND CABIN PLAN—DESIGNED BY MARTIN C. ERISMANN FOR SEYMOUR OPPENHEIMER, 1905.

**Design for a Cruising Launch.**

DURING this last fall Dr. Seymour Oppenheimer, of New York, commissioned Mr. Martin C. Erismann, naval architect, of Port Richmond, New York city, to design for him a cruising launch, whose plans we are pleased to publish herewith. The instructions conveyed were for a boat similar in some respects to a smaller boat designed by Mr. Erismann last spring. The length and other proportions were to be increased, and the accommodations provided for four berths, a maid's room and two men in the engine room. The minimum speed was placed at 11½ miles per hour, so as to give the owner opportunity to get as far away from the city in a limited time as possible. The interior to be arranged as simply as was consistent with a comfortable home during the summer months, and, above all, the hull was to be designed, constructed and described in such a way as would, within narrow limits, insure a strong, able and staunch boat with ample stability and seaworthiness. It is a fact, however, in the above respects that accommodations are often made most of, and a result very frequently met with is a hull unsuitable for the work, for, admittedly, a houseboat is not and can never be a racer and seek in those fields for such honors. It must be added, however, that some startling results and combinations have been obtained by men who were conscientiously devoting their lives to the developments of the yacht for all the varied services that the present enlightened and commercial generation requires.

As the drawings show, the boat possesses an ample freeboard forward and aft, and, for this type of boat, the most effective sheer is a flat one; but well marked by a heavy fender, thus carrying the lines as long and low as possible and producing an effect of trimness. The sides of the hull, in way of owner's quarters, are carried up flush to the raised deck, increasing the strength of the boat over what it would be in a cabin trunk, where the ties or beams are cut in three places, also adding greatly to the apparent inside room. About the engine hatch the deck is roomy and makes an easy and safe place to move about on; the cockpit aft is large and comfortable, and is really the outside living room of the boat.

Forward, under the deck, is located a gasolene tank for 250 gallons of fuel, giving the boat a large cruising radius. This tank, being entirely isolated from the ship in this wise, it is ventilated and drained to the sea, insuring absolute safety.

Immediately aft of the tank compartment is located a toilet and bathroom. The tub is raised to give sufficient head room to sit in the bath, and it also adds somewhat to space and locker room; the plumbing is to be of the best open type. Aft of bathroom is located the owner's or ladies' cabin, fitted with berths on each side, with drawers under and hanging lockers at forward end. Still aft of the owner's cabin is situated, the main saloon, which is about 8ft. long; on each side are placed large

comfortable sofas which at night will make up into berths, and there are provided a writing desk, book rack, dining table and dresser, spaces for napery and silver. Aft of the saloon on starboard side is located a state-room for either a guest or maid, and on the port side a galley of good proportions, allowing the cook a needed amount of comfort to do his work, which, in all yachts, is rather arduous from the cramped quarters.

The galley is equipped in the best manner with oil-burning stove, porcelain-lined, ice-box, etc. The engine room is large and well ventilated, and, besides containing an engine of 50 horsepower, will have a small electric lighting plant, and there will be two pipe berths for the crew and a toilet. The after end of the forecabin will be taken up with the ship's water tank. The joiner work will be simple. The fronts of berths and furniture of mahogany to above a line about 3ft. from the floor; the woodwork will be enameled white, giving the owner's quarters a very pleasing and light appearance. The upholstery will be done in either yellow or the conventional green. The panels of doors, etc., will be of pine, but left bright and varnished, giving relief to the eye and breaking the white paneled surfaces.

The hull is to be painted white, the sides of the raised deck of mahogany, as will be also the rest of the deck-work, but the top of cabin house will be painted a suitable green, as in the bright sunshine of the summers in

this vicinity white is often very trying to the eyes. Awnings of the double type are to be fitted.

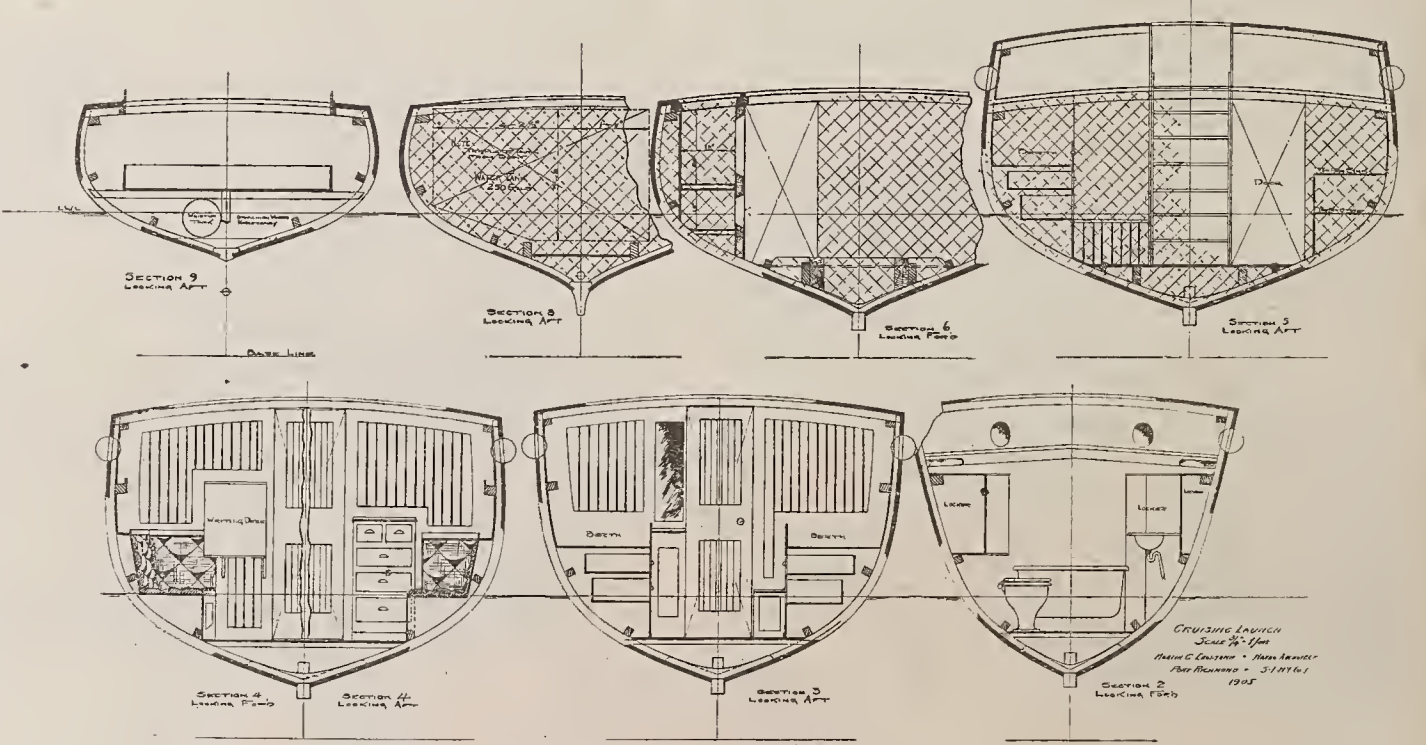

A signal mast is fitted to have a small square sail and in runs where favorable winds may be taken advantage of the sail will be set. This will add greatly to the comfort of those aboard and reduce the rolling.

The construction will consist of oak frames and yellow pine longitudinals and cedar planking, and will be copper fastened throughout. The deadwoods also to be of oak, and all the work will be of the best class of yacht work.

The boat will be in commission, it is expected, early in the season of 1906 and will prove a very handsome addition to the already large fleet of launches in these waters.

The dimensions of the boat follow:

Length—	Over all	61ft.	3in.
	L.W.L.	57ft.	
Overhang—	Forward	1ft.	9in.
	Aft	2ft.	6in.
Breadth—	Extreme	11ft.	7in.
	L.W.L.	10ft.	11in.
	At deck	11ft.	2in.

CRUISING LAUNCH—SECTIONS.  
Designed by Martin C. Erismann for Seymour Oppenheimer, 1905.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

THE "LONE MARINER" TO ROUND CAPE HORN.—Capt. Adolph L. Frietsch, the "Lone Mariner," who has sailed alone to almost every port in the world in a little open boat, covering nearly 50,000 miles on the high seas during the past few years, left Jackson this morning for Gulfport, Miss., where he will make an effort to repair his boat, the Ada S., and start on a long cruise in Southern waters, says the Jackson, Miss., correspondent in the New Orleans Times-Democrat.

Captain Frietsch spent the past week in Jackson taking in the exposition. His stay in this city was the longest period he has spent away from the ocean for many years, and he is anxious to ascertain the exact amount of damage sustained by his little boat, which was beached near Gulfport during the recent storm along the Mississippi coast.

During his Southern voyage, Captain Frietsch will touch at Central and South American points and, as usual, he will make the trip alone. He expects to round Cape Horn within three months after setting sail from Gulfport.

NEW AUXILIARY BUGEYE.—Mr. A. A. Blow, of North River, Chesapeake Bay, has commissioned the Williams-Whittelsey Co., Steinway, Long Island City, to build for him an auxiliary bug-eye. It is a rather unusual thing for a boat of this type to be constructed in a Northern yard, and for that reason she will attract more than ordinary attention. The boat will be 70ft. long, 14ft. breadth and 4ft. draft. The frames are of oak and the planking is of yellow pine. All the finish on deck is of mahogany. The motive power consists of a 50 horsepower Standard engine and a speed of over 11 miles is expected. This new boat, which will replace Mr. Blow's Kosagaas, will be used for cruising on the Chesapeake. She will be completed and ready for delivery by May 1, 1906.

A CORRECTION.—In our description of the new schooner building for Mr. Henry A. Morss, Vice-Commodore of the Corinthian Y. C., of Marblehead, that appeared in our issue of Dec. 9, we stated that the boat's over all length was 95ft. 3in. This was an error, as the boat is 85ft. 3in. on deck. We are glad of an opportunity of correcting this mistake.

PAVONIA Y. C. OFFICERS.—At the annual meeting of the Pavonia Y. C., of Bayonne, N. J., held recently, the following officers were elected: Com., William E. Thorpe; Vice-Com., Frank Mullins; Rear-Com., D. C. N. Collins; Cor. Sec., Henry Smith; Fin. Sec., John Wilson; Treas., Claudius Harz; Meas., R. W. Baughn. The club will hold its annual dinner on Jan. 7.

ANEMONE'S LONG VOYAGE.—Mr. Charles L. Tutt, a member of the South Coast Y. C., of San Diego, Cal., has purchased through Manning's Yacht Agency the fine British-built auxiliary ketch Anemone from the estate of the late John Murray Mitchell. Anemone left Erie Basin on Dec. 12, and, after adjusting compasses, started on her long voyage around Cape Horn to San Diego. She is in charge of Capt. H. Lindeberg, and it is expected that about four months will be consumed in making the voyage. The start is being made at the best possible time, as she will reach southern latitudes when the days are longest. Anemone is one of the finest cruising yachts afloat and she is just the vessel to make this trip. She was designed by Mr. A. H. Brown and built by Messrs. Camper & Nicholson, at Gosport, England, in 1899. Her construction is of wood and she is 112ft. over all, 91ft. waterline, 19ft. 5in. breadth and 11ft. 6in. draft. She is a flush deck vessel with a clipper bow and a graceful overhang aft. She has 15 tons of lead on her keel and inside there is more lead and iron ballast. Ratsey & Laphorn made her sails and she carries on davits a launch, a cutter, a gig and a dinghy. Messrs. Simpson & Strickland & Co. built her engines, which are of the quadruple surface-condensing type with cylinders 6in.,

Draft—

Extreme .....	3ft.	8in.
To rabbet .....	2ft.	10½in.

Freeboard—

Forward .....	4ft.	4in.
Least .....	3ft.	
Aft .....	3ft.	1½in.

Mr. Erismann is one of the younger naval architects to begin business on his own account. He has completed for the Model Committee of the New York Y. C. drawings of such famous old schooners as Vesta, Henrietta and Flectwing, who in 1866 raced in mid-winter across the Atlantic. These drawings were made from all the available data obtainable and have required a year to finish, and now they are to go to the model makers and full-rigged models will be made. It will be remembered that this is a gift of Mr. James Gordon Bennett, who owned Henrietta, and was one of the principals in the famous race.

Mr. Erismann has designed a number of boats which are now under construction, among which is a boat for a speed of 23 miles an hour to be fitted with a steam turbine. This boat is the smallest of this remarkable type so fast displacing, for certain purposes, where speed is required, the reciprocating engine.

Mr. Erismann's experience has been, for so young a man, long and varied, and includes all kinds of work in the drawing office and yards in this country and study abroad. We would say in conclusion, and we have had occasion to speak of it before, that all the work we had the pleasure of seeing from Mr. Erismann's office has been far in advance of that generally seen, and at no very distant time it will compare very favorably with the work of the naval architects of Europe.

BRIGAND AND HARELDA SOLD.—Mr. Hollis Burgess has sold the cruising sloop Brigand, owned by N. C. Nash, of Cambridge, Mass., to Dr. F. I. Proctor, of Boston; also, the knockabout Harelda, owned by James Weld Carrot, of Cambridge, Mass., to Joseph A. Will, of Dorchester, Mass.

# HOUSEBOATS AND HOUSEBOATING

BY ALBERT BRADLEE HUNT,

Yachting Editor of Forest and Stream.

A volume devoted to a new outdoor field, which has for its purpose three objects:

- First**—To make known the opportunities American waters afford for enjoyment of houseboating life.
- Second**—To properly present the development which houseboating has attained in this country.
- Third**—To set forth the advantages and pleasures of houseboating in so truthful a manner that others may become interested in the pastime.

Illustration from "Houseboats and Houseboating."

The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and halftone reproductions of plans and exteriors and interiors. A most interesting chapter is devoted to houseboating in England, where the sport is one of the most delightful features of outdoor life.

The book has been carefully prepared by Mr. ALBERT BRADLEE HUNT, a well known authority on the subject.

The work is printed on extra heavy coated paper, and is bound in olive green buckram. The price is \$3.00 net.

(Postage 34 cents.)

The book will make a unique and most attractive holiday gift.

FOREST AND STREAM PUBLISHING CO., - 346 Broadway, New York.

8in., 10½in. and 14in., with a stroke 8½in. She has a single screw and a donkey engine. The Scotch boiler has a working pressure of 175 lbs. Her bunkers have a capacity of 10 tons, and her water tanks hold 8 tons. Under natural draft Anemone consumes in 24 hours 18 cwt. of coal. Her speed under steam is about 7 miles an hour. Below there are three double staterooms and one single one, besides the large main cabin. Forward there is a captain's room, a galley, pantry and a large fore-castle. The engine room is aft. The staterooms are finished in birdseye maple and satinwood with silk panels. The main saloon is of mahogany and oak. Anemone was brought out from England in 1902 and she has just passed Lloyd's survey and reclassified 18 A1, which is the highest classification for a yacht of her type. Anemone will probably be the flag ship of the South Coast Y. C., and very properly so, as she will be the finest yacht owned on the Pacific coast.

**HUNTING LAUNCH FOR S. T. SHAW.**—Mr. Samuel T. Shaw, New York Y. C., is having a cruising launch built at Morris Heights by the Gas Engine & Power Co. and Chas. L. Seabury Co., Cons. The boat is of the type known as a hunting launch, i. e., with the low cabin trunk forward. She is 42ft. over all, 9ft. breadth and 2ft. draft. A four-cylinder Speedway engine of 28 horsepower will give the boat a speed of about 12 miles.

**LAUNCH LUCY A. SOLD.**—The 40ft. cruising launch Lucy A. has been sold by Mr. George Focht, of Hoboken, N. J., to Mr. J. R. M. Dillon, of New Orleans, La., through the office of Mr. Stanley M. Seaman. She has been shipped South by rail, and will be enrolled in the fleet of the Southern Y. C.

**A FLEET OF HOUSEBOATS.**—The floating hotel Jacob A. Stamler, which was anchored off the Statue of Liberty, or more correctly speaking, Liberty Island, last summer, demonstrated the possibilities of a fleet of houseboats to be moored at about the same place, say from May 15 to Sept. 15.

That there would be money in such an enterprise we are firmly convinced, and we are pleased to learn that a practical shipwright like Ira S. Bushey, the proprietor of the dry dock at foot of Twentieth street, South Brooklyn, N. Y., has long held the same views.

Mr. Bushey thinks that a company ought to be organized to give the new project a trial next summer, and suggests the building of a number of wooden houseboats of about the following dimensions, etc.: Scow, 60ft. long, 20ft. wide and 3ft. deep, the house to be 50ft. long and be the full width of the deck, and to have 5ft. clear at the forward and after ends. Dining room, 20x10ft. Four bedrooms, 10x7ft. The kitchen, bathroom and toilet each to be in one room. The top of the house would be used as a "sitting room" and would be covered with an awning, or a double awning with an air space of a foot between the two.

Mr. Bushey further suggests a smaller houseboat of, say, 30ft. in length and 15ft. width, the hull of which would cost about \$1,800 and the house \$600, or \$2,500 for the complete houseboat. The latter would either be sold outright or leased by the month or for the whole season.—American Shipbuilder.

**KETCH SITARAH SOLD.**—Mr. Russell A. Alger, Jr., of Detroit, Mich., has sold his auxiliary ketch Sitarah to Mr. Amilius Jarvis, the well-known Canadian amateur yachtsman, through the office of Mr. Stanley M. Seaman. Sitarah is a cruising yacht, designed and built by George Lawley & Sons Corp., 1903. Dimensions: 85ft. over all, 52ft. waterline, 17ft. beam, 5ft. 6in. draft. She was built for Mr. J. H. Cromwell, of New York city, who sold her to Mr. Alger last spring; the latter fitted her with a gasoline motor. She has been delivered to Mr. Jarvis in Toronto, who will use her for cruising on the Great Lakes.

### Officers of A. C. A., 1906.

(Assumed office Oct. 1, 1905.)

Commodore—H. Lansing Quick, Yonkers, N. Y.  
Secretary—William W. Crosby, Brighton Mills, Passaic, N. J.  
Treasurer—Frederic G. Mather, 164 Fairfield Ave., Stamford, Conn.

#### ATLANTIC DIVISION.

Vice-Commodore—Woolsey Carmalt, 82 Beaver St., New York.  
Rear-Commodore—Matthias Ohlmeyer, Francis H. Leggett & Co., 128 Franklin St., New York.  
Purser—George S. Morrisset, 73 Mercer St., New York.  
Executive Committee—William A. Furman, 846 Berkeley Ave., Trenton, N. J.; Louis C. Kretzmer, Schepp Building, New York; Clifton T. Mitchell, 46 E. Sedgwick St., Germantown, Pa.

Board of Governors—Robert J. Wilkin, 211 Clinton St., Brooklyn.  
Racing Board—Daniel B. Goodsell, 36 Washington Sq., New York.

#### CENTRAL DIVISION.

Vice-Commodore—Henry R. Ford, 45 N. Division St., Buffalo, N. Y.  
Rear-Commodore—Edward H. Demmler, 526 Smithfield St., Pittsburgh, Pa.  
Purser—B. Irving Rouse, 981 Lake Ave., Rochester, N. Y.  
Executive Committee—John S. Wright, 519 West Ave., Rochester, N. Y.; Lyman T. Coppins, 691 Main St., Buffalo, N. Y.; Jesse J. Armstrong, Rome, N. Y.  
Board of Governors—Charles P. Forbush, 164 Crescent Ave., Buffalo, N. Y.  
Racing Board—Harry M. Stewart, 85 Main St., E. Rochester, N. Y.

#### EASTERN DIVISION.

Vice-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.  
Rear-Commodore—Frank S. Chase, Manchester, N. H.  
Purser—Edgar Ward, 112 Highland St., West Newton, Mass.  
Executive Committee—Daniel S. Pratt, Jr., 178 Devonshire St., Boston, Mass.; Arthur G. Mather, 84 South St., Medford, Mass.; H. L. Backus, 472 Lowell St., Lawrence, Mass.  
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; Herman D. Murphy, alternate.

#### NORTHERN DIVISION.

Vice-Commodore—J. McDonald Mowat, Kingston, Ont., Canada.  
Rear-Commodore—James W. Sparrow, Toronto, Canada.  
Purser—Russell H. Britton, Gananoque, Ont., Canada.  
Executive Committee—Charles E. Britton, Gananoque, Ont., Canada.  
Board of Governors—John N. MacKendrick, Galt, Ont., Canada.  
Racing Board—J. McDonald Mowat, Kingston, Ont., Canada.

#### WESTERN DIVISION.

Vice-Commodore—John A. Betkey, St. Paul, Minn.  
Rear-Commodore—Lucien Wulsin, The Baldwin Co., 142 West Fourth St., Cincinnati, O.  
Purser—Wade Hampton Yardley, 49 Pioneer Press Bldg., St. Paul, Minn.  
Executive Committee—George H. Gardner, 149 Kennard St., Cleveland, O.; Augustus W. Friese, The Journal, Chicago, Ill.  
Board of Governors—Henry C. Morse, Peoria, Ill.  
Racing Board—Frank B. Huntington, 90 Sheboygan St., Fond-du-Lac, Wis.

#### How to Join the A. C. A.

"Application for membership shall be made to the Treasurer, F. G. Mather, 164 Fairfield Ave., Stamford, Conn., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

#### A. C. A. Arrangements.

Editor Forest and Stream:

Knowing that the cold weather does not affect the enthusiasm of our "tried friends and true" in the American Canoe Association, I want to make an announcement of a few of the arrangements which are being made for pleasure and comfort of the 1906 meet at Sugar Island.

Mr. Louis Reichert, who so ably filled the position last year, will act again as chairman of the Transportation Committee, and with the efficient assistance of Mr. Frank C. Moore, of the Atlantic, and Mr. Daniel S. Pratt, Jr., of the Eastern Division, will see that the very best rates and facilities for shipping canoes are secured for the members.

The Camp Site Committee is not yet fully organized, but I can safely say that it will follow the model example set by last year's management and improve upon Mr. Andreas' arrangements, if it be possible to do so.

The veteran canoeist, Mr. George P. Douglass, has consented to act as chairman of the Regatta Committee, and to all those who are familiar with his racing record, no further promise is necessary. He is carefully selecting the other members of the committee and has declared that the racing at next summer's meet will be more like the good old times of 1890.

The administration is this year undertaking something that has never been attempted before. There has always seemed to be so much dissatisfaction with the meals at camp that it has been suggested that the Association run its own mess. Mr. Lyman T. Coppins, who so successfully managed the affairs of the Buffalos last year, has consented to take the chairmanship of this committee, and as he has secured the masterly assistance of Mr. Harry R. Ford as his co-worker, there is no doubt but that the members in making preparations for the meet may dismiss all thought of the inner man. The proposed schedule of prices for meals is as follows: Breakfast, 40 cents; lunch, 40 cents; dinner, 50 cents, and for all three meals the usual price of \$1.25.

In separating the prices in this way it is my earnest hope that all the campers, including those who have messed for themselves in the past few years, will meet at dinner and enjoy a jolly time together at the end of the day and thus be saved the annoyance of themselves preparing and clearing away a dinner which cuts short the afternoon and makes them late at camp-fires. I have received a number of suggestions concerning the arrangements for camp and the chairmen of the different committees and myself will gladly welcome any new ideas which may be advanced by any of the men in the A. C. A. The chairmen of these committees have been requested to report progress to the canoeing papers from time to time so that the members may be in touch with the plans for next year and begin to get enthusiasm in bunches.

H. LANSING QUICK, Commodore.

YONKERS, N. Y., Dec. 11.

## The Kennel.

### Parasitic Skin Disease in Dogs.

IN all cases the prominent feature of the diseases is an eruption, vesicular in the early stage, pustular and scabby in the more advanced forms. It is generally believed that the itching and inflammation which are observed in all forms of parasitic disorders of the skin are due to movements of different species of acari or mange mites, some of which bury themselves in the skin, forming galleries. But a more potent influence than the mere movement of the parasite's legs or the action of the mouth is at work in the form of an acrid secretion which is poured forth on the skin, or, in the case of the sarcoptic mites, into the structures through which the mite burrows by the aid of its strong cutting jaws. It is stated by Newmann in his work on parasites and parasitic diseases that Gerlach, by a simple experiment, proved the local effects of the fluid secreted by the mange mite. He, by means of a fine needle, made a groove in the epidermis or cuticle, and then moistened the point of the instrument with fluid obtained by crushing some of the mites, and applied it to the groove which he had made. No pain was felt, but only a vague sensation. When, however, the point of the needle was pushed into the dermis or true skin, well supplied with nerves and bloodvessels, pain was caused instantaneously, and was succeeded by a papule and a vesicle. Continuing these experiments, Gerlach found that the psorptes secrete the most acrid fluid, and after them in order are the sarcoptes and the chorioptes. The last named attacks the ear of the dog and other animals. Psoroptes have only a single species, Psoroptes communis; they secrete, as before stated, an acrid fluid, which causes intense itching in horses, oxen, sheep, goats and rabbits; but the dog appears to be exempt from their ravages. Sarcoptes, or burrowing mites, are popularly supposed to be the common cause of mange in the dog, but it is a fact of some importance that expert investigators have failed to find the parasite in cases of mangy dogs which presented the ordinary symptoms of the disease, affecting particularly the head, the skin round the eyes and the ears, extending from these centres to the root of the tail, the chest and abdomen. Of course, the failure

to discover the parasite in any form of skin disease does not by any means prove that it does not exist, and with regard to burrowing mites it is perfectly obvious that there are special difficulties in the way of detection. The mites, for example, when they are not in their burrow, are concealed in masses of scabs, which are always found in advanced cases of mange, and to distinguish them in the collection of debris in which they are concealed requires not only a great deal of patience, but a keen eyesight or the use of a magnifying glass, and occupies more time than a busy practitioner could afford to devote to it, and there is always to be considered that the detection of the parasite would not in any material degree alter the treatment which would be pursued under any circumstances. That the parasite really does exist in nearly all the cases in which the symptoms of mange are apparent is hardly a matter of doubt. The disease is readily communicated from one dog to another, presumably by the passage of the insect from the diseased animal to the healthy; and it has also been transferred to the human being, and specially to children who have been nursing mangy dogs.

Chorioptes contain two species, both of which affect the domestic animals. The Chorioptes symbiotus causes a localized form of mange in the horse and ox, but does not appear to attack the dog. The other species, the Chorioptes auricularum, lives in the ear of dogs, cats, and ferrets. The disease which it causes has been often observed in packs of hounds. It produces deep-seated inflammation in the ear, which may remain for some time undetected, so far as the microbe is concerned, and some authorities contend that it is at least a probable cause of catarrh of the ear, which often attacks sporting dogs. The catarrh of the ear would ordinarily be described as canker; certainly the symptoms very closely resembled those of what is known as that disease in this country. The animals attacked constantly flap their ears and give other indications of itching from which they suffer, but there is an added symptom to which we referred in a previous article, namely, the occurrence of an epileptic fit. This happens after a walk, or, according to Nocard, among hounds after hunting. The animal attacked, he says, starts with as much vigor as usual, but in about half an hour, or sometimes less, it will utter a violent cry, and then bound away as if it were mad, howling every time it comes against an obstacle, and, after turning round several times, will fall down in the climax of the fit. These fits are frequently repeated, but rarely while the animals are at rest. It may be some considerable time before any suspicion is excited of the existence of disease in the animal's ears, but when the auditory canal is examined it is found to contain an abundant quantity of dark-colored secretion, in which, by the use of the microscope, a number of parasites may be discovered. Mr. Sewell has stated in a number of cases there is very little to be seen in the ear, which merely looks as if it were slightly dirty; but he adds that if, instead of giving a hurried look into the ear in these cases, the parts are carefully examined, and the canal leading into the ear is watched, tiny white specks oval in shape and about the size of an ordinary small sewing needle will be observed. These, he says, are the parasites which he considers to be the cause of the disease called canker of the ear. And there are a good many reasons for believing that this view is correct, at any rate in any case where dogs are constantly shaking their heads, and especially if there is any discharge from the canal, or even if it only looks slightly dirty, search should at once be made for the purpose of detecting the parasites, if they are present. The occurrence of an epileptic fit is referred by some authorities to the plug of waxy material pressing upon the cartilage of the ear when the dog is at rest, and by the violent movements of the waxy mass when the animal is running about. The stimulation which would be caused by the movements of the acari on the nerves of the external auditory canal have also to be taken into account as a further cause of the occurrence of a fit. Under ordinary circumstances there is no doubt that the epileptic fit would in the mind of the owner mask all other symptoms, and the attention would be entirely directed to the treatment and cure of epilepsy, without any reference to the condition of the ear which causes it. It may be some help to know that the epileptic fits of parasitic origin are chiefly confined to young dogs. It is fortunately the case that the affection yields very readily to proper treatment. It was stated in a previous article that various authorities give remedies for the cure of the disease. The most simple of the mixtures employed is the one recommended by Nocard, consisting of olive oil 100 parts, naphthol 10 parts, and ether 30 parts, to be kept in a well-stoppered bottle. A small quantity of this liniment is to be injected every day into the external auditory canal, which is then to be closed by a plug of cotton wool for ten to fifteen minutes to prevent the evaporation of the ether. Mr. Sewell's remedy, which he has found to answer admirably both in dogs and cats, consists of ointment of nitrate of mercury 1 dr., well mixed with oz. of olive oil. This liniment is to be applied all over the internal surface of the ear daily with a camel hair brush, or a few drops may be poured into the ear. After a week the ear should be syringed with methylated spirit 1 part to 10 parts of tepid water.—London Field.

#### Pessum Time.

From the Charlotte Daily Observer.

Oh, dip some 'taters down in grease  
En fling de dogs a 'tater apiece.  
Ram yo' brogans clean er tacks,  
Split de splinters en fetch de axe.  
Hit's possum time again!

Catfish tender, catfish tough,  
We's done et catfish long enough.  
We's tar'd er peas en white side meat,  
En we's gwine have suppin' 'at's good to eat.  
Hit's possum time again!

De pot's gwine simmer en blubber en bile  
Till hit gits scummed over wid possum ile.  
Hit'll look jis' 's juicy as tar soapuds,  
Whoop! Come along, coons! We's off to de woods.  
Hit's possum time again!

—John Charles McNeill.

Rifle Range and Gallery.

Fixtures.

Feb. 12-17.—Grand Rapids, Mich.—Indoor Twenty-two Caliber Rifle League of the United States tournament. Chas. J. Otis, Cor. Sec'y.

March 12-17.—New York.—One hundred shot indoor championship.

Ohio Rifle Notes.

The West Sonora Rifle Club started its series of winter medal shoots on Dec. 2, ten members taking part. The wind was blowing strong across the range, making accurate work difficult. All shooting was at 100yds., offhand, any rifle, open sights, 4 shots, possible 48.

There was a hot contest between Chas. Glaze, Geo. W. Izor and Mose Pence for the medal of the Gratis Rifle Club, on Dec. 2. The conditions are 10yds., offhand, 4 shots, possible 48.

The records show that the attendance at the quarterly shoot of the Preble County Rifle Club, held on Dec. 1, at Eaton, was about the smallest in the history of the club. Nevertheless, there was a sharp contest for the championship medal, and eight cash prizes in the main event.

Patrolman Brady, of Covington, Ky., made a score in revolver practice of 57 out of a possible 60. Lieut. Mosbacher was second with 54.

New York Central Schuetzen Corps.

HENRY D. MULLER, fondly called "Bullseye" Muller by his best friends, was high man on the ring target at the shoot held Dec. 6, and third on the bullseye target. The scores, at 75ft., offhand:

Table of scores for New York Central Schuetzen Corps. Columns include names and scores for various targets.

Zettler Rifle Club.

THE attendance of members shows an increase as the winter advances, and the scores are higher as a result of the practice. At the shoot held Dec. 5, Arthur Hubalek was high with 2437 points for 100 consecutive shots, and W. A. Tewes had the highest 50-shot total, 1225.

Table of scores for Zettler Rifle Club. Columns include names and scores for various targets.

New York Schuetzen Corps.

THE attendance at the indoor shoots is increasing steadily, there being nearly one hundred present at the shoot held Dec. 8, while seventy-six members shot two targets each in the club match.

Table of scores for New York Schuetzen Corps. Columns include names and scores for various targets.

Table of scores for Bullseye target, degrees. Columns include names and scores.

Indoor .22 Caliber Rifle League.

GRAND RAPIDS, Mich., Dec. 8.—The annual tournament of the Indoor Twenty-two Caliber Rifle League of the United States will be held in this city Feb. 12 to 17, 1906, under the auspices of the Rifle Club of Grand Rapids.

By courtesy of Grand Rapids Battalion M. N. G., the armory has been placed at the disposal of the League, and present indications are that the coming event will surpass all former affairs of this nature.

The programme as proposed will be made specially attractive by a very liberal prize list. The championship match will have twenty prizes ranging from \$100 down.

Contests will be open to all, regardless of League membership, and special railroad rates will be provided.

CHAS. J. OTIS, Cor. Sec'y.

New York City Schuetzen Corps.

THE attendance at the shoot held Dec. 7 was good. August Kronsberg was high man with the best two scores and a total of 482 for the 20 shots. The totals follow:

Table of scores for New York City Schuetzen Corps. Columns include names and scores for various targets.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of this Association at Four-Mile House, Reading Road, Dec. 3. Conditions: 200yds., offhand, at the Standard American target.

Trapshooting.

Fixtures.

Dec. 14.—Travers Island, N. Y.—Amateur championship of America, under auspices of New York Athletic Club. Gus E. Grief, Chairman, 302 Broadway, New York.

DRIVERS AND TWISTERS.

The Bergen Beach Gun Club, of Brooklyn, will hold a tournament on Jan. 1.

The Riverside Gun Club, of Utica, N. Y., has fixed upon Dec. 25 for an all-day tournament. E. J. Loughlin is the Secretary.

The Poughkeepsie, N. Y., Gun Club announces Jan. 1 as the date for an all-day shoot. Competition will begin at 11 o'clock. Wm. J. Perkins is the Secretary; A. J. Traver, the Captain.

Mr. Carl Von Lengerke, one of the shooting committee of the Hudson Gun Club, sets forth in our columns elsewhere the good work done in rehabilitating the club's grounds, after their recent visitation of vandalism.

An advertisement in the Miami, Fla., Metropolis, reads as follows: "To the person making the highest score this week there will be given a goosic at Martin's Shooting Gallery, on Avenue D. Take a shot." And thus even the geese enter into the spirit of the holiday season and fill a long-felt want.

In the series of the Philadelphia Trapshooters' League, last Saturday, the Florists defeated Narberth by a score of 166 to 140. Lansdale defeated Clearview, 195 to 186. S. S. Whites defeated Media, 178 to 174. Mcadow Springs defeated Highland, 183 to 169. N. Camden defeated Merchantville, 170 to 151.

A five-man team of the Boston Athletic Association defeated a five-man team of Harvard at Riverside, Dec. 9, by a score of 213 to 201. E. F. Gleason broke 46 out of 50, the latter number being that which each contestant shot at.

The cup shoot of the New England Kennel Club, at Braintree, Mass., on Dec. 9, resulted in a tie on 23 for the 1905-6 cup, between Messrs. William F. Beal and Henry N. Richards.

Owing to delays in preparing for occupancy their new place of business, at 349 Fifth avenue, Messrs. Von Lengerke & Detmold did not begin moving from their present place of business, at 318 Broadway, on Dec. 1, as contemplated.

Mr. Fred Gilbert, whose fame as a shooter reverberates, demonstrated at the Christiana-Atglen shoot last week that he has not forgotten how to shoot pigeons. In three events of 5, 7 and 10 birds respectively, he shot without scoring a miss.

There is a rumor that Mr. Edward Banks, assistant manager of the Shotgun Smokeless Bureau of the Dupont Powder Co., Wilmington, will be the next challenger of Mr. A. B. Richardson, of Dover, to contest for the championship of Delaware.

The amateur championship of America at clay birds, open to all amateurs of the United States, to be held under the auspices of the New York Athletic Club at Travers Island, N. Y., on Dec. 14, has all the earmarks of success.

The annual meeting of the Interstate Association, fixed for Thursday of this week, is a matter of paramount interest to a number of clubs which are candidates for recognition in connection with the holding of the Grand American Handicap next year.

The second December shoot of the Crescent Athletic Club was specially well attended by club shooters. Fourteen participated in the December cup contest, the result being a tie on 24 between Messrs. C. A. Lockwood, of Jamaica, and O. C. Grinnell, Jr.

There are so many important matters for the consideration of the Interstate Association at its annual meeting this week it is quite probable that the meeting will last two days. Mr. E. H. Tripp will appear, in behalf of the Indianapolis Gun Club to present the advantages that club can offer in respect to holding the G. A. H.

A correspondent writes us: "A. B. Richardson, of Dover, Del., successfully defended his title to the championship of the State of Delaware, Dec. 9, by defeating W. M. Foord, of Wilmington, by a score of 96 out of 100, to Foord's 90. Three expert traps were used. Weather conditions were favorable. The race was shot in strings of 25 targets. Richardson's strings were 23, 24, 24 and 25. Foord's 21, 24, 23 and 22. A good crowd was present, among them Fred Gilbert, who broke 146 out of 150 shot at, including 5 pairs. A six-man team race was shot between members of the Wawaset Gun Club, of Wilmington and the Dover Gun Club, each man shooting at 50 targets. The Wawaset won by 263 to 250. J. T. Skelly was high for the Wawaset team with 46, and Richardson with 48 and Reed with 47 for Dover."

James A. Ogden died at his home in Warwick, N. Y., on Dec. 5. This is sad news to his many friends, but particularly sad to the many shooters of the Hudson River Valley, who knew him well and loved him. He was in the prime of life, was of a noble, manly personality, and was a prominent business man of Warwick. A correspondent writes us as follows: "He was in his forty-fifth year, and a prominent member of the town in which he lived, a shooter of renown, the Vice-President of the Warwick Gun Club, and member of the Orange County Gun Club of Middletown. He was a member of the hardware firm of Ogden & Patton. A widow and daughter survive him. Jim was never known to say an unkind thing about any one."

The team match between Perryman and the Baltimore Shooting Association, on Friday of last week, resulted in a victory for Perryman, on the grounds of the latter. The Perryman novices did remarkably well, considering their inexperience at the traps and the few times that they have ever been out of sight of home. As showing some of their restrained performances, out of 120 Mr. Lester German, of Aberdeen, broke 116, Mr. A. B. Richardson, of Dover, Del., broke 114; Mr. Ed. Banks, of Wilmington, Del., broke 115, it peculiarly happening that of the 5 lost 2 were out of the first 5, and three out of 115. Mr. Foord shot over a 90 per cent. gait. However, of the individual scores in the team match, Mr. J. R. Malone's 49 was highest.

BERNARD WATERS.

Lively Local Limericks.

An attractive "Benedict," named "Jim,"  
With "smokeless powder" is quite "in the swim;"  
He talks it all day,  
For which his friends have to pay—  
And by night they are "full to the brim."

The good-looking Edward Banks,  
Can keep up with "Nancy Hanks"—  
Until he shoots for the championship cup,  
Which "Billy" didn't give up—  
But his friends thought it one of his pranks.

An "Infallible" shooter, called "Hood,"  
Stood "single blessedness" long as he could—  
He married a girl,  
Who had been 'round the world,  
And now he stays home and plays "good."

The "Peters" representative, Storr,  
Fills all his competitors with awe—  
He's a "bully good man,"  
For the treats he will stand—  
And the boys eagerly shake his "paw."

That good-natured, jolly "Mal" Hawkins,  
Can "do" all the boys with his "talkins";  
He never lets anything run  
That gets in front of his gun,  
Or says a bad score is due to his "balkins."

A merry, fat shooter named German,  
Can preach to the boys quite a "sermon,"  
For he hits in the eye  
All birds "on the fly,"  
With a magic quite equal to "Herman."

There is good Capt. James R. Malone,  
The boys never leave him alone;  
He can hit "on the wing,"  
Most "any old thing,"  
And that the "B. S. A." is his "hobby," is known.

To that worthy young "Secretary Chew"  
Many bows from Baltimore sportsmen are due;  
We feel grateful indeed,  
For his skill and his speed,  
And the rapid way the "Association" grew.

And here's to the "eroaker," named "Ed,"  
Who's not afraid the boys will get ahead;  
He dislikes the cold,  
And won't give up his "gold,"  
That in the papers a "good score" may be read.

Good luck to "young Billy Foord,"  
A wonderful amateur record has he scored;  
He handles a gun with ease,  
That is sure to please,  
And to mountain heights he has soared.

A society favorite, called "Huff,"  
To the fair sex never is "gruff";  
He breaks many hearts  
By his fascinating arts—  
But no girl has yet called his "bluff."

Try the J. A. R. Elliott "invention,"  
I am sure it was his intention,  
To protect the ear drum  
From a noise and a "hum,"  
And it should be used at the next G. A. H. Convention.

There's the very well-known Jack Fanning,  
Who revenge on his friends is planning,  
For buying a "rope" cigar  
From the Indianapolis bar,  
And the distance between— they are not spanning.

The gay, debonair Tom Marshall,  
To the "fair sex" is most partial;  
He comes from the West,  
And wears fancy vests,  
And laughs at anything "farcial."

To Fred Gilbert, the wonderful "wizard,"  
Who can hit targets in a "blizzard";  
He breaks a hundred straight,  
And the boys mourn their fate,  
And crawl "out of sight" like a "lizard."

Then there is "Tobacco Bill,"  
Who makes Gilbert feel quite ill,  
When he foots up his score  
And finds "Crosby just one more,"  
Because there was a "pigun" he didn't kill.

"Last, but not least," is Luther Squier,  
Who is always ready to "fire."  
No matter what is the score,  
He is sure to go  
Over the other fellows, one or two higher.

Other shooters the sporting papers show,  
Whom I have not the pleasure to know;  
But they will get in this rhyme,  
At some future time,  
If introductions are not very slow.

A SOCIAL TRAMP.

Perryman, Md., and B. S. A. Team Shoot.

"Less" German's "collection" were in cahoot  
At the much-talked-of Perryman shoot,  
But Malone was high gun,  
And his team had such fun,  
For Jim went home with money "to boot."

A shoot was held at the club grounds, Perryman, Md., Friday afternoon, Dec. 8. The gun club is still in its infancy; but the grounds are prettily located, and are about three minutes' walk from the station. They have a blackbird trap which works perfectly, being on an elevation with a sky background, and throws targets forty and fifty yards. The club house is small, but comfortable. It was built by big and liberal hearts, but would not accommodate many men the size of its genial host, German.

A picked team from the Baltimore Shooting Association, captained by Malone, consisting of fourteen shooters, shot a team race with German's carefully selected amateurs (?) from New York, Wilmington, Delaware and Dover. The Baltimore team was ignominiously defeated by a score of 586 to 532.

No race of men, scarcely an individual, is so void of intelligence as not to recognize power, and before a gun was fired, all felt convinced the Perryman boys would be victorious. The contest was at 50 birds a man. There was an optional sweep of \$1 on each 25 birds, divided 50, 30 and 20 per cent., and one of \$3 on the total two high guns. Captain Malone was high gun, his score being 49. The score is as follows:

Baltimore.		Perryman.	
Malone	49	Edward Banks	48
"Du Pont"	45	William Foord	45
Lupus	43	Lester S. German	48
Waters	43	Richardson	48
Moxley	42	McElvey	43
Bowen	42	Baldwin	44
France	42	Sutton	32
Kessler	36	Morgan	37
Silver King	37	Turner	29
Reinhardt	24	McCommons	45
Roberts	35	Towner	45
Baskerville	36	Mitchell	39
Leland	37	De Haven	45
Mordecai	32-532	Cord	38-586

Three extra events, at \$1 each:  
No. 1, 20 targets:  
Malone ..... 19  
Banks ..... 20  
Richardson ..... 20  
German ..... 19  
Lupus ..... 19

No. 2, 25 targets:  
Banks ..... 24  
German ..... 24

No. 3, 10 targets:  
France ..... 8  
Moxley ..... 8

German and his collection of crack shots will be entertained by the Baltimore Shooting Association Wednesday, Dec. 20, at a return match. We predict that Jim Skelly and Luther Squier will own Colonial residences in Perryman by that time.

A SOCIAL TRAMP.

Crescent Athletic Club.

BAY RIDGE, L. I., Dec. 11.—The combination of puzzling background and overcast sky were not an obstacle to good scores. There was not sufficient wind to be an interference. There was a good attendance, and the participants stayed well to the end of the programme. For the December cup, Messrs. C. A. Lockwood, of Jamaica, and O. C. Grinnell, Jr., tied on 24, each breaking 22 and each having an allowance of 2. Mr. F. B. Stevenson broke 22 also, but being a scratch man, he scored only what he broke.

In the contest for the State trophy, Mr. F. B. Stevenson scored a leg with a straight score of 25, thus establishing a record of two wins on the gun which is the prize in this event. Several others have one win to their credit in the competition for it.

Messrs. Lockwood and Hendrickson, in the two-man team contest, scored a leg on the two cups which are the trophies of that contest. Other winners in the programme events were Messrs. L. C. Hopkins, C. A. Lockwood, O. C. Grinnell. Scores: December cup, 25 targets:

Hdp.	Brk.	T'tl.	Hdp.	Brk.	T'tl.
C A Lockwood	2	22	W C Damron	4	14
O C Grinnell, Jr.	2	22	A G Southworth	0	17
F B Stephenson	0	22	W W Marshall	4	13
Dr. Keyes	2	19	L C Hopkins	2	12
D C Bennett	2	17	E W Snyder	4	9
J N Teeter	4	15	F C Raynor	3	10
J H Ernst	7	12	A E Hendrickson	4	9

Stake trophy, 25 targets:  
F B Stephenson 0 25 25  
O C Grinnell, Jr. 2 22 24  
A E Hendrickson 4 20 24  
W C Damron 4 19 23  
Dr. Keyes 2 20 22  
J H Ernst 7 15 22  
E W Snyder 4 18 22

Team shoot, 25 targets:  
Lockwood ..... 2 19 21  
Hendrickson ..... 4 15 19

Stephenson ..... 0 22 22  
Grinnell ..... 2 14 16

Dr. Keyes ..... 2 20 22  
Teeter ..... 4 11 15

Trophy shoot, 15 targets, handicap in parentheses— Hopkins (1) 13, Southworth (1) 12, Stephenson (1) 12, Lockwood (1) 12, Foster (1) 12, Raynor (1) 12, Ernst (4) 11, Marshall (2) 9, Teeter (2) 8, Grinnell (1) 6, Snyder (2) 5.

Trophy shoot, same conditions—Lockwood (1) 15, Stephenson (1) 14, Ernst (1) 13, Grinnell (1) 12, Marshall (2) 12, Foster (1) 12, Hopkins (1) 11, Damron (2) 9, Hendrickson (2) 9, Southworth (1) 8, Teeter (2) 8.

Trophy shoot, same conditions—Grinnell (1) 14, Lockwood (1) 14, Raynor (2) 14, Snyder (2) 14, Stephenson (13), Keyes (1) 13, Bennett (1) 13, Ernst (4) 13, Foster (13), Southworth (11), Teeter (2) 10, Marshall (2) 11.

Shoot-off, same conditions—Grinnell (1) 15, Lockwood (1) 15, Snyder (2) 14, Raynor (2) 8.

Shoot-off, same conditions—Lockwood (1) 12, Grinnell (1) 13.

Team shoot, 15 targets, all scratch—Team No. 1: Southworth 5, Foster 11, Ernst 5, Snyder 7, Damron 8, Lockwood 8, Hendrickson 9; total, 53. Team No. 2: Stephenson 14, Grinnell 8, Keyes 8, Hopkins 12, Teeter 6, Welles 12, Marshall 8; total, 68.

Pigeon Speed.

The following, taken from London Tit-Bits, shows that the speed of a flying pigeon is not so marvelous as commonly supposed, as a matter of fancy, though very swift as a matter of fact: "So many wild statements are made as to the speed of a carrier pigeon that it is interesting to learn how fast it can actually travel under the most favorable conditions.

"On a recent Saturday between two hundred and three hundred thousand birds were tossed in competitions in various parts of the country, and some thousands of these feathered athletes raced to London from Retford and Brantson, journeys of 127 and 115 miles respectively. The conditions were ideal. The weather was beautifully clear, and a fresh wind was blowing to help the birds on their way; and yet under such favorable circumstances few of the birds attained a speed of a mile a minute, which in these

days of swift locomotion is beginning to be considered comparatively slow.

"Better times were made not long ago, when a thousand pigeons were tossed at Templecombe to race to London. Assisted by a southwest wind, they traveled so rapidly that many of them had reached their cotes some time before their owners even thought of looking for them. One bird actually covered 108 miles in ninety-four minutes, maintaining throughout the long journey a speed of nearly sixty-nine miles an hour; another did equally well by traveling to Chelsea at the average rate of 2.18 yards a minute, while one bird out of every ten exceeded sixty miles an hour."

New York Athletic Club.

TRAVERS ISLAND, N. Y., Dec. 9.—A gale of wind seriously affected the flights of the targets, and the scores suffered in consequence. There was a good attendance of shooters. Hibbard and Crowe tied on a score of 23, and were high in the contest for the December cup. Scores:

Event 1, 25 targets, handicap:		Handicap. Score.			
Grieff	0	22	Calhoun	4	25
Lamer	2	16	Hibbard	5	20
Briggs	2	23	Gales	7	16

Baltimore, Md., Shooting Association.

BALTIMORE, Md.—A shoot at "white flyers" was held at the grounds of the Baltimore Shooting Association, Wednesday, Dec. 6, at 20 birds, \$5 entrance. Birds extra 20 cents. Three moneys, 50, 30 and 20 per cent. The shoot was advertised for 2 P. M., but it was 4 before some of the shooters arrived, making the last event very unsatisfactory, as the birds could not be seen, and hitting them was pure guess work. If these tardy shooters (who could just as well get out on time) would be punctual, it would be much more satisfactory for all men interested.

High score was made by young Clarence Malone, son of Captain J. R. Malone. He killed 19 out of 20 from the 27yds. mark. Hood Waters was a close second with 18 from 30yds. Three—J. R. Malone (31), Dunn (29), Moxley (27)—scored 17.

The scores:  
Clarence Malone, 27..... 19  
Hood Waters, 30..... 18  
J. R. Malone, 31..... 17  
J. Dunn, 29..... 17

Bowen, DuPont and Franklin withdrew on their seventeenth bird. While waiting for the late shooters, there was a \$1 miss and out: Bowen 7, Malone 7, DuPont 7, C. Malone 7, Franklin 1, Waters 2, France 6, Robinson 4, Dunn 6.

A SOCIAL TRAMP.

B. A. A.—Harvard.

BOSTON, Mass., Dec. 9.—The first half of a five-man team match, 50 targets per man, between the Boston Athletic Association and Harvard, was won by the former, as per the scores following:

UNITED STATES CARTRIDGE CO., LOWELL, MASS., U. S. A.

Agencies: 497-503 Pearl St., 35-43 Park St., New York.

114-116 Market St., San Francisco.

WESTERN TRAP.

Cincinnati Gun Club.

THE attendance on Dec. 9 was a little more like old times, fifteen members shooting in the Oakley trophy. Williams finished high with 45. The day was a mixture of fog and smoke until about noon, when it cleared off nicely, but with a strong wind which kept the boys guessing about the targets.

In a team match Gambell and Harig did good work for their teams, breaking 47 each. There will be nothing special for Christmas Day, but Gambell promises something about New Years.

The weather was fine on Dec. 3, and several of the members visited the grounds, the following shooting their scores in the Clement's trophy contest: Harig (19yds.), 25, 21-46; Bonser (17), 23, 22-45; Gambell (16), 22, 20-42; Dick (16), 22, 17-39; Miles (16), 17, 14-31.

Just to keep the boys going, and give them a chance for some easy money, Gambell offers another of his "sure things," as follows: He says, that from now on (Dec. 9) he will give \$5 to any member breaking 25 straight targets under the following easy conditions. All stand at 16yds.; entrance \$1, which includes targets, and must be paid in advance. No less than four entries received at one time. Squads must have not less than four, nor more than five shooters. Squads must continue shooting until all competitors have missed. Re-entries will be allowed, and money refunded for targets not shot at, for a miss up to and including the fifth target. Entries in this case may be made when the event is finished. No more than one re-entry will be allowed a contestant in the same event. No allowance made for targets not shot after the fifth target. Competitors must see that their squads are thoroughly familiar with the rules before going to the firing line.

A. E. Doually, "Captain," will become a benedict on Dec. 12. His friends—and he has a host of them—will all wish him and his bride many years of happiness. The couple will start for Florida after the ceremony, where they will stay a month.

Following are to-day's scores:

Table with 2 columns of names and scores for various trophies and team races.

Ohio Notes.

Several members of the "Millionaire" Hunting Club, an organization across the river from Cincinnati, left the other day in their launch, the Leo J., for Green River. They are all good wing shots, and should return with plenty of game.

New records are being made every day, and the following is at the head of all hunting records without question. Dick Hart, a local sportsman of Petersburg, Ind., established a new record for wing shooting on Dec. 6. He saw a flock of wild mallards flying over the western part of town. He ran into the house, got his gun and brought down twenty-two ducks at one shot.

J. E. Clark, superintendent of the Indianapolis Gun Club, and Jack Abrams, of Indianapolis, were quail hunting in Brown county this season, when they ran across three big timber wolves, and after a hard fight captured one alive, which they brought home with them on Dec. 7, in order to prove their yarn. The wolf is as large as a setter dog and put up a hard fight.

C. H. Cord, of Dayton, has just returned from his annual hunting trip, and reports a fine time. While he was away, a party took a fancy to his pointer, Navahoe Chief, and carried him off from the kennel; but he was recovered in a few days.

The Greenville Gun Club is doing nothing in the shooting line at present. The annual meeting will be held after Christmas, and plans laid for the next season.

Charley Matthews, of Euphemia, one of the best-known trap and rifle shots in southern Ohio, was out quail hunting with his young Irish setter Duke. The dog located a number of quail and Charley killed the limit, and made a number of his Dayton friends happy when he divided.

M. J. Schwind and James McConnell, popular trapshooters, of Dayton, have been taking in the turkey shoots at Union, Phillipsburg and the Stock Yards, and incidentally they gathered in fourteen of the gobblers. They are talking of going into the poultry business, and will shoot a match at 100 targets to see which one has the bunch. In one of the contests Schwind and McConnell each broke 40 straight, the former finishing with 94 per cent, and the latter with 92 per cent. They are sure enough shooters.

W. T. Wellman, president of the Mt. Washington Gun Club, Cincinnati, presided at the club's annual dinner on Dec. 7, which was held in the Colter Cannery, the large canning vats serving as tables. Sixty-five members were present. The dinner favors were clay pigeons, with fanciful drawings of the club's latest shooting match, and were prepared by Geo. H. Hartford.

The New Lebanon and Dayton gun clubs are preparing for Christmas shoots, with turkeys, geese, ducks, beef and pork as prizes. Other clubs in the valley will also be in line.

It is said that the Greenville Gun Club will hold a Christmas shoot, but nothing authoritative has been given out.

Capt. Ben Downs, of the Springfield Gun Club, enjoyed hunting on every day of the open season, and had fine sport. He bagged sixty-three quail, an average of four and a half per day, and had quail for his 6 o'clock dinner every day of the season.

Arthur Humble, of Dayton, made the record for that city during the hunting season. He killed sixty-eight quail and 148 rabbits. It is sure that good sport may be had in that locality if the sportsman has good dogs and knows where to go.

Harry Engle, a member of the Rohrer's Island Gun Club, of Dayton, met with the loss of his pointer dog Sport while on a hunt in Kentucky. The dog became entangled in a barb-wire fence, and while attempting to free himself, worked against a barb which entered his breast and pierced his heart. He was one of the best field dogs in Dayton.

Hunters report that they found quail more plentiful during the last part of the season in the vicinity of Dayton. This is accounted for by some on the theory that the hunters erred in working the cover during the pleasant days, when the birds remained in the open feeding grounds. The latter part of the season was stormy, with rain and snow, and the birds then sought the thicker cover and were found in large beevies. This insures plenty of birds for breeding next spring.

From the nature of the discussions in the Farmers' Institutes last winter, it is believed that a well organized effort will be made early in the session of the next Legislature looking to the enactment of a law forbidding the killing of quail for five years. This will be fought not only by those favoring a shorter period of prohibition, but by many sportsmen who wish an open season every fall, as now provided.

The Montgomery County Fish and Game Protective Club held a meeting in Dayton on Dec. 6 and elected the following officers for the coming year: Edwin Bert, President; Chas. E. Pease, Vice-President; J. F. Campbell, Secretary; W. N. Kuhns, Treasurer; Executive Committee: B. F. Seitzer, Hon. O. B. Brown, H. G. Protsman, E. T. Hardy, B. F. Hershey, H. M. Altick, Dr. D. W. Greene. After the transaction of a large amount of routine business, a committee was appointed to look after fish and game legislation at the next meeting of the Legislature. This committee was instructed to co-operate with the Fish and Game Commission in the matter of a revision of the laws now governing these matters. Another committee was appointed to make arrangements for a smoker to be given the members of the club some time in January. Several new members were admitted.

In Other Places.

S. G. Leonard and wife, H. J. Drout, F. E. Taylor, Phillip Moleter and Wilber Oliphant, of Kinsley, Kansas, were in attendance at the shoot at Larned last Monday.

With a high wind blowing directly in their faces, the members of the Will County Gun Club, Joliet, Ill., participated in their weekly shoot last Sunday.

George Russell won the handicap race at Bradford, Pa., last Saturday with 21 out of 25 from the 18yd. limit.

The Kinsman Gun Club, Ashtabula, Ohio, held their Indian summer shoot on last Thursday.

The Central and the Highland gun clubs, of Duluth, Minn., will be merged into one club. W. J. Webb, of the Highland Club, has been the moving spirit, and he is quite elated, as the new membership will be not less than 215.

T. S. May has won the medal at the last shoot of the Great Bend, Kansas, Gun Club, and now will wear it for keeps.

The annual pigeon pie supper, given by the Lexington, Mo., Gun Club, was enjoyed by the members of the club and a large number of their friends Thursday last. There were one hundred birds in the pie and the members numbered sixty. And thus the season and the birds were brought to an end.

The Greeley, Colorado, Gun Club held a team shoot on Thursday, Nov. 30, and the losing side was taxed for an oyster supper.

The New Lancaster, Kan., Club held a shoot last Thursday. It was their initial effort.

Mullens was the only member of the Lead, S. D., Gun Club to attend the shoot last Sunday, but he did not send in his scores to the secretary and it did not count on the trophy.

The report comes from Mt. Pleasant, Iowa, that shooters get much pleasure out of their meets at the traps.

Mr. Hern, of the Penn Gun Club, Norristown, Pa., made a straight score of 25 at their last meeting, Plover 23, N. F. G. 20, Shambough 19, Drake 16, Matcher 16, Eusinberg 13, Steiner 9.

A gun club with five members has been organized at Burr Oak, Kansas. Joe King is the captain.

At the county shoot held at Exira, Ia., last Thursday, Dr. Brooks, of Audubon, won the medal, while Kirk Knox won the first money. Scores, 24 out of 25.

The Benton Ridge, Ohio, Gun Club spent a few days at the Lewiston reservoir last week.

D. O. Heathman won the trophy put up by the Lexington, Mo., Gun Club for the past season. At their last shoot, K. R. Hammer, William Shacklett and Dr. T. B. Ramsey tied with 9 out of 10 birds.

Ben. T. Williams, William Newkirk and Tobe Reeves, of Murphysboro, Ill., won the beef at the shooting match held there Saturday last.

The regular shoot of the Balmy Beach Gun Club, Toronto, Canada, was held Saturday with a fair turn out of members and visitors.

The Spokane, Wash., Rod and Gun Club is getting ready for the winter schedule of shoots. It is customary for the club to hold tournaments for the championship during the winter, and the first shoot will be held first of the month.

The contestants who were present at the Highland Gun Club were compelled to shoot on a sliding scale. Those who won a turkey were set back two yards, and that gave the others a chance to win.

Harvey S. Reen, Henry Miller and C. F. Jenkins, of Las Animas, Col., escorted members of the Pueblo Gun Club to the Blue Lakes, where they bagged 82 ducks and 50 rabbits.

A. Topperwein while at El Paso, Texas, visited local gun club

grounds and gave a fancy exhibition with the rifle. The shotgun men were blazing away at live birds, Bulwer and Rand each getting 24, and Shelton 23. Stevenson and Vilas were the others who participated in the shoot.

The Rantoul, Ill., Gun Club sports the name of Royal, and in order to entertain Mr. A. A. Funk, an old member, a shoot was held there on the day preceding Thanksgiving.

Those of the DuPont Powder Company engaged as salesmen lately met at Indianapolis, where they were given a sort of post-graduate course in the handling and selling of explosives.

The Kendallville, Ind., Limited Gun Club held a shoot at their grounds Thursday last. Many of the Goshen shooters were present, and a good time was reported.

President Schruman, of the Cornell Military School, Terre Haute, Ind., has made a strong plea as an encouragement for minor sports in favor of a gun club. It is hoped that it will be as sport as lacrosse and cricket. If there is anything that a student in a military academy needs to become proficient in, it is the use of firearms.

The gun club at York Haven, Pa., has gone into winter quarters. Many of the members were factory men, part working in the day time and others at night, so that it was difficult to get enough together at one time to make the shoot interesting.

The Fort Side Gun Club, Norristown, Pa., held the opening shoot for the fall season on their new grounds, and it provided an interesting event, as the targets used were live birds. It is reported that everything points to a very successful season, and the new club will hold live-bird shoots frequently.

The Batavia, Ill., Gun Club have finally awakened from their slumbers of the past summer and held a meeting. It is to be hoped that there will be some matches held there during the winter months. Shall be pleased to chronicle same at any time.

At the weekly shoot of the Houghton, Mich., Gun Club, held last Sunday, the attendance was limited, owing to the many members who were out deer hunting. J. H. Rice and J. J. Lealand won the handicap match, and the cup was won by R. M. Edwards.

Another new shooting club has sprung up. This time it is Mediapolis, Ia., that claims the honor. The new club made a beginning by starting out last Thursday, with a shoot for a beef, four shoats and some ducks and geese, and so the club hopes to interest most of the scatter-gun artists living in its vicinity.

Dr. Carl Hogen, of Silver City, N. M., has completed arrangements whereby he will become European representative of the DuPont Powder Company.

All the Iowa shooters were invited to participate in their annual Thanksgiving shoot by the Parkersburg, Iowa, Gun Club. At least that would be indicated by the programme issued, which invited everybody to come who was large enough to shoulder a gun.

At Moorehead, Iowa, where there were opportunities for winning fowl as prizes, all were invited to bring their best gun.

The South End Gun Club, Reading, Pa., held an interesting all-day match on last Friday. All the events were ten targets. Some of the best scores were made by Messrs. Licker, Herbein, Gerhart and Yost.

A local Missouri paper comments thus: "Much fault is found with the new game laws of Missouri, which discriminates against the people at large and is in favor of gun clubs." This is misleading, as anything that is good for members of gun clubs is also good for all the hunters who live in the State. If reference is made to taxing those who live in another State, why then that is in favor of those who live in the State.

Way out in Mayor Hodge's town, Olathe, Kansas, there has been an uprising of the trapshooters. After several years of lay-off, a number of the "old boys" betook themselves to the south side of the city, and there proceeded to shoot at 14 pigeons. Blackburn, Thiel and Dent got 11, Hollenback 10 and McIntyre 8.

The North Side Gun Club, New Albany, Ind., will give a shoot next Thursday at Schonhof's place on the Paoli Pike.

A shooting match is announced for Thursday next at Solon, Iowa. There will be lunch served on the grounds.

The West Point, Iowa, Gun Club will hold a shoot at the fair grounds, Thursday of the coming week. Shooting will start at 9 o'clock and continue throughout the day.

All amateurs were invited to take part in Thursday of this week shoot at Grinnell, Iowa, when the Grinnell and Brooklyn clubs were to hold a team shoot.

Elmer Deisene, L. C. Rairdon, of Bellefontaine, Ohio, attended a shoot at DeGraff last Thursday and came home proudly bearing three turkeys.

After many moons, the Castle Gun Club, Belvidere, Ill., has come forth and held a shoot on their grounds near the corset factory. We shall be pleased to hear more from Belvidere in the future.

Hargemeiser Park, Green Bay, Wis., was the scene of a team match on Thursday last between the members of the Bay Gun Club. Some time in the near future the winners will feast at the expense of the losing side.

Miss Grace Butler, Ralph O'Neil and Glenn Baird, of Urbana, Ill., were present at a ball given by the Homer, Ogden, Ill., Gun Club.

H. W. Cadwallader is traveling through Iowa and giving some interesting rifle and shotgun exhibitions. Last week, at Tama, he shot a tie with A. W. Mounsdon, 32 out of 35.

It is to be regretted that the hunters at Forest City, Iowa, held a hunt on Thanksgiving day, and with 30 to 40 men scoured the country for game. These side hunts deserve to be abolished unless crows only are killed.

Last Thursday at South English, Iowa, a large gathering of local sports saw Chas. L. Holden win the match of 100 targets for \$50 a side from Will Ridley. The score was very close, 91 to 90. There will probably be another match soon.

Among the many "turkey" day shoots, we mention that of San Jose, Ill.

Brenham, Texas, is alive to the interests of the shooters of the southwest; \$1,500 will be given. Professionals will be barred from all save one or two events. Nery Alf, Gardner is the "king bee" tournament manager of the great southwest.

The Acme Gun Club, Beaver, Pa., are not unmindful of the social side of life, and with their wives and sweethearts, held a dance last Thursday night.

The scores made Wednesday by the members of the Tipton, Iowa, Gun Club were low, owing to the trap being out of order, and are not published through courtesy. A shoot is being arranged wherein the Red Oak boys will participate.

A meeting of the Youngstown, Ohio, Club was held Saturday to decide the handicap trophy. Black, with 45 out of 50 proved the winner; Seaborn, second, with 44.

**Allowance in Aiming at Moving Objects.**

INTERESTING as were the figures of striking velocities we published last week, the deductions we may now draw from them are of far greater application to the problems of every-day shooting. Unless he can see a tangible result from experimental researches, the sportsman is never quite satisfied. Hence our desire to give him an opportunity of applying the information now available to the wise selection of his ammunition and the improvement of his shooting. The ultimate test of abstract research is that it shall be capable of application, and in the present instance we can fully satisfy this somewhat difficult requirement. On the basis of the figures which were published last week we can inform the sportsman the exact allowance he must give to a crossing bird according to the range at which the shot is taken.

To analyze the values of striking velocity at every distance, as published in our last issue, we first of all converted them into the following table of mean velocities between the muzzle of the gun and the various distances into which the range was divided:

Size of shot.	Distances over which the mean velocities are specified.	0-20yds.	0-25yds.	0-30yds.	0-35yds.	0-40yds.
3	1050	1009	971	944	903	
4	1050	1005	962	929	888	
5	1050	1003	959	923	882	
5½	1050	1001	955	917	876	
6	1050	1000	952	912	871	
6½	1050	998	949	906	865	
7	1050	996	946	901	860	

All velocities are stated in feet per second. From this table we gather that a charge of No. 6 shot fired from a standard cartridge having a velocity of 1050ft. per second over 20yds. has a mean velocity of 952ft. over 30yds., and 871ft. over 40yds. The corresponding values for the other sizes of shot are similarly set forth in the above table, and we see from it that there is a difference in the mean velocity over 40yds. of 43ft. between shot sizes 3 and 7. This means that, although the 25yds. mean velocity is equal in all cases, the greater ranging power of the larger sizes of shot gives them a distinct advantage in mean velocity at all sporting ranges beyond that of 20yds., which infers that the large sizes of shot reach the bird quicker than the smaller sizes, and, in the absence of definite quantities, it would appear as though a distinctly greater allowance must be given, say, in the case of No. 4 shot as compared with No. 7. Having a really authoritative set of relations to work upon, it is obviously the best plan to reduce these differences to actual quantities in inches of allowance.

The time occupied between the fall of the hammer and the arrival of the shot at a given distance is naturally not included in the time value derived from the mean velocity from the muzzle to the object struck, and we must accordingly add the amount of time occupied from the fall of the hammer to the arrival of the charge of shot at the muzzle. Persons of an over-refining turn of mind might be inclined to argue that an extra time allowance should be made in respect to the interval between the brain signal that the gun is properly aligned and the response of the finger by way of pulling the trigger. This may, however, be dismissed, for the reason that, if the swing of the gun is continuously maintained, the process of the shooter's mind may for all practical purposes be ignored. In this way the distance of the bird's flight while the shot is reaching it must date, so to speak, from the fall of the hammer to the impact of the shot.

We have accordingly reduced the mean velocity shown in the first table to a series of time values, which are represented in the form of decimal fractions of a second. To each of the values so obtained we added an allowance of .0040 of a second for the delay in the gun above referred to. The following table of values accordingly represents the time which elapses with each size of shot from the fall of the hammer to the arrival of the charge at the various distances named:

Size of shot.	Points on range for which time delays are specified.	20yds.	25yds.	30yds.	35yds.	40yds.
3	.0611	.0783	.0967	.1162	.1369	
4	.0611	.0786	.0975	.1177	.1391	
5	.0611	.0788	.0979	.1184	.1401	
5½	.0611	.0789	.0982	.1189	.1411	
6	.0611	.0790	.0985	.1194	.1418	
6½	.0611	.0792	.0988	.1200	.1427	
7	.0611	.0793	.0991	.1205	.1435	

All times are stated in decimals of a second. As figures are never very interesting unless the mind can grasp their actual meaning, our comments upon this table shall be very brief. All we wish to point out is that when the differences in the times of arrival are represented to the nearest ten-thousandth part of a second, they appear quite considerable. For instance, at 40yds. there is a time interval of .0066 of a second between the arrival of a charge of No. 3 shot and a charge of No. 7 shot. The question to be settled is how far the bird will travel during this interval of time, the value shown by such a calculation being the amount of extra allowance that must be accorded to No. 7 shot as compared with No. 3.

Now, in order to produce a table of allowances for aiming at moving objects, it is necessary to adopt a characteristic rate of flight as a basis for comparison. We accordingly adopted the value of 60ft. per second, which corresponds with forty miles an hour, and is the average rate of flight which we have ourselves fixed by chronograph measurements for a clay bird sprung from a powerful trap and throwing at an angle with the ground more or less horizontal. It is similarly the recognized speed of a fast-flying pheasant or a driven grouse or partridge. Almost needless to say, many birds fly much slower than this, whereas others move along at a greater rate when the wind is in their favor and when the rate of flight is aided by gravity, as is the case when a bird is flushed on a hill and is inclining its course towards a lower elevation. To obtain the distance covered in a given time by a bird traveling at 60ft. per second is a very simple matter. The values in the above table of time allowances must be multiplied by 60, the number of feet covered in a second. The result is the number of feet the bird will cover in the fraction of time used in the sum. Without further preface, we will introduce our third table, which shows the exact distance a bird will travel during the time that elapses from the fall of the hammer to the arrival of the various sizes of shot at the distances named:

Size of shot.	Distance of bird when the hammer falls—				
	20yds.	25yds.	30yds.	35yds.	40yds.
3	3ft. 8.0in.	4ft. 7.4in.	5ft. 9.6in.	6ft. 11.7in.	8ft. 2.6in.
4	3ft. 8.0in.	4ft. 8.6in.	5ft. 10.2in.	7ft. 0.7in.	8ft. 4.1in.
5	3ft. 8.0in.	4ft. 8.7in.	5ft. 10.5in.	7ft. 1.2in.	8ft. 4.9in.
5½	3ft. 8.0in.	4ft. 8.8in.	5ft. 10.7in.	7ft. 1.6in.	8ft. 5.6in.
6	3ft. 8.0in.	4ft. 8.9in.	5ft. 10.9in.	7ft. 2.0in.	8ft. 6.1in.
6½	3ft. 8.0in.	4ft. 9.0in.	5ft. 11.1in.	7ft. 2.4in.	8ft. 6.7in.
7	3ft. 8.0in.	4ft. 9.1in.	5ft. 11.4in.	7ft. 2.8in.	8ft. 7.3in.

Here we have in an absolutely tangible form an important portion of the lesson that is to be learnt from the series of investigations which culminated in the table published in our last issue. We find that in shooting at 20yds. the same allowance is required for all sizes of shot, the amount being 3ft. 8in., which is thus far greater than many would suppose. At 25yds. the required allowance is increased by practically another foot. At 30yds. there is a rather greater proportional increase, while at 35yds. the allowance becomes the very substantial one of 7ft. or more. At 40yds. the shooter who desires to center his charge of shot on a fast-flying bird traveling at right angles to the line of flight must aim rather more than 8ft. in front of it.

Turning now to the differences in the specified allowances for the extreme sizes of shot shown in the table, it will be seen that up to 30yds. they are less than 2in. At 35yds. the separation of values becomes more pronounced, and the difference is, practically speaking, 3in., while at 40yds. it attains a maximum just under 5in. These figures entirely disprove the assumption that the shooter requires to alter his allowances when aiming at moving objects according to the size of shot in his gun. Adopting No. 6 shot as a standard size, we find that there is a difference of only 2in. in the allowance for a 40yd. shot when a change is made to size No. 4. In view of the impossibility of knowing the precise velocity of the cartridge, the true range of the bird, and its correct rate of flight, it is obvious that such fractional differences as are created by a change in the size of shot are too infinitesimal

for serious consideration. We accordingly adopt the allowance shown for size No. 6, and draw up the following exceedingly simple code of instructions to the shooter who desires to have a tangible idea of the allowance that he must give to a fast-flying bird:

When the bird is at 20yds., the shooter must allow 3ft. 8in.; at 25yds., 4ft. 9in.; at 30yds., 5ft. 11in.; at 35yds., 7ft. 2in.; at 40yds., 8ft. 6in.

As already stated, the above allowances only represent the daylight between the bird and the point at which aim should be taken in the case of crossing shots. When a bird's flight is inclined so as to produce a foreshortening effect of its line of travel, the distance it covers is still the same, but the amount of daylight between the bird and the point at which aim is taken is a reducing quantity, which culminates at the zero mark when the bird is flying either directly toward or directly away from the shooter. This question of angle is, however, one which the shooter must instinctively settle for himself. If he knows approximately that the bird will move, say, 7ft. while the shot is reaching it, he must decide in his own mind, according to the angle at which the bird is flying, whether this must represent 1ft., 2ft., or 3ft., as the case may be, of daylight between the bird and the point aimed at.

There is, however, another aspect of the question, which raises an apparent difficulty in the application of the above figures. Supposing that the bird is directly going away, and that its distance is 35yds. at the moment when the hammer falls, the bird will naturally have moved 7ft. 2in., not by the time that it is struck, but by the time the shot has reached the distance of the bird when the hammer fell. During the time that the shot is covering the 35yds., already mentioned, the bird still continues its flight. Consequently, some further time must elapse while the shot is covering the extra 7ft. 2in. Referring to our curve of values, we find that the average velocity of a No. 6 pellet between 35 and 38yds. may be taken at 680ft. per second. Under such circumstances, the bird will move a further 7.67in. while the shot is traveling the extra 7ft. 2in. It thus happens that the total flight of a going-away bird at 30yds. between the fall of the hammer and the impact of the shot on the feathers is as nearly as possible 7ft. 10in., instead of the 7ft. 2in. for a crossing bird. As, however, no allowance is necessary in the case of an approaching or a going-away bird, this difference is absolutely immaterial, except in so far that the shot does not strike the bird with the velocity it possesses when at the 35yds. mark.

Referring again to our curve, we find that the striking velocity of the shot at the moment when it reaches a bird at 35yds. is 695ft. per second. This velocity is reduced to 670ft. per second when the bird has traveled a further 7ft. 9in., and if we deduct 60ft. from the striking velocity by reason of the fact that the shot is not colliding with a stationary object, but one moving away at about one-tenth of its own velocity, then we find that the actual velocity of impact of a going-away bird shot at when 25yds. away, becomes 610ft. per second. This enables us to lay down that the velocity with which the shot strikes a going-away bird, shot at when 35yds. distant, is the same as that of shooting at a crossing bird 44yds. away.

From the point of view of the actual flight of the bird during the travel of the shot it will be found that the perspective foreshortening of the line of flight for semi-crossing birds makes it entirely unnecessary to increase the allowance by reason of the fact that the bird is increasing its distance from the shooter while the shot is traveling up the range. The resolving of our calculations into the very simple series of figures which are given above may thus be considered all sufficient for practical purposes. We have laid down the necessary allowances that must be made in the case of cartridges having a standard velocity. In the future we shall be able to examine cartridges which depart from this standard, either by showing an excess or a decrease on the standard velocity laid down, and we shall be able to show in inches the differences of allowance which arise from abnormal cartridges, whether they be on the strong or on the weak side. A careful examination of our tabulated results enables us to say that we shall be able to ascertain the striking velocity at all distances of any cartridge by making the very simple time measurement involved in ascertaining the mean velocity between 15 and 25yds. We have shown that from the muzzle to 20yds. velocity test affords a splendid insight into the general characteristics of a cartridge. We shall, in the future, be able to show that its effectiveness from the sportsman's standpoint may best be tested between 15 and 25yds. It would be unfair to anticipate the teachings of experiments yet to be made. We can therefore dismiss the subject for the moment, now that we have stated the exact allowances that must be made at all sporting distances for cartridges giving a standard velocity.—London Field.

**Gun Accidents.**

As often related in these columns, every shooting season that comes to us brings with it two or three accidents, always melancholy, and oftentimes fatal. It seems in the natural order of things that this should be so, though, to look at the matter from a common-sense point of view, one would imagine that in these days of breechloaders a serious accident ought to be a rarity. It is nothing of the sort, however, and the present season, so far from being any exception, furnishes three fatalities in the British Isles alone, to say nothing of what may have occurred abroad. Mishaps in the shooting field are always sad to contemplate, because, no matter how they may have come about, the supposition underlying them is that some one or other has been culpably negligent, or that the victim—apart from suicide—was unfit to be trusted with a loaded gun. Anyway you look at it, a sort of stigma attaches to the occurrence, and seems to fasten itself on some one or something; and, sad to relate, when the matter is inquired into, the circumstances, if elucidated at all, are elucidated only at the expense of somebody's character and reputation, or to the detriment of the sufferer's own position. Let us glance briefly, then, at one or two mishaps which have come about since the present season opened, and see if there is or is not a lesson to be learned from the circumstances surrounding them, so far as we know them.

In the English Midlands, a few weeks ago, two men were out rabbit shooting. In getting through a hedge, one of the guns went off, and shot the carrier dead. The entire charge seems to have gone through the unfortunate gunner's neck. Surely our sympathies go out to the poor fellow in the most whole-hearted manner; but, again, surely such an accident could have been prevented by simply taking the cartridges out of the gun before negotiating the hedge. There are not wanting those who exclaim "Serve him right." But death robs all right-minded men of malice or vituperative sarcasm, and therefore, all there is to do is to express one's sorrow for a brother gunner. In doing so, however, this moral may be pointed out to others, namely, to unload their guns before climbing gates or hedges, or doing anything of a similar nature in the shooting field.

It happens, all the same, that this very identical piece of advice has been preached from time immemorial; but no diminution has come about in the annual death roll. Men seem bent on going on their own way, and in their own fashion, and the more the pity, considering the results. In fact, it seems impossible to impress on some shooters the necessity of unloading their guns as often as possible. A shot may be lost now and again, certainly, just as a shooter has removed the cartridges from his gun; but what about it? Surely a chance may be lost or sacrificed occasionally to a natural desire for safety? Yet—it is a curious fact—I have known men persist in getting through a hedge with their guns loaded, just because they have lost a chance on the other side on previous occasions by not doing so. For remonstrating with them, too, I have been called an old woman; but that is a mere detail.

By improperly loading a gun, a less serious accident happened only last week. A shooter opened his gun, put in two cartridges, and closed it. But he closed it by bringing the barrels up to the breech, and in some unexplained manner the caps of the cartridges struck against the strikers, and one of the cartridges exploded. The result was that another gunner, standing some thirty yards or so off, got the best part of a charge of No. 5 in his side, his thick clothes, fortunately, saving him from serious injury. Now, if the loader of the gun had opened the breech with the barrels pointing to the ground, and then, after inserting the cartridges, had closed it by bringing the stock up to the barrels (while the latter were still pointing downward) the accident could not have possibly happened. Any one can satisfy himself on this point by trying the methods of loading implied by my remarks. Yet here, again, I have been snubbed by speaking to shooters about carelessness in loading (but live to tell the tale all the same).

If there were the same laws written or unwritten regarding shooting as there are governing hunting, coursing, yachting, and, indeed, nearly all other sports, we should not have so many accidents. But, as things are at present, any one who can buy a gun, get a license and leave to shoot somewhere or other, is full-fledged, as it were, and, if he gets into a party, becomes at once a nuisance and a danger. He does not take advice readily, and is deaf to remonstrance. There are no laws to which he can be held amenable, and so accidents happen, sooner or later. The master of a hunt soon clears the ground of undesirables, and the

judge at a coursing meeting generally does the same. Cricket and football have to be learned before they can be indulged in, and so have most other pastimes. It appears to be very different with shooting, and so we have a dangerous sport participated in by those without the necessary training, with the result that lives are lost. Well, it is a curious state of things at this period of the world's history, and I submit, with all respect, that it is high time something was done to insure a knowledge of guns and how to use them on the part of every one, and no one should be granted a license until he had at least reached the standard of ordinary "safety."—Shooting Times.

**IN NEW JERSEY.**

**Montclair Gun Club.**

MONTCLAIR, N. J., Dec. 9.—The regular monthly shoot for the Daly gun was run off to-day, with Moffett the winner for the month, with a score of 41 to his credit. Moffett broke 20 targets in the first string (event 3) for the gun and 17 in the second string, this with his handicap of 4 giving him a score of 41. Bush came in a good second with 40 net to his credit.

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7

**Pleasure Gun Club.**

ENGLEWOOD, N. J., Dec. 11.—Inclosed find scores of our Thanksgiving Day shoot, which was well attended. Owing to the very disagreeable weather, the scores were not what they should have been. Mr. Geo. Piercy won first amateur high average, and Mr. Carl Richter second. In events 3, 6 and 1, first prize was a large fat live gobbler. Extra events were shot for turkeys after the regular programme had been finished, and many of the shooters carried a good dinner home. Scores:

J. WESTERVELT, Sec'y.

**At Point Breeze.**

PHILADELPHIA, Pa., Dec. 9.—On the grounds at the Point Breeze track to-day, the competition was remarkably close. In the event at 10 live birds five tied on 8, and the remaining three contestants tied on 7. In the 5-bird event, J. Morris was alone with a straight score. In the second match at 10 birds, he was high with 9. Scores:

Ten live birds, \$5 entrance, two moneys. Rose system:									
Felix, 30	2002221222	8	Cobb, 28	1112220110	7

### ANNOUNCEMENT.

WITH the issue of January 6, which will be the first number of the sixty-sixth volume, several important changes will be introduced in the style of FOREST AND STREAM. In keeping with the pronounced tendency of the day we shall adopt a page of reduced size and one which has been determined upon not only because of its much greater convenience in the reading, but because it is more adapted than the present one to purposes of illustration. Of illustrations there will be largely increased use. That, too, is in line with the progressive journalism of the hour. The subjects to which the FOREST AND STREAM is devoted offer abundant scope for illustrating, and with the new departure it will be our ambition to make the pictorial features a fitting complement of the reading columns, and thus to give the paper a new and added interest.

In its changed form the FOREST AND STREAM will be a regular weekly issue of forty pages, with the issue of the first week of each month increased to fifty-two pages. This will give two volumes per year of 1,112 pages each, or 2,224 pages for the year.

Beginning with January 1 the subscription price will be \$3.00 per year.

These changes are all in the way of a better, brighter, handsomer paper. The new FOREST AND STREAM will be received as an acceptable and appreciated advance over the old.

The quality which has always marked the reading matter will be preserved, and the standard will be sustained. The paper will continue to chronicle the experiences of the man, who, in the unhampered world of the open air and the outdoor life does things worth the telling, of nature's ways notes things worth recording, and in the getting back to nature finds his spirit stirred with thoughts worth the expression. As for thirty years past, these pages will be a medium for such interchange among those who do, and see, and feel.

The field of the FOREST AND STREAM is of boundless interest. The theme of the outdoor world and its rational enjoyment is inexhaustible, and one that is always new and fresh, and ever attractive and stimulating. To present weekly pictures from this great playground of nature, which is the heritage of the American sportsman, and to relate his activities therein—this will be the chosen office of the FOREST AND STREAM in 1906, in the furthering of which it invites and anticipates the support and co-operation of its hosts of friends, old and new.

### NOTICE TO SUBSCRIBERS.

BEGINNING with Jan. 1, 1906, the subscription price of FOREST AND STREAM will be \$3.00 per year; or \$1.50 for six months.

All subscriptions now on our books which have been paid at the \$4.00 rate, and which run for any period into 1906, will be extended pro rata to conform to the changed price.

### THE INTERSTATE ASSOCIATION.

At the meeting of the Interstate Association, held in the Grand Hotel, New York city, last week, the action in respect to the holding of provincial handicaps, subsidiary to the Grand American Handicap, is deserving of more than a passing notice. At one bound it places the Association in a position of full national importance as a matter of fact instead of the heretofore national importance accorded it as a matter of assumption in respect to its material interests.

The Grand American Handicap, great and dignified shoot that it is, draws the main part of its support from a radius of 300 or 400 miles about the city at which it happens to be held. Therefore, while it unquestionably has been national in its moral influences and wholesome stimulus in respect to the sport of trapshooting in its material aspects, it has been provincial in its material scope.

The four subsidiary handicaps, established by the action aforementioned, are designed to supply the needs of general competition in territory not fully covered by the Grand American Handicap. One was assigned to the section of the United States east of Buffalo and Pittsburg; one to the section south of the Ohio River and east of the Mississippi; one to the section west of the Mississippi and east of Salt Lake and Oregon; and the fourth was assigned to the section west of Salt Lake and Ogden, to be known as the Pacific Coast Handicap. By thus allotting the great tournaments to the great natural divisions of the country, a general and beneficial impetus will be given to the sport of trapshooting. No more efficacious means for its betterment could be devised. No other body possesses the influence, dignity, stability and confidence of the public, qualities so essential to the success of such a great work.

It should be borne in mind that the scope of the Interstate Association includes the educational as well as the competitive. Under the supervision of the famous Interstate Association Secretary-Manager, Elmer E. Shaner, the Interstate tournaments are an object lesson in all the details of perfect tournament management. They are models for local clubs to copy. Cashiers, clerks, scorers, squad shooters, etc., are perfectly organized to work toward the perfection of a perfect whole. An atmosphere of perfect respectability pervades. A visitor need not hesitate to take with him "his sisters and his cousins and his aunts." It is inherently a clean and healthful sport, one whose place is in the open air, where there are sunshine and green fields.

The allotment of great handicaps to the four great natural divisions of the United States will appeal to sectional pride and activity. While, as a people, we are all citizens of the United States, the spirit of sectional pride is ever alive and active. It is a commendable pride, too, for it incites to beneficent emulation and rivalry. Indeed, its spirit is as great in small places as elsewhere. Where is the city so humble as to hide its glories? Where is the cross-roads which has not some greatness to flaunt where all men can behold and admire? States trumpet their greatness to the world, some modestly and mildly, as Kansas, others according to their excellence and humor.

The local spirit will go far toward insuring a strong support. Shooters of rare skill and courage will be graduated. Local pride will require that the best the world can produce shall be met in friendly competition, with the result that the best of the East, South and West will rally to the greatest contest of all, the Grand American Handicap.

It is a satisfaction to record the formation of the Anglers' Club of New York. There is abundant material for such an organization here, and its desirability has long been recognized. We bespeak for the movement a cordial support.

### SPORT AND HISTORY.

OF the stories we print in this Christmas number there are three which are deserving of special note because of their value as documents of history and because of the human interest in them.

Colonel Gordon has drawn from his recollections of the stirring events in which he had part a little story of war and sport and brotherhood, which is an altogether felicitous contribution to the literature of Christmas. His description of the prompt cessation of hostilities by opposing forces of the Blue and the Gray, that they might join together in the friendly emulation of a fox hunt, well illustrates that feature of the American Civil War which amazed the world at the time and will long compel attention—that the great armies which those momentous years saw arrayed against each other were made up of men of the same race of friends and kindred, bone of bone and flesh of flesh. And while on either side, each individual soldier was loyal to his own cause, it was no unusual thing, when opportunity offered, for the man of the North and his brother of the South to come together and fraternize as was done here on the occasion that Pious Jeems so well describes. It was this circumstance of brotherhood, which, while it made the actual strife all the more bitter and desperate, yet when the conflict was over and the weapons of war had been put away, led to the early and lasting reconciliation of the combatants as brothers again. This, too, is a feature of the Civil War which we may be sure will engage the attention and compel the admiration of the world for so long as the story of the conflict shall be told.

The many stories which we have published from the pen of Cabia Blanco, of hunting adventure in the Southwest among the Indians and the buffalo, are supplemented to-day by his account of the killing of his last buffalo. As for the particular tribe of Indians with whom he was hunting, and for the other tribes, who, as he tells us, sought the game there, this hunt meant the extinction from the face of the earth of a species which for countless generations had afforded them a food supply. For them the killing of this last buffalo was the final act of a change of conditions which meant for them an entire alteration in their mode of life and in the relationship between the white man and the red. It is not fanciful then to say that Cabia Blanco's buffalo story is a bit of the history of the Southwest, and of the events which transformed that region from a wilderness filled with game and sparsely peopled by savage tribes into a civilized community.

A like interest attaches to the chapter printed this week of the account of life among the Blackfeet as participated in by a white man who had the eye to see it and the hand to write it. We have expressed an opinion that this is one of the most intimate, and for that reason one of the most valuable, stories of Indian life ever put into print. It depicts the actual home life of the Rocky Mountain people in the old days. It gives us the Indian as he was, the Indian of fact, not the creation of romance nor yet the creature pictured by dread and hate; but the real Indian man and woman and child as they lived their lives.

It is a suggestive coincidence that in conjunction with this account of buffalo extirpation in the Southwest we should publish the communication from Mr. Baynes recording the movement to establish refuges for the buffalo remnants now left to us, and promoting the activity of a society organized for the express purpose of buffalo preservation.

MR. CHARLES CRISTADORO, of St. Paul, has given long, careful and intelligent study to the forestry conditions prevailing at the headwaters of the Mississippi, and whatever he writes on the subject is deserving of careful heed and special consideration. As Mr. Cristadoro well says, the matter of reforestation and drainage as applied to this district concerns not Minnesota alone but the nation. To permit what is urged by the selfish and traitorous schemers who would for their own individual aggrandizement procure the abandonment of the present system would be an act of national folly.

THE exposition given by the New England Forest, Fish and Game Association in Boston, beginning Dec. 25, promises to be one of the most interesting of the exhibitions in this line, for which Boston has won pre-eminent credit.

# FOR CHRISTMAS READING.

## A Fox Hunt on the Picket Line.

It was Christmas Eve of the year 1869 when a number of guests were gathered at Lochinvar, the home of the writer, as was the custom in Southern plantation homes in the olden time when guests were assembled to spend the merry Christmas Day. On this occasion Col. Harry Rodman, of New York, was visiting his old friends of the South, when one of the ladies of the party remarked: "We must not depart from that good old custom of having Christmas stories to-night. Colonel Rodman, can't you tell us a legend or a war romance?" she added, turning to him.

"I know very few legends," replied the Colonel, "but since you request it, I can tell you a little episode of the Civil War, and how we spent a Christmas Day in the army. It is a story of a fox hunt on the picket line.

"We were stationed in winter quarters around the village of C., and the Confederate forces were also in winter quarters a few miles below us. It was Christmas morning in the year 1863 that I was on picket with my regiment between the two armies. It was a beautiful morning, and as I stood by the bivouac fire I could hear the distant cry of hounds slowly trailing a fox, and the occasional cheer of hunters. I stood listening until I heard the hounds break forth in full cry. On they came nearer and nearer, until they passed through our lines. I was so excited that I shouted with delight, and all along the line of our pickets a cheer went up that extended back to the main army, where a rousing cheer from the soldiers in camp turned the fox back until it passed through our lines toward the Confederate, when the yells of the soldiers turned it back again.

"It had been running back and forth when the relief picket came and I sent my command into quarters while I went out beyond our lines with a squad of men to enjoy the sport.

"We had not gone far when a jolly Rebel boy ran into our squad and was captured before he was aware of our presence. I learned from him that his regiment had just been relieved from picket and his colonel with a squad of soldiers was, like myself, enjoying the chase, which had been gotten up for his benefit by a gentleman in the neighborhood who owned a pack of hounds. He was a bright little fellow, with merry blue eyes; but I could see his lips quiver and his eyes fill with tears when I remarked: 'I am sorry, my little man, to have to spoil your Christmas frolic by sending you to prison.'

"'It is a hard core,' he replied, 'and we were going to have a hop to-night in the village, and my girl will be so disappointed when her escort fails to put in an appearance. Say, Colonel,' he added, brightening up, 'can't you give me a chance to escape? Give me a little start, and let me make a break, and I'll take the chances of your shooting me.'

"I felt really sorry for the young fellow, and wishing to test him, said: 'Young man, if I let you go will you promise to return to our pickets to-morrow and surrender yourself?'

"'No,' he answered promptly, 'that would be like desertion, and there is no two to one bet that I won't escape yet before I see inside of a prison.'

"I cannot trust you out of sight then?' I remarked.

"'Not one inch,' was the honest reply.

"I like your pluck, my little fellow,' said I. 'How old are you?'

"'Sixteen next June,' he answered.

"What are you doing in the army then?'

"'Fighting for Dixie land; and I intend to fight as long as there is one of us left,' said he defiantly.

"What is the number of forces in your camps?' I asked.

"'Something less than a million,' he replied.

"That's not answering my question,' I added, sternly.

"Neither do I intend to answer it,' he replied fiercely.

"You forget that you are in my power,' said I.

"I don't forget it, neither do I fear it,' said the plucky little fellow. 'Pshaw!' he added contemptuously, 'you can kill me, but you can't scare me. I'm a Southern soldier, and I'll die ten thousand deaths before you extort one word from me regarding the strength of our forces or anything else I don't wish to tell.'

"To what regiment do you belong?' I asked.

"To the Second Mississippi Cavalry,' he announced proudly.

"Will you tell me your colonel's name?'

"Yes; he is Colonel —'

"Imagine my surprise when he mentioned my old friend Pious Jeems here.

"He is one of my best friends,' I said.

"You might not think so if you met him in that blue coat,' said he with a sneer.

"When you see him again tell him you met Col. Henry Rodman, of New York, and that I wished to be kindly remembered and would like to meet him some day under flag of truce.'

"I will deliver your message very soon,' he muttered. "I did not notice the covert remark, for just then the hounds again came in our direction and attracted our undivided attention for a moment, when the young Rebel bolted. I knocked up the gun of a trooper as he turned to fire on him. 'Hold,' said I, 'don't shoot. He is a brave boy and deserves his liberty. Let him go. He asked for a chance and he shall have it.'

"The pack now came rushing past us, and filled with the excitement of the chase, I dashed after them, and passing through a thicket got separated from my men. As I emerged into an opening I saw some forty paces distant coming out of the thicket on the opposite side a Confederate officer riding a handsome black charger. I halted and placed my hand on my holster. The officer grasped his pistol at the same moment.

"Well, Yank,' said he, 'I suppose we will have to fight it out by ourselves; but I wish you had waited until this fox chase was over.'

"I recognized the voice and familiar form of my friend here.

"If that's Pious Jeems, he and Harry Rodman can manage some better way than killing each other,' I replied, advancing slowly.

"Harry Rodman by all that's holy!' he exclaimed, dropping the pistol into its holster and grasping my hand.

"We exchanged a few friendly greetings when I asked: 'Have you any of your men with you?'

"Yes, I have a squad of about a dozen men with me.'

"So have I, and lest they meet and come to blows, which they will be sure to do, let's ride forward and get the two squads together and finish the hunt as friends.'

"The proposal was heartily agreed to and we were not a moment too soon, for our little escaped prisoner had fallen in with his comrades and notified them of our proximity, and they were collecting to make a charge on my squad, who had discovered them and were drawn up in line of battle ready to meet the charge.

"Pious and I rode forward together and each took our position in front of our commands; and as the situation was explained, a rousing cheer went up from both sides.

"It was a touching scene to see those bronzed veterans who a moment before were ready to rush together in mortal combat, shaking hands and expressing the warmest admiration for each other.

"We agreed to finish the chase together, and if the fox chanced to pass the line of either army the party into whose lines they passed should protect the other from harm. Pious and I dashed off, and the boys in blue and the boys in gray with a wild cheer entered with a new zest into the spirit of the chase. Over hill and dale we went, shouting and yelling with joy, until the fox was run into and caught, the brush being won by our little Rebel prisoner of an hour before.

"After the chase was over I sent one of my men to headquarters for a supply of liquors, eggs and sugar, which, fortunately, I had on hand, to make a Christmas egg nog; and there under the trees by a bivouac fire we awaited their return. Pious had sent off for his box of good things that had been sent to him from Lochinvar for his Christmas dinner; and a jollier Christmas Day was never passed by soldiers fighting under different flags. After enjoying our dinner to the utmost, the men divided into small groups and amused themselves in card playing and telling stories of adventures, each party vying in courtesies and in compliments to the prowess of the other.

"Pious and I conversed long on the pleasures of the past and the prospects of the future. We agreed that our regimental battle flags should be distinguished by a streamer of white bunting so we might know each other and avoid any effusion of blood unless when duty compelled us to ignore all ties, except loyalty to the cause each had espoused; and we further agreed that if any member of our commands should be captured, a letter addressed to the commanding officer on the side of the captor, making known the fact, should be promptly attended to, and his wants supplied by the side into whose hands he might fall, and the money advanced by one regiment for a member of the other, should stand as a debt of honor to be paid on presentation of the amount furnished under a flag of truce or otherwise, as the emergency of the situation might permit. This agreement made comfortable members of each regiment whom the fate of war consigned to a prison life during the years of strife that followed; and I do not believe there was a soldier in either command who would not have sacrificed his wearing apparel and gone bareheaded and barefooted before one of those obligations should have gone unpaid. Ever after this, when our men faced each other on the picket lines, it was their delight to exchange friendly greetings instead of firing at each other, as had been their custom before. If the soldiers of the two armies could have been permitted to meet and settle their diffi-

culty in a friendly social way the politicians would have been compelled to change their tactics, or they would have lost their occupation; for whenever the soldiers met in friendly converse under flags of truce or along the picket lines, there was a mutual admiration for each other's prowess that readily ripened into friendship; and it continues the same to this day.

"At the North the most inveterate haters of the South are the home guard heroes who never slept by a bivouac fire on the frozen earth, under the cold stars on a wintry night, or lived on hard tack and jerked beef, or went hungry on long and weary marches; and vice versa—the Southern home general is more vindictive against the North than the soldier who bared his breast to the storm of battle and fought until 'Dixie's hopes and his were o'er.'

The ladies clapped their hands with delight when the gallant Colonel finished his story of "A Fox Hunt on the Picket Lines."

PIOUS JEEMS.

## Seeing Things Through the Window

It's a blustery, blizzard-like afternoon. The snow has been drifting badly, piling up in convenient places, and, after every gust of wind, leaving the air filled with girating particles.

The thought of woods and fields being mantled under one great snowy blanket was not a pleasant thing to contemplate, and as evening came on we still looked out the window. Visions of other days came back to us. A southerly-exposed side hill, grass-grown and sparsely covered with lady-like white birches, with a small hemlock of the Christmas-tree variety, interspersed here and there. It is well on in the fall; the grass has been browned and cured by the sun, and above it is spread a carpet of leaves freshly fallen from the trees above.

The flight of woodcock is on, great, brown, plump birds, who, as they flush, stand not on the order of their going but cork-screw with incredible speed in and out and between the trees. No more the lazy summer gait as the bird leaves one spring hole to leisurely seek another. Quick the eye and rapid the action of the trigger finger to down one of these knightly birds. What ideal cover and how glorious the afternoon October sun shines down upon us!

We look again through the window and see a swale well timbered and brush-grown, with a brook flowing peacefully at its bottom. There are partridges here. One man takes the bottom of the swale, the other two taking positions well in advance upon the top of the swale to right and left. What thunder the birds make as they flush from beneath a hemlock and curve to the right or left toward the woods on each side of the swale. Mark! mark! And so it goes until the swale has been well hunted to where it comes to level ground where wheat stubble and brier fence corners fairly scents the air with quail. They have been feeding and have laid up in the fence corner. How the dog holds them, or, being comfortable, how they hate to leave their sunning quarters. But with a roar away they go to pitch and scatter in a nearby woods. Before we can get within gun shot of them they already have begun to call co-ee, co-ee, co-ee. The dog finds them and those that get away seek refuge along a hedge where the dogs pick them up one by one and stand them staunchly. And beyond the fence is a spring hole with much wet ground around it. Why not an English snipe? Will try. And before a depression in the grass the dog draws up and presently a pair of long-billed birds dart out with an erratic flight and a scape! scape! that tells the story only too plainly—a brother and fit companion piece to the woodcock. Great is the sportsman who can make continuous doubles on these erratic birds. They have a way of "flying out of it," exasperating in the extreme. We look westward and find the lakes mantled with wild rice with a ridge and cover between, over which the birds must pass from one feeding ground to another. If the day is clear and calm the great fat mallards and lightning-like teal fly high and warily avoid the concealed sportsman, but if the wind blows, and especially if there is sleet or rain in the air, how they come! Flying low and in a continuous line, paying attention to nothing and seeing nothing. The winds cut you to the bone and the rain seeps down your back, but as long as the ducks are flying and you have shells left to shoot the weather does not count. Honk! honk! honk! How they come flying low and circling the lake before they alight. And as some of their number drop from their ranks they again circle and present themselves most favorably to the concealed hunters. A second fusilade warns them away, and with parting honks they leave for pastures anew.

The September sun has already dried the dew from the prairie grass. The dogs are ranging nicely as we trot the horses along through the long grass. Steady! The birds are here! How well the dogs stand and back! Away

they go with a roar as they flush ahead of the dogs, and spreading out fan-like, each one again seeks individual cover to burrow down deeply amid the grass roots, there to defy the nose of the dog and remain quiet even with the breath of the dog upon them. They know where they are safe, and save for being actually kicked out would no doubt defy the dog and remain in cover. Was there ever such hunting as that, where the dogs are well broken and the birds lie snug and close? And when the birds flush, an open space and view unobstructed above the line of the prairie grass for miles between you and the horizon. Under such conditions one marvels that a prairie chicken can be missed—but missed they are, sometimes more frequently than at others.

How fresh the prairie breezes and how exhilarating the sport. How welcome is the dinner hour when beside the spring the hamper is opened up and its substantial spread out. How good to light one's pipe and spread out upon the fragrant prairie grass and gaze upon the fleeing clouds overhead and think of the afternoon yet to come. The dogs lie dreaming by our sides and under the balmy influence of the sun's rays we too drop asleep and walk the dreamland prairies.

CHARLES CRISTADORO.

## In the Lodges of the Blackfeet.

### Days With the Game.

Who should roll in one day but Sorrel Horse and his wife, with whom I had passed the summer, and with them came young Bear Head, and his Gros Ventre wife, whom I had helped him steal from her people. That is, I went with him on that expedition to the Gros Ventre camp, and gave him very good will in his undertaking if nothing more. Berry and his wife were as glad to meet them all again as I was, and gave them one of the rooms in the fort until such time as Sorrel Horse should have a cabin of his own. He had decided to winter with us, trap beaver and poison wolves, and perhaps do a little trading with the Indians. With Bear Head to help him, he soon built a comfortable two-room cabin just back of our place, and put in two good fire-places like ours. I was glad of the fire-places, for I counted on spending some little time by them in the long winter evenings to come. Nothing on earth gives one such a sense of rest and abiding peace as a cheerful blaze in a wide fire-place when cold weather comes, and blizzards from the north sweep down over the land.

Among other things, I had brought west with me a shotgun, and, now that the geese and ducks were moving south, I had some very good shooting. Whenever I went out for a few birds a number of Indians always followed me to see the sport; they took as much delight in seeing a bird fall at the crack of the gun as I did in making the shot. Once I dropped eleven widgeons from a flock passing by, and the onlookers went wild with enthusiasm over it. But I could never induce them to accept any of the fowl I killed; birds and fish they would not eat, regarding the latter especially as unclean. All they cared for was ni-tap'-i wak-sin: real food, by which was meant the meat of buffalo and the various other ruminants.

In November many of the Blackfeet proper came down from the north, where they had been summering along the Saskatchewan and its tributaries, and following them came the Kai'-na, or Bloods, another tribe of the Blackfeet. The latter went into camp a mile below the Piegiens, and the former pitched their lodges about half a mile above our fort. We now had, including women and children, something like 9,000 or 10,000 Indians about us, and the traders were kept busy all day long. Buffalo robes were not yet prime—the fur did not get its full growth until about the first of November—but a fair trade was done in beaver, elk, deer and antelope skins. About the only groceries the Indians bought were tea, sugar and coffee, and they cost them, on an average, \$1 per pint cupful. Blankets—three-point—were \$20, or four prime head-and-tail buffalo robes, each; a rifle, costing \$15, sold for \$100; whisky—very weak, was \$5 per quart, and even a package of Chinese vermilion sold of \$2. There was certainly profit in the trade. As a matter of fact, there was not a single thing in the trader's stock that was not an unnecessary article of luxury to the Indian. The trader's argument was something like this: The Indians don't need these things, but if they will have them, they must pay my price for them. I'm not risking my life in this business for anything but big profits.

Of course Berry did not expect to get all the trade of the three great camps. Parties were continually going into Fort Benton with robes and furs, indeed, the larger part of the trade went there; nevertheless, the little fort on the Marias did a fine business.

Winter came early that year, in the fore part of November. The lakes and streams froze over, there were several falls of snow, which the northwest winds gathered up and piled in coulées and on the lee side of the hills. It was not long before the buffalo began to keep away from the river, where the big camps were. A few, of course, were always straggling in, but the great herds stayed out on the plains to the north and south of us.

After the snow fell they went no more to water anyhow, as they got enough of it in the form of snow, eaten with the grass. So long as they took water in this way they remained fat, no matter how long and severe the winter was; but as soon as the snow began to melt and water stood everywhere on the plains in little pools, they drank it and lost flesh and fat rapidly. Since the buffalo came no more near the stream the Indians were obliged to go out on a two or three days' camping trip, in order to get what meat and skins they needed, and several times during the season I went with them, accompanying my friends, Weasel Tail and Talks-with-the-buffalo. On these short hunts few lodges were taken, fifteen or twenty people arranging to camp together, so we were somewhat crowded for room. Only enough women to do the cooking accompanied the outfit. As a rule, the hunters started out together every morning, and sighting a large herd of buffalo, approached them as cautiously as possible, until finally the animals became alarmed and started to run, and then a grand chase took place, and if everything was favorable a great many fat cows were killed. Nearly all the Piegiens had guns of one kind or another; either a flint-lock or percussion-cap, smooth-bore or rifle; but in the chase many of them, especially if riding swift, trained horses, preferred to use the bow and arrow, as two or three arrows could be discharged at as many different animals while one was reloading a gun. And yet those old smooth-bores were quickly loaded. The hunter carried a number of balls in his mouth; as soon as his piece was discharged he poured a quantity of powder from the horn or flask into his hand and thence down the barrel; then taking a ball from his mouth he dropped it down on top of the powder, gave the stock a couple of sharp blows to settle the charge, and primed the pan or put on the cap, as the case might be. When loaded in this manner the piece had to be held muzzle up else the ball would roll out; and when ready to shoot the hunter fired the instant he brought the gun down to the level of the mark. Some of the hunters—fine shots and astride exceptionally swift and long-winded horses—often killed twenty, and even more, buffalo on a single run, but I think the average number to the man was not more than three. After one of these hunts the return to the main camp was a sanguinary sight. There were string after string of pack horses loaded down with meat and hides, and some hunters even slung a hide or two or a lot of meat across their saddles and perched themselves on top of that. There was blood everywhere; on the horses, along the trail, on the clothing, and even on the faces of the hunters.

I went on several of these hunts when the weather was so cold that a buffalo hide froze stiff as it dropped away from the cut of the knife; yet, the Indians skinned their quarry bare-handed. I wore the heaviest of underclothing, a thick flannel shirt, a buckskin shirt, coat and waistcoat, a short buffalo robe overcoat, and buffalo robe "shaps," and even then there were times when I was uncomfortably cold, and my cheeks and nose became sore from frequent nippings of frost. The Indians wore only a couple of shirts, a pair of blanket or cowskin leggings, fur cap, buffalo robe gloves and moccasins—no socks. Yet, they never froze, nor even shivered from the cold. They attributed their indifference to exposure to the beneficial effect of their daily baths, which were always taken, even if a hole had to be cut in the ice for the purpose. And they forced their children to accompany them, little fellows from three years of age up, dragging the unwilling ones from their beds and carrying them under their arms to the icy plunge.

When on these short hunts there was no gambling nor dancing. Some medicine man always accompanied a party, and the evenings were passed in praying to the sun for success in the hunt, and in singing what I may term songs of the hunt, especially the song of the wolf, the most successful of hunters. Everyone retired early, for there was little cheer in a fire of buffalo chips.

You have perhaps noticed on the northwestern plains, circles of stones or small boulders, varying in size from twelve to twenty and more feet in diameter. They were used to weight the lower edge of lodge skins, to prevent the structure being blown over by a hard wind, and when camp was moved they were simply rolled off of the leather. Many of these circles are found miles and miles from any water, and you may have wondered how the people there encamped managed to assuage their thirst; they melted snow; their horses ate snow with the grass; buffalo chips were used for fuel. The stone circles mark the place of an encampment of winter hunters in the long ago. Some of them are so ancient that the tops of the stones are barely visible above the turf, having gradually sunk into the ground of their own weight during successive wet seasons.

By the latter end of November the trade for robes was in full swing, thousands of buffalo had been killed, and the women were busily engaged in tanning the hides, a task of no little labor. I have often heard and read that Indian women received no consideration from their husbands, and led a life of exceedingly hard and thankless work. That is very wide of the truth so far as the natives of the northern plains were concerned. It is true, that the

women gathered fuel for the lodge, bundles of dry willow, or limbs from a fallen cottonwood. They also did the cooking, and besides tanning robes, converted the skins of deer, elk, antelope and mountain sheep into soft buckskin for family use. But never a one of them suffered from overwork; when they felt like it they rested, they realized that there were other days coming, and they took their time about anything they had to do. Their husbands never interfered with them, any more than they did with him in his task of providing the hides and skins, and meat, the staff of life. The majority—nearly all of them—were naturally industrious and took pride in their work; they joyed in putting away parfleche after parfleche of choice dried meats and pemmican, in tanning soft robes and buckskins for home use or sale, in embroidering wonderful patterns of beads or colored porcupine quills upon moccasin tops, dresses, leggings and saddle trap-pings. When robes were to be traded they got their share of the proceeds; if the husband chose to buy liquor, well and good; they bought blankets and red and blue trade cloth, vermilion, beads, bright prints and various other articles of use and adornment.

Berry and some of his men made several flying trips to Fort Benton during the winter, and on one of them brought out his mother, who had been living there with her companion, the Crow Woman. Mrs. Berry, Sr., was a full-blooded Mandan, but very light colored, and brown-haired. She was tall and slender, good looking, very proud and dignified, but of great kindness of heart. She was very good to me, nursing me when ill and giving me strange and bitter medicines, always picking up and putting away with care the things I scattered about, washing and mending my clothes, making for me beautiful moccasins and warm gloves. She could not have done more had she been my own mother; I was under obligations to her which nothing could ever repay. When I contracted mountain fever, and one evening became delirious, it was she who tended me, and brought me safely out of it. Her companion, the Crow Woman, was equally kind to me. She was a woman with a romance, and one evening, after I became well acquainted with her, she told me the story of her life as we sat before the fire.

WALTER B. ANDERSON.

[TO BE CONTINUED.]

## My Last Buffalo Hunt.

Editor *Forest and Stream*:

In a part of the summer and all of the fall of 1879 I was engaged in helping our post carpenter, being carried on "daily duty." This sort of work should have been "extra duty," for which I would get extra pay, but it was not, in my case, and I need not have continued at it more than ten days unless I wanted to do it. I did want it. That was why I was not put on the extra pay roll I suppose. The quartermaster knew he could get me without extra pay, then save my pay for some one else.

After we had built an addition to the hospital and had done all other repairs in our line, I next went to painting. I was no more a painter than I was a carpenter, but could do a little at both these trades and several others besides. The new hospital and a row of officers' quarters needed painting and I proceeded to paint them. My term of service would be up here about the middle of next December, and I lay awake nights now studying how I could string out this job of painting so as to get it and my term done about the same day. The captain put in his time growling to himself and me about my continued stay with the quartermaster. He knew better than to do any of his growling when it might have some effect with the post commander. These captains try every way to keep their men out of the quartermaster's employment; they need the men themselves, but some one has got to do this work.

At last a happy thought struck me. I would get through with that painting job a few weeks before I would be through with all jobs here, then strike the captain for a two weeks' hunting pass; and I would not get it from him; but I thought I knew whom I would get it from—the post commander. I'll get that pass from the colonel's wife, I told myself. She had the reputation among the men of being the real commanding officer. If she was, we might easily have a worse one, but, in fact, she seldom meddled with any affairs but her own.

When I had got to her quarters I painted them from top to bottom, doing everything just to suit her; and while doing it told her of my anxiety to go hunting next, but that I was afraid I could not, and told her why.

"When you get through here," she told me, "go to the Colonel for that pass. I will see him myself about it."

The colonel was only one by brevet, but we always addressed him as colonel, an act of Congress had told us at one time to stop the use of the brevet when addressing these officers, but we were not supposed to know how to read at that time, and the officers forgot to tell us, so we kept up the old custom, all of us except a few smart Alocs did, at least, and the smart men would stand a good chance to be called down when they addressed a brevet-colonel or general as captain. I applied to the captain for that pass as soon as I was ready for it. It would be only a matter of form to ask him for it; I would not get it.

"Are you going to re-enlist with me?" he wanted to know.

"No, sir; I am going to St. Louis to enlist."

He was short a sergeant; he had been short of one for some time now and had not promoted a corporal.

"I will appoint you sergeant the day you re-enlist," he told me. "I can keep you out of the quartermaster's then, I think."

"I am afraid not, sir; he wants me for a wagon master, he told me; that sergeant's appointment would just suit him."

"Well, then, I am afraid I can never let you do any more hunting here, you have done the last of it."

I went straight to the colonel now and told my story. It was no doubt an old story with him now; he had heard all about it from his wife.

"How long a pass did I want?"

"About fifteen days, sir. I want to go up the Canadian again." I had been up it less than a year ago. Then this captain of mine was anxious for me to hunt; I was hunting up stray Indians then to send them in home for him.

The colonel started to write my pass, then handing it to me said: "Now, if you can't get back in fifteen days, think up an excuse for not doing it, and I won't mark you a deserter when you do get back."

Going back to the captain I handed him my pass and said: "I would like to start early in the morning, sir. Will you please give me an order for my horse?" I could not take him out of the stable without an order.

I got the order and for a wonder did not get a calling down for going to the colonel. You have not quite given up the hope of getting me for another five years, I thought. That is why I don't hear from you in this connection.

Starting early next morning I rode clear through to the Wachita Agency, getting in there in the middle of the afternoon. But I had a good horse, the one that the loco weed had failed to kill, as I told about some time ago. And the horse would have ten days to rest up in now. I would turn him into the chief's herd and ride a pony. The horse would be at home here, I had had him running with these ponies two winters already while I rode ponies.

I needed another pass now, one for my Indians, from the agent and asked for it, telling the agent that we would need no rations from him. I would buy them at the store here. This was another stroke of policy, for this store belonged to the agent, but was in another man's name to keep the agent out of hot water with the Indian Bureau.

I got the pass with less trouble than it had taken me to get the first one; then keeping on up to camp I told the chief to get ready for a hunt right away. I wanted to take about a dozen of his men and boys, and he told me to detail those I wanted myself. I did so, then added three squaws to the detail. I wanted the squaws to pack, drive and cook for us. I would make the boys do part of this, they would do it if I told them to, but would not do it for their sisters if I were not present to make them do it. Next morning the chief and I, taking three of his mules went down to the store, and here I loaded up the mules with about all they could carry of coarse supplies—flour, coffee and sugar, baking powder and salt, adding to this a good supply of smoking tobacco; the Indians did not get much of that now, nor much of anything else either, since there were no more buffalo robes to pay for it; part of these supplies I meant to give out in camp. This would be the last time I would get a chance to feed these Indians for a long time now; they had often fed me. The supplies would cost me about half what they would have cost an Indian, had I been a stranger here; but I was not a stranger, so they cost me still less. I concluded from my bill that agent had seen the storekeeper since I had seen the agent yesterday, and had "put him wise" (that seems to be the popular way of expressing this now). I might report any excess in these charges to Washington, or I might "put the agent in the papers." I had threatened to do both in his case a few years ago. I had no notion then of doing either, but he did not know that. I had put another agent in the papers, and I might put him in. That was what he did not want. "These agents out here were spending the best part of their lives in trying to benefit the Indian, while we spent our time in finding fault with them."

We pulled out from camp early next morning to go on the hunt. I had already used up two of the fifteen days now, and did not want to waste any more time if I could help it; and so we struck out straight for the Canadian River by the shortest route to it, not stopping to do any hunting on the way there, and got into the valley of the Canadian after two days' hard riding, striking it just west of Fort Elliott; and now we could move slower and do a little hunting as we kept on up the river.

This Canadian River Valley is a fine one. It had been less than a year since I had seen it last, then I had ridden down the whole length of it alone. There were but two ranches in the whole valley then, several more had been built in it since then; but the most part of it was out of doors yet. Still keeping up the valley we made our last camp at White Deer Creek. Deer were what we were looking for, and we found plenty of them the whole length of the valley. There were large herds of cattle

in here and the deer could often be found right among the cattle.

On the afternoon of the day that we went into camp, some of the Indian boys went off on a hunt still further up the river, and that evening one of the boys, coming into the chief's lodge, reported that he had seen a buffalo in the afternoon out on the prairie to the left of the river. The buffalo was a mile away from him, he said, and he had not tried to run it, his pony would not be fast enough and he did not want to scare the buffalo off, we could get it to-morrow.

"No," the chief told him, "you saw no buffalo. There is none here now to see. The white man has killed them all."

"Well, it seems that there is still one that the white man has not yet killed," I told him, "but if he keeps himself in this country until to-morrow you or a white man will kill him. Which of us does it will depend on which of us has the fastest pony. Don't you suppose that this boy knows a buffalo when he sees him? This boy and I have killed enough of them for you while we still had them here to know them again when we see them."

Next morning, leaving only one man and the squaws in camp, we started to get that buffalo. We kept on up the river for nearly fifteen miles, all of us keeping a good lookout for the buffalo's trail, for he would have to come in here after water. At last we found it; he had been in here to-day. We followed the trail up on the prairie, and, stopping here, I took the chief's field-glass and swept the country with it, and soon saw the buffalo. It hardly needed a glass to see him; he was only about two miles away and was grazing.

We started in slowly and had got at least a mile nearer him without his seeing us, when the chief gave the signal to go for him, and we went at a gallop. I was riding a pony that the chief had given me four years before. I have never seen another Indian pony and but few cavalry horses that could outrun him, and I had made a good buffalo pony out of him. The chief had one of his fast ponies but I left him behind now, and the other ponies were never in it after we had once started.

I got to within 600 yards of the buffalo before he saw me and started to run; but he might as well have stopped where he was. My pony placed me alongside of him in the next quarter of a mile, and a ball out of my Colt's pistol put in just behind his shoulder did the rest.

The pony ran on a few hundred yards, then pulling him up I rode back, and by that time the chief had reached the fallen buffalo and had dismounted there.

"I think this is your last buffalo and mine," the chief said. "If there are any more in this country I don't know it. There may be some up in the north; I have heard that there are."

"There are none up there now. The white men have killed them off," I told him, "this one is our last one, I think."

The buffalo was a young bull, three years old, we thought, and was in first-rate condition, he had all this country to graze in, he ought to be in pretty good order.

It was right up here where the Indians had got their last of the buffalo before they finally all disappeared. The last winter that any were got at all the Pawnees hunted them here and got a few. The other Indians who hunted south and east of this did not get any. Some of them came near starving. Our troop patrolled the country that winter to watch the Indians, and we had to give these Indians our horses' corn to keep them alive; the horses lived on grass. This old captain of mine had kept me going alone all over the country that winter hunting up Indians because I "knew the country," he said, "and would not get lost; and I seemed to be able to get along with these Indians somehow." It was then that I found the whole Pawnee tribe, over 1,000 of them, up where my camp now was on White Deer Creek, but this is another story and I have nearly forgotten the buffalo.

We got the hide off; then took nearly all of the meat. The chief meant to bring it in to the camp on the Wachita. He dismounted several of the boys to use their ponies to pack meat on, telling the boys to strike out on foot for camp.

They were about to start, and as the crow flies, make a straight line of it from where we were now to camp.

"Wait, my brothers," I told them, "you go back now to the river; then go across that smooth grass there to camp. It is a long way to it I know, but the way you were going is a longer one. You will find many sand hills that way; you won't want to climb them on foot. I know that country out there, I have been all over it; you have not. Don't go over it to-day."

They started off the way I had sent them, and were in camp away ahead of us and the ponies.

The next day was put in hunting deer. We did not expect to find any more buffalo, and found none. Our squaws were kept busy drying meat on small platforms which they built over stone fires. Had we had the time to spare to it all this meat would have been dried in the sun. The chief wanted to have the robe tanned, then send it up to me.

"No," I told him, "I won't be there then. I am going home to Washington now (every place outside of the Indian Territory was Washington with him). You tan

the robe and sell it to buy rations. This is the last one you may ever have to sell."

On the second day after killing the buffalo we started on the return march, and got into the chief's camp a day before my pass would be up. Then on the following morning I started for home and got into the post before night.

CABIA BLANCO.

## On Getting Found.

*Editor Forest and Stream:*

Apropos of Mr. Hardy's and Mr. Kephart's articles on getting lost, permit me to give evidence from an incident which I know of personally. Some time I intend to write an article on "the vanity of the outer," for being one of those devotees myself, I have been much interested in the psychology of other outers. That is my excuse for "butting in" and presuming to place myself on the same level as two such experts.

Now, the personal experience of this young man which I am about to relate, was contrary to the opinion of these gentlemen, largely modified by his remembrance of the directions given by our great leader, Nessmuk.

He left a camp at 8 o'clock in the morning of a gray day that threatened snow. He was warmly clad, with the felt boots and rubber shoes of a lumberman, and heavy reefer, but light gloves and hat. He had his Winchester and eight cartridges. He walked until about 12 o'clock, in a direction which he afterward found to be north, swinging around to the west, and entered a big cedar swamp. He ran across several signs of deer where they had knocked the moss from the top of fallen decayed logs and saw their tracks in the mud. It is probable that he lost his memory of direction in his interest in these tracks.

About 2 o'clock the thought came to him that he did not know in which direction the camp lay. Now, having only been twice before in woods of any great extent, he had little experience, and what knowledge of woodcraft he had he had obtained from reading articles in papers and magazines and from Nessmuk's book. He says that at once he thought of Nessmuk's description of getting lost in November and the details were fairly clear in his mind. He made his first mistake right here by not bending over trees in quite a large circle and tying a white handkerchief on one of them and then blazing his way in whatever direction he took for camp. The philosophy of this course is as follows. By blazing his way he could always come back to his starting point, and the handkerchief on the bush would at once engage his attention, even if he should walk in a circle and come back to the same spot on another side.

Now, I claim that this remembrance of Nessmuk's directions was of great advantage to him if they did not result in saving his life. One must remember that the day was gray, that he was in the midst of a cedar swamp, and that there were no streams or water courses in his vicinity and that he came across none until quite a time afterward. He says one sentence in Nessmuk's book was of great comfort to him, which he remembered something as follows: "That there was no need of getting excited and panicky and that getting lost ought to prove only another experience."

He traveled until it began to snow, which by his watch proved to be about 3:30. He then found a large windfall about a foot from the ground. He filled the space under the trunk of the tree with moss, leaves, etc., which, being very moist in the course of the night, froze into a solid mass. He then cut brush and made a lean-to from the top of the trunk to the ground, leaving him a space inside long enough and wide enough for him to recline. This he carpeted with brush, filling in the opening at the head with more duff. He built his fire against the upturned roots of the tree about two feet from the opening and near his feet. He had nothing to eat, but between rustling for wood and the covering of his lean-to by six or eight inches of moist snow during the night he was fairly warm and comfortable. He found plenty of water by stamping in the swamp. The water would then rise in his heel marks.

In the morning he was more uncomfortable from hunger than anything else. The snow was still falling. He started again and probably made about one mile an hour for the rest of the day. In the middle of the forenoon he shot a rabbit and says that he remembers that it was great satisfaction to him that he killed the rabbit with one shot, as he realized that he had seven cartridges left. At 1 o'clock he made a fire against a tree and cooked the hindquarters of the rabbit. It was a distinct disappointment, as he had no salt and he said it did not allay his hunger. At 3 o'clock in the afternoon the snow was still falling, but had not fallen enough so as to impede his progress much. He built another lean-to, but used a rock instead of a tree for one side of it. He cooked the remainder of the rabbit. He says he was not the least bit frightened, but he speculated considerably upon what his companions were doing in camp, and what a good story he would have to tell them when he returned. He ate the remainder of the rabbit and had a better night than the previous night. He was still very hungry and he derived the most comfort from drinking water of any-

thing he did. The next morning he started early under the belief that he must put in a longer day.

Some time in the morning, he is uncertain as to the time, he struck a brook that was six or eight feet across. He said he knew that if he followed down this brook he would get "somewhere." At 1 o'clock he came to a deserted lumber camp, where there were four or five cabins in various states of subsidence and decay. He picked out a small one, made a hole through the roof, and gathered wood. He did not feel as hungry as the day before, but felt very sleepy and a little weak. While gathering wood he saw two red squirrels and wasted three of his cartridges without killing either one, but he was not the least bit frightened, and, in fact, was rather enjoying his experience, especially since he found the brook and the cabins. In searching through the cabins he found a large lump of rock salt, very brown and dirty, in one of the buildings which had probably been a stable for oxen. This he brought into the cabin he intended to occupy and amused himself by crushing it up fine with a club to use if he succeeded in getting any more meat.

While he was quite warm during that night, he was still more uncomfortable than either of the previous nights, and said that he was nervous and that his feet twitched so that he did not get much sleep. Very early the next morning he started down the road and walked constantly until about 11 in the forenoon, when he saw another man coming up the road. During the storm there had been about eight inches of snow, but no more after the morning of the second day.

Now, the proof that he was not frightened and not insane and that his mind worked normally is shown by the story afterward told by this man he met. This man said that he saw my friend walking leisurely toward him. His clothing was not disarranged and there was nothing in his manner to indicate that he was lost, hungry, and in a desperate condition. The stranger saluted him with "Good morning, have you seen any traces?" My friend replied, "No." The other man said: "When did you come in?" My friend replied: "A while ago." He said: "Where did you come from?" My friend said, "Vanceboro." The stranger then remarked: "I think the camp must be in this direction," indicating a point at his right hand. The lost man said, "Yes," and without further talk they started in that direction. They walked about four miles, and during the last half-mile my friend was very weak, so much so that it was noticed by the stranger. Upon reaching the camp he was surrounded by all his companions, who shook his hand violently and addressed most of their questions to the stranger, asking him where did he find him? How did he find him? etc. Not until then did the stranger suspect that my young friend had been lost or that he was the very man he had been hunting for. For the members of the party had sent back to Vanceboro a guide and obtained other men to come from the town and hunt the woods.

In speaking of his experience afterward he always maintained that his recollection of the directions given by Nessmuk, the light way in which Nessmuk regarded being lost, and the definite instructions to build camps in case of being lost, saved him from becoming panic-stricken, and that his experience was rather pleasant than otherwise.

EDWARD FRENCH.

## The Gentleman in the Woods.

THE perfect gentleman is always welcome in society, wherever he goes. The homes of the cultured and refined and well to do, as well as of the humble and lowly, are constantly open to him, and there is ever a place for him at their firesides. From time out of mind it has been so, and always will. Say what you may, humanity is ever quick to recognize and appreciate courtesy, and gentleness and amiability, and such never goes without its reward. These qualities are always at a premium, and he who possesses them ranks with the nobility. The gentleman is always in demand. He is wanted, everywhere. He wins attention wherever he goes. The heart opens to him like the rose to the sun, and the open hand of friendship is continually outstretched to him.

Even when he turns his back upon society and plunges into the solitude of the woods, the result is precisely the same. Nature receives him with open arms, too, and all that she has is his. She loves to commune with him, conforming herself to his mood, no matter what it may be. She tells him all her secrets, many of them precious and long withheld, and seeks by many wiles to keep him in her company. He comes and goes in her domain as he pleases, and she is always at his beck and call.

But the case is much different with the rough and boisterous, the boor and the thoughtless. She flees at their first approach, and little indeed do they have in common. She will have nothing to do with such, and would have them well out of the way. If they are not wanted in society, neither are they here. If you would be heartily received into the inner circles of the woods, you must enter them precisely as you would a drawing room; as a perfect gentleman.

Have you never stood upon some high hill and

listened and watched while some chance party of visitors to the woods made their way through them? Often they can be heard for miles, their shouts and gruff voices ringing through the woods, and echoing far and near. You will see the birds leaving and flying away in flocks in alarm before them. Now and then an unusually saucy specimen, like a crow or jay, will stop to scold at them a bit, but takes good care, nevertheless, to be well out of the way before they are within half a mile or so. Frightened animals can be heard scurrying away to safety through the woods, from their intended path, long before their arrival; and should you fall in and follow in their course, you would find the vicinity devastated of life of every kind, as though swept by fire, or invaded by a terrible ogre, for such the noisy man seems invariably to be, to the wood dwellers. They cannot conceive of him as anything else.

But if you go into the woods as a perfect gentleman, then the case becomes quite different, and all the wood folk are anxious to meet you and make your acquaintance. They cannot see enough of you, and are ready to devote unlimited time to your company. Go quietly into the woods, sometime, and sit down under the nut trees, and soon the squirrels will gather around, and begin to hail you and exchange greetings with you. If they find you sufficiently gentlemanly, they will actually come down out of the trees and shake hands with you, not exactly after the formal, pump-handle fashion of society, but more literally shake hands at you, as well as heads and tails, to attract your attention, and make their way into your good graces. Always provided that they find you a perfect gentleman, but not otherwise.

One motion of hand or head, or intimation of any kind that you are not perfectly trustworthy, and they are away in an instant, and will not have anything more to do with you, under any circumstances. They have then made up their mind about you, and it is not easily to be changed.

Once while I was walking in the woods with a celebrated naturalist, we fell in with a sportsman out after birds. We could hear him coming some distance away, shouting at his dogs, and whistling and scolding. "Had any luck?" my friend asked, as he came up. "No!" was the indignant reply, "I never saw such a place, anyway! There aren't any birds around here! Might as well look for 'em on top of a flagstaff as here!" and on he went, muttering and cursing over his ill luck.

"Just for the fun of it, let's see whether there are any birds here or not!" continued my companion, after the gunner was out of sight and hearing, and turning into the bush, we sat down for a time on a fallen log, and waited and listened. It was not long before we could hear the well-known drumming of a grouse, doubtless a young bird, trying his hand at this fascinating occupation with him.

Have you never sat down for a brief rest in the woods, and upon rising been startled by the roaring wings of a flushing grouse? And have you not thought it a bit strange that you should have happened to sit down so near to one of these birds, and that, too, without having frightened him away? Ah, but you had but little inkling into the true meaning of the affair! He was not there at all, when you sat down, but having heard or seen you, he crept up to have a look at you, mayhap in the hope of making your acquaintance, if you appeared to be of the right sort, and in the closeness of his proximity to you, you may read his candid opinion of you, see yourself reflected in the eye of a grouse, as you would in a glass!

Birds of all kinds love the company of the gentleman after their own heart. Instances of this fact are to be seen daily. I once visited a hermit living in a lonely cabin on the side of a mountain. After showing me about the place, he stepped inside for a moment and brought out a dish of corn meal porridge. Then he began calling at the top of his voice, "Charley!" "John!" "Jerry!"

Almost immediately the air seemed to be filled with crows. Black forms came flitting down from the tree-tops, far and near, lighting on the arms and shoulders of my host, and standing by twos and threes on his head. It was dinner time for them, and they ate the contents of the dish with a relish.

After they had finished, the hermit invited me to come in and sit down awhile, which we accordingly did. But it was only with the greatest difficulty that we could keep the crows from entering also. Gladly would they have been counted as guests also on that occasion, if opportunity had offered. "Sometimes on rainy days I let them come in to keep out of the wet," was the explanation offered of their eagerness to follow, but a second might be found also in the fact that birds, as well as men, love good company.

Thoreau, the eccentric hermit of Walden Pond, relates that while floating in his boat on the pond, if he only went about it in gentle enough fashion, the fishes would allow him to place his hand cautiously under them, and lift them out of the water.

It is a familiar legend, how Saint Francis of Assisi is

said to have gone to the woods on one occasion to preach to the birds; and came away uplifted in soul and elated in spirit, not through the success of his mission, which had proved a failure, but because instead the birds had preached to him! What an opportunity it was for all the songsters of the woods! Not often did they have the chance of falling in with such a real gentleman as he! No wonder that they sang to him their sweetest and best, and that his soul was raised to loftiest heights! Well may we imagine that not a moment of his stay was lost! He came with the best intentions, and deserved none but the best. He was repaid an hundred fold in his own sterling coin.

Similarly, anyone who goes to the woods with all the qualifications of the perfect gentleman, will be received by nature with outstretched hand, and will depart with the happiest of recollections ringing in his heart.

R. B. BUCKHAM.

## The Biography of a Bear.—XII.

AFTER hanging up the deer that I had carried until I figured that it ought to be worth a dollar a pound, I proceeded to investigate the apparent ruin of the tent and the general chaos surrounding it. I found that the upright poles had been thrown over sidewise and the pegs, to which the side ropes were made fast, had been pulled out of the ground. The whole tent had been dragged along the ground from one corner, leaving it fast to one or two stakes only. All of our blankets had been dragged about and distributed generally and indiscriminately over about four acres of ground. Our pillows, coats, in fact, everything that was in the tent when we left it in the morning was strewn about as though each separate article had received special attention, and had then been deposited off by itself. Our improvised wash stand, our water pail, our combs and brushes and our mirror were all upon the ground and more or less covered with grass from the tent.

I next went with a great deal of solicitude to examine the hut in which our provisions were stored. I found the door ajar, for its fastenings, consisting of a strap hooked over a nail, offered little resistance to anything or any person bent upon raiding it. I was greatly relieved to find that nothing within the hut had been disturbed. Even our tin plates and the remnants from our breakfast, that we had not taken time to clear away in the morning, were undisturbed. I returned to the wreckage about the tent, and upon investigation I could not see that anything had been damaged but the mirror—a small affair—and it was cracked as though it had been trodden upon. As I was very tired I thought the easiest thing to do would be to lie down in some tall grass nearby, and while watching for the possible return of the raider try and conjecture what manner of man or beast it might have been. Before I did so I noticed that the few books, and a few numbers of the FOREST AND STREAM that we had in the tent, were now not only scattered but they were mostly torn and separated leaf from leaf. Upon one of the pages of FOREST AND STREAM—which very page contained an account of a bear hunt—I found the muddy footprint of a bear.

This footprint rather confirmed my suspicion that Jack had been doing the mischief, but the footprint was not complete, and what there was of it seemed larger than that of one of Jack's feet. Furthermore, as evidence in his favor, he had never been known to do anything of this kind. It is true, he sometimes carried about one of our boots, but he had never taken them far nor damaged them. He had once chewed up a straw hat for me, but it was one that I had endeavored to teach him to wear. From time to time I had tried it upon his head, and I believe he destroyed the hat because it was not a good one, and was out of date and style. He had never been destructive.

A little before dusk Enochs came in and Dick followed shortly after. I had left things as I found them, and they were as much puzzled as I until they saw the track upon the paper. Enochs insisted that it was Jack's track, but Dick agreed with me in the opinion that it was too large to be one of Jack's footprints. None of us was sure of his opinion, and we never did fully satisfy ourselves about the matter, but I later formed the theory that Jack had been visited by one of his own tribe and that his visitor, or both of them together, had decided to upset things. None of us had seen Jack since daybreak. Enochs and Dick had tramped many miles, each of them upon a different mountain. Both had seen deer, but Dick had failed to get a shot, while Enochs protested that he was too far from camp to bother with them—he was out after bear, he claimed. We made the usual allowances.

We set up the tent and restored its contents, glad to find that this was not as great a task as it seemed at first glance. We had our supper, made our evening camp-fire, and recounted the day's doings while we smoked. Although we called and whistled for him at intervals, Jack did not show up. As this was the first time we had all left camp at one time we now conjectured that Jack had followed upon the track of one or the other of us. If so, he would be in for a long tramp, and as he always had so

many things to look into when he was out, and as he was so deliberate in his travels, we thought he would be late getting back. When morning came and he did not get in to breakfast Enochs asserted confidently that Jack had gone home to his folks, that he had either gone back to the bosom of his family, or that he had been gathered in even closer than that by some of the old folks in that vicinity. We had intended to break camp that morning, but by popular vote we decided to put off moving until the next day. We would give Jack twenty-four hours grace. The day passed, and, as we sat down to supper in the evening, we had about given over ever seeing him again.

While I greatly regretted losing him in one way, I was not so sorry in another. I believed he could take care of himself in the woods unless he was discovered by some hunter, but if he came across a man or a house, he would show no fear and would doubtless be shot on sight. On the other hand, if I took him back with me to town I had my fears for his future. I was occupied with these thoughts when we sat down to our little table in the hut, with the lantern hung above it to illuminate our spread of venison steaks, potatoes, hot biscuits and sundries. We were all very hungry, and on the point of attack, when the dogs gave a short alarm, the door was pushed in with a slam, and here was our bear. As he entered and saw us he favored us with the loudest bawl I ever heard him make, his eyes shone with green fire, and he arose on his hind feet as he made a rush for the table. I filled a plate with whatever was nearest, and some of it was hot. I had to push him from the table with my feet until I got him to see the plate full upon the floor.

Wherever Jack had spent the thirty-six hours—the two full days and night of his wanderings he had apparently had nothing of material consequence to eat. He was now ravenous to the superlative degree. He ignored all other matters, while he concentrated his soul upon whatever he could get upon his plate or within his reach. My prompt catering was all that saved him from charging upon the table. I had never known him to exhibit so much ferocity. He would have fought anyone or anything that stood between him and food. He had grown so gaunt that he seemed about as long again as he should be in his normal condition. He snapped at and bolted his food, such of it as was very hot he slapped angrily to one side. When he looked up, to see if more was forthcoming, his eyes flashed green in the lantern light.

After a little, however, he began to eat more deliberately, his voracity moderated, and in a few moments he was comparatively satisfied and we put him out while we finished our own supper, minus the portion contributed to Jack. All things considered, it had not taken a prodigious quantity to satisfy him, but what he required he demanded in a hurry. When we got to the tent for the evening we found Jack there with the dogs in a very peaceful and playful mood, although he was too tired to hold out very long at a romp. He soon lay asleep by the fire, although we noticed that he would, at times, jerk his feet and start, while he would breathe quicker and snort, as dogs will when they dream. He had evidently had his troubles in his long ramble in the mountains. It would have been worth something to hear about his adventures if he could have told about them.

In the evening we talked about bears, the subject having come up when I reminded Enochs that possibly the big one he was after had lost his patience and had been to camp the day before looking for him, his blankets having been shaken out and more widely distributed than other things from the tent. He replied by saying he thought his bear record would tally up with mine.

"Not quite," I replied. "I have a record; yours is to get."

"Have you killed a bear?" he inquired.

"Killed a bear! I killed my first bear twelve years ago, when I was fourteen, and the bear was about the same age, or a few years older."

"When did you kill your last one?"

"Same time. Same bear."

"Well, then, if it isn't another echo story. Let it go, if it isn't too long-winded. If you get to guessing at things, though, I'll go to bed."

"I've heard of that bear; story's all right," said Dick.

Since I had told Enochs about the echoes in the Santa Cruz Mountains Enochs demanded vouchers for most of my statements. He had very little discrimination, and this fault of his made him suspicious. I had to assure him that this story was absolutely pure.

"If necessary, this story can be proved by the annals of a Methodist church. The entire congregation at a Methodist revival camp then at Bell's ranch on Clear Creek, Shasta county, State of California, SS.—Bell, J. J. Bell was proprietor, and personally conducted a roadside hotel, a toll-bridge, a stage station and a large ranch of 2,700 acres. I helped Bell run these things for two years. We had half a dozen men, but he and I had most of the trouble and responsibility. I had most of the trouble and he made most of the fuss.

"Bell had so much live stock on the ranch that it took all the money he made with his hotel and toll-bridge to feed the stock, and he made about \$50 a day. He had horses—several hundred of them—mules, cattle, goats,

sheep, hogs, a pack of variegated dogs, and every kind of domestic fowl known. None of these things paid for their food; he only kept them because he couldn't sell them, lose them, nor kill them off as fast as they increased. Whenever any of his stock matured and reached market value, some one else drove it off, it died, or something happened to prevent his getting any profit from it.

"The men on the place had to get up in the night to feed and care for the animals, and at daybreak that ranch roared like the crowd at a college football massacre—only it lasted all the time. As soon as Bell got out after breakfast trouble of all kinds thickened. Horses kicked the hostlers through the side of the barn, cows kicked the milk pails over the fence, the calves got out, the hogs got into the garden, the dogs got after the sheep, the goats butted in everywhere, while Bell yelled about everything like a steam calliope. Nothing on the ranch would either stand up, lie down or stay put. When the live stock quieted down a little sometimes, Bell was sure to get into a riot with travelers who objected to paying toll.

It was so busy at this ranch that I only saved my life by sneaking off at every opportunity with an old target rifle and going hunting. This rifle weighed about thirty pounds, owing to the weight of the barrel, which was very long, two inches in diameter, and was only bored for a round ball the size of a buckshot. When I fired it I had to sit down and rest it upon my knee or find a log or stump. It would shoot to the dot wherever it was held; the hard part of it was to carry it, or hold it.

"After carrying that gun perhaps a thousand miles I had killed two or three deer. Deer were not very scarce at that time, and I saw plenty of them in my trips, but by the time I could find a place to rest the gun, or sit down and get the muzzle of it sufficiently elevated, the deer would suspect something and trot away into the woods. The deer I managed to kill I got by lying in wait for them at a salt-lick. About four miles from the ranch was a spring known as the Spanish Spring. It was the only water, late in summer, for a large area of dry hills which were densely covered with oak, chaparral and manzanita thickets. It was in the valley foothills and a few deer watered there.

"One morning I got up about two hours before daybreak and set off for the spring, which I reached by the time it was light enough to see to shoot. On the way I had come upon two or three deer, but it was too dark to see to shoot them, or shoot at them. Finding a thicket of low bushes on the hillside about fifty yards from the spring I hid myself and patiently watched and waited.

"The sun came up, it began to get hot, and nothing had come to the water but some quail and a lot of half-wild hogs. I grew drowsy and tired of watching while sitting quietly in one position, and I lay back and before I realized it was fast asleep. I slept perhaps an hour when I was roused by the flying and chattering of the quail, and as I looked toward the spring I saw the hogs scooting down the gulch from the water.

"On the opposite hill a deer trail came down to the spring from the dense chaparral, and now, as I glanced in that direction, I saw a sight that caused me to rub my eyes and stare stupidly. I felt chilly there on the hot hillside as I saw a bear, and a very large one, coming leisurely down the trail. No mistake; it was a bear sure enough; and the way he slouched along with ponderous indifference, swinging his great head from side to side, made me feel very bashful and reticent. There was not supposed to be a bear within fifty miles of this place—none had been heard of for twenty years or more.

"My first impulse was to go away from there with the least flourish possible. Then I reflected that I had the 'wind' of him, had a rest for my ponderous rifle, and that now or never was my opportunity to kill a bear. I hesitated, and then I decided that I would not sneak for it. As I got into position to shoot I had a vague notion that if he came for me I would leave there without ceremony and go up the first tree that I could reach without any foolishness.

"As he approached the spring I saw that beyond question he was a genuine bear, larger than I wanted, very tough and mighty serious in the expression of his countenance. He glanced to neither side nor in my direction but lumbered down the hill steadily until he reached the gully, and then he commenced to lap the water. Slowly and cautiously I raised the heavy rifle up, up a little more until I had the bead in line with his ear, then I let it settle a trifle and touched the trigger. The rifle cracked but little louder than a firecracker, but it was a spiteful little report. The great creature sank into the gully and was hidden by a clump of willows that shook a little; there was not a sound nor a sign of a disturbance. What was he doing?

"Fearing my shot had been a miss I now began to get excited as I reloaded. It was not a case of throwing in a fresh cartridge—the work of an instant with a modern arm—but I had to draw the plug from my powder horn, pour the powder in a buckhorn charger, empty this in the small bore of the gun, reach in my pouch for a ball and a patch, fit these in the muzzle, draw out the ramrod and drive the bullet down. The bullet often stuck in the muzzle when the patch was a trifle thick or dry, and in this instance I had to use the 'starter'—a short stick the

size of the bore with which to get the bullet well started into the barrel. The bullet rammed home, until the ramrod would rebound from the bore. I next had to get a percussion cap from a metal box—Eley's waterproof caps—fit this to the nipple by pressing it in place with the hammer, and then set the trigger and pull back the hammer, and I was ready to fire. Sixteen shots can easily be fired from a Winchester rifle while a muzzle-loader can be made ready for a single shot.

"Meantime I had kept an eye in the direction of the spring, whence neither sound nor sign had come. I was now so intensely interested as to be almost excited"—

"Well, there wasn't very much at stake," put in Enochs, "if the bear had got you it wasn't so very much; and I see he didn't even do that."

"No," I had to admit, "it wasn't so much, but it was a personal matter with me. Probably it *wasn't* so much, but what there *was* I had other use for. Of course there wasn't so much of me *then* as there is of you *now*, but as to what there *was*—"

"O, go on with the story."

"Well, it was the uncertainty of the situation that interested me mostly. You see, I didn't know whether that bear was waiting to charge as soon as he located his enemy, whether my shot had dazed him, made him temporarily irritable, or only a little crazy, maybe. My heart pounded against my ribs until—"

"Until you heard it echo from the hills, I reckon. But go on."

"That heavy rifle shook in my grasp as each step took me down to the clump of willows that screened the gully where the bear was. Each step took me into a more difficult position from which to retreat in case I had wanted to get out of there rapidly."

"Well, why didn't you go back before you had a fit?" said Enochs.

"I did, if that's a matter of consequence. I've a notion to let you tell the rest of the story. *You* know all about bears, *you* do."

"O, go on with it. When you get through I want your witnesses or the hide."

"Well, I'll refer you to some of the people who ate some of that bear. There was R. M. Saeltzer, now of Redding; Judge Bush, Bill Hopping, Mrs. Patterson—"

"Tell the story. Tell the rest of it. Don't, don't bring in any more things to talk about. Get to the bear."

"I'm going to. It'll be a long time before you get to one. Step by step I got down into the willows until I could peer into the gully, a few feet below where the bear went down. The spring seemed to be running blood instead of water. The bottom of the gully was red with it, while a few feet from me lay a brown mass that I saw was the bear, motionless and still.

"As I approached him I could see the blood yet spurting from the little puncture made by the ball beneath his ear. It had evidently cut the jugular, while the twisted and upturned nose and head implied that his neck was broken. I sat down upon the bank trembling and completely unnerved. At that time I could not have raised a hand to save my life."

"Thought you'd have a fit," said Enochs.

"Well, you would have had a dozen. You'd have had some of 'em before you fired a shot—"

He jests at scars who never had a wound—  
You jest at bears you never yet have found!

"Wait until you bring in a bear skin. If it's as large as that of a rabbit I'll have to revise my present opinion. Dick, there, knows you couldn't kill a bear with a Gatling gun."

"Did you eat him raw?"

"After a few moments I realized that the bear was stone dead, and I got out my sheath knife with the intention of cutting his throat so he would bleed properly. My knife had a thin blade—doubtless made from the same quality of hoop iron that many cutlers yet use in their wares. I got down into the gully and tried to cut the skin on that bear's neck, and I might as well have tried to cut sole leather with a butter paddle. In desperation I found a stone and drove the knife point into the bullet hole sufficiently to let the blood out more freely.

"I next examined my bear as well as I could. He was lying in mud and water, had shed much of his hair—which left him bare and shiny in places—while the hair that remained upon him was a rusty brown. He was not pretty. I tried to turn him over to get him out of the mud, but as he weighed about 500 pounds, and was limp and flabby, and as I only weighed about eighty, I had to abandon the enterprise after one or two efforts.

"A man by the name of Wade, old Jim Wade, lived in a cabin about two miles from this spring, and I decided to go to him for help. Leaving my heavy gun with the bear I set off through the woods and was fortunate enough to find Jim at home. Jim Wade might have been as illustrious as George Washington if he had had the right opportunities, but in a different way. If Jim had cut the cherry tree, history would now glow with some of the most elaborate statements conceivable. He was in his time one of the most noted and distinguished liars in northern California, and heaven knows, he had plenty of opposition. That he had not a national or universal

reputation can only be accounted for upon the theory that local zealots suppressed the returns. He was a Democrat, pent within a Republican district, or he might have entered Congress. He was illiterate enough but lacked political diplomacy. As a liar——

"Did he invent that echo story of yours?" demanded Enochs. The echo story seemed to have infected Enochs with incredulity. He was one of those tenderfeet who cannot appreciate Western possibilities.

"Oh, no, he never heard of that. I will give you a story or two of his, one of these times, so that you will be able to distinguish truth by comparison; somehow you seem unfamiliar with it. As I was saying, I found Jim Wade in his cabin in the hills, and I told him as calmly as I could about having killed the bear."

"Thar hain't been a b'ar in these hills sence I kill'd ole Ephe in Willer Gulch nine years ago," said Jim.

"Well," I replied, "I've killed a sure enough bear. See the blood on my knife? Look at it on my shoes."

"I reckon you've kill'd something. I'll go with you. But thar hain't no b'ar in these hills."

Jim got his rifle, knife and a hatchet and we started for the spring. On the way he questioned me closely.

"Ar you shore you hain't kill'd one o' my hogs?" said Jim. "I've got a ole sandy shotc thet's nigh big enough for a b'ar."

"No," I protested. "I know a shote from a bear."

"If you've killed ole Sandy you'll have to help me pack 300 pounds o' hog meat down to the road," he insisted,

"thar hain't no b'ar, an' you've sartinly kill'd something, I reckon."

When we reached the spring we found the bear had waited for us without a protest. Jim was speechless with astonishment for five minutes, while he examined the bear from all points of view. He then began to murmur:

"He's shore the same ole' he one; his teeth is wore down; he must be twenty year ole. He's full o' some-thin' an' I'll jes' bet he's been after my hogs. I miss'd pigs last week, an' I found this feller's track an' I been a huntin' him evr since. I follered him up Willer Gulch for four mile las' Sunday; he cross'd by the sheep ranch and went down, an' I knöde he was gwine fer the big chaparral thicket. I've tracked him 'bout a hundred mile. I'd a shore got him to-morrer. I saw him yisterday evening about dark, an' I was comin' hyar to lay fer him."

"With this much to start with Jim went into a long and bewildering account of the adventures he had (never) gone through with this particular bear. He reckon'd it was the last b'ar in the Sacramento foothills, and he finally acquired sufficient momentum to allege that he had been after this bear for seven years, averring that we'd surely find him full of lead and splinters of bone.

"It was late in the afternoon when we had the bear dressed and hung up. The hanging we had only accomplished by quartering him, and then swinging the quarters upon a pole, with leverage in the fork of a tree. He was not fat or he would have weighed 600 pounds or more. Beyond question he had been after hogs, for in

his post-mortem explorations Jim found great balls of hair and hoofs of pigs."

"Look thar!" he exclaimed. "An' look thar! Thet's ole Nancy's litter o' pigs shore; he must a' got the whole lot of 'em!"

"I don't see any lead in him, Jim."

"No, well thar's a lot of it in the meat somewhar. I've been a shootin' bullets into this b'ar for nine or ten year. Never got jes' the right bead on him. I'll bet——"

"But he went on and on, growing more and more fluent and utterly reckless in his statements, until in the end he claimed to have killed the animal the day before and was unlucky enough to lose track of it. When he began to express gratitude to me, for finding it for him, I was mad, fighting mad, but I set out for Bell's, intent on getting a wagon there. I intended to carry the bear's skin with me, but when it was removed I found that it was all that I could lift, and the old target rifle was all that I could manage to carry the four miles, after that tiresome and exciting day. And so we hung the skin up with the meat."

"That was a long yarn," yawned Enochs.

"That's not all of it. Most of the danger and excitement came later. I came nearer being killed after that bear was hauled in than ever before. Bell——"

"Let that go. I'm—I'm——" asleep he might have said, for the unmistakable snores of Enochs, Dick and Jack pervaded the tent. To these and all other matters I, too, was soon oblivious.

RANSACKER.

## NATURAL HISTORY

### Do Animals Fear Death?

A FEW days ago, having nothing to do except think about my sins, and not finding this a pleasant subject for prolonged contemplation, I took occasion to recall some reminiscences which, under the above heading, may be worth noting. That wild animals fear and avoid capture and fight restraint is undoubtedly true, whether or not they fear death is another question. But I am not going to theorize, only to state three or four facts which those who indulge in theorizing on subjects they know little or nothing about, may add to their stock of knowledge.

1. When shooting from a blind out on the open water down on the Atlantic coast, I have frequently noticed that with some varieties of wildfowl (notably *Branta bernicla*) when one of a flock on the wing is shot and killed, the rest of the flock will return, apparently to recover its lost mate, and if the shooter remains so completely hidden as not to be seen he may shoot the entire flock, one or two at a time, as the survivors continue to return. But if the shooter is seen they will seldom return. Evidently in such cases the only fear which governs them is the fear of man, and not of his gun. Nor does it seem reasonable to suppose that they have any idea of death as a result of the shooting, even though one or more dead members of the flock lie motionless on the water. The sight of the shooter will keep them away, but the sound of the gun which drops one bird will not. Hence, in that particular class of cases it would look much as if man and not death was the occasion of the fear.

2. Once when out in a sailboat, going to my blind, with gun unloaded, a small duck (*Charitonetta albeola*) flew past unusually near, and near enough for its every movement to be distinctly seen. Just as it was passing an eagle, which I had not previously noticed, swooped down and grasped the duck fairly between the claws of both feet. After being thus caught the duck made no resistance or effort to escape, but crouched or drew itself together much as if paralyzed, and so continued as long as it remained in sight—which, however, was not long. Doubtless this crouching was an indication of probable fear, or even terror; but whether of anticipated death or not I do not know. Of course I can guess, as everybody c'se can, but I do not see that guesses under such conditions amount to much.

It is also well known that there are many wild animals, some of ferocious instincts and habits, which, when thoroughly cowed or overcome, make no further resistance to any treatment. Grasping a live wolf by its lower jaw well back of its front teeth, as recently narrated by President Roosevelt, and then, but while still so holding it, handling it as freely and harmlessly as one would a kitten, is a case in point. If, under such conditions, the wolf had any fear or apprehension, or even conception of death, it is very singular that it made no effort whatever to avoid it.

On the other hand, there are many wild animals that, even after being overpowered, will fight savagely as long as strength remains to use tooth or claw, but what particular motive or feeling so prompts is another matter for guess-work.

3. There is another phase of animal life which, though it doubtless is well known to stock raisers, I have never seen described in print.

In early life (and a long time ago) as the son of a country farmer, I had much to do with domestic animals. Nearly every spring some one calf was selected for slaughter, and allowed to run with its mother until properly fattened and sufficiently matured for table supply. Ordinarily the mother cow, on suddenly losing her offspring, would low almost incessantly for an hour or more at a time, and keep it up day after day sometimes for a week or more, apparently calling for her calf. At times her lowing would become almost pitiful. My father was

rather more than ordinarily humane, and he discovered that if, after killing the calf, he took off the skin carefully, say on a clean barn floor, or on a bed of straw, avoided "mussing up" its hair, and kept it free from taint of blood, and then hung it, stretched out, on a low gate or fence, hair side outside, and allowed the mother cow to smell of it and stay with it for a half hour or so, that the usual lowing was rarely heard, or at most, lasted only for the residue of that day.

Now (unless it were well authenticated) I would not believe this story myself if I had not witnessed such an occurrence time after time. I do not know any reasonable or probable theory of animal psychology which can account for or explain it. Evidently in each such case the mother cow perceived that her calf—which she could of course identify by the natural odor of its hide—that something had happened to it, that it was not a calf any longer. The old and familiar calf odor was there; the hide was there; but the calf wasn't. How it was that such perception so acquired could end or terminate the natural and usual expression of her motherly instincts is something I cannot explain. But did this experience convey to the cow an idea or conception of what we call death; and that this death was something to which she and all other cows, and their calves as well, were subject; and that it was a calamity to be fought off, shunned and avoided at all hazards? Possibly so, but the observed facts, whatever else they may indicate, do not prove quite that much.

4. Another fact bearing on the animal consciousness of serious danger may be worth reporting.

At the end of the Civil War of 1861-5 the corps to which I belonged was sent to the Mexican frontier, supposedly as a notice to Napoleon III. to withdraw from Mexico the French army which he had sent there to support the pretensions of the ill-fated Maximilian. Our regiment was landed on a barren sand beach a few miles east of the mouth of the Rio Grande. Several regiments were already encamped there and their requirements exhausted the fresh water supply. We could get no water for man or horse. Our horses, sent in another boat, had been landed the previous day. To relieve our distress, we were ordered to march that night to the Rio Grande, where, of course, fresh water was abundant. We arrived at the river about 11 P. M. of a clear, starlit night in June; no moon, but it was light enough for us to distinguish water from land, but that was all. To the eye as I sat on my horse, the water of the river was breaking in ripples on what seemed to be a shelving beach. As my horse had had no water for fully twenty-four hours, I decided, without even waiting to dismount, to let him drink at once. He put his head down, smelt of the shore, and stepped back. I drew up his head, gave him a dig with the spur, and the performance was repeated. I was too tired to quarrel with him, so, mentally cursing him for a dashed fool, I dismounted and turned him over to the care of an orderly. When daylight came I found that the river was on a freshet and was running bank full, with, just at that place, an abrupt shore of loose alluvial sand, and that the water, nearly flush with the surface like the soil, and probably twenty feet deep, was running like the tail race of a mill. If the horse had taken another step forward, as I urged him to do, neither his life nor mine would have been worth the value of a one cent canceled postage stamp of the most common vintage. As it was, one or two of our men fell in as the treacherous bank crumbled beneath them when lying down to drink, and were never seen again.

Now, that horse, half-famished though he was with thirst, perceived in some way that that place was dangerous for him. Now, was he a timid horse? He had become well injured to pretty much all the dangers incident to active war. Artillery and musketry fring and steam whistles he cared nothing for. He would walk without hesitation up the narrow and steep gang-plank of a transport even while steam was noisily blowing off close

beside him. He would pick his way over the broken corduroys in front of Richmond, and flounder through the mud of the James River flats, just as if he enjoyed it. On no other occasion, either before or afterward, in daylight or darkness, did he hesitate to go anywhere I wished. But on that occasion he evidently perceived danger. And what was the danger as it existed in his perception? Did he perceive a danger of death, or was it only of some danger recognizable by his horse sense as a thing to be avoided—somewhat as the brant (*Branta bernicla*) avoids flying over land; or as some of us elderly men with a touch of gout avoid icy pavements? I don't know. Anybody that does can have the floor.

SHAGANOSS.

### The American Bison Society.

THE movement for the preservation of the last few hundred buffalo, which was started nearly two years ago, and which has been growing steadily ever since, will hereafter be conducted by the American Bison Society, a national organization, of which President Roosevelt is the chief officer and leading spirit.

This Society was organized last week at the New York Zoological Park, at a meeting attended by many prominent naturalists and sportsmen, chiefly of New York and Boston.

The meeting was called to order at 10:30 A. M., and Mr. William T. Hornaday was made chairman pro tem. A nominating committee was appointed, and this committee shortly presented the following list of officers: Honorary President, Hon. Theodore Roosevelt, President of the United States; President, William T. Hornaday, Director of the New York Zoological Park; Vice-Presidents, Dr. Charles S. Minot, Harvard University, and A. A. Anderson, president of the Camp-Fire Club of America; Secretary, Ernest Harold Baynes, Meriden, N. H.; Treasurer, Edmund Seymour, banker, 45 Wall street, New York; Advisory Board—Prof. Franklin W. Hooper, director of the Brooklyn Institute of Arts and Sciences; Madison Grant, of New York; Prof. David Starr Jordan, Leland Stanford University, Cal.; Prof. Morton J. Elrod, University of Montana; Prof. L. L. Dyche, University of Kansas; Prof. John J. Gerould, Dartmouth College; William Lyman Underwood, Massachusetts Institute of Technology, and Ernest Thompson-Seton, Coscob, Conn. The secretary pro tem. was instructed to cast one ballot. All the officers elected had previously expressed their willingness to serve.

Then followed a discussion on the advisability of seeking the co-operation of the Canadian Government, which not only possesses a large and thriving herd of buffalos in the National Park at Banff, but has under its protection the only wild herd of any importance now in existence.

It was the opinion of all present that the Canadians would be deeply interested in the movement, and a motion by Professor Hooper that the Governor-General and Premier of Canada, respectively, be asked to accept honorary offices in the newly-formed Society, was carried unanimously.

On being requested by the Society to appoint an Executive Committee of seven, the President named Madison Grant, secretary of the Boone and Crockett Club; Frederick H. Kennard, Boston Society of Natural History; William Lyman Underwood, Massachusetts Institute of Technology, and Ernest Harold Baynes. Three other members are still to be appointed. At the suggestion of G. O. Shields the Executive Committee was instructed to draft a permanent form of organization.

It was decided that there should be three forms of membership, for one of which the annual dues should be \$1, for another \$5, the third form to be obtained on the payment of \$100 or more at one time. The names of the several forms of membership were left to the Executive Committee. This committee was also instructed to ap-

point delegates to confer with President Roosevelt.

The American Bison Society desires to begin at once a vigorous campaign in the interest of the noble animal which even now is on the verge of extinction, and which must surely pass unless the American people will raise their hands to save him. The Society was organized in the strong belief that the people desired to have the buffalo preserved, and that they would give their support to a body of men able and willing to work indefatigably for its preservation.

The 5,000,000 or 6,000,000 buffalo which less than thirty-five years ago caused the Western plains to tremble beneath their hoofs, and which constituted one of the wonders of the world, have vanished, and there remain to represent them some 600 or 700 head, exclusive of those in the zoological gardens, which do not count when we come to the question of the preservation of the species. Most of these are in a few widely scattered bunches, only two of which, the Corbin herd at Newport, N. H., and the Pablo herd on the Flathead Indian Reservation, Mont., contain over 100 head. Of this little remnant of the once mighty hosts not a single animal is safe; every owner in the country is willing and some very anxious to sell, and I doubt if there is a herd in the country which would not be sold to-morrow morning if a customer appeared with the money. In the large herds there is another menace to the race—contagious disease, to several forms of which the buffalo is subject, though less so than domestic cattle. If tuberculosis or the hoof-and-mouth disease should attack one of the three or four comparatively large bunches, the fate of the buffalo might be sealed then and there, as even now the number of herds is so small that it will probably require careful management to prevent excessive inbreeding.

The American Bison Society believes that these dangers can be avoided in just one way, and that is by Governmental ownership of all available pure-blooded buffaloes. The Government alone can resist the temptation to sell the heads and hides of these wonderful creatures; the Government alone can keep them with the least possible risk of loss by disease, and with the greatest opportunity to increase to the point where there will be no longer any immediate danger of their extinction. It was through the shortsightedness and indifference of the United States Government thirty odd years ago that the American people lost the grandest and most valuable animal native to their soil, and it surely is the right of the people to demand such reparation, late and insufficient though it may be, as may be had through the preservation by the Government of the last remnant of what but lately was the most numerous large mammal of recent times.

Personally, I believe that the strong sentiment in favor of our greatest American animal is sufficient to save him, if those who feel it will only speak. I believe there are tens of thousands of people who can appreciate the buffalo as a great character in American history, in whose living presence only can we really understand the Indian and the life he led in the early days; I believe that these same people and many more, will admit the debt we owe the buffalo for the great part he played in "the winning of the West." Of Americans born there must be many, many thousands whose relatives or friends would have suffered hunger, if not starvation, but for the presence of the vast herds of buffalo beyond the Mississippi, and no doubt there are many who from personal experience can testify to the great value of the animal to those obliged to traverse the wilderness in times gone by. I do not believe that these people will allow the bison to pass without making an effort in his behalf.

But there are good economic reasons why this animal should be saved and allowed to increase in numbers. Shorn of all sentiment, and as he stands on his hoofs he is the most valuable native animal in the country; kill him, and there is no domestic animal in America whose carcass will bring as much in dollars and cents. The meat is as good as domestic beef, and some parts of it rather better, while the hide alone will sell for money enough to purchase three or four good cows. A fine head is worth much more, and although the value of heads would probably decrease as buffaloes became more numerous, there would always be a good market for the skins, as for many purposes we have nothing quite so good. I know a man who is wearing a buffalo ulster which has been in use for twenty winters, and it is not by any means worn out. As a winter carriage robe it is generally conceded that a buffalo skin has never had an equal, and for this use alone the article would probably command a high price indefinitely. Then the buffalo has wool almost as thick as that of the sheep. Naturally, there is much more of it, and while it is coarser than sheep's wool, it can be woven into very warm and useful garments. There was a factory devoted to this industry in operation in Winnipeg, and I am informed that the enterprise was very successful until the extermination of the buffalo put an end to the supply of raw material. It would be a fairly simple matter to shear the animals in the spring as sheep are sheared, but this might not be necessary, as the buffalo sheds its wool annually, in patches resembling felt, and this might be gathered from the ground.

As a beast of burden the bison is almost unknown, yet I suspect that if properly broken when young he would prove superior to the domestic ox for speed, strength and endurance. My own experience with the team of buffalo calves which I borrowed and broke to the yoke and to harness last summer, tends to confirm this suspicion; at any rate, I do not believe that any pair of domestic calves of the same age in New England can either travel so fast or handle so heavy a load as those eight-months-old buffaloes. They have already shown what they are made of at the Sullivan county, N. H., fair, and they will be tested again at the coming Sportsmen's Show in Boston.

Of buffalo-domestic cattle hybrids I will say nothing at this time, beyond stating that in all probability the rearing of them will be profitable. The American Bison Society will interest itself in the preservation of the full-blooded buffalo. When this is assured it will be time enough to think about cross-breeding. If we don't save the fullbloods we can't even have hybrids.

It is so well known that, under proper management, buffaloes multiply rapidly and that they are both easy and inexpensive to rear, it is hardly necessary to repeat it; the point now is to have the Government undertake this work until the herds are sufficiently large to warrant their distribution to stock raisers, farmers and others who may desire to handle them. In order that Congress may feel justified in appropriating the money necessary to do this,

it is necessary that a great number of Americans shall show their interest in the matter. There are many ways in which they can do this, but the most direct way just now is to support the American Bison Society by becoming a member of it. The annual dues have purposely been made very low, in order that no one interested in the preservation of animals may be prevented from sharing in the good work. It is hoped that sportsmen's clubs will be among the first to come to the front, and that wherever possible the members of such organizations will join the American Bison Society in a body. The assistance of women's clubs is also greatly desired, and women members will be heartily welcomed to the ranks of the new organization. Girls and boys, too, should be urged to join it, partly for the immediate benefit to the cause of the buffalo, and partly because an early appreciation on their part of what is due to so noble an animal, will tend to make them better citizens. In short, let every man, woman and child who has love or sympathy for American animals, join hands in saving for the country the grandest of them all. Although on the brink of extermination this rugged and typically American character must be saved; it can be saved, and, with the support of the people, the American Bison Society is prepared to do the work which will be necessary to save it.

ERNEST HAROLD BAYNES.

## The Oregon Beaver.

THIS animal is nearly extinct. It is nearly as rare now in nature as it is on the Oregon coins—called beaver money—of the early time. All early explorers and settlers of the Oregon country were familiar with the beaver. The Oregonian is not sure that any members of the species now remain. It was said a while ago that L. L. Hawkins, of Portland, who, as a naturalist, takes interest in all the fauna and flora of the country, knows where there is now a colony or family of beavers, not thirty miles from Portland; but he wouldn't tell, lest betrayal of their retreat might lead to their destruction.

There was scarcely a more favorite haunt of the beaver than the streams of the Oregon country. It was the beaver, chiefly, that led the explorers and trappers hither. Following the expedition of Lewis and Clark, the American Fur Company pushed into the vast western territory. Furs and peltries were the main objects of their enterprise. Chief of the valuable fur-bearing animals was the beaver. His haunts were the rivers and lakes bordered by woodland. A large part of North America was his habitat. Canada, the upper Mississippi and Missouri regions, the territory of the Columbia and Fraser rivers, and especially the whole of western Oregon and of British Columbia were his favorite grounds. The animal was always very shy, not prolific, and therefore easily exterminated. In many particulars the beaver of the Western Hemisphere was different from the beaver of the Eastern, yet of the same general family. But since the historic period began it never was so numerous in the Eastern Hemisphere as it was in the Western, at the time of the discovery and till long afterward.

The demand for the fur of the beaver—strange as it may seem—was one of the factors that combined to break the way into the great wilderness of the West; and in its result of primary exploration that led up to settlement, it was the most important one. It led the trapper and trader from the Great Lakes and the Mississippi to the Western ocean.

Swift streams, flowing through rocky cañons, the beaver avoided—unless here and there such streams opened out into valleys where there were lakes or marshes that could be controlled and where there was timber or brushwood in some abundance. Where the stream was large and deep and swift the beaver could not build a dam, nor was it necessary, since the animal could not burrow into the banks and establish his chamber at a steady water level. Where waters were continually swift and uncontrollable, willow, yellow birch and other favorite wood food of the beaver was absent. Where brooks and creeks were small, with proper wood growths, the beavers were abundant, as well as in the natural lakes and quiet reaches of the larger streams.

The purpose of the beaver in building his dams was to maintain a steady water level. That is, the object of the dam was the formation of an artificial pond, the principal uses of which were the refuge to them when assailed, and the water connection it gave to their lodges and to their burrows in the banks. Hence, as the level of the pond must in all cases have risen from one to two feet above these entrances for the protection of the animal from pursuit and capture, the surface level of the pond must have been subject to their immediate control. With this in view their dams were always constructed. The animal lived wholly on bark and twigs; its food for winter, where the climate was severe, was prepared by cutting poles and branches which it dragged into place within or beside the lodge, and the bark was stripped off as wanted. The cutting was done mainly with the inferior or lower teeth—the upper teeth, though formidable in appearance, being used mainly for holding.

All early settlers of Oregon were familiar with the habits of the beaver. So common was the animal, indeed, that it was not possible to miss notice of him. Throughout the entire Oregon country, west of the Cascade Mountains, there was scarcely a creek or swamp which the beaver did not inhabit. Strange to say, the Indians lacked the ingenuity to capture them, which the whites so quickly developed. One reason was, doubtless, that the Indians lacked the incentive of profit, for till the whites came the furs had little or no value.

But the beaver now is almost unknown. In the Oregon country he is practically extinct. He can live no life but that of nature, undisturbed by man. For man's desire to kill, and his eagerness for profit, exerted upon a timid and not very prolific race of animals, has virtually destroyed it. Yet there are persons still living in Portland who have seen dwellings of the beaver within short distances all around the present city, if not within or upon the very site of it.—Portland Oregonian.

## Wild Pigeon Speculation.

Editor Forest and Stream:

There have been several inquiries and several explanations of late as to the final taking off of the wild pigeon. Very little information, however, has been brought out by either. That there is no one competent to give any accurate details seems certain. That they were drowned in the Gulf of Mexico during a storm is a tradition that has made its appearance in print now and then for the last twenty years. I think it originated with Joe Mulhatten and first appeared in the daily papers about 1883. As the story first appeared, the waters were completely covered for miles with dead birds. In fact, the ship that reported them was several days late from plowing its way through the mass. There are several authorities, however, that are well up in bird lore who still cling to the theory of drowning. My own opinion on the subject has a slightly different trend, though, of course, it is based on nothing more substantial than any other man's guess might be. The nesting and breeding habits of the pigeon was the cause of their undoing. Nesting and roosting as they did in some particular piece of woods in such great numbers made them an easy prey for the netters. The squabs were knocked from the nests and sent to market and the old birds netted and sold to trap-shooters or slaughtered for market.

For years this was a feature in Wisconsin and Michigan, and earlier in Ohio. At last there came a year, 1881, when no birds appeared in their usual haunts. The pace had got too hot for them; they deserted their old stamping ground. Later, word came that they were nesting in Indian Territory. The Territory was not settled at that time, but netters were sent from Chicago in special cars and later the cars returned laden with squabs and live old birds. The Illinois State Sportsman's Association used them at their first annual tournament that year, and many thousand were used right there, for there were 175 entries in the principal event and each shot at ten birds, beside twice as many in minor events. That was the last time wild pigeons were used in any great quantities for trap-shooting. That was the last great roosting and nesting ground known to history. Minor roosts of course there were, but not of sufficient importance to attract the attention of the squab hunters. There is a great deal of guess work in this statement. I never shot a wild pigeon at the trap. Never saw a pigeon net, nest or roosting ground. The facts, if they are facts, are taken from the history of events as recorded by current news and as memory recorded them.

One can readily imagine how the pigeons might have been destroyed by a great storm while crossing the Gulf, though I have noted that the line of flight of birds, especially ducks, migrating before cold weather, was along the coast to the westward and around the Gulf, not across it. This might be changed by varying winds, but I doubt if any birds voluntarily cross the water.

Nearly every season up to 1895 I have seen more or less wild pigeons in Illinois, Minnesota and Manitoba. As late as 1889 I saw a flock of at least a hundred in Illinois. In 1891 I saw several small flocks in this (Aitkin) county. In 1895 I saw the last one; it was alone and bobtailed, which might be regarded as being close to the finish, though I learn from the prints that they are appearing in the East at different points in increasing numbers.

E. P. JACQUES.

AITKIN, Minn.

## Insensibility to Pain Among Animals

PROBABLY no question has excited more interest, among humanitarians especially, than that pertaining to the degree of pain suffered by animals when attacked, injured, operated upon by the vivisectionist or killed. Extreme humanitarians especially than that pertaining to the death of the lower animals. They protest against fishing and hunting almost to the extent of some semi-barbaric tribes who refuse to kill any animal. Others object to vivisection, thereby depriving science, and especially surgery, of one of its chief sources of information. Others again believe that animals do not suffer pain and condemn the humanitarians as extremists. There is, doubtless, a happy medium which all can be governed by.

That animals suffer pain cannot be denied, at least by anyone who has had opportunities to observe them. All animals doubtless suffer from injuries and attacks, but in some it is reduced to a minimum, which can be easily illustrated. In other words, many animals are so constituted that what are apparently serious injuries to the humane and human observer are hardly felt by the animal. This is well illustrated among the fishes. Few anglers but have hooked the same fish twice in the same day; and many fishes have been caught with a hook in their mouth. I have hooked a large seriola twice in a forenoon, and when ultimately caught it was found to have four hooks in its jaws, one very badly rusted. This fish would seize the hook, make a gallant rush 100 or more feet away, struggle wildly a few moments, as though stricken with fear or mad with pain, then finding itself trapped and unable to break the line, would rush at the wharf upon which the observers stood, wind the line in and out around the piers and break it, to presently appear on the surface so near that the dangling line and the bloodshot mark in its jaw could be seen; yet, this fish, which weighed about 35 pounds, took another hook fifteen minutes later and repeated the act. For several minutes after escape it appeared "worried." I could see it repeatedly "shake its head," opening the mouth and gill covers convulsively, but soon it was swimming up and down in full view taking whatever bait was tossed at it. I have noticed this in trout, rock bass, the Gulf of Mexico barracuda, and especially in sharks, and assume that in fishes at least a large number are, if not impervious to pain, suffer very little when caught or played. How much they suffer after being caught and allowed to die slowly is another question. A fish should be killed immediately when taken from the water.

If we were inclined to take a snap judgment many fishes appear to suffer from the fact that they utter remarkable sounds when taken from their native element. One of the most interesting is the Southern grunt—a delicious pan fish—but I must confess that I disliked to take this fish, as its extraordinary "grunts" appeared like protests and ran such a gamut of tones that it was dis-

trussing, particularly as the yellow grunt has a most liquid and expressive eye that seems to follow one around. I was often subject to the ridicule of an old boatman because I chose to interpret these sounds as expressions of pain and tossed the fish back. If the shark has any feeling it conceals it cleverly. I have seen several large sharks attack a dead and floating animal, and in the confusion a shark at least ten feet in length bit a large piece out of the belly of one about five feet long. For a few moments the latter continued to pull at the meat, tearing it like a bull dog, and only ceased when it in turn was attacked and devoured by its companions. Whalers have observed sharks feeding about a dead whale, which could not be driven away though repeatedly pierced by lances.

There is, however, the greatest difference among fishes. Sardines and their allies are possibly the most sensitive among the well known fishes. Any slight injury is liable to be fatal, and they sometimes die when exposed to the air and display evidence, so far as motion is concerned, that they suffer. On the other hand, eels, sharks and many fishes live a long time out of water and soon recover. The squid is very sensitive to injury, while the octopus will withstand almost any wound that does not affect its vital organs. One after the other its tentacles may be cut away without apparently injuring it. I have fed a large octopus with one hand while severing a tentacle with the other, the only evidence of pain it displayed being to pounce upon my hand in a savage manner; but it did not relinquish its food and continued to eat.

Mollusks are doubtless to a great extent insensible to pain. The eye of a large strombus can be stripped off quickly without seriously discommoding the animal, the wound rapidly healing. It is possible that the insensibility to pain in animals is to some extent proportionate to their faculty of reproducing lost organs. In a collection of lizards which I had at one time they displayed the greatest facility in tossing off their tails. I could make a lizard jerk its tail off by striking the earth violently by its side, the shock causing the little creature to give its tail so violent a lateral jerk that an inch, more or less, flew off at the vertebral joint. Little or no blood was lost, the wound healing immediately or drying. The portion thrown off went through the most extraordinary gyrations, leaping and coiling for some time, due to muscular contraction; and if it had been considered a distinct animal it certainly displayed evidence of pain. But the living portion would feed immediately and was, so far as could be observed, in no way annoyed by the loss, and in time a new tail began to grow. I had lizards with stumps or new tails in various stages, and undoubtedly this tail-casting is often repeated.

Frogs and toads doubtless suffer but little from injuries. I have frequently watched the operation of a snake swallowing a toad, the latter giving no evidence of suffering, not even struggling. Turtles may fall into this class. I have seen a large loggerhead turtle attacked by sharks, its flippers being bitten to shreds, yet the animal apparently did not lose its appetite. While a turtle may not be susceptible to acute pain or be very sensitive, it is easily frightened. I have dived down in eight or ten feet of water in a large water corral and suddenly grasped a large loggerhead by the shell just back of the head, arousing it from sleep, when its actions were suggestive, and very naturally, of great fear and surprise. The first movement would be to strike the front flippers violently against the bottom, and in a few movements the turtle reached the surface, there breathing quickly, then plunging downward endeavoring to shake me off by the violence of the rush; but this was rarely successful. Some very large turtles would attempt to "drown" me off by remaining under water, but I could always bring them to the surface by hauling my knees up on the shell, presenting my chest as a water brake. I have caught many large turtles in this way in the inclosure and never had one attempt to bite me, though many were loggerheads, which would snap at an oar and bite through a heavy piece of wood.

That certain animals are overpowered by animals that affect man is shown in the following: I once swam across the trailing tentacles of a physalia, or Portuguese man-of-war, with an almost fatal result, and bore the marks of the fire-like stings and poison for a year, the poison eating into the skin. Later I found a hawksbill turtle floating on the surface, its head completely enveloped in the purple mass and apparently dead or paralyzed, as it made no movement when I picked it up and placed it in my boat; but after treating it, rubbing off the tentacles and applying oil, it fully recovered and in an hour was swimming about as well apparently as ever.

It can hardly be proven, at least in my opinion, that the lower we go in life the less pain is felt. Thus a crab can be dismembered without displaying pain, but wound a common angleworm, the bait of anglers, and note the convulsive struggles it makes, writhing and winding itself in knots, showing, so far as appearances go, it to be one of the most sensitive of animals.

Experiments with crabs and crawfish (the spiny variety) have shown that they appear to care little for mutilation and very soon reproduce lost members. I have detached a claw from a crab, amputating it by a quick turn, not lacerating the joint, then offered it to the crab, which ate it with avidity and complacency.

That birds suffer far more than reptiles or fishes there is no question. The domestic fowl will "groan" and scream violently after its fashion when injured, and is very sensitive. A tame hawk which I once had, broke its wing and underwent great agony doubtless before it was discovered, then sitting quietly while it was treated. In rage this bird would scream like a fiend incarnate, but it never displayed pain in this manner. Those who have heard the cry of pain of the common hare of the West, the jack-rabbit of the lowlands, can never forget it. In a section of the San Gabriel Valley some years ago these animals were a pest, girdling trees and doing great damage to crops, hence they were hunted by packs of greyhounds. One day my dogs ran down a "jack," and the leading dog came around behind me on the opposite side of a hedge where I suddenly heard agonizing screams, which I thought were those of a child. I started through the hedge, falling several feet into a lane to find my dog wagging his tail and standing over a dead jack rabbit, whose cries of agony I had heard. Whether foxes suffer much is a question; if they do, they conceal it. I refer to the small Californian variety. I have seen one with its leg broken and claw crushed, that paid little at-

tention to it, nor did it resent handling. But the fox and many animals, doubtless have a certain stoicism not possessed by dogs which will whimper, groan and cry out and become perfectly miserable, even when slightly injured.

I am inclined to be belief that some insects are extremely sensitive, and some are not. My own experience with ants have been such that, as a rule, I try to avoid stepping on them. Examine a wounded ant beneath a glass; it displays evidence of great pain. If impaled or bitten by another animal it struggles convulsively, rolling over and over. This is well displayed when watching an ant topple over into the trap of the ant lion. The moment the average ant falls into this pitfall it displays anxiety, and when seized it is thrown into a paroxysm of struggles by its brutal and murderous foe. Spiders are doubtless very sensitive to pain, while the scorpion is so sensitive that it often convulsively stabs itself, giving rise to the fable that it commits suicide where the movement of stinging can well be compared to a human being tearing his or her hair or striking himself in rage.

Of all the animals I have observed the mantis is the most stoical. I once kept a number in confinement, and here we certainly have an insect that, if not impervious to pain, makes a remarkable pretense. It is possible that the mantis, like the shark, has an innate ferocity that makes it insensible to sensation. Thus a mantis will seize and devour another while the second mantis is eating a third, and the cannibalistic operation will continue until one or the other dies. I have seen a mantis decapitate another mantis, the victim standing rigid, apparently unmoved. In another instance a mantis held up its hand-like claws, which were cut off, bit by bit, yet there was not the slightest withdrawing or tremor. I cannot conceive, however, that the animal did not suffer. In all probability its power of suffering or its sensitiveness was reduced to the minimum. Dr. Riley gives some remarkable observations on the mantis. He says, "They are blood thirsty creatures, and are forever quarreling and at enmity among themselves, as well as with other insects. Many a fierce battle is fought by the males, in which neither eye nor limb is spared, and in which the winner ends by making a repast off the body of the vanquished. They are so void of feeling that the male (the female being the strongest and most voracious) risks his life in courting and usually succeeds only by slyly and suddenly surprising his mate, who often coolly seizes and devours him. So tenaciously do these insects fight that they will often continue without cessation or inconvenience for some minutes after the loss of their heads. We have seen a female, decapitated and with her body partly eaten, slip away from another that was devouring her, and for over an hour afterward fight as tenaciously and with as much nonchalance as though nothing had happened."

CHARLES F. HOLDER.

## Warning to the Mississippi Valley.

THERE is perhaps no question of greater importance in connection with the future prosperity of this country, than that of reforestation, coupled with drainage and irrigation.

The controlling of the waterflow of the Mississippi River is one that is causing more concern every year and growing more serious each year.

Every inhabitant of the entire Mississippi Valley is more or less interested in the flowage and navigability of this great river. At its headwaters in Northern Minnesota are 800,000 acres of timber land, lake, river and swamp, making a great storehouse or natural reservoir for the river. This 800,000 acres for many years remained an Indian reservation. There were those who looked far enough ahead, who were in favor of the retention of this land intact as a Government reserve for all time, and the turning over to the Bureau of Forestry the administration of the lumbering interests on the reservation. Everything pointed to the propriety and wisdom of such action. There was offered no argument against such a course, demonstrating that the reservists were in the right.

Yet opposition to the reserve sprang up from two sources, the lumberman who wanted the timber, and the town-site speculator, anxious to have access to the land itself.

The effects of the reservists to save the reservation intact resulted in a compromise bill passed by Congress, known as the Morris Bill. This opened up the reservation to the lumberman and the town-site speculator, the reservists being conceded 20,000 acres of timber land and 200,000 acres of cut over lands for reforestation purposes, on which 5 per cent. of timber was to be left standing. And, unable to do any better, the reservists accepted the situation and made the best of it. The Bureau of Forestry stepped in, and the first great movement to perpetuate the pine forests in Northern Minnesota by reforestation was taken.

The Morris Bill, be it remembered, was a compromise bill, an agreement between two bodies of men, one who wanted to see the forests preserved and the headwaters of the Mississippi conserved and a body of men, "skimmers," I think Mr. Roosevelt calls them, whose policy was to take everything in sight and after us the deluge.

The "skimmers" having gained so much through and by the Morris Bill, one would have thought that they would have been satisfied. The lumbermen are satisfied, they securing the timber, but the town-site contingent of the "skimmers" are far from being satisfied. The 200,000 acres of cut-over lands mean more to them as town-site possibilities than to the future welfare of the river. So they scheme and plan to repudiate the compromise agreement entered into. Before the Minnesota Legislature adjourned last winter, during the last few days of the session, when all was turmoil and confusion, these "skimmers," by some means or other, got a resolution passed whereby our Legislature put itself on record by a majority vote of a want of confidence in the reforestation of Northern Minnesota under the Morris Bill, and a recommendation to Congress to abolish the same. The vote was a hurried and meaningless one, for on approaching a number of legislators after the vote was cast it was learned that they were totally unaware of the subject matter for which they had cast their vote.

This little clique of land and town-site speculators and "skimmers" were actually deft and tricky enough to get the Minnesota Legislature to play into their hands and vote against one of the most important steps that could be taken, not only for the benefit of Minnesota, but the whole Mississippi River Valley.

They forgot that reforestation, irrigation and drainage went hand in hand, and that these three problems successfully worked out meant untold benefits to Northern Minnesota, the Mississippi River and the entire Mississippi Valley. Now let us go a step further. This reservation at the headwaters of the Mississippi River has within its area certain reservoirs for the control of the water-flowage. Years of trial have demonstrated the usefulness and necessity for these great reservoir dams. Yet, this little clique of "skimmers," with town-sites and other land speculations in their eye, actually made a determined effort to have these very dams condemned. The opposition to the move, however, was so strong and emphatic, and their scheme of self-aggrandizement was so quickly shown up that they crawled into their hole and pulled the hole in after them. Nothing more was heard from them.

These same "skimmers" would now drain the northern section of our State as dry as a bone under some drainage plan, presumably to get rid of the water at all times as speedily as possible and discharge it into the river under no control whatsoever, doing something in fact entirely contrary to what the dams and reservoirs have been doing for years, viz., letting free the stored-up waters when they were most needed. The reforestation of the river's headwaters and the ditching and controlling of the swamp land waters for irrigation is what is needed. The denudation of the forests, the abolishment of the reservoir system and the drainage of the swamp lands would bring about a condition of affairs at the headwaters of the Mississippi that no man can adequately describe, and that would mean disaster as far as the river is concerned from St. Paul to New Orleans.

And understand, incredible as it may appear, this little clique of "skimmers" have organized a campaign in Washington this winter, that, if carried out successfully, will mean a cessation of reforestation of the Mississippi River's headwaters, an abandonment of the dam system and complete drainage system of the land surrounding the river's headwaters.

This matter of reforestation and drainage as applied to the headwaters of the Mississippi River is not a mere local Minnesota State proposition. Far from it. It is of national importance, and it affects the whole Mississippi River Valley with its millions of inhabitants.

These people, residing upon the banks of this river, are hoping for the completion of the Panama Canal. They hope for the deepening of the river that it may prove a navigable highway for the commerce of the valley toward the Panama Canal. Bodies of merchants in the valley are already preparing to secure from Congress appropriations for deepening the river. The question of the future of this great river is one receiving now the greatest interest and attention. And as preposterous and incredible as it may read, this little clique of speculating "skimmers" in the northern part of Minnesota have actually induced the Minnesota Legislature to repudiate the plan of reforestation of the river's headwaters, would do away with the great reservation and would, if they could raise the money out of Congress, ditch and drain the great sponge near the source of the Mississippi's headwaters.

It is time that the people from St. Paul to New Orleans understand the situation and become interested, and alert to any and every move made affecting the headwaters of the Mississippi. It is no more a local Minnesota proposition. If the people of the Mississippi Valley, a few years ago, understood the situation at the river's headwaters, the Morris Bill would never have been allowed to pass, and instead the 800,000 acres of timber land, lake, river and swamp would have been reserved and turned over to the Bureau of Forestry. Already those who have only recently given the matter some study say this should have been done. But the Morris Bill passed. The timber is being cut, and the damage is in a measure being remedied by reforestation—a sure, but slow process. It is a fact that wires are being pulled and plans laid at Washington to destroyed this attempt at reforestation by repealing the reforestation clause in the Morris Bill.

Those interested in the welfare and future of the Mississippi River need be vigilant. Once the river's headwaters are denuded of its timber, the reservoir system abandoned and the land ditched and drained, there will come many changes in the river, among others higher water than ever before experienced at flood times, and the lowest water at times of drouth.

What the latter will mean in the way of a problem to the men who are planning to deepen the river's channel need not be gone into. It is patent on its surface.

Remember that just now eternal vigilance will be the price of the future of the Mississippi, and that those interested should watch what goes on in Congress, affecting the river, for mischief and the "skimmers" are abroad in the land haunting the halls of Congress and, like a certain expatriated political chieftain, "working for their pockets all the time."

CHARLES CHRISTADORO.

## Death of John Morris.

THERE died recently in this city at the age of seventy John Morris, who for very many years had a flower store in Jefferson Market, and who, if not a sportsman, was a good deal of a naturalist. He was absolutely devoted to his flowers and to the improvement of the flower trade in New York, and made many efforts to have a permanent flower market established in Union Square.

One summer many years ago a woodcock came into his possession, and for a long time he had it in a cage in his store, where it was visited by many sportsmen who loved to see it bore for worms. Mr. Morris always kept a quantity of angleworms on hand, and it was a great delight to him to show off his pet. Mr. Morris was a good citizen and a faithful public official, having served for a time as a member of the Board of Aldermen.

## Some Commentaries.

In the comments upon the wild pigeon in recent numbers of *FOREST AND STREAM* I have seen no allusion to the wild pigeon we have in California, and I do not know our bird is classified. While they are not plentiful as compared with the accounts of the birds east of the Rockies in former times, it is not unusual to see them in flocks of one or two hundred in this region. They nest in the mountains of Shasta county in certain localities, and seem to congregate in flocks in the late fall, at which time their flights may be commonly observed. They are wary and difficult to approach, as they seem to have a systematic way of keeping sentinel birds constantly on duty while the flock feeds. Upon shooting several of them last year, I was surprised to find their craws each contained from two to four whole acorns from the black oak. These acorns are larger in diameter than the normal necks of the birds, and it would appear to be an impossibility for a whole acorn to get through their heads, although it is true they open sufficiently in the emergency. The birds are about the size of the domestic blue rock pigeon, but in color they are slatish blue, yellow crescent over the eyes and red feet. [The bird is the band-tailed pigeon (*Columba fasciata*, Say.)]

About the scale carp: The Sacramento River was stocked with them and small yellow catfish, and ten or twelve years ago the lower reaches of the stream and its tributaries and sloughs teemed with these pests. I presume they have not decreased in numbers. There were formerly plenty of native fish in the Sacramento, no one of which was not superior in every way to either carp or dwarf catfish. I believe the fish commissioners deny having introduced the carp, but it and the catfish seem to comprise the chief addition to California waters—whoever is guilty of it.

The article upon the quail of the United States by Sylvester D. Judd, of the Biological Survey, duly enrolls the California mountain quail, and I would like to see more space in the article given to the bird. He is, in my opinion, the finest, as well as the most beautiful game bird of the West, if not of the continent. His call notes, too, deserve full praise. These notes are many; the bird an accomplished ventriloquist. His clear, full whistle echoing from the mountainsides is one of the most cheerful and inspiring sounds imaginable.

A San Francisco paper gives a portrait of the English peer Earl de Grey, together with what purports

to be a lengthy cable dispatch eulogizing the nobleman as the finest shot in England, if not in the world. He knocks over 500 grouse in a day's shoot, and again 750 pheasants—and when he goes out for rabbits he bags 950 as a matter of keeping his trigger-finger in training.

The article blandly states that in America (can it be?) many people would regard these facts as mere slaughter, but English folks do not so consider them, and "Earl de Grey is English in everything." Up to ten years ago he had killed 316,699 "head" of game.

These statements read smoothly enough in a modern daily paper, but what an arduous time the noble Earl must have when he goes out for 750 pheasants or 950 rabbits! Even if he misses no shot, he must take along about 1000 cartridges weighing about 125 pounds, not to mention a lunch. When he comes in with 950 rabbits or 750 pheasants—either approximately weighing a ton—he must be tired.

Such an account as this must make our market hunters think life in this country is a failure, while the rising generation of American sportsmen will have to abolish the game laws in order to emulate English nobility. In order to count 316,699 head of game our ambitious representatives of the quadrupeds that the devil was conjured into will have to hustle for sufficient ammunition.

It appears that there are no real sportsmen among the cablegram editors of the atrocitated\* press, while they are rare enough among editors throughout the country. When are we to hear from the Kaiser's annual roundup, with accompanying photographs of his trophies?

N. B.—To kill 950 rabbits in a day the peer, shooting steadily for ten hours, would have to kill something over a rabbit and a half per minute. No charge against the press for these deductions.

CHARLES L. PAIGE.

CALIFORNIA, October.

\*Made the word myself; it means "fierce."

## Antlers in the Velvet.

LEOMINSTER, Mass., Dec. 12.—*Editor Forest and Stream*: I killed a moose on Sept. 23 which had not shed his velvet a particle; in fact, had not begun to rub his horns at all. The veins in the velvet were still full of blood, and this velvet in all probability would not have come off for ten days or two weeks. W. F. W.

LOCKPORT, N. Y.—*Editor Forest and Stream*: A party of six Lockportonians returned from a week's hunting in

St. Lawrence county Nov. 15 and brought home six deer, five of which were bucks, a queer head among them, of which I send you a photograph. The antlers, besides being deformed, were also in the velvet, and so soft that blood showed where they were broken during transportation. The deer was in as good condition as any of the other five. Is it not rare for antlers to be in the velvet so late in the year? The head was presented to me by Mr. Huber.

I have a pair of antlers in the velvet that are larger than any antlers of the Virginia deer I ever saw. The deer was killed several years ago by a boy thirteen years of age, while watching for woodchuck in a field of oats. The deer came in and was feeding on the early-growing grain, same as the woodchucks, and the boy slaughtered it. The antlers were not full-grown, but at the fourth prong they measured 23½ inches in width from inside of one antler to the outside of the other. Before I got these I had a pair of antlers that I thought were very large, but they measured only eighteen inches in the widest place. I doubt that you will get a larger pair of antlers among your coming prize heads than the pair of antlers in the velvet would have been. J. L. DAVISON.

## Explorers' Club.

THE annual meeting of the Explorers' Club was held on Wednesday, Dec. 6, at the rooms of the Club, 23 West Sixty-seventh street. Prof. Henry Fairfield Osborn occupied the chair, and the business meeting was largely devoted to a review of the events connected with the Club's recent incorporation. The officers elected for the following year were: President, Gen. A. W. Greeley; Vice-Presidents, Col. D. L. Brainerd, Carl Lumholtz and Dr. William H. Furness; Secretary, Henry Collins Walsh; Treasurer, Tappan Adney; Board of Governors, Dr. F. A. Cook, Prof. Herschel C. Parker, Henry Collins Walsh, Frank M. Chapman, F. S. Dellenbaugh, Prof. Marshall H. Saville, George Bird Grinnell, Tappan Adney, Herbert L. Bridgeman.

The business meeting was followed by two talks of unusual interest. One, by Dr. W. H. Furness, on his travels in Borneo, dealt especially with the wild and unknown natives of that country. It was illustrated by a multitude of colored slides of great beauty, and the descriptions of the habits of life, the customs and the beliefs of these people was of the greatest interest. Following this came a talk by Dr. D. G. Elliott on his travels in Somali Land, whither he had gone to secure natural history specimens for the Field Columbian Museum, of Chicago. Dr. Elliott's slides showed many species of African mammals and his descriptions of the country and its fauna and of the methods of travel through it, were very entertaining.

## Boston and Maine.

BOSTON, Mass., Dec. 16.—*Editor Forest and Stream*: The Nominating Committee of the State Association, of which Dr. Benjamin Varnum Howe is chairman, at the December meeting, on Wednesday next, will present the name of Prof. William Brewster, the well known ornithologist of Cambridge, as their candidate for the presidency of the Association for 1906. Professor Brewster is widely known among bird lovers as a practical sportsman, in full sympathy with sportsmen's interests as well as an eminent authority in scientific knowledge of natural history subjects, and the members of the committee are highly gratified by their success in securing his acceptance of the nomination to the presidency. The election will be held at the annual meeting, the second Wednesday in January.

The annual meeting of the Massachusetts Forestry Association was held in Boston on Thursday last. The ballot for officers resulted in the choice of Henry P. Walcott, of Cambridge, as president; Edwin A. Start, of Billerica, secretary-treasurer, and among other officers chosen appear the names of Messrs. William P. Gale, of Springfield; James S. Russell, of Milton; Richard A. Hale, of Lawrence; Charles Francis Adams, of Lincoln; George M. Weed, of Newton; Fred. L. Olmstead, Jr., of Brookline, and George N. Whipple, of Boston, and several others, besides a number of prominent ladies. Mr. Frederick Cunningham, of Brookline, presented the following resolution, which was unanimously adopted:

"That the Association wishes to place on record its great appreciation of the services of Mr. James N. Bowditch to the cause of forestry, both as one of its officers and as an individual; its regret that he can no longer serve on its Executive Committee, and its hope that he may be able to do so again at some time in the future."

Mr. Bowditch has held that position by annual election ever since the Society was organized in 1898. This is one of the associations which joined hands with the sportsmen's clubs in the celebrated convention of 1899, when the first steps were taken in forming the Massachusetts Central Committee for protection of fish and game, and which resulted in the passage of the anti-sale law of 1900, prohibiting the sale of woodcock and ruffed grouse. It needs no argument to show the close relations that the advancement of systematic forestry bears to the interests of the sportsmen.

The Maine deer hunting season closed at midnight the 14th. The receipts at Bangor for Friday were 145 deer, one moose and one bear. Among Boston hunters bring-out out deer that day were A. R. Rogers, N. Dorr, Levi Davis, J. O. Richards, J. W. Small, H. W. Davis and several others. There were also representatives from Worcester, Gloucester, Medford and other towns of the State, and quite as many from Maine towns as all the others combined. The records for the year exceed those

of 1904 by about 400 deer; total to Friday being 4,646 deer, 215 moose and 40 bears.

The annual meeting of the Maine Sportsmen's Fish and Game Association will occur on Jan. 2, at Bangor, when one of the questions that will be discussed is "What, if any, changes are necessary in the close time for fish and game?" This will bring out the opinions of Maine sportsmen on further protection of big game by shortening the hunting season. Other topics for discussion are to be the prohibition of the carrying of firearms into the woods during the close time; whether non-residents should be allowed to carry firearms into the woods in the open season without a license to hunt birds or other game.

This year has witnessed less shooting accidents than occurred last year, when there were eleven that resulted fatally. This year seven such have occurred, but all that proved fatal this year have been caused by residents of the State.

The friends of "Bill" Sewall, of Island Falls, the President's old guide, are much pleased by his recent nomination as collector of customs for the Aroostook district. He is reported to have made a personal canvass of the entire county for the position. H. H. KIMBALL.

The Boston Herald gives this description of the biograph pictures, which are to be among the attractions of the Boston Exposition:

"It looks very much as if the biograph pictures of a real moose hunt will prove the big sensation of the sportsmen's show at the Mechanics' Building, the exhibit by the New England Forest, Fish and Game Association, which will open on Christmas Day. Next to the interest of seeing the pictures themselves it is a very interesting story that is told as to how a party of sportsmen started out from Boston for the avowed purpose of hunting and shooting moose in order that it all might be caught by the biograph machine and thrown on the canvas at the coming sportsmen's show.

"The party was composed of Dr. Heber Bishop, Boston's well known sportsman; R. E. Follett, the second vice-president of the New England Forest, Fish and Game Association and manager of the sportsmen's show; C. Everett Johnson, an artist of this city; F. J. Marion, manager of the American Mutoscope & Biograph Company; G. W. Bitzer, chief operator of the Biograph Company, and Harry B. Coe, of Portland, representing the Maine Central Railroad.

"The moose hunt pictures start with a view of the party boarding the train at the Union Station, Portland, and on the platform as the train pulls out are Dr. Bishop, Mr. Coe, Mr. Follett and other passengers.

"After arriving at St. John, N. B., the journey was made on the Intercolonial Railway to Peticodiac, a couple of hours' run from St. John, and there a special train was taken on the Elgin & Havelock Railroad. This train consists of the entire equipment of the railroad,

including one locomotive, one flat car, one passenger car and one box car, the latter used for baggage. The uniqueness of the road is well depicted in the moving pictures, and the tall grass growing between the rails of a rough-and-tumble roadbed makes the journey over it one that will not be forgotten. On this special trip the moving pictures were taken from the baggage car, looking toward the engine, showing the party in all their hunting clothes on the way to the moose hunting grounds.

"The biograph machine now follows the party very closely, showing their arrival at Havelock, where they were met by guides with teams. Then follows a drive of eighteen miles to the forks of the Canaan River, with pictures showing the general character of the country through which they pass. Then come the scenes showing the party taking to the bed of the Canaan River, which stream in their trip up its course for seven miles to the next stage of their journey, had to be forded fifty-two times. Incidentally, one sees Mr. Follett fording the stream and catching trout as he goes along. His record is just sixty on the trip. At times the horses are seen up to their bodies and the wagons up to their hubs in the river.

"At the end of the seven-mile trip the so-called Bad Lands were reached, a great stretch of country which has been burned over and is now a mass of charred stumps of trees. The arrival at Jim Ryder's head camp is interestingly shown, located on the ridge which forms the watershed between the Canaan and Salmon rivers, both of which streams finally find their way into the St. John River. Jim Ryder, probably the best known guide in New Brunswick, is shown calling the moose, and then there is the camp scene, with the supper being cooked and the return of Dr. Bishop from a hunting trip.

"One of the best series in the biograph is that showing Mr. Follett shooting the moose. He and Mr. Johnson went out to the Crow's Nest and stayed all night until the following morning at daybreak Mr. Follett, who had never called a moose before but knew what kind of a sound they made, succeeded in getting an answer to the calls he sent out over the barren waste. Soon the moose, an immense bull, came out of the brush and met his doom for the benefit of the biograph pictures. The moose was an immense one, its antlers having a spread of fifty-four inches, and it weighed 1,200 pounds. It was mounted and will be on exhibition at the sportsmen's show.

"Another section of the series of the biograph pictures shows Dr. Bishop and his guide paddling across the lake in a canoe, then the sighting of the moose and coming around the point and shooting it, and finally coming ashore. This particular moose is the twenty-eighth that Dr. Bishop has shot.

"In all, over one mile of film was exposed, or a total of 45,000 pictures taken at the rate of six a second. It requires a little over half an hour to show them on the biograph.

"The biograph people say that the pictures are far better than they had any reason to expect, being taken under such unusual conditions, and those of the camp fire and calling the moose are two of the best they have ever made."

## Is He a Backslider?

JAMESTOWN, N. Y., Dec. 15.—*Editor Forest and Stream:* In your issue of Dec. 16, under the caption, "Good Times at Barnegat," Mr. Stephen P. M. Tasker enlarges upon the pleasures of duck and brant shooting at Barnegat Bay, having evidently just returned from a shooting trip in that region. Upon reading this article it occurred to me that Mr. Tasker had last summer proclaimed a new creed in *FOREST AND STREAM* on the subject of hunting, and looking over my priceless file of your paper I find him on record in the issue of June 17, under the title of "The Heroic Pose," in which he states, among other things:

"I am filled with remorse every time I look upon my walls and into the wild glass eyes and think of the murder I have done—for murder it surely is, to wantonly slaughter the poor defenseless creatures that people the wilderness of our country.

"I am far from setting myself up as an example, or to say that a certain amount of shooting of birds and beasts is not necessary to ourselves and them, but I do want to entreat my fellow sportsmen to quell the insane desire to kill, and to be content as I intend to be hereafter, with photographs and memories of noble game crashing through brush unhurt by any bullet from my firearm.

"Killing game—and I will except no animal on the face of the earth—is not dangerous work when the hunter carries in his hand the latest and most approved weapon. No, but it is cowardly.

"And so I ask you, gentlemen, to try it for this year at least. Let us go to the woods and lakes with a firm determination to let live what animals we hunt, and come home with beautiful pictures of life and not with a feeling of defeat, but of victory over the spirit of the hunt to kill."

Here's a how-de-do! But upon reading Mr. Tasker's Barnegat article over four times I cannot find that he admits murdering any wild creatures. No, but he says you can hire your guide to do it for you—and it won't cost you anything but the price of the ammunition! How are the mighty fallen! Can it be that an erstwhile slayer of moose and caribou seeks to "quell his insane desire to kill" by putting on six pairs of socks and employing his guides to slaughter wildfowl for him at the cost of the ammunition? I hope that Mr. Tasker won't have any guide-butchered waterfowl adorning the walls of his home—if so, their wild glass eyes ought to haunt him far worse than do those of his hard earned moose and caribou.

And how about the "Heroic Pose" anyway? Wouldn't Mr. Tasker do well to drop it and get fairly back into the ranks of honest sportsmen? Those of us who hunt and kill mostly as a means to an end—as an incentive to seek out nature's rough spots and to court health-giving discomforts that we would never care to endure were we to leave behind the gun and carry only the camera, or perchance, a volume of poetry. Above all things, Mr. Tasker, if we know of any guides who are willing to slaughter game for the cost of the ammunition, let us hold them up to the obloquy they deserve rather than commend them to the good offices of our brother sportsmen.

W. A. BRADSHAW.

## The Vermont Season.

*Editor Forest and Stream:*

Now, that the mercury up here in northern Vermont is skirmishing down around 20 below zero, we may say that the shooting season is fairly over. Even the hardy fox and hare hunters prefer to stay in doors and hug the stove rather than to tramp around over the hills and swamps, though there is a good tracking snow of some six inches in the valleys and a plump foot on the uplands.

Taking the grouse season on the whole, it has been a poor one, as the wet weather in the early part of the summer drowned out the early broods and the great overflow that occurred in July must have submerged all the nests that were on the alder bottoms. We trust that our next Legislature will shorten the grouse season, making the open season from Oct. 1 to Nov. 30, and also continue the limit in number to be killed.

In some localities woodcock shooting has been fairly good, though in the northern part of the State the native bred birds migrated before Sept. 1. The open season on woodcock in this part of the State should be from Aug. 15 to Aug. 31, and from Oct. 1 to Nov. 10. This would give us a chance at the native-bred birds that we have protected during the summer, and would also give us over a month at the migrators.

Though there was in some localities plenty of mast, butternuts, beechnuts and acorns, there were but very few gray squirrels seen. We looked for a migration but it did not come, because of the fact that the mast crop was good in other localities.

More deer were killed this season than last year, and they were much larger, as the abundant rains made the feed good in all of the back pastures. There were, we believe, more does and fawns shot this season than during any of the past years. There were at least 1,500 new rifles sold in the State this year, and many of these guns were high power rifles, and went into the hands of boys and young men, who went out to "kill something"; and it is a mystery to us that a single deer of either sex escaped. It is a pleasing thought to us that we have in the person of Mr. Thomas an energetic Fish and Game Commissioner, for he is making it hot for some of these pot-hunters. He is in his office early and late, keeping in constant touch with his wardens and trying to get them to imbibe some of his enthusiasm and energy. He is certainly the right man in the right place, and we hope that our next Legislature will give him an appropriation of at least \$20,000 to carry on his work instead of a beggarly \$5,000. Give him \$20,000 a year for five years and the State would get a big revenue from summer visitors, for to couple good shooting and fishing with our beautiful scenery and pure air would make this little State of Vermont the peer of all places as a summer resort.

We believe that one of the dreams of our life is about

to be realized, which is that net-fishing of all kinds is to be stopped in the waters of Missisquoi Bay. This means good hook-and-line fishing for all our taxpayers, and for thousands of summer residents. Brother Chambers will, of course, give in your columns a full account of the work done at a recent meeting in Montreal. Now, let the net-fisher who owns property along the lake shores burn his nets and build cottages and boats for summer boarders, and he will have far more money at the end of the season than he has now. The world moves, and in the right direction, but sometimes for us old fellows it seems to move slowly.

STANLEAD.

Stowe, Vt., Dec. 15.

## Parks, Preserves and Public.

*Editor Forest and Stream:*

In his views upon the case of Rockefeller vs. LaMora, Mr. Raymond S. Spears reiterates the principle alleged to be sustained by courts and legislation, that the wild game, wild fish and wild birds belong to the public. This particular principle or allegation appears to be the cause of a great deal of contention and misunderstanding. It is the same doctrine that the Italian shooter of song birds adopts when he invades private grounds, and when he threatens or shoots the owner who protests.

I cannot agree with Mr. Spears that "the robin which sings in the maples of a private lawn is owned as much by the laborer digging a drainage ditch as by the man he works for," nor with the sentences that follow in the paragraph quoted from:

I believe that the rational and proper principle is generally understood to be that the "wild fish and game belong to the public when they are upon the public lands." The fish and game should be properly the property of the State when upon State lands, and not otherwise.

Will any individual or court undertake to maintain that any State, or our Federal Government can establish ownership of the wild things that pass over into Canada or Mexico, or even from one State to another? Is the State or Federal Government or the public to take a right from its citizens arbitrarily, after having granted the right? In deeding to a settler upon Government land his 160 acres, does the Government or the State reserve the fish and game upon the land deeded? I am a settler upon wild land, claim 160 acres as a homestead, and it is not my understanding that the Government retains any lien of this nature upon the land. If the State can throw open my gates to the public hunters and fishers against my protest I will abandon the land.

Personally, after a rather extended observation of the widespread vandalism upon public lands—and private lands, too—I favor every sort of preserve, park and refuge that can be maintained to protect some regions from the general public. I would rather see some square miles of our wilderness owned and posted by millionaires for parks than to see all of it utterly devastated by the public or by commercial organizations. The material possessions which belong to everybody do not flourish—in proof of which we can point with sorrow to thousands of square miles of our public lands. The period when most of the public wilderness and its fish and game might rationally have been maintained open to public depredation has passed, leaving unimpeachable evidence of the abuse and destruction of them.

I believe individual and corporation acquisition of land (and money) should be restricted, but if we deed land let us not try to treat deeds to settlers or others as we have treated the concessions accorded to American Indians. Real property is the foundation of social polity everywhere, and in no country more than in this. Molest that and disintegration will swiftly follow. Public rights and privileges in material property cannot rightfully be projected upon private premises under the Constitution of the United States (without a great deal of trouble to somebody) by any sort of litigation.

If there are flaws in Mr. Rockefeller's title to the lands or waters in question that is another subject.

CHARLES L. PAIGE.

CALIFORNIA.

## Luck in the Moose Woods.

*Editor Forest and Stream:*

I notice at the top of your paper, "Report your luck," and as the result of my recent hunt in Maine was largely luck I must tell you about it. It also savored considerably of what A. J. Stone would call a parlor moose hunt.

I left Oxbow with a guide on a Thursday morning, and after footing it for two days and a half, sleeping the first night at a camp near the headwaters of the Aroostook River and the second at Munsungan Lake, we arrived at Bluffer Pond Camp, which was to be our home for a few days. And, by the way, this tramp in was the most strenuous work I did the whole trip, for I foolishly wore an old pair of low shoe packs, and the long walk part way over an old rough and frozen State road so bruised my feet that they pained throughout the time I was in the woods. George, the guide, may have wondered why I hopped along so fast the second day, but my object was to keep my feet in the air as much as possible.

On arriving at camp we started right in hunting, but the conditions were against us, and what with missing one good and one poor chance on deer we did nothing until Nov. 1. The night of the last of October it started to rain and kept it up all night, and the following morning found us out early on good tracking ground and in high anticipation.

The luck commenced at once. It was our intention of crossing the pond at the foot of the hill on which our camp was situated, and hunting the ridges on that side, but we found the pond frozen over, and so being unable to cross in the canoe we decided to hunt the ridges on our own side.

An old road runs along the side of the pond and up this we had gone but very few yards when we saw a fox at the side of the road feeding at an old decayed carcass of a buck; my first shot missed him and he ran back in the woods, but on our keeping very quiet and still for a few minutes he returned and my second shot got him.

George laid him on a stump close to where he dropped, and we turned off the road to the left up the ridge and had gone but very few yards when we struck the very

fresh tracks of two moose, one considerably larger than the other. George said they were a bull and cow. The tracks wandered in an aimless manner as though they were looking for good day beds, and this proved to be true, for in a few minutes we came upon the bull lying down and chewing his cud not sixty feet ahead of us. We finished him in short order, and the fusillade started off the cow that was with him, but I never saw her, as I had but eyes for the bull.

He was a good-sized moose and had as fair head as Maine heads average, spread about forty inches, and seventeen points. The luck in this instance consists of the small amount of easy tracking we had, the fact of his not being startled by my shots at the fox, and also finding him in what might be called the camp yard, as we were less than 1,000 yards from the cabin. We were gone perhaps one hour from camp. To finish a successful day we got a doe in the afternoon.

This was my red-letter day, and the game, with two more foxes, completed my bag, which added what might be called the climax to a very beneficial and pleasant trip to the Maine woods.

CHARLES A. GIANINI.

## Adirondack Deer Hunting.

THE following resolutions and petition were adopted by the Essex County Board of Supervisors last week:

"Whereas, it is the sense of this Board that a deer hounding law would work for the benefit of the county as a whole; and

"Whereas, we already have a precedent in the exception of Essex county from the provisions of the so-called bear law and in the laws now on the statute books allowing hounding on Long Island; and

"Whereas, the county of Essex is the roughest and most mountainous county in the State, its physical features putting it in a class by itself; and

"Whereas, we consider that a law giving us a certain hounding season would be observed and lived up to, working to an actual increase in the number of deer and the better observance of the game laws as a whole; be it

"Resolved, That we ask our Senator and Member of Assembly to do all in their power to secure the passage of an act securing to Essex county a deer law allowing hounding of deer from the 10th to the 31st of October, both days inclusive.

"2d. Fixing a license fee for non-residents of the county of \$10 for the season, the money to be paid to the county treasurer and considered as a part of the contingent fund of said county.

"3d. The repeal of that section of the present law that provides for the killing of dogs used to hunt deer, and any other provisions of the game law inconsistent with this act.

"4th. That the chairman of this Board appoint a committee of three members to lay our wishes before the Forest, Fish and Game Commission and to co-operate with our Senator and Member in every possible way, and that this committee be allowed their necessary expenses.

"5th. That each supervisor circulate the petition, a part of this resolution, and attached hereto, securing all the signatures possible thereto, and transmit the same to the committee, which is going before the Legislature.

"6th. That the clerk of this Board be instructed to send a copy of this resolution to Hon. Frank C. Hooper and Hon. Senator S. G. Prime.

"PETITION.—We, the undersigned residents of the county of Essex, hereby petition the Legislature of the State of New York that the recommendations embodied in the above resolutions be carried out."

Each supervisor in Essex county has a petition in circulation. The committee appointed to present the matter to the Forest, Fish and Game Commission consists of Messrs. Robert W. Motisher, of Keene; J. D. Richards, of Lewis, and John R. Carson, of North Hudson.

An earnest effort will be made to change the deer law. One thing is reasonably certain, if the law is not changed there will in the future be more rigid enforcement than there has been in the past.

GEORGE L. BROWN.

## The Oppression of the Poor.

MR. CHARLES A. SHRINER, whose name used to be very familiar in these columns when he was doing things worthy of note as the New Jersey State Game Warden, tells in his paper, the Paterson Chronicle, this moving story of an English pheasant operation in that region:

"A number of residents of this city will bear witness to the fact that this year has been an exceedingly poor one for English pheasants. In former years considerable numbers of these birds found their ways to the tables of people in this city, but this year there have been hardly any. The reason may be of interest to readers of The Chronicle, especially such as have had pheasants for dinner in previous years. It is a tale of the oppression of the poor by the diabolical machinations of the wealthy.

"The Stuyvesant-Rutherford-Vanderbilt preserves are located at Allamuchy, in Warren county, about six miles from Hackettstown. The owners of this property annually import a number of birds from Europe, and they also breed birds from the stock left over every year. A Paterson man one day discovered Allamuchy; also the fact that the farmers there did not permit shooting on their farms excepting at so much per. Being of a practical turn of mind, the Paterson man took a lease on the farms adjoining the preserves and for some years there was better shooting there than anywhere in New Jersey. A club was formed of a few friends of the discoverer and the members always rubbed their hands in glee at the approach of cold weather in anticipation of the fun they knew they would have. It was discovered that the pheasants were fond of raisins, and so raisins were sent to Allamuchy from Paterson, in order that birds which strayed from the preserves might remain strayed. This was playing it rather low down on the birds and the owners of the preserves, but then the Paterson men were poor and they needed the birds.

"Everything went along nicely for a number of years and bags of from ten to thirty, and even more birds a day for two gunners were not at all uncommon. Then the natural greed of the rich took possession of the owners of the preserves. They went to the Legislature and

secured the passage of a law which permitted them to shoot birds a month ahead of the regular open season. The poor Patersonians had to put up with this display of favoritism to capitalistic greed, and the only thing done was to double the importation of raisins to Allamuchy.

"But now a new element has entered into this struggle between the rich and the poor. The pheasants up there are either imported or bred. No matter how they get there, they are fond of something to eat. So a bird-trainer has got his work in and as soon as the birds arrive or are hatched and big enough to fly he feeds them, always first sounding a whistle with a peculiar note. This whistle may be heard for a distance of over a mile, and no sooner does it sound than every pesky pheasant starts for home and grub. In this way the birds are trained to keep off the property of the poor men from Paterson. Then the bloated bondholders begin their shooting in the early part of October, and by the time the law permits the common mortals to shoot, all the birds have either been shot or cooped up for the winter. Pheasants have been so scarce up Allamuchy way this year that some of the poor men from Paterson have been actually compelled to pay \$3 and \$4 apiece for birds in order to make something like a decent showing on their return to their families and friends."

## Hunters of France.

PARIS, Nov. 10.—President Loubet is a mighty hunter, yet he was recently unable to invite Alfonso to a deer hunt on his own state forest grounds of Rambouillet—a duchess stopped him. It is a curious story, and has to do with what remains to-day the most typical as well as the most aristocratic of French sports.

It is the "chasse a courre," in which the stag is not shot, but just "run" with horses, hounds and horns for half a day or more until he drops. The young King of Spain, knowing that in France to-day there flourish some 380 highly-equipped hunts of this character, and having vague ideas about the French state forests, hinted that the ancient "sport of kings" would be acceptable in his sight, as well as suitable to his age, tastes and traditions.

Yet it could not be done, the republic possessing neither the equipment nor the present use of its own game forests. Compiègne and Fontainebleau are leased outright; Marly, the only one reserved completely to the president, is almost devoid of big game; while Rambouillet, beside the president's own favorite hunting chateau of that name, is in this strange situation. Suppose the president had invited young Alfonso to shoot rabbits with him in the fields of Rambouillet. They might have heard approaching the melancholy notes of the horn and the musical baying of the hounds. Then there would have dashed past them a hunt gay in red and blue, with gold and silver braid—a vision of the old régime. And had Alfonso asked "What, on your presidential grounds?" M. Loubet would have been constrained to answer: "Yes, the right to chase deer is leased to the duchess."

It is the Dowager Duchess d'Uzes, and her rights go back to the time of Louis Philippe. After the revolution of 1848 the crown forests—of which Louis Philippe acknowledged himself only the life tenant—returned to the state and were put in "Adjudication" as a measure of republican simplicity.

The first lessees of the crown forests considered themselves lucky, for prices in those unsettled days were low. Their joy was short-lived, however, for after Louis Napoleon's coup d'état in 1851 there seemed nothing left but to kill as much as possible before the inevitable confiscations should fall upon them. As a fact those who had not been courtiers enough to "cede" their right to the emperor were despoiled in the calmest manner, and the lessees of Rambouillet, among whom were the Duc d'Uzes, the Duc de Luynes, the Duc de Noailles, made one great final hunt on March 15, 1852, which remains celebrated in the annals of French venery.

The confiscation profited Napoleon III. but little. After the proclamation of the empire, the Prince de Wagram, on account of his aptitudes, was named grand veneur of France, but he was shortly after replaced by Marshal Magnan, who knew little of the subject, while the emperor soon lost all interest. It thus came to pass that in 1868 the Duc de Luynes and the Duc d'Uzes were hunting again at Rambouillet, firmly established in the new leases. On the death of the Duc de Luynes, killed at Patay in 1870, the duchess, his widow, no longer cared to keep up her end of the pack. The Duc d'Uzes took it over, and when the Duchess d'Uzes became a widow, in her turn, she continued to maintain it alone, her passion for the chase, like that of the late Empress of Austria, never failing—even in these days of automobilism, when she holds the first "watman's" certificate issued to a woman by the French authorities.

The noble Dowager of Uzes, of Crussol, of Bour-sault, of Bonnelles and other places, called "The First Huntress of France," made no move to help the president out of his difficulty, nor could she, indeed, given the political situation. The president retains the right to shoot rabbits and partridges at Rambouillet, but should he wish to chase the deer, the duchess must invite him from her nearby chateau of Bonnelles.

She does not invite him often. In return, perhaps, he has forbidden the military uniform to appear at the meets of the duchess—a thing all the more annoying to her, as the burden of it falls, not on the great lady, but on the aristocratic but not always well-to-do young officers of the neighboring garrison, thereby forced to go to the considerable expense of keeping up slightly modified eighteenth century hunt costumes.

It is, perhaps, the most aristocratic hunt in France, yet President Loubet, as it dashes past him, can reflect that if its middle-class blood and money of even recent times were taken from it, the purely aristocratic residue would be very much less brilliant and numerous.

It is the same with the dogs. The French revolution, which dispersed and financially crippled so many aristocratic families, also dispersed the aristocratic packs of deer hounds whose ancestry often went back in an unbroken line much further than that of their masters

—to St. Louis and old Charlemagne himself. In some cases the race was preserved pure through a small pack or pair of dogs. Such was the famous race of Saintonge, which in 1789 was on the point of disappearing. If it exists to-day it is thanks to a Dr. Clemot of Saintes, to whom the Marquis de la Porteaux-Loups intrusted two males and a female. On the return of the marquis from the emigration Dr. Clemot gave him back the increased family, who became the ancestors of all the pure Saintonge and Saintonge-batards of to-day, and they are notoriously delicate.

Thus it happened that when the restoration came scarcely a single great family could reassemble a pack of pure descendants of the famous old races whose qualities resulted from more than one thousand years of selection. To individual dogs of pure race were therefore "misallied" English sires and dams, mostly foxhounds. They called the progeny "batards," but in spite of the name, the new blood did no harm, because toward 1840 the invigorated races began showing themselves so much superior to the all-pure blood products that they now compose the vast majority of all the packs of France.

The Uzes dogs are technically Vendean batards, but if we trace their ancient blood line we find it springing from two historic animals who, in their time, came to court as "outsiders"—like the three brothers d'Albert when they came up to the court of Louis XIII. with one new suit among the three of them, and were reproached with being of "little birth." That did not prevent the founder of the family of d'Albert de Luynes winning the young king's favor by his skill in training butcher birds to kill sparrows, and so becoming grand falconer and duke and constable of France.

It happened thus—in the time of Louis XI—that a poor Vendean gentleman presented to that monarch a white dog marked with dark orange. The animal's name was Greffier, and he is supposed to have been a white bloodhound, called in England to-day a Talbot dog, with a dash of mastiff. Greffier was mated to a female of his color and marking, no less celebrated in her day, being Baude, the favorite dog of Anne of France, daughter of Louis XI. Baude seems to have been a braque, or English poacher's dog, having a resemblance to our pointer.

From this union descended "the white dogs of the king," a race that enjoyed two centuries of royal favor. Then, being supplanted by the Norman race, they remained chiefly in favor in the Vendean district, and the pure Vendean race is nothing but their continuation. M. Baudry d'Asson, the present day patron of the pure Vendean stock, hunts with them, but not a member of the Uzes hunt would be willing to trade packs.

Why? Because in the "batards" of the Uzes the delicacy and crankiness of the pure old race have been corrected by new blood.

AN AMERICAN IN PARIS.

## The Greatest Duck Shooting Place on Earth.

RALEIGH, N. C., Dec. 14.—A letter from Bird and Game Warden John B. Upchurch, who is on duty this season on Currituck Sound, the greatest duck shooting place on earth, says that he thinks everything has been gotten into good shape. He has been there now forty days, and says the night shooting, known as "fire lighting," in Currituck Sound is a thing of the past. There is a little shooting between sunset and dark, which the law seems to allow, as it says that no one in Currituck Sound shall leave his landing before sunrise for the purpose of hunting or shall continue to hunt or fish after dark. He has only heard two guns fired after dark this season, and he says he thinks the people are becoming more reconciled to the law. Regarding game, he says there are great quantities of swan and wild geese, and that he has seen more than 200,000 of these in the past fortnight, together with at least a million coots and a great many canvas and red-head ducks.

Samuel A. Cooper, who is the game warden on Knott's Island, says there are more canvasbacks and red-heads than in any other season past, but that they are very wild and stay out in the surf on the seaside most of the day, and only come into the sounds to feed at night, this being very probably because of the warm weather which has prevailed. When the weather gets colder they will be plentiful in the Sound and not so wild.

Warden Upchurch has visited the club houses on Currituck Sound and says he finds the clubmen extremely well pleased with the work of the game wardens who are under the Audubon Society. The clubs are as follows: Narrows Island, Palmer Island, Monkey Island, Swan Island, Deal's Island, Morse's Island and the Currituck Shooting Club, all owned by non-residents and employing at least 150 men as marsh guards and guides, etc., all employes being natives of that county and receiving \$50 a month on an average, this bringing in quite a revenue to the people. The clubmen say they hear no more night shooting this season.

Quantities of bass and rock fish are being taken in those waters, which bring the fishermen an average of nine cents a pound. Warden Upchurch finds that last season's shipments of fish in those waters brought in about \$100,000, and the shipments of duck, geese, swan, etc., about \$150,000. Good fishermen, two in a boat, make \$10 to \$12 a day with a small net. He says there are from 300 to 500 gunners on Currituck Sound every good shooting day at an average cost of about \$5 to every good shooting man. He remarked that this will show that wardens in that section have heavy work in looking after so many people daily, they having to see that the gunners leave at night. Very few of the fishermen or gunners are stubborn or make any trouble about the rule as to night work, and most of them like the new law and express themselves as glad that it is being thoroughly enforced. The news of the good protection of game in those waters will interest fishermen all over the country.

FRED. A. OLDS.

ALL the mountains in Switzerland have suddenly been reduced in height by about ten feet. In 1820 the tip of a certain rock in the Lake of Geneva was calculated to be 376.86 metres above ocean level, and on this basis all the summits in the country were calculated. Recently, the discovery was made that an error had been made in fixing the height of that rock, and that it is 3.26 metres lower than it was marked.

## Towering Birds.

WHY is it that a mallard, a grouse, a quail, and, for the matter of that perhaps any bird when wounded in the head during flight will frequently tower or mount upward at an acute angle, oftentimes to die in midair and drop dead to the earth like a plummet or setting its wings, come to earth at a long, sloping angle?

I remember a curious case of this kind in connection with a sharp-tail grouse. We were walking through prairie grass well above our knees when a long distance ahead upon a knoll on the prairie we espied a sharp-tail grouse, an old cock bird, standing erect in a sort of oasis of short, velvety grass not more than a couple of yards in diameter.

We walked quietly along taking care not to stamp our feet upon the ground any more than necessary. The bird seemingly was engrossed with something, for with its back to us it paid no attention to us whatsoever until we had advanced within about eighty yards of it. Turning its head it sized us up and then began to show symptoms of restlessness, first standing on one leg and then upon the other. The early afternoon sun was shining brightly and the beautiful bird with neck and head erect and body distended upon its restless feet made an attractive and unique picture.

The wary bird evidently thought we were close enough when, with a spring and a coo coo, he darted up in the air. My friend slightly in advance of me took the shot. The bird did not seem to change its course or alter its flight in any way. Up, up, up almost in a straight line, the bird towered, its wings beating the air and propelling it skyward. We watched the towering bird until we thought it would go out of sight, when its wings ceased to beat and became set, as when alighting upon the ground.

Down, down it came, slowly at first and then more rapidly at an angle directly toward us, finally falling stone dead at our feet. Picking the bird up and carefully examining it we found that a single shot had penetrated its head. Presumably the nerves of direction in the brain were paralyzed and the bird, yet full of life and vigor, beat the air and ascended upward. I have seen a mallard do this same thing in the towering line, likewise a quail. What is the explanation? CHARLES CRISTADORO.

## Ran into a Flock of Geese on the Potomac.

CAPT. BAILY REED, master of the river steamer Harry Randall, reports a singular occurrence that happened on the trip of his steamer up the river Thursday night. Captain Reed says that the attention of the men in the pilot house was attracted to a singular noise in the air over the steamer, like she was passing through a flock of big birds. Turning on the searchlight, it was discovered that a large flock of wild geese, flying low, had run afoul of the steamer, and, blinded by the rays of the searchlight, were flying wildly about the smokestack. Several of the big birds struck the stack, but fell into the water, where they could not be recovered in the darkness. The men on the steamer fired on the geese, but failed to bring any home, though they claim they shot several.—Washington Star, Nov. 25.

## That is What We All Want to Know.

PORT RICHMOND, N. Y., Dec. 18.—*Editor Forest and Stream:* A week or two ago your columns contained a reference to the liberation of hares on a Long Island preserve. Your item said that when the hunting season came there was none of the hares to be found. Why?

This matter is of interest to a good many sportsmen here. Can you or your readers give us any light?

SIDNEY EDWARDS.

## From a Nebraska Epicure.

THE bosom of a mallard duck, stewed down until there are no juices going to waste, a baked potato about the size of a goose egg, two slices of Boston brown bread right out of the oven and spread with butter that has no a hetic reputation, a spoonful of raspberry jelly, a cup of Young Hyson of moderate strength, a piece of pumpkin pie, man's size, and you have a dinner that ought to keep you in a good humor until curfew rings.—Nebraska State Journal.

## From Morristown, N. J., to Minneapolis, Minn.

MORRISTOWN, N. J., Dec. 13.—FOREST AND STREAM is a welcome visitor each week. Wish you a Merry Christmas and many of them.

C. M. PHILLIPS.

MINNEAPOLIS, Minn., Dec. 11.—*Editor Forest and Stream:* I received the copy of Hamilton's "Sixty Years on the Plains" some days ago and finished it at one sitting. I should not have done such a thing, but read a chapter at a time, but the book was so fascinating that I could not drop it.

I inclose my check for \$1.50, and would request that you send a copy to my nephew ———, California, and put the inclosed card in.

I could write many good things about your paper but am quite averse to publicity, and do not like to do it for that reason; but will say that I have noticed that a great many subscribers have talked about reading it for a dozen or fifteen years. It seems to me that I have read it ever since I quit the "primer," and I have now passed the half-century mark. Nothing comes into my house that I look forward to so eagerly as the advent of FOREST AND STREAM each week.

I think that "Old Bill's" book is the best thing ever turned out. My copy is already done up and ready for mailing to a nephew in Illinois, for I do not see how a boy can get a better or truer idea of the early West.

The following account of how punctiliously sport is conducted in Germany is amusing. After the Kaiser had conferred on the King of Spain the right to wear the Royal Prussian hunting uniform, the two monarchs engaged in the shooting of wild pigs near Hanover. The beaters drove 240 pigs in front of the guns. The Kaiser shot 22, the King 29, and the Crown Prince 18. These nice gradations in the number of pigs slaughtered is supposed to be significant. It is stated quite openly that the Kaiser could have shot more, only he wished his Royal guest to come out first. As a matter of fact, the King was greatly pleased with himself. He told the Kaiser that he thought the scenery around Hanover just like Spain.—Shooting Times. [In such manner are game hogs disposed of abroad.]

# SEA AND RIVER FISHING

## Fish and Fishing.

### A Tarpon in Quebec.

THE Garrison Club, of Quebec, has recently been the recipient of a magnificent specimen of the tarpon, to be added to its fine collection of trophies of rod and rifle. Its carcajou and beaver, and the beautiful specimens of heads which adorn its walls have long been famous, the latter including buffalo, moose and caribou, having been added to not long ago by the loan of a grand collection of South African horns, belonging to Captain Swift, who saw service during the late Boer War. A handsomely preserved salmon is one of the mural ornaments of the club, and it was here, too, that the lately-created Lord Harmsworth, some few years ago, when simply Mr. Alfred Harmsworth, was shown the 8 and 9-pound specimens of American brook trout from Lake Batiscau, of which he wrote so enthusiastically to the late Mr. A. N. Cheney. The tarpon, which has just reached the club, is the first and only specimen of the silver king in Quebec. It was caught at Aransas Pass, Texas, and presented to the club in appreciation of courtesies received by Drs. Civilion Fones and George L. Porter, of Bridgeport, Conn., who are among the many American anglers to enjoy the hospitality of the club when passing through the old French capital of Canada on their way to their northern preserves of fish and game.

### President Roosevelt Honored at a Canadian Banquet.

Dr. George L. Porter, of Bridgeport, Conn., was in Montreal last week in attendance at the Fish and Game Convention called by the Hon. Mr. Prevost, the new Minister of Fisheries of the Province of Quebec, and while there made what was perhaps the most eloquent speech of the occasion, in response to the toast of "Roosevelt, the Sportsman." The reputation for eloquence enjoyed by Dr. Porter throughout New England had preceded him to Montreal, and while he had been marked in advance for a speech at the banquet which terminated the Congress, the toast in reply to which it was made, was suggested by the references to the President made by the Hon. Mr. Prevost, who was the guest of the evening. It was in replying to the toast of his own health that the Minister asked where better or more thorough-going sportsmen were to be found than His Majesty, King Edward, or than President Roosevelt, "who is honored and beloved as much, perhaps, in this Canada of ours as in the neighboring republic across the lines, because of his sterling qualities as a ruler and as a man, who has achieved the signal honor of initiating the honorable peace which closed the greatest war of modern times, and who, in spite of his love of peace is one of the most fearless and most successful hunters of modern times."

When Mr. Prevost resumed his seat, Dr. Finnie, the chairman of the banquet, immediately rose to propose the health of the President, the orchestra played "The Star Spangled Banner," and Dr. Porter was called upon to reply. In the course of his remarks the Doctor referred to President Roosevelt as one who believed not only in a square deal between man and man, but also in a fair deal between man and beast. The speaker's eloquent references to the beauties of the north Canadian country, and especially to that part of it in which is situated his own beloved Bostonian Association's preserve were loudly applauded, and nothing more charmingly vivid than his description of a fire in the forest could well be imagined. The newspapers made it the feature of their reports, and their sketch artists reproduced the Doctor's figure addressing the dinner company in the following issue of the papers. If Dr. Porter could be induced to dictate his speech to a stenographer, the reproduction of it in FOREST AND STREAM would afford much pleasure to the readers of it.

### The Change of Sentiment in One Year.

Referring to the banquet and the speeches made at it, one of the Montreal newspapers had this to say: "In direct contrast to last year's affair, when the principal speech of the evening had been directed in criticism of the Provincial Government, the forty-seventh annual dinner of the Province of Quebec Association for the Protection of Fish and Game was devoted to eulogy of the present administration, and particularly of the efforts being made by Hon. Mr. Prevost to reform the evils which for so many years the Association had striven to remove."

This pretty well sums up the popular appreciation among local sportsmen of the policy outlined at the recent convention by the new Minister in regard to his administration of the fish and game affairs of the Province.

### Americans at the Convention.

American sportsmen were well represented at the convention, and took quite an important part in the proceedings. Among many others present were Messrs. Robert E. Plumb, Detroit; Frank S. Hodges, Boston; Mr. Chamberlain, president of the Metabetchouan Fish and Game Club; Dr. Porter, of Bridgeport, president of the Bostonian Association; Andrew Irving, of Ogdensburg, N. Y.; ex-Governor Nelson W. Fisk, and Commissioner Thomas, of Vermont; George A. Stevens, Lake Placid, N. Y.; Paul Smith, Adirondacks; R. H. Brown, New Haven, Conn.; State Senator Aulls, New York; Assemblyman Knapp and C. H. Wilson, Glens Falls, N. Y.

The New York and Vermont delegations had an interview with the Minister concerning the suppression of the netting in Missisquoi Bay, and left Mr. Prevost satisfied that he will leave nothing undone that is within his power to terminate the pernicious practice which has for so long prevailed on the Canadian side of the bay.

Much of what was said, both by the Minister during the sitting of the conference and also by the delegates from the United States was of considerable interest to anglers, and I shall have occasion to refer to some of the discussion in a future article, when I have had time to expand my notes of the proceedings. Some of the net results of the convention may be hastily summed up as follows:

The Minister declares his general policy to be a change in the present system of protecting fish and game, which he hopes will assure better sport to all visiting anglers. As the system will be a more costly one for the Government he will require to either increase, in future, the prices paid for leases of fishing and hunting rights, or to exact that these lessees, like other non-resident sportsmen, shall pay license fees, in addition to the price of their leases; their licenses, however, to give them the right, which they do not now possess, as mere lessees, to fish or hunt, or both, as the case may be, on any open Government territory in the Province.

Mr. Prevost also promises a definite suppression of all netting in the inland lakes of the Province and the reduction of it as far as possible in the St. Lawrence and its lake expansions, and the estuaries of other large streams. He has agreed to the increase of the bounty on wolves from \$5 to \$10 per head, has promised the adoption of the tag and coupon system for the shipment of game, and undertaken to ameliorate the entire system of fish and game protection throughout the Province.

E. T. D. CHAMBERS.

## The Anglers' Club of New York.

PREVIOUS announcement has been made in these columns of the preliminary meetings held by a number of anglers of this city for the purpose of forming an anglers' club, but it was not until the night of Dec. 12 that a club now known as the Anglers' Club of New York was formally organized and officers elected. This meeting was held at the home of Mr. James D. Smith in West Eighty-sixth street, and was presided over by Mr. Robert B. Lawrence, who had previously been chosen to act as temporary chairman. Messrs. Lawrence, C. G. Levison, Edward Cave and G. M. L. La Branche, who had been appointed to draw up a constitution, reported the results of their labors, and were discharged. The proposed constitution was then taken up, section by section, and adopted with a few minor changes. Among its provisions the following may be of interest to our readers:

Among the club's objects are these: " \* \* \* to acquire by lease or purchase a club house or houses, grounds and waters adjacent thereto or convenient for use in connection therewith, as a resort or resorts for fishing or shooting; and to promote social intercourse among its members; to cultivate and practice the art of scientific angling; to encourage contests of skill in fly and bait-casting; the protection and propagation of fish and game."

No person who has taught for pay the art of casting, who fishes for the market, acts as a guide for pay, or is engaged in the manufacture or sale of tackle or sporting goods can become an active, voting member, but may become an associate member. Associate members cannot hold office, form a part of a quorum or vote at meetings.

The charter membership, limited to twenty-five, is as follows: Robert B. Lawrence, Milton H. and James D. Smith, Edward Cave, Gonzalo Poey, John F. Bullwinkle, Perry D. Frazer, Chancellor G. Levison, Charles Stepath, Joseph and John Zdankiewicz, Dr. R. J. Held, G. M. L. LaBranche, Edward B. Rice, William J. Flynn, R. H. Klotz, Dr. George W. Blakeslee, E. T. Keyser, F. W. Sumner, W. G. Geety, R. H. Chambers, Lody Smith, T. E. Batten, Charles A. Bryan and W. A. Babson. The names of a large number of applicants are now in the hands of the committee on admissions.

Officers were elected as follows: President, Robert B. Lawrence; Vice-President, Milton H. Smith; Treasurer, Gonzalo Poey, 116 Broad street; Secretary, Perry D. Frazer, 501 West 164th street; Executive Committee, Messrs. Lawrence, M. H. Smith, Poey, Frazer, Edward Cave, C. G. Levison and John E. Bullwinkle. Committee on Admissions, G. M. L. LaBranche, 30 Broad street, Chairman; Edward B. Rice, Dr. R. J. Held, James D. Smith and Charles Stepath.

The club's fiscal year will commence on the second Tuesday in January, at which time the annual meeting and election of officers for the ensuing year will be held. Applications for membership can be sent to the chairman of the committee on admissions, whose address is given above, or to the secretary. Applicants must be proposed by a member and seconded by another member, both of whom know him; applications to be made in writing, giving the name, residence and occupation of the applicant. Applications passed on by the committee on admissions will be voted on by the executive committee. Members-elect must sign the constitution and pay their initiation fees and dues to the treasurer within thirty days after notice of his election.

The secretary of the new club requests secretaries of the various fly and bait-casting clubs throughout the United States to send him the record scores of their members, stating briefly the conditions under which they were made; weight of rod in fly contests, and weight and kind of bait in bait-casting contests; also whether club or open, and whether into or with the wind. If this is done he agrees to compile all obtainable records, wherever made, and publish them in all of the sportsmen's papers in this country, for the benefit of anglers and clubs generally. This seems to be the only method by which the confusion existing at present

can be untangled. Mr. Gonzalo Poey, the treasurer of the Anglers' Club, was the secretary of the old National Rod and Reel Association, and as he has all of the records, these will be recorded by the secretary of the new club. All of the records made in the tournaments held in Madison Square Garden will also be recorded in the club books, and if the secretaries of the Chicago, San Francisco, Kalamazoo and other clubs are sent to Mr. Frazer, in due time these will all be published in concise form, and the fly and bait-casters of the country, whether club members or not, can see what has been done in the past and what is to be accomplished by diligent practice with rod and reel.

### Fish Eggs Come in Free.

RECENTLY the Pennsylvania Department of Fisheries learned that there was a possibility of securing some lake herring eggs on the Canadian side of Lake Erie and sent cases over for them. A day or two later the superintendent of the Erie hatchery reported that the custom officials at Erie stated there would be a duty of 20 per cent. to pay thereon. The Commissioner of Fisheries immediately wrote to the Secretary of the Treasury asking if that were the case to have the duties removed on the grounds that the eggs were for public use entirely and neither for barter nor sale, and that the fish hatched therefrom would be returned to the waters from which the eggs were taken. A few days later, Commissioner Meehan received a letter from the Treasury Department to the effect that any collection of duty on fish eggs would be a mistake since, under the law, fish eggs are entered duty free.

Under an act passed by the last Legislature, seines are allowed for the capture of carp, suckers and mullets under certain restrictions, provided the owners and operators of such nets gave a bond in the sum of \$200, to be approved by the county court, that all fish other than carp, suckers and mullets be returned to the water, etc. Recently, a court in Warren county approved a bond giving authority to a club to fish a seine, and the bond was signed by two individuals. This not appearing to the Department of Fisheries to be in regular form, notwithstanding its approval by the county court, it was submitted to the Attorney-General's Department and that department has made a ruling that such a bond is not proper, under the law, and directed the Department of Fisheries not to issue a permit under the bond notwithstanding it has been approved by the county court.

On Dec. 12 there were in the six hatcheries in Pennsylvania 105,228,500 fish eggs, or 37,064,100 more than on Dec. 31 of last year. It is also only about 37,000,000 less than the total output of fish by the department this year. The prospects are therefore that in 1906 the output of fish will break all records ever made by Pennsylvania or any other State.

### Mr. Forey's Proposed Net Bill.

SYRACUSE, N. Y., Dec. 16.—*Editor Forest and Stream:* I note in your report of the proceedings of the annual convention of the New York State Fish, Game and Forest League, held in this city on the 7th inst., that the measure introduced by J. A. Forey relating to the seizure and destruction of nets, seines and other illegal devices for the capture of fish when found on or near the shores of lakes or streams in which the use of such devices are forbidden by law, was, after some discussion, "dropped."

By some hocus-pocus, perhaps unintentional, it was so reported to one of our daily newspapers and was copied by other newspapers from that one.

The truth of the matter is, that the measure was adopted by an unanimous vote of all the delegates, and the Law and Legislative Committee were instructed to prepare and endeavor to have introduced and passed by the Legislature a bill practically along these lines.

In my opinion such a law as this is necessary to stop the wholesale piracy that is being practiced in all of our inland waters, as our State game protectors and our special protectors find it next to impossible to find the nets, seines, etc., in the waters, but they, and thousands of genuine sportsmen, do see them hanging on fences, trees, bushes and buildings drying out, after having been hauled and emptied of their illegal catch, preparatory to being again used in the waters.

The measure introduced makes it a misdemeanor to have such illegal devices in one's possession, in such localities, and punishable by same fine as though the owner was caught in the act of using such devices in the waters.

[We share Mr. Forey's view as to the value of such a law, and we regret that the action of the League respecting it was incorrectly reported.]

### Canon City, Colo.

WE have received the supplement to the Cañon City Record, issued Nov. 23, 1905, a beautifully illustrated paper devoted to Cañon City and its various industries. Among its articles are two or three on shooting, fishing and natural history, and among the illustrations two of Dall Deweese, famous as a reclaimer of desert lands, fruit grower, Alaska traveler and hunter and founder of the Pike and Carson Club, dedicated to the protection and preservation of the game animals of North America and to scientific exploration. The club is modeled on the Boone and Crockett Club.

"Cañon City Illustrated" is a beautiful publication.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

### Tampico Tarpon Fishing.

TAMPICO, Mexico, Dec. 10.—*Editor Forest and Stream:* The tarpon season in Mexico was inaugurated yesterday by Mr. St. Clair Boyd, of San Francisco, Cal. After two hours of exciting contest, using a seven-foot lancewood rod, he succeeded in landing a magnificent tarpon measuring in length exactly seven feet and one inch, with weight of 190 pounds. The record fish of the season of 1904-'05 was seven feet and two inches, and it is remarkable that a tarpon so nearly approaching in size the largest of the past year should be caught at the very beginning of this year's sport. Mr. Boyd's tarpon is being prepared by a Tampico taxidermist, and will be shortly shipped to his home in San Francisco for exhibition among the California sportsmen. A few days previous Mr. A. M. Poindexter, proprietor of the Hidalgo Hotel, while fishing for tarpon, hooked and landed with identically the same

tackle, a jewfish or black bass, weighing 400 pounds. The River Panuco, at this point, is as yet a trifle too muddy from the fall rains for the best of fishing, but a couple of more weeks will find the water clear, and all indications point to a very large catch of tarpon before spring.

### Henry Van Dyke on "Adirondack Murray."

In a personal letter written by the Rev. Dr. Henry Van Dyke to Harry V. Radford, whose biography of "Adirondack Murray" has recently appeared, the author of "Little Rivers," "Fisherman's Luck" and "The Ruling Passion," makes the interesting disclosure that it was in the Adirondack region that the distinguished preacher-author-sportsman first learned the use of rod and gun. Dr. Van Dyke's letter is as follows:

"AVALON," PRINCETON, N. J.—My Dear Mr. Radford: Let me thank you very cordially for sending me your little book about 'Adirondack Murray.' Your writing takes me back in imagination to that beautiful country of mountains, and rivers, and lakes, where so many of the happiest months of my early life were spent, and where I learned to cast the fly and shoot a rifle. It is pleasant to feel the sincere and cordial enthusiasm with which you write of the fine traits of Mr. Murray's character, and the big out-of-door side of his life in which the best of his nature found expression. I congratulate you on the success with which you have performed your task of gratitude and friendship, and hope that your book will find its way into the hands of thousands of those who love the woods and the waters.

"With best regards, Faithfully yours,

"HENRY VAN DYKE."

# YACHTING

## And the Lost Shall be Found.

BY WILLIAM LAMBERT BARNARD.

"No hand was there to guide her,  
No eye to see the sight,  
Destruction ran beside her  
As she battled through the night."

—The Wreck of the Royal George.

ONE crisp, clear morning in late November I found Captain Nate perched on the rail of Oliver's Wharf, contemplatively regarding the single line of catboats spreading out along the beach on each side of the bath houses. Stripped of all gear and rigging they were, and innocent of canvas covers and such swaddling clothes with which their yachting sisters are tucked in for the winter. Their gaunt masts, erect but seemingly woe-begone, gave the last dreary touch to what is always a desolate scene.

"You can talk 'til you're blue," asserted Captain Nate, quite as though we had been having a long argument, "but I can't help feelin' that a boat's a good deal like a woman. They need a good man to run 'em. Then, again, there's some what can go it alone in a way to 'surprise you. Just look at 'em! There's the Marie, an' the Prudie, an' the Rachael—good, steady-goin' old packets, never done nothin' outer the way nor come to any harm. But turn 'em adrift an' Lord bless you! they'd go all to pieces. On the other hand, look at that round-bellied slab there that 'Lonzo built for Cap'n George years ago—called her the Uneedher, after some new brand of can milk, or some such truck. One day she has a lee helm, next day she wants to stick her nose right up in the eye of the wind an' keep it there. If you don't want to reef she needs it, an' if you did she'd stand up like a church an' hardly get out of her own way. She certainly is the cussedest, cantankerous old wagon I ever did see. By rights she'd orter been on the rocks long ago. But no, sir! durned if she don't go an' do what I'd never believed the best boat, an' with Cy in her at that, could do.

"You remember the storm we had two years ago—two years ago to-day now I think of it. The time Pollock Rip and the South Shoals went adrift. We had a late season that year an' no one hauled out as early 's this. I'd been down to the west'ard scollopin' an' I seed it was makin' up for bad weather—almighty bad. So I pulled up stakes an' druv' the Caroline for home. Didn't much more'n make it, either.

"Cap'n George had hired out the Uneedher to one of those hair-leggers down Harwich way for the scollopin' season. George allowed that 's long 's the folks down there was so sot agin our scollopin' on their grounds he might 's well do the next best thing an' make her get some of the money, seein' 's he couldn't. Didn't I ever tell you 'bout the rinktums they raised down there over our scollopin' on their grounds? Got so hot they hed a special town meetin' to stop it. All their fishin' men went to the meetin' to hev a say, an' while they was resolutin' an' regulatin' we cleaned up purty nigh the last scollop that was left. Howsumever, that was three years ago.

"The man that hired the Uneedher of Cap'n George was named Bassett, I think—yes 'twas Lem Bassett. He had her moored off the beach, purty well out, 'count o' the flats that run out from the beach, an' he bein' too lazy to take her round into the river every night. An' so when the wind's off shore it gets quite a sweep before it strikes Lem's moorin'.

"Well, sir, when the bad weather struck in from the noth'east it struck hard. There warn't no preliminaries with that breeze. It jest arrived. An' it blew. My eye! but it blew. Seemed if it jest picked my house up an' shook it. It blew the surface right off the harbor, so what with that an' the flyin' sand you could scarcely tell v'here the beach ended an' the water began. Everything was white.

"The Uneedher caught it heavy but she stood up to it

purty well. Course she reared an' plunged something awful an' skated around like all possessed. There ain't anything cruises round her moorin' worse than a catboat, 'ceptin' one of these gasolene launches—an' they ain't really boats. But Lem's moorin' was a big stone, 'most as big as a millwheel, an' a new warp of three-inch manila with plenty of scope. Seems 's if she orter held on, an' I say she would if that durned Lem Bassett hadn't been so slack. He'd made that warp fast with a bit of inch'n a half rope—an' old rope at that. Said afterward that his warp had an eye-splice instead of a hook, an' as she didn't have no bitts he didn't have no other way to make her fast. Now, what'd folks say if I left the Caroline any such way? He might have bought new rope, but you know how 'tis—when they buy rope in Harwich it's time to pray.' Lem Bassett had been a purty good boatman, but he'd been skipperin' a Boston man's little yacht for three summers 'n I 'spose that associatin' with you ama-chooors had kinder spoiled him."

Captain Nate paused for a quiet laugh at my expense.

"Wal, it parted, an' she just sheered off and sailed away to loo'ard," he continued. "The spring tides was runnin' that week an' she must have just fetched the first of the west'ly current. That would give her a purty good cant to the west, an' I reckon she went inside the Bishops an' then struck across purty straight for the East Chop. How she ever made out to get by everything is too much for me. I'll bet there ain't a man on the Cape that would 'a gone out there thet night to save his soul. No, sir, not for \$50, either!

"Everybody here figures it out different. Some say she must have fetched down by the Squash Meadow, an' others think she was more to the noth'ard, but she must 'a been pretty far down the Sound before the tide turned to the east'ard.

"Bout that time, blest if the breeze didn't back to the nothwest, without losin' a stroke, a clean eight points, an' keep right on blowin' a gale. Jest think of the cross sea it must have kicked up out there!"

And he slowly waved his hand from east to west to include all the shoals from the Handkerchief to Succonneset.

"My eye! but it must have been fierce," he continued. "Thinkin' 'bout it's bad enough, an' I don't never want to see if it's 's bad 's I think.

"Wal, off she goes agin. An' she must have kept edgin' out more or less—don't seem as if the tide could have give her all the eastin' she made. Lord knows how she ever got by the Cross Rip an' the Horseshoe without swampin'. I tell you, Charlie, there couldn't have been no waves on those shoals that night, nothin' but a jumble of holes with straight sides, runnin' in every d'rection. But she got through it somehow an' out across the Point Pip—an' that's the wickedest place of all. The light keeper there at Great Point made her out in the mornin', joggin' along to the south'ard on the outside. Said he never saw a funnier sight. There she was, sail furled, riggin' taut an' ship-shape, ridin' high an' takin' it easy with nary a soul on board, as far as he could see.

"There's quite a back eddy makes in along that shore, makes right in to the beach, an' he suspicioned what might possibly happen. So he telephoned up the beach to the life savin' station an' then started up the beach after that old Uneedher. The wind was still blowin' a gale, an' of course it was off shore there. Well, sir, he followed that old hooker as far as the station an' then the whole caboodle of 'em follered her, takin' some rollers an' tackle an' a horse along with 'em. She'd edge in, an' edge in, an' tease 'em along, keepin' that up 'til they was nearly up to the Haulover Bar, an' then, durn me, if she didn't stick her tail between her legs an' scoot for shore, landin' on the beach right at their very feet. All they had to do was hitch on, put a roller under her, an' give the horse a slap an' there she was, high an' dry an' safe 's n' old maid under the misseltoe."

"She hadn't parted nothin' or started nothin', an' there warn't more'n a barrel of water in her, either. Could any man livin' have took her through the Sound that night without sinkin' her? Wal, I guess not! An' that's why I say a boat's like a woman. You never can tell what she will do 'til she's done it. An' then, most likely you won't believe it."

## Boston Letter.

LONG DISTANCE RACES.—Two of the Massachusetts Bay clubs are planning long distance races for the coming season, the Corinthian Y. C. and the Eastern Y. C., both of Marblehead. Both clubs have been interested in long distance racing, the Corinthian in an annual event, which is sailed from Marblehead to the Isles of Shoals and return, and the Eastern Y. C. in somewhat longer races, one from New York to Boston and the other, last season, from Marblehead to Halifax.

It is quite possible that the Corinthian Y. C. will again hold its race to the Isles of Shoals and return, as this event has created much interest, and in the two years that the races have been sailed, good attendances have been secured. While nothing definite has been announced, it is now considered likely that the Corinthian Y. C. will provide for larger classes than have yet sailed in its long distance races, and that the larger yachts will be given a course probably from Marblehead to the Isles of Shoals, thence to some point off Cape Cod and return, a distance of about 130 miles.

The Eastern Y. C. is not likely to repeat its long distance race from Marblehead to Halifax next year, as its Regatta Committee does not believe in too much sameness in such big events, and also because it is felt that such a race would be putting the Halifax yachtsmen to too much constant expense in entertaining visiting yachtsmen. One course that is now under consideration by the Regatta Committee is from Bar Harbor to Cape Cod and thence to Marblehead, a distance of something over 200 miles. In the event of this course being given, the race would be sailed at the end of the annual cruise, which, in this case, would be in July.

In the light of former long distance races, it seems that such courses as suggested in the foregoing would be far better than courses of equal length, where only the starting and finishing points give an idea of the positions of the yachts. In such cases there is a lively interest at the start, and then as the yachts are not seen or heard from, the event is nearly forgotten until the first yacht finishes; and that ends it. Where the yachts approach different points near enough to have their relative positions made out, it is likely that more interest would be shown among those who are left on shore, and at the same time there would be plenty of opportunity of showing skill in navigation.

There should be a good fleet of entries for both of these proposed races. The three big racing schooners, Corona, Elmira and Emerald are now enrolled in the Eastern Y. C., and their owners are generally quite willing to race. There are two new 55ft. schooners, one that is now building at Lawley's for Vice-Commodore H. A. Morss, of the Corinthian Y. C., and the new Shiyessa, owned by Rear-Commodore Alfred Douglas, of the Boston Y. C., recently completed at the same yard. Shiyessa was successfully launched last Tuesday, and was christened by Commodore Douglas' son Charles, in the presence of a large gathering of yachtsmen friends of the owner. In addition to these there are many yachts of more than 40ft waterline whose owners might be willing to contest.

SCHOONER FOR BIOLOGICAL WORK.—Mr. B. B. Crowninshield is at work on the plans of an auxiliary schooner to be used in connection with the work of the United States Biological Station at Woods Hole in gathering specimens of marine life along the New England coast. The schooner will be a centerboard, of good body and not too hard bilges for working in a seaway. She will be 51ft. over all, 38ft. waterline, 14ft. breadth and 5ft. draft. Her engine will be of low power, sufficient to take her to port in calm weather; but it will be used principally for working her dredging apparatus with which the specimens are gathered.

JUBILEE Y. C. OFFICERS.—At a meeting of the Jubilee Y. C., of Beverly, last Wednesday evening, the following officers were elected for the coming year: Com., Daniel W. Hardy; Vice-Com., Daniel W. Taylor; Rear-Com., William Pickett; Regatta Committee, John H. Claffin, T. O. Gilliatt and J. A. McLarren.

NEW LAUNCH ORDERS.—Messrs. Swasey, Raymond & Page have received the following orders for launches: 60ft. cruising launch for Rochester, N. Y., 70ft. trunk

abin launch to be used on Lake Michigan by a Chicago yachtsman, 60ft. cruiser for use on the St. Lawrence River, and a 65ft. launch for a Boston yachtsman for use on the south side of Cape Cod.

**LAUNCH FOR DR. EAMES.**—The Murray & Tregurtha Company is building a cruising launch for Dr. George F. Eames, of the Boston Y. C. This boat will be 45ft. long and 10ft. breadth. She will have a 25 horsepower four-cylinder engine. The 58ft. cruiser building at the same yard for Mr. C. A. Welch, Jr., of the Boston Y. C., is all planked and her engine has been installed.

**BLINK SOLD.**—The 40ft. hunting cabin launch Blink, owned by Mr. C. W. Estabrook, a competitor in the long distance race for the Rudder Cup last season, has been sold to Buenos Ayres parties. She has been shipped to New York by rail, whence she will be taken on the deck of a steamer to her destination.

**TUNA IN SOUTHERN WATERS.**—The 86ft. cruising gasoline yacht Tuna, owned by Mr. John I. Inglis, sailed for Florida on Nov. 26. She is in charge of Captain Lawson. JOHN B. KILLEEN.

#### Facts About Circular Lighthouses.

THE Minot Ledge Light is famed for the number of men who have gone crazy in it, and for that reason it is an object of interest to students of mental diseases. It is, as everybody knows, a piece of engineering of the highest order, being in that respect only second to the famous Eddystone Light. More than a year was consumed in getting a foundation for it, and so high are the tides and so terrific the storms that the entrance to the light is more than forty feet above the water.

Then, one above the other, come the five rooms occupied by the keepers and used for storage purposes, and then the watch room, and finally the lantern. The tower being circular and space greatly in demand, naturally everything is made to conform, so that no room shall be lost. Even the beds on which the men sleep are curved, the tables against the walls are circular and the benches are half moons. Everything is round.

In this lighthouse there have been at least five well marked cases of insanity, and others in which madness

has been suspected and the men relieved from duty. Experts in mental diseases who have made a study of conditions at the Minot Ledge Light attribute the unusual prevalence of insanity there to its peculiar form of structure. There is no point, they say, on which the eye may rest, so it travels round and round in a maddening whirl.

They therefore suggest that some means be devised for filling the curves and producing corners and angles. In support of this theory they cite instances of men who have lost their mental balance during long confinement in circular prisons, but have quickly regained it on being transferred to an ordinary room of corners and angles.

Baron Trenck spent much of his time in prison making marks and corners to break the circularity of his surroundings and keep his reason from slipping away on the mad whirl of encircling walls. Casanova, an Italian engineer, who was imprisoned in a round tower, gives much the same testimony. He says he felt great mental relief on being moved to an ordinary square room.

As it is well-nigh impossible to make much change in the form of the structure of the Minot Ledge lighthouse, the number of men in charge of it has been increased to five, in order that they may have frequent leaves from duty and take turns in going ashore for a visit to family and friends. This system has resulted in a decrease in the number of cases of melancholia and more serious mental disorders.

In fact, but for the frequent changes made in the service by shifting men from one station to another, the number of cases of this sort everywhere would be much greater than it is. In some cases a man is kept in a place for only a few months, and then sent to some less isolated station for a while.

To give the men something to think of other than their loneliness, and to occupy the long hours during which they have nothing to do, circulating libraries of fifty books each are provided. The books are carefully selected and changed every three months, when the inspector makes his visit. In the collection are biography, history, travel, fiction, poetry, illustrated magazines, and, in some cases, newspapers. Also medicine chests are provided for relief in cases of sickness and careful directions given for the use of their contents.

Despite the dangers and hardships of lighthouse life, there are many applicants for positions in them. Whenever a vacancy occurs in the service there is always a number of men to select from. And yet the pay is small. In fact, the law provides that the average compensation given keepers shall not exceed \$600 a year. Probably the best paid keeper in the service is the man at Hell Gate, who gets \$1,200 a year.—Chicago Chronicle.

**HILDEGARDE AND MARGARET SOLD.**—Manning's Yacht Agency have sold the auxiliary schooner Hildegard to Messrs. Frank R. Long and Jacob L. Swayze, of Hackensack, N. J., and the steam yacht Margaret for Messrs. William Gokey & Son to Mr. Charles F. Carbonell, of Havana, Cuba. Margaret will make Havana her hailing port in the future and she will be used by her new owner in Cuban waters. Hildegard is now at Morris Heights. She was built by Messrs. Camper & Nicholson, Gosport, England, in 1874 for the Prince of Wales, now King Edward. Mr. George Gould purchased her in 1887, and after a few years disposed of her to Gen. B. M. Whitlock, who sent her to the Herreshoffs in 1897, where she was overhauled and fitted with compound engines. General Whitlock afterward sold her to Mr. Blakely Hall.

\*\*\*

**NIAGARA LEAVES FOR SOUTHERN CRUISE.**—Mr. and Mrs. Howard Gould and a number of friends sailed from New York on the steam yacht Niagara on Dec. 16 for an extended cruise in the Caribbean Sea. Niagara has recently been overhauled by Messrs. Tietjen & Lang, and was in that firm's dry dock in Hoboken. Nassau is to be the yacht's first stop, and then she will proceed to Jamaica. On the return voyage she will put in at Havana.

\*\*\*

**DIANA CHARTERED.**—Mr. Percy Chubb has chartered his steam yacht Diana, ex Delaware, to Mr. H. H. Rogers, through Messrs. Tams, Lemoine & Crane. Mr. Rogers and his friends will join the yacht at Savannah, and she will make an extended cruise in the Caribbean Sea.

# HOUSEBOATS AND HOUSEBOATING

BY ALBERT BRADLEE HUNT,

Yachting Editor of Forest and Stream.

A volume devoted to a new outdoor field, which has for its purpose three objects:

**First**—To make known the opportunities American waters afford for enjoyment of houseboating life.

**Second**—To properly present the development which houseboating has attained in this country.

**Third**—To set forth the advantages and pleasures of houseboating in so truthful a manner that others may become interested in the pastime.

Illustration from "Houseboats and Houseboating."

The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and halftone reproductions of plans and exteriors and interiors. most interesting chapter is devoted to houseboating in England, where the sport is one of the most delightful features of outdoor life.

The book has been carefully prepared by Mr. ALBERT BRADLEE HUNT, a well known authority on the subject.

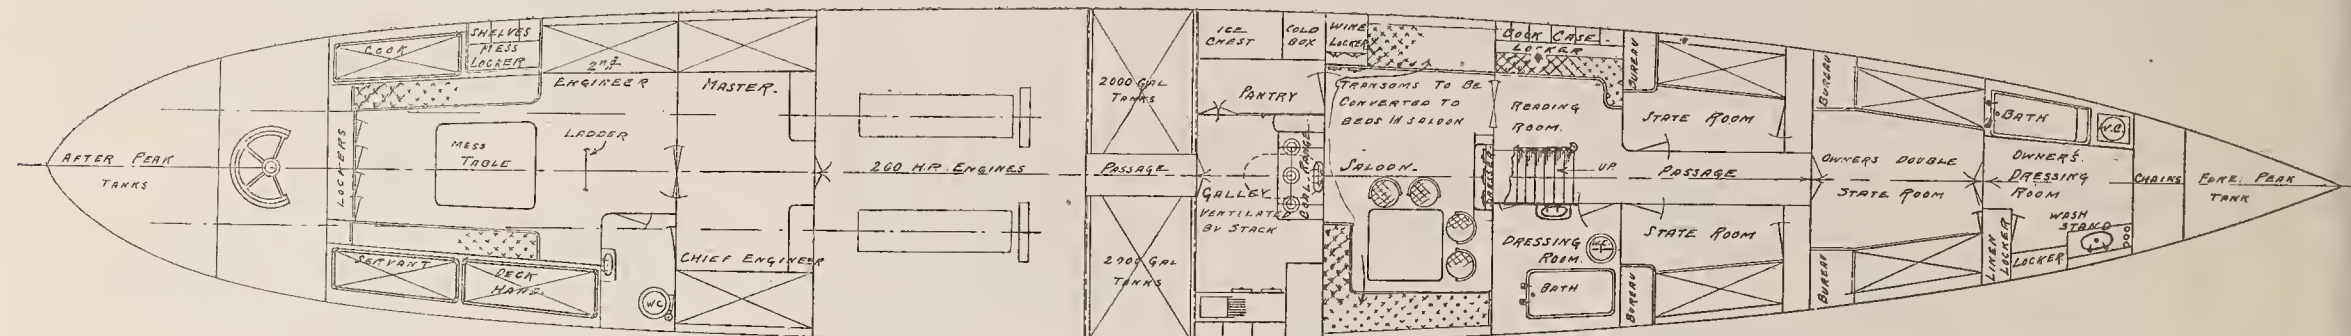

The work is printed on extra heavy coated paper, and is bound in olive green buckram. The price is \$3.00 net.

(Postage 34 cents.)

The book will make a unique and most attractive holiday gift.

FOREST AND STREAM PUBLISHING CO., - 346 Broadway, New York.

HIGH SPEED CRUISING LAUNCH—OUTBOARD PROFILE AND CABIN PLAN—DESIGNED BY SWASEY, RAYMOND & PAGE, 1905.

High Speed Cruising Launch.

We depict in our columns this week the plans of a 103ft. cruising launch designed by Messrs. Swasey, Raymond & Page. The boat will be built this winter but the name of the owner is withheld for the present.

The plans show a thoroughly modern cruising yacht intended for long distance coast line work. The owner specified a cruising radius of 1,200 miles at a speed of 18 miles an hour. To make this rather unusual requirement possible a space of 6ft. in length has been bulk-headed off almost amidships, and in these compartments are gasoline tanks of 4,000 gallons capacity. These tanks are installed on water-tight steel floors with scuppers draining outboard.

The arrangement plan provides for the owner's and guests' quarters forward. The pantry and galley amidships and quarters for the crew aft.

The boat is designed to accommodate eight guests besides the crew. Ample room has been set aside for machinery, which, together with the crew's quarters, is entirely isolated. A low pilot house is shown, which is provided with an auxiliary steering wheel, this being quite a necessary feature on a boat designed for long distance cruising. A spacious bridge is provided where nautical instruments are arranged and protected from bad weather.

Much care has been taken in the design of the heating and ventilating features, as the boat will be used for cruising purposes both north and south. There is a large galley in which there is built an ice-chest capable of holding a ton of ice and a large size steamer's cooking range designed to burn either coal or wood.

The ventilation of the galley is through the stack, which in turn keeps the engine room sweet and cool. There is 7ft. head room nearly all through the boat.

The motive power consists of two 200 horsepower gasoline motors. Two boats are carried on the davits, a launch and a dinghy.

The dimensions are as follows:

Length—	
Over all	103ft.
L.W.L.	96ft.
Overhang—	
Forward	2ft. 6in.
Aft	4ft. 6in.
Breadth—	
Extreme	15ft. 9in.
Draft—	
Extreme	4ft.
Freeboard—	
Forward	7ft.
Aft	5ft. 2in.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

ALTERATIONS ON SLOOP OSEETAH.—Mr. Martin C. Erisman, naval architect, has been commissioned by Mr. Frank C. Wild to carry out certain alterations on his sloop Osetah. The work will be done at once at some yard on Great South Bay.

NEW SPARS FOR SCHOONER KATRINA.—Mr. James B. Ford, New York Y. C., is having his schooner Katrina overhauled at the yard of the Greenport Basin & Construction Company, Greenport, L. I., under the direction of Messrs. A. Cary Smith & Ferris. Katrina will have new masts and topmasts, and a new bowsprit will also be fitted. Other minor changes and improvements will be made on the boat.

A. M. P. B. ASSOCIATION MEETING.—A general meeting of the American Power Boat Association was held at the Arena, West Thirty-first street, on Dec. 15. The following delegates were present: J. Howard Wainwright, American Y. C., the president; H. J. Gielow,

Atlantic Y. C.; Ernest W. Graef, Brooklyn Y. C.; J. H. McIntosh and W. H. Ketcham, Columbia Y. C.; S. J. Averill, Chippewa Y. C.; Anson B. Cole, Manhasset Bay Y. C., the secretary; George P. Granberry, New Rochelle Y. C.; Charles P. Tower, Riverside Y. C.; H. J. Mitchell, Riverton Y. C.; Dr. E. B. Sherwood, Shattemuc Y. and C. C.; T. V. Roc, Sr., and W. A. Gill, Tarrytown Y. C.; C. E. Van Auken, Yonkers Corinthian Y. C., and Thos. Fearon, Yonkers Y. C. The object of the meeting was to hear the reports of the committees appointed to inquire into the following subjects:

Amending the deed of trust governing the Association's challenge cup by raising the minimum rating, etc., and changing the present formula for the calculation of horsepower, so as to avoid revolutions.

The following changes were recommended by Mr. J. H. McIntosh, chairman of the committee, on the proposed change in the deed of gift:

"Amend article 2, in the declaration of trust, to read as follows: Matches for the cup shall be limited to boats propelled by power only, which, according to the rules, are in the automobile racing class and whose waterline shall not be less than 30ft."

This amendment was adopted, but the Chippewa Y. C., of Chippewa Bay, N. Y., the present holders of the trophy, must give their consent to the change before the next race for the cup can be held.

Mr. Henry J. Gielow had been appointed to draw up an amendment to cover the matter of calculation of horsepower, and he recommended the following, which was adopted:

"That in four-cycle automobile engines the area of the piston in square inches be multiplied by the number of cylinders and divided by two; that in the two-cycle automobile engines the area of piston multiplied by the number of cylinders be divided by 1.5; that in cruising engines the area of piston be multiplied by the cylinders in four-cycle engines and divided by three, and in the two-cycle engines by 2.25."

This system does away with the counting of revolutions, and it assumes the piston speed at 1,000ft. a minute for automobile engines and 666ft. for all others; and the mean effective pressure at 66 pounds per square inch in four-cycle engines and 49.5 pounds for two-cycle engines.

It was decided that a cruise should be made annually by the Association after hearing Mr. J. H. McIntosh's report on that subject, and a committee will be appointed to arrange a cruise for the coming summer.

NEW SCHOONER FOR W. E. ISELIN.—Mr. A. Cary Smith has prepared plans of a 103ft. schooner for Mr. William E. Iselin, former owner of the schooner Emerald. Mr. Iselin has been unable to find a boat in the market that just suited his requirements, and it is quite possible that he will build a new boat.

HIGH SPEED YACHT FOR A. C. BOSTWICK.—Com. Albert C. Bostwick has just ordered a high speed steam yacht to be built by the Gas Engine & Power Co. and Chas. L. Seabury & Co., Cons., from designs by Mr. Henry J. Gielow. She will be known as The Limited, and she will be built of wood. The motive power consists of a Seabury triple-expansion engine and a Seabury water-tube boiler. A speed of 20 knots an hour is expected. She is 98ft. over all, 87ft. 8in. waterline, 11ft. 6in. breadth, and 4ft. 5in. draft. The yacht will be lighted by electricity, and two boats will be carried on the davits.

A FLOATING MOTOR VILLA.—According to La Figaro of Paris the Marquis de Dion's floating villa will be 30ft. in breadth and 100ft. long, of very shallow draft, and driven by motor power at about 6 knots an hour. There will be a salon, a dining room, and several bedrooms. The Marquis hopes to have the villa, which is what would be called a houseboat in America, so low, above and below the waterline, that he can bring it up the Seine to Paris and depart in it when his day's business is over. Next

summer he will "coast" the Mediterranean shores in the vicinity of Monte Carlo. The motor villa will also have a place on board for an automobile, on which the guests may make excursions into the surrounding country.—New York Times.

A. C. A. Membership.

NEW MEMBER PROPOSED.

Central Division—Walter E. Ahlers, Allegheny, Pa., by F. C. Demmler.

NEW YORK C. C. OFFICERS.—The annual meeting of the New York C. C. was held at the Hotel Astor on Thursday evening, Dec. 14, and the following were elected: Pres., Louis S. Tremann; Sec., C. Fred Speidel; Purser, George S. Morrissey; Com., D. D. Allerton; Capt., William Yelland, Jr.; Trustees, R. S. Hawthorne and G. A. Bennett; Auditing Committee, C. A. Robinson, Harry McCaughley and I. M. Dean.

Rifle Range and Gallery

Fixtures.

Feb. 12-17.—Grand Rapids, Mich.—Indoor Twenty-two Caliber Rifle League of the United States tournament. Chas. J. Otis, Cor. Sec'y.

March 12-17.—New York.—One hundred shot indoor championship.

Ohio Rifle Notes.

The Somers Township Rifle Club held their closing shoot of the year at Camden, on Dec. 8. The attendance was much smaller than usual. In the medal event, four shots, offhand, at 100yds., possible 48, Albert Campbell won with 11, 12, 12, 47; Ohmer Parker 8, 12, 10, 11-41; H. Boomershine 12, 5, 10, 6-33; Campbell has won the medal nine times this year, in May and June with 47 and in July with a perfect score of 48. He won a match for money prizes in November with a perfect 48. Ohmer Parker has won the medal twice and Lerton Platt once. Following is the record: January, February, April, May, June, July, August, September and December, Albert Campbell with these scores respectively: 12, 12, 11, 11-46; 9, 11, 12, 12-44, 12, 10, 12, 12-46; 12, 12, 12, 11-47; 12, 12, 12, 11-47; 12, 12, 12, 12-43; 12, 11, 12, 9-44; H, 11, 10, 12-44; 11, 12, 12, 12-47. March and November, Ohmer Parker 12, 11, 11, 11-45; 12, 10, 10, 11-48. October, Lerton Platt, 12, 12, 11, 12-47. In the September shoot Campbell and Platt tied on 44, and in the shoot-off the former won, 12 to 10, one shot. Parker and Campbell tied in November on 43, and the former won the shoot-off. The club will hold their first medal shoot of 1906 on Friday, Jan. 12.

The Englewood Rifle Club will hold an all-day shoot at their new range, at Englewood, eight miles north of Dayton, on the D. C. & P. traction line, on Dec. 19. The new club house, which has just been completed, is to be dedicated, and all riflemen are invited.

C. W. Matthews, of Euphemia, has a record, made on the indoor range at Eaton, which has not been approached as yet. The conditions were 20 cards, 4 shots each, possible 20, center counted 5, possible total 400. Offhand, open sights, 50ft. Shoots were held each week and at the close of the winter contest. Mr. Matthews had a perfect score of 400. There were over 300 entries, and the contest lasted eleven weeks.

The regular shoot of the West Sonora Rifle Club was held on Dec. 9. There were five events of 4 shots each, possible 48, offhand, 100yds., 3/4 in. center; possible total for 20 shots, 240. In the first event, C. W. Matthews was first with 12, 11, 10-44; L. Hinea 9, 11, 12, 11-43; Clarence Tice 42, P. Tice 41, Chalmer Tice 39, T. Parks 36, T. E. Garreth 38, B. Leas 27. In the second event L. Hinea 12, 10, 12, 11-45; P. Tice 12, 10, 11, 10-43; Matthews and Garreth, 42 each, T. Parks 39, Clarence Tice 36, Chalmer Tice and B. Leas 35 each. Third event, Hinea 11, 11, 10, 12-44; P. Tice 9, 11, 12, 11-43; Matthews and Garreth 42 each, Chalmer Tice 40, T. Parks 38, B. Leas 36, Clarence Tice 32. Fourth event, Hinea 12, 11, 11, 12-46; Garreth 11, 12, 12, 11-46; P. Tice 45, T. Parks 43, Matthews 39, Clarence Tice 38, Chalmer Tice 39, B. Leas 39. Fifth event, Matthews 11, 12, 11, 12-46; T. Parks 12, 12, 10, 10-55; Garreth 43, Hinea 42, P. Tice 36, Charles Thal 42, Clarence Tice 33, B. Leas 40. In the aggregate score, Hinea led with 220, Matthews 213, Garreth 211, P. Tice 208, T. Parks 200, Chalmer Tice 195, Clarence Tice 181, B. Leas 177.

Rolla Heikes, Ed. Rike and Charlie Matthews went out to the Dayton Sharpshooters' range on Dec. 12 to try a new Winchester rifle of Heikes' and to have a little practice. Matthews is well-known as a crack rifle shot, but the others have made their

records, good ones, too, with the scatter gun. After testing sights, three matches were shot, 200yds., muzzle rest, 3 shots, possible 72. Each won an event, and agreed to settle the tie later.

Darkness stopped the shooting, but the scores made were such as to induce Heikes and Rike to challenge any team of the Dayton Sharpshooters' or any other Dayton riflemen to shoot a match with hunting rifles, not weighing over 8lbs., open sights.

At the monthly contest for the Miliken medal, which took place in the range at City Hall, Cincinnati, Sergt. O. O. Williams of the Police force won, and will hold the trophy for thirty days.

The Jackson Township Rifle Club held their last shoot of this year on Dec. 12. The weather was fine, with a strong breeze across the range, but good shooting was done just the same, and the contest was a hot one.

His score of 47 to-day is only the third time that mark has been reached this year. The others who made it were J. W. Lesher on Feb. 11 and Isaac M. Stiver on May 6. The regular contest for September was omitted, but the special of May 6 made up the usual twelve shoots for the year.

Ed. Rike, Rolla Heikes, Horace Heikes and Ike were at the Dayton Sharpshooters' range on Dec. 13 for another afternoon of rifle practice. Rike did not do quite so well as on the previous occasion. Three 6-shot matches were shot at 200yds., muzzle rest, possible 144.

Providence, R. I., Revolver Club.

A VERY enthusiastic special meeting was held on the 14th for the purpose of taking action on several matters of importance. The subject of affiliation with the National Rifle Association was generally discussed, and decided favorably, so that for 1906 we expect to have our name added to the list and do a little Krag shooting on the State range.

Since the closing of our Saturday afternoon shoots, the wind-up of half-holidays and bad weather, we have spent considerable time looking for suitable indoor facilities. A place downtown would be handy, but the best we could find was the basement of the battery armory, which, owing to its short length, would give us but 62ft., and thus bar the 22 men.

Our annual meeting, Jan. 25, promises to be of more interest than usual, for most of the year's red tape was settled at the special meeting, and will give us plenty of opportunity to indulge in smoke talk.

Saturday, the 16th, we shot a revolver match with the Cavalry team. We have been trying to bring about a match with them for a year, and had given it up. At short notice, and when we were rather unprepared, we received word they would be present.

We allowed the militiamen all the advantage possible, it being at their option whether to shoot on Standard target or Creedmoor, with four points added to military weapon scores, either count. They chose the Creedmoor count.

Argus was high man in the match, he shooting his big new Service in fine shape. Following are the scores:

Table with 2 columns: Name and Score. Includes Troop B, 1st Bat. Cavalry, P. R. C., Lieut. Crowshaw, Gifford, McKenna, Flynn, Richards, Allowance.

Table with 2 columns: Name and Score. Includes Wm Almy, Arno Argus, Revolver, Standard target, 50yds., Gifford, McKenna, Flynn, Richards, Allowance.

The following scores were shot in practice: Revolver, Standard target, 50yds.: Wm Almy, .38 Officer's model. 8 9 10 9 9 10 6 6 8 8-83

Independent New York Schuetzen Corps.

GUS ZIMMERMANN had the best score at the shoot held in the Zettler gallery the night of Dec. 15, when the following scores were made at 75ft., offhand, best two 10-shot tickets to go on record:

Table with 2 columns: Name and Score. Includes Gus Zimmermann, August Begerow, F. Liegibel, Henry Koch, Frank A. Young, John Facklamm.

Zettler Rifle Club.

IN the club shoot held Dec. 12, Arthur Hubalek was high man on the ring target with 51 points, under the possible, W. A. Tewes had the best 50-shot score, and Barney Zettler won the bulls-eye prize. The scores:

Table with 2 columns: Name and Score. Includes A. Hubalek, O. Smith, T. H. Keller, Jr., August Begerow, H. Fenwirth, Fifty-shot scores, Back score.

Harlem Independent Schuetzen Corps.

THE regular shoot was held the night of Dec. 13, at headquarters, in New York city. Bruno Eusner was high on the ring target with the best two scores, and W. Koch captured the bulls-eye prize. Scores at 75ft. offhand:

Table with 2 columns: Name and Score. Includes Ring target, 20 shots, Bulls-eye target, degrees.

Lady Zettler Rifle Club.

MRS. FENWIRTH, president of this club, made the highest score in the shoot held on the Zettler ranges in West Twenty-third street, New York city, Dec. 9, and her total for two scores was a point higher than that of Mr. Folcke, who was high on the men's list. All shooting was at 75ft., the ladies using a muzzle rest, the men offhand, two best scores to count:

Table with 2 columns: Name and Score. Includes Mrs. H. Fenwirth, Mrs. Liegibel, Miss B. Ludwig, Miss Schue, The men's scores, G. Hart, H. Fenwirth, A. Mamok.

Tirs a Segno Nazionale.

THE first shoot of this Italian society was held a fortnight ago on the Zettler ranges, in New York city, but the attendance was slim, and adjournment was taken until Dec. 11, when these scores were made at 75ft. offhand:

Table with 2 columns: Name and Score. Includes Mandell, Conti, Reali, Mastropalo, Migliore, Castolemi, Paglinghi, Mandell, Mastropalo.

Trapshooting.

Fixtures.

- Dec. 20.—Phillipsburg, N. J.—Alert G. C. first annual holiday shoot. Dec. 25.—Utica, N. Y.—All-day tournament of the Riverside G. C. E. J. Loughlin, Sec'y.

DRIVERS AND TWISTERS.

The Bound Brook, N. J., Gun Club will shoot for medals, cups, etc., on the afternoon of Christmas Day. All shooters are invited.

Messrs. F. E. Butler, of Nutley, N. J., and W. H. Heer, of Concordia, Kans., have announced that they will attend the mid-winter shoot of the Mt. Kisco, N. Y., Gun Club on Jan. 1.

The Newton, N. J., Gun Club gave its team members a banquet on a delightful evening of last week, in recognition of their valor in winning the team series of the North New Jersey League.

Mr. Irby Bennett, of the Winchester Repeating Arms Co., is convalescing slowly after his severe ordeal in the hospital in New York. He contemplated returning to his home in Nashville, Tenn., after the Interstate Association meeting last week.

Beginning with the first shoot in January next, the Florists' Gun Club, of Philadelphia, will add to the programme two prizes in each regular contest. Also a trophy will go to the best score from scratch, and to the best score with handicap. The prizes are won outright at each contest.

Mr. A. E. McKenzie made an eloquent plea in behalf of the Denver Gun Club, before the members of the Interstate Association at their annual meeting last week, and the financial inducements were not short of princely in their worth.

At the regular monthly shoot of the New Haven, Conn., Gun Club, Dec. 13, good weather and a good attendance contributed to a successful shoot. Mr. C. B. Bristol, famous as a shooter of rare skill, won first prize, a carving set, with a score of 24.

Distinguished trapshooters who were visitors at the Grand Hotel, New York, during the meeting of the Interstate Association last week were Messrs. J. E. Avery, Atlanta, Ga.; W. Fred Quimby, New York; J. L. Head, Peru, Ind.; Tom A. Marshall, Keithsburg, Ill.; J. S. Fanning, New York; Geo. A. McAlpin, New York; E. H. Tripp, Indianapolis; J. W. Garrett, Colorado Springs, Colo.; A. G. McKenzie, Denver; Lou Parker, New York; Capt. A. W. Money, Oakland, N. J.; W. M. Ford, Wilmington, Del., and Ed. Taylor, of Jersey City.

Elsewhere in our columns this week, we taken pleasure in presenting the portrait of Mr. J. A. Haskell, the President of the Interstate Association. He was elected at the annual meeting held last week, a report of which is elsewhere in our trap columns. Mr. Haskell is an able business man, long identified with the manufacture of powder. For a long while he held the eminent and responsible position of President to the Lafin & Rand Powder Co., of which company he is still an important officer.

C. L. Kites, Springfield, Mass., writes us that "The Springfield, Mass., Shooting Club will hold their annual turkey shoot on Christmas Day, Dec. 25. The programme calls for 150 targets, divided into ten events. Grounds will be ready for shooting at 10 o'clock. Principal event of the day will be the sixth, commencing as nearly 1 o'clock as possible. This will be a 25 target event, \$1 entrance, including price of targets. There will be three turkeys to shoot for. Whether they will be put up for three high scores in one event, or for highest score in three separate events will be decided by the number of entries. Targets one cent each. Distance handicap. Handicaps arranged by committee chosen from among the shooters present. Hot lunch served at noon. Loaded shells for sale. Don't stay away on account of the cold. We have a nice warm club house, and will give you a good time. Programmes are now ready, and may be secured of the secretary. No sweeps. Everyone welcome.

A standing Handicap Committee for all of the five tournaments of the Interstate Association next year would either kill the tournaments or be killed by the contestants, in a Pickwickian sense. After a tournament, there is no body of men who are gazed at so furtively as the handicappers. Many shooters, making poor scores, blame the bad handicaps assigned them, and this regardless of whether they have a yellow streak when in competition, or whether they sat up too late the night before, or what not. Some who have a brain pan of circumscribed area, look upon the handicapper as a blend of donkey and wolf. In our opinion, the appointment of a committee at the annual meeting for the G. A. H. is all right, but each provincial handicap should have a distinct committee, drawn entirely from the respective sections in which they "subsidiary" handicaps are held, thus the onus bestowed on any one committee ends with its handicaps. Furthermore, handicappers who reside within the respective geographical limitations of the sections to which "subsidiary" handicaps are assigned, would likely be much more acceptable to such sections.

The new ruling of the Interstate Association, which requires that all Grand American Handicap contestants, who have not shot in Grand American Handicaps prior to 1906, shall send in with their applications a specific statement of their general averages through the six months prior to their application, will eliminate that unpleasant feature colloquially referred to as "a dark horse." Heretofore the handicappers have had to rely on their own knowledge of the contestants, or upon such imperfect data as could be gathered hurriedly from rumor or hearsay. Where there were so many hundreds contesting, there were some of them whose ability with the shotgun was entirely unknown to the handicappers and the management. These were handicapped on the theory that if they were unknown they were likely to be ordinary performers. So many winners of past G. A. H.'s, men of seasoned skill, have won from the 16yd. mark, that the need of definite information was urgently needed. The new ruling will meet the need fully. If it should happen that any applicant should falsify his average, there is no doubt but what the Interstate Association would make "the punishment fit the crime."

The Bergen Beach Gun Club, of Brooklyn, N. Y., offer a programme of practice events at 15 targets, and a main event at 50 targets, distance handicap, 16 to 25yds., for twenty or more merchandise prizes. Entrance, \$2.50, including targets. High guns. Handicappers, Mr. Harry D. Bergen, Capt. H. W. Dreyer and the manager. The following is further presented in the programme: "Practice events at a charge of 25 cents for 15 targets. One re-entry may be made in main event up to 1 P. M. sharp, at a cost of \$1.50 extra. The shooter making re-entry may shoot one yard in, provided his original score is 30 out of the 50 or less; but he is entitled to one prize only, his highest of the two scores to count. In main event, at 50 targets, all targets at 2 cents each to those shooting for targets only. Shells for sale at grounds. Manufacturers' experts may shoot for targets only. Lunch and refreshments for shooters and their friends by courtesy of the club. Flatbush avenue Bergen Beach trolley from New York City Hall, Brooklyn Bridge entrance, direct to the grounds for 5 cents. Go to the grounds early, as the sun sets before 5 P. M. L. H. Schortemeier is the Manager, 201 Pearl street, New York." The date is Jan. 1.

Eastern Championship.

NEW YORK, Dec. 14.—The championship contest, known officially as the amateur championship of America at clay birds, was a distinct success. There were forty-eight participants in its amateur features, and eight professionals who shot along. Of the latter, Mr. W. H. Heer, of Concordia, Kans., was high with 96.

The championship was won by the Long Island City cracker-jack, Mr. J. H. Hendrickson, of the Queens County Gun Club, with a score of 94. His closest competitor is a famous trap-shooter of Colorado, Mr. John W. Garrett, of Colorado Springs. The latter scored 93.

Representatives were present from Massachusetts, New Jersey, Delaware, Kentucky, Florida, Connecticut, Missouri, Pennsylvania and Virginia.

Mr. Gus Grieff is entitled to much credit for bringing together the large number of shooters who contested in this event. Three traps were used. The targets were thrown out over the water, which without doubt was a difficult condition for those unaccustomed to it.

The conditions were 100 targets, entrance, price of targets. Scores:

Table listing scores for Eastern Championship. Columns include names and scores. Top scorers include W. D. Rose (New York), N. Y. A. C. (15 18 23 13-68), D. Rait (Larchmont), L. Y. C. (15 11 16 17-59), G. Piercy (Jersey City), Bergen G. C. (21 24 23 20-88).

PROFESSIONALS.

Table listing scores for professionals. Top scorers include J. A. R. Elliott (New York) (25 18 23 22-88), W. Heer (Concordia, Kans.) (24 25 25 22-96), Sim Glover (New York) (19 22 22 19-82).

Florists' Gun Club.

PHILADELPHIA, Pa., Dec. 12.—Delightful weather favored the mid-winter shoot of the Florists' Gun Club, held to-day. Renowned professionals were present as follows: Messrs. Fred Gilbert, Luther Squier and Neaf Apgar, and they excellently sustained their reputations as sportsmen of skill and worth. Gilbert was high with the excellent average of 124 out of a total of 125. Luther Squier, who has been showing great improvement since associating with the "Demon of Spirit Lake," stood second with 117, having two runs of 25 straight to his credit. Apgar had a clean score in the first event, and then gradually lessened. E. C. Coleman, one of the steadiest shots of the Florists' Club, put up a uniform race, and completed 108. Shew had 105, and Ford 103. In the club event, two classes, Ed. Coleman was high in Class A with 44 out of 50. Shew broke 43, Tansey 42. In Class B, Luther Parsons tried his gun after an absence of several months, and led with 30 breaks. Haywood was second with 29.

Beginning with the first shoot in January, the Florists' members will compete for two prizes in each regular contest. A trophy will be given to the best scratch score with handicap added. This trophy becomes the property of the winner at each shoot. The scores of the last regular shoot follow:

Table listing scores for Florists' Gun Club. Columns include names and scores. Top scorers include Gilbert (25 25 25 25), Squier (24 24 24 24-121), Apgar (23 20 25 24-117).

Table listing scores for Florists' Gun Club club shoot. Columns include names and scores. Top scorers include Coleman (22 22-44), Shew (21 22-43), Parsons (14 16-30), Haywood (15 14-29), Peterson (13 15-28).

Baltimore, Md., Shooting Association.

BALTIMORE, Md.—Through six inches (or more) of "beautiful snow" fourteen enthusiastic shooters went to the club grounds Saturday, Dec. 16, to a target shoot, for practice and turkeys. There was one practice event at 25 targets and four events at 15 targets each, for turkeys.

High score was made by Clarence Malone, who broke 65 out of a possible 85 targets. This was especially creditable, as the targets were thrown 70 to 75 yds. First turkey was won by Lester German, who scored 14. Second turkey by Clarence Malone, with 13. Third turkey, Moxley and Waters tied with 13, and in the shoot-off, Moxley won; score 10 to 8. Fourth turkey, Moxley and France tied on 10 each, Moxley winning in the shoot-off, 9 to 8.

There is not the interest taken in a team race I expected to find from the club with a membership of eighty-five. There were less than fifteen shooters out for practice. With such "lukewarm" members, I predict the Perryman boys will again be victorious. Too bad! Some of the best shooters hug the fireside when they could be out helping to win laurels for "home."

Programme, one 25 and four 15-target events. The scores:

Table listing scores for Baltimore, Md., Shooting Association. Columns include names and scores. Top scorers include Waters (22 10 4 13 8), Moxley (17 12 11 13 10 9), Elderkin (12 10 12 9 7), German (20 14 8 12 9), Padgett (13 5 7), Malone (21 8 8 12 9), Walker (17 9 10 9 9).

The return race with Mr. German's carefully selected professionals and amateurs from Perryman, Md. (?) will be shot Wednesday, Dec. 20, at 2 P. M. If Malone will give us blue skies and a balmy day perhaps as many as ten men could be induced to help make a better score for the B. R. A. team.

A SOCIAL TRAMP.

Crescent Athletic Club.

BAY RIDGE, L. I., Dec. 16.—A sky, darkly overcast and a storm of snow and sleet which prevailed for a time in the afternoon, were unfavorable conditions for trapshooting.

Eight events were completed, of which one was the December cup, one the team contest, and the remaining one the Stake trophy. Mr. A. G. Southworth scored a leg in the December cup event with a score of 23. The successful team had Messrs. F. B. Stephenson and O. G. Crinnell, Jr., as members. The leg in the Stake trophy event was won by Mr. H. B. Vanderveer after a shoot-off with Mr. W. C. Damron, after a tie on 25. Scores:

Trophy shoot, 15 targets: D. C. Bennett 15, A. G. Southworth 14, F. B. Stephenson 14, L. M. Palmer, Jr., 14, W. C. Damron 14, L. C. Hopkins 14, O. C. Grinnell 14, G. A. Lockwood 14, Dr. Teeter 12, W. W. Marshall 11.

Trophy shoot, 15 targets: L. M. Palmer 14, W. W. Marshall 12, D. C. Bennett 12, A. G. Southworth 11, F. B. Stephenson 11, W. C. Damron 11, L. C. Hopkins 11, Dr. Teeter 11, O. C. Grinnell 10, C. A. Lockwood 10.

December cup, 25 targets, handicap: A. G. Southworth 23, F. B. Stephenson 22, H. B. Vanderveer 22, W. C. Damron 21, L. M. Palmer 19, W. W. Marshall 19, Dr. Teeter 19, C. A. Lockwood 18, D. C. Bennett 16, L. C. Hopkins 16, Dr. Keyes 16, O. C. Grinnell 15.

Team contest, 25 targets: F. B. Stephenson 22, O. C. Grinnell 24; total 46. A. G. Southworth 20, W. W. Marshall 18; total 38. L. M. Palmer 23, L. C. Hopkins 14; total 37.

Stake trophy, 25 targets: H. B. Vanderveer 25, W. C. Damron 25, D. C. Bennett 23, F. B. Stephenson 23, Dr. Teeter 23, O. C. Grinnell 23, Dr. Keyes 22, A. G. Southworth 18, W. W. Marshall 18, L. C. Hopkins 18, C. A. Lockwood 18.

Shoot-off, 25 targets: Vanderveer 21, Damron 20. Trophy shoot, 15 targets: L. M. Palmer 12, C. A. Lockwood 11, O. C. Grinnell 9, W. C. Damron 8, J. N. Teeter 8, L. C. Hopkins 8.

Trophy shoot, 25 targets: J. N. Teeter 24, L. C. Hopkins 22, F. B. Stephenson 21, L. M. Palmer 21, H. B. Vanderveer 21, W. C. Damron 20, O. C. Grinnell 20, A. G. Southworth 19, D. C. Bennett 19, C. A. Lockwood 19, Dr. Keyes 18, W. W. Marshall 14.

Trophy shoot, 25 targets: Dr. Keyes 25, H. B. Vanderveer 25, J. N. Teeter 25, O. C. Grinnell 24, L. M. Palmer 24, W. C. Damron 24, A. G. Southworth 22, D. C. Bennett 22, C. A. Lockwood 22, W. W. Marshall 21, F. B. Stephenson 21.

Shoot-off, same conditions: J. N. Teeter 24, H. B. Vanderveer 19, Dr. J. J. Keyes 18.

Cumberland Gun Club.

BRIDGETON, N. J.—Herewith please find scores made at the fourth amateur tournament of the Cumberland Gun Club of this city. The shoot was well attended, especially by the professional shooters, among whom were the following: Mr. Fred Gilbert, the "Western star," Luther Squier, William Heer, Frank Butler, J. F. Heath, J. A. R. Elliott, Neaf Apgar, and Sim Glover. Mr. Gilbert was high professional, with score of 148 out of possible 150, having run off with 144 straight. Mr. Harry Fisher, of Philadelphia, was high amateur, with score of 141. Scores:

Table listing scores for Cumberland Gun Club. Columns include names and scores. Top scorers include Gilbert (15 20 20 20 15 20 20), Elliott (14 19 20 15 20 20), Heer (14 20 17 19 15 18 19), Fisher (15 17 16 19 15 20 19), Apgar (15 16 19 14 19 18 20), Hackett (14 18 20 17 15 20 17), Glover (14 19 18 19 13 18 15), Pratt (12 17 18 20 13 18 17), Squier (14 18 20 15 11 18 17), Newcomb (12 17 16 17 15 17 16), Armstrong (13 18 15 18 13 19 14), Aumack (11 18 16 18 11 17 16), Platts (11 18 18 12 9 16 16), Butler (12 13 16 15 10 14 12), Munyan (15 18 15 13 15 15), Hurff (11 17 16 16 11 16), Adams (14 15 15 12 13), Compton (11 17 16 15 17 16), Hettinger (11 17 16 15 17 16), Skull (11 17 16 15 15 15), Cooney (11 17 16 15 15 15), Sheppard (11 17 16 15 15 15), Brown (11 17 16 15 15 15), L. Hurff (11 17 16 15 15 15), Fox (11 17 16 15 15 15), Esibell (11 17 16 15 15 15), Gage (11 17 16 15 15 15).

A. H. Sooy, Sec'y.

Bergen Beach Gun Club.

BROOKLYN, L. I., Dec. 12.—There were twenty-four contestants at the shoot of the Bergen Beach Gun Club to-day. A high wind prevailed. Several renowned experts were present. Each event was at 15 targets. Scores:

Table listing scores for Bergen Beach Gun Club. Columns include names and scores. Top scorers include Welles (8 15 14 14 14 13 10 12 14), Heer (15 14 14 13 15 15 15), Kelly (13 13 14 13 13 13 15 14 12), Metz (4 2), F. Butler (10 14 13 12 9 10 9), Dreyer (9 9 8), Hopkins (10 11 12 13 11 10 10), Bob Schneider (12 13 13 9 13 7), Hitchcock (6 12 8 7 10), Dr. Griffith (8 11 9 8 10 9 11), Schorty (13 12 10 12 11 13 14 12), Kroeger (10 11 12 7 11 9), Geideman (8 8 10 12 9 11), Messloh (5 4 9 8 11 4), Van Valer (7 10 7 10 6), Cramer (12 13 12 12 12 10), Franklin (8 10 8 9), Voorhis (12 8 7 7 8 12 9), Gehring (10 11 10 12 11 9), Wellhrock (9 10 12 11 10), Doughty (3 3 8 7 8 3), Suydam (14 10 12 14 14 12 13), Herman (2 2 3).

Last two events shot in twilight. SCHORTY.

Ossining Gun Club.

DOUBTLESS the holidays and their attendant troubles for those interested in trade had something to do with the small attendance to-day. At any rate, the Scribe is always ready with the mantle of excuse, hoping for greater general interest to be manifested.

Samuel R. MacDonald naturally was disappointed in the turnout.

The traps will be open Christmas Day for any who may wish to shoot. On New Year's Day the Ossining Gun Club will send a team to Mt. Kisco. As many members as can be asked to attend this shoot. Team will leave Ossining on the 8:30 A. M. train to Tarrytown. Take trolley to White Plains and Harlem Division train to Mt. Kisco.

Table listing scores for Ossining Gun Club. Columns include names and scores. Top scorers include C. G. Blandford (23 18 18), S. R. McDonald (19 19 17).

Mount Kisco Gun Club.

Mt. Kisco, N. Y., Dec. 18.—The Mt. Kisco Gun Club mid-winter tournament has a programme of nine events, eight at 20 targets, entrance, \$1.40 each, and one at 25, which includes a five-man team race between Ossining and Mt. Kisco. This tournament will be supported by the Ossining Gun Club and Remington Gun Club, of Portchester. The trade will be well represented at this tournament. Our club will not spare time to make this shoot a success.

Mt. Kisco is thirty-seven miles from New York, via N. Y. Central, Harlem Division. For further particulars write to A. Betti, Manager.

Hudson Gun Club.

JERSEY CITY, N. J., Dec. 17.—The weather was clear, cool and pleasant, with a little wind blowing betimes. The two special committees were on hand and worked hard in perfecting all details. No less than fifteen extra men were engaged to assist. The second set of traps worked badly, somewhat on account of their patched-up condition. Mr. Tom Kelly, the cashier, deserves special praise for his efforts. Mr. J. Hughes acted as compiler of scores, took entries, etc., while Mr. Carl von Lengerke (Dr. Sergeant) was in evidence everywhere, and worked all day, from pumping out the trap house to assisting the cooks and keeping squads moving, etc.; so busy was he that he did not have time to fire a shot, much as he likes the sport nevertheless. Mr. J. Whitley, chef, did his work in the same excellent manner for which he is famous.

On account of running short of targets and darkness supervening, all the prizes were not shot off, but will be shot for the next time we hold an open shoot.

All events were announced to number 20 targets, one cent to all contestants; entrance for prize, 50 cents extra; three prizes in each event; handicap allowance. The last three events were shot off at 10 targets, because of the short supply.

First prize shoot had winners as follows: First, H. Pape, cup; second, H. W. Bissing, gold pin; third, gold button.

Second event: First, E. L. Akers, cup; second, J. Murphy, pin; third, A. Evans, gold button.

Table listing scores for Hudson Gun Club. Columns include names and scores. Top scorers include Scofield (15 13 20), Staples (13 18 19), Piercy (16 18 17), Schorty (14 19 18), Bissing (15 15 16), A. E. Barry (12 13 10), Castle (15 17 14), Glaster (15 14 13), Akers (14 14 17), Putney (17 11 14), Lindley (6 14 14), Elter (13 13 12), Murphy (11 14 13), McMahon (12 9 13), Fanning (15 20 18), Heer (15 20 20), Butler (16 10 15), Akard (15 18 13), Nicol (5 11 11), Headen (10 12 15), Evans (16 17 12), Hallinger (14 12 13), Wright (10 14 11), Gille (12 16 13), Burns (5 10 14), Reynolds (17 18), Schoverling (11 16 12), Cass (16 7), Wynne (16 16 16).

New York Athletic Club.

TRAVERS ISLAND, N. Y., Dec. 16.—Mr. C. A. Billings won the leg on the December cup, at the shoot of the New York Athletic Club to-day. Mr. Gus Grieff won in several of the events. Scores:

Table listing scores for New York Athletic Club trophy. Columns include names and scores. Top scorers include G. E. Grieff (23), J. W. Hibbard (21), W. Brown (21), C. Hunt (20).

Trophy shoot, 10 targets, scratch: G. E. Grieff 10, J. W. Hibbard 8, W. Brown 6, C. A. Billings 6, Dr. Hamlin 6, G. Kuchler 6, C. Hunt 5.

Trophy shoot, 15 targets, scratch: G. E. Grieff 15, C. A. Billings 12, J. W. Hibbard 12, G. Kuchler 10, C. Hunt 10, Dr. Hamlin 9, W. Brown 8.

Maiden Creek Tournament.

SECRETARY L. B. STOUT, of the Maiden Creek Gun Club, of Maiden Creek, Berks county, Pa., announces Tuesday, Dec. 26, as the date for the club's fifth annual target tournament, to be held, rain or shine, on the Half Way House shooting grounds, located one mile west of Blandon. The latter place is only eight miles from Reading, and easily reached by either the Allentown & Reading trolley line or by the East Penn Division of the Philadelphia & Reading Railway. Carriages will meet all trolley cars and trains, and convey the shooters direct to the grounds. A fine programme of sweepstake events have been arranged, with a special 15-target event, \$1 entrance, as the main event of this shoot, for which the tournament committee will offer a fine thoroughbred Helstein bull weighing 3,000 lbs., as first prize. The conditions of this event allow re-entry, but one man only to shoot five tickets, no more. This event will be started promptly at 10 A. M., and will continue until 4 P. M., when the winner will be announced. Two sets of traps will be used to throw the targets, and the official score will be kept on a large board in sight of all.

These annual shoots of the Maiden Creek Gun Club attract large crowds of the lovers of trapshooting, and last year sixty-three sportsmen faced the traps in the events of the day, and from the present outlook this year's tournament will eclipse any ever held by this well-known organization. A fine dinner will be served after the shoot, and the tournament committee desires to extend an invitation to all to attend and enjoy a good day's outing. The events are open to all amateurs. The trade representatives, several of whom have notified the committee that they will be present, will shoot for the price of the targets.

Any information desired will be cheerfully furnished by addressing L. B. Stout, Half Way House, Maiden Creek, Berks county, Pa.

At Newark.

NEWARK, N. J., Dec. 16.—The noted experts, Messrs. W. H. Heer, Frank E. Butler and Sim Glover, were visitors at the shoot held on Smith Bros. grounds to-day. The wintry conditions, a mixture of sleet, wind, dark light, were deterrents that even the wonderful skill of the seasoned experts could not overcome; therefore their scores were not up to their usual standards. Nevertheless Heer broke 132 out of a possible 140, which would pass as a very good fairweather score for many other shooters. Butler scored 117 out of 140, and Glover 105 out of 120. Quite a number of local trapshooters participated, including Police Commissioner Fred Castle. The scores made in one of the 25-bird matches were as follows: Heer 22, Butler 19, Glover 21, Betts 15, Nichol 19, S. Castle 10, Wilkins 8, Moffett 14, Glaister 16, Putney 19, Eckard 19, Gaynor 7, James Murphy 14, F. Castle 14, McMahon 21, Riley 17, Drum 13, Thornton 8, Joseph Murphy 12, Day 15.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Dec. 16.—Habich won the Peters badge. The attendance has been so small for the past month on account of the boys trying conclusions with the quail, that we could not get a quorum.

The third contest for the English Hotel cup will take place on Saturday, Dec. 23, between Nelson W. Wise and Alonzo Harcourt. Both gentlemen are members of the Indianapolis Gun Club.

Table listing scores for Indianapolis Gun Club. Columns include names and scores. Top scorers include Moore (23 20 18 22), Smoke (19 24 24 22), Habich (21 22 21 21), Armstrong (22 22 21 18 19), Dark (19 11 13).

### Interstate Association's Annual Meeting.

The annual meeting of the stockholders of the Interstate Association was held at Oakland, Bergen county, N. J., Dec. 14, 1905, at 10 A. M. The meeting was duly adjourned to meet the same date at 1:30 P. M., at the Grand Hotel, New York city.

The adjourned annual meeting was called to order at 2 P. M., with President Irby Bennett in the chair.

The roll call showed the following members present: Tatham & Bros., by Charles Tatham; Union Metallic Cartridge Company, by A. C. Barrell; Winchester Repeating Arms Company, by Irby Bennett; Parker Bros., by W. F. Parker; E. I. DuPont Company, by J. T. Skelly; Laffin & Rand Powder Company, by A. W. Higgins; the Marlin Fire Arms Company, by J. Howard Marlin; Hunter Arms Company, by John Hunter; the Peters Cartridge Company, by T. H. Keller; Hoyt Metal Company, by W. P. Markle; Chamberlin Cartridge & Target Company, by Paul North, and the Lefever Arms Company, by A. H. Durston. The Remington Arms Company was represented by A. C. Barrell, by proxy. B. Waters, of FOREST AND STREAM; W. K. Park, of Sporting Life; John Taylor Humphrey, of Shooting and Fishing, and Capt. A. W. Money, honorary members of the Association, were also present, as was Elmer E. Shaner, Secretary-Manager of the Association. J. A. Haskell, President of the Laffin & Rand Powder Company; L. C. Parker, of Parker Bros., and W. Fred Quimby, of the E. I. DuPont Company, were present by invitation.

The minutes of the meeting held Feb. 10, 1905, were read and approved. Mr. A. W. Higgins, treasurer, presented his report for the year ending this date. The report showed that the Association was in good financial standing. The report was received, approved and filed, and a vote of thanks tendered Mr. Higgins. The Secretary-Manager's report was read, and upon motion was received and filed, and a vote of thanks tendered Mr. Shaner for his careful review of the year's work. The report follows:

PITTSBURG, Pa., Dec. 4, 1905.

To the President, Officers and Members of the Interstate Ass'n: Gentlemen:

There is a strong temptation while writing these annual reports to begin with the salutatory of the old-time clown in a circus: "Here we are again, master," and let it go at that. The task is very monotonous. An unbroken record of success, cumulative, while eminently gratifying to the writer, is not stimulative to the imagination.

Another unending season of success suggests again the reflection that trapshooting is one of the few eminently clean sports left to the true sportsman. Here the degeneracy caused by gambling never disgusts nor demoralizes the real sportsman. Pride in skill and the ambition of fresh blood deprive the gambler of a chance for manipulation, and the history of the Interstate Association is a guarantee of a fair field and no favor.

While trapshooting is dormant in a few particular localities, the records of this office, and the best information obtainable from the manufacturers of sportsmen's supplies, show there is more trapshooting now than ever before, and interest will continue to accumulate just so long as the sport is controlled on the present equitable lines. The guidance and influence of such an organization as the Interstate Association is imperatively, not to say absolutely, necessary to keep the sport at its present high standard.

The success of the tournaments held in Colorado and California abundantly justifies the wisdom and foresight of those who favored broadening the propaganda.

#### Tournaments.

The opening tournament for 1905 was held in Augusta, Ga., April 5 and 6, under the fostering care of the Augusta Gun Club. Notwithstanding the latitude, the weather was decidedly unpropitious, and the contrast of flowers of April with overcoats, suggestive of Alaska, was one of the prominent features. In spite of fierce, northwest gales, cold rain, hail and general discomfort, the attendance of both contestants and spectators was good. No foresight could flank Old Prob., and though the Association's outfit was demoralized, stoicism not only overcame circumstances, but there was a cheerful acquiescence in the inevitable.

#### At Hopkinsville.

The second tournament of the series was held in Hopkinsville, Ky., April 26 and 27. A high wind left over from the Augusta tournament, had moved north; but, though it hurt the scores, it was more endurable than the Georgia variety. Attendance was not up to expectations, and no one was able to give a reason, as the Hopkinsville Gun Club, though but three years old, is up-to-date, its membership large and enthusiastic, and it enjoys a full measure of popularity.

#### At Owensboro.

"And it was windy weather" at Owensboro, Ky., on May 17 and 18, but the Daviess County Gun Club's arrangements made the meet interesting nevertheless. Though the attendance was but medium, interest was well sustained, and the best of humor prevailed.

#### Grand American Handicap.

The sixth Grand American Handicap, at Indianapolis, under the auspices of the Indianapolis Gun Club, June 27 to 30, showed conclusively what the Interstate Association has accomplished in teaching not only the young, but also the adult idea "how to shoot," the entries having grown almost 400 per cent. since the year 1900, when the event was inaugurated. This year's event was signaled by an extraordinary number of entries, showing not only a local, but also a national interest; by the large number of averages exceeding the 90 per cent. mark; by the large and fashionable attendance of spectators; the unprecedented number of targets thrown, and the smoothness that characterized the work from beginning to end, as well as the good humor which prevailed. All in all, it was a record-breaking event, and the hearty co-operation of the Indianapolis Gun Club was not the least meritorious adjunct. Strenuous work was, of course, necessary to get the thing through successfully, but all arrangements dove-tailed so perfectly that there was no perceptible jar in the machinery. The

work of the Interstate Association is stimulating, and training shooters was exemplified by the fact that the scores made make the winning scores of previous years look rather small. The total number of targets trapped in four and one-half days was 184,500. This would have been impossible had not the system of squadding and manner of handling the contestants devised in 1904 been enforced. On the first day 284 contestants faced the traps, and high averages were made. On the second day the State team event varied proceedings. This contest was keenly interesting and will doubtless evoke a large entry next year. The principal event of the tournament was, of course, the Grand American Handicap, and it was also the great event of the Western Continent as to trapshooting. The winner scored 99 out of 100, being but one ahead of four contestants who tied on 98. The result has prompted a number of suggestions which the Association can digest at leisure. The 1905 Grand American Handicap tournament may in future be equalled, but strenuous work will be required to eclipse it. There is no lack of inducements held out by various cities as places for holding the next G. A. H., so we have a large margin for choice.

#### At Menominee.

The Menominee, Mich., meet on July 12 and 13, was a success from every point of view, though a heavy shower of rain somewhat delayed the wind-up. The contestants numbered sixty-five the first day and sixty-one the second, fifty-four of whom shot in all events. Two sets of traps were used, and 23,050 targets

J. A. HASKELL,  
President of the Interstate Association.

were trapped during the two days. The local club handled visitors in a manner which left nothing to be desired. The attendance of spectators was encouraging. The Menominee Gun Club's shooting grounds on Green Bay are unsurpassable as to scenery and convenience of location.

#### At Albert Lea.

The sixth tournament of the season was held at Albert Lea, Minn., Aug. 2, 3 and 4. With the exception of the second day, which was too damp for comfort, the most pessimistic had no complaint coming. The shoot was under the fostering care of the Albert Lea Gun Club. The affair ran like clock-work, and general satisfaction was expressed. A feature of each day was event No. 7, which called for 10 pairs, something unusual of late. Hon. Henry A. Morgan, president of the local club, and Secretary N. E. Petersen and other officers exerted themselves to make visitors and contestants comfortable.

#### At Kansas City.

Though "sizzling" heat, rain and high winds held sway, the tournament Aug. 16, 17 and 18, at Kansas City, Mo., was pulled off quite satisfactorily. It was under the auspices of the O. K. Gun Club, and a crowd was drawn to the Schmelzer Shooting Park. Many names of contestants present are familiar to the trapshooting fraternity. Considerable Mark Tapleyism was necessary to assure comfort on the third day, but despite rain, high wind and clouds, the shooting was, on the whole, good. The club management was commendable from A to Izzard.

#### At Colorado Springs.

The eighth meet, at Colorado Springs, Colo., amid the wonders of the Celestial Architect, was especially notable for the work of the Colorado Springs Gun Club, which, not satisfied with the adage, "enough is as good as a feast," left no stone unturned which might possibly afford visitors pleasure. The most exciting

could find no fault with the appointments. The local tournament committee, Messrs. John W. Garrett, A. J. Lawton and D. C. Sanderson, mutually surpassed each other in their efforts to have everything in apple-pie order. This tournament was held on Aug. 29, 30 and 31, and 119 contestants were in evidence. The contest was close and exciting, and the third day closed with every event on the programme rounded out. There was never before such a notable gathering of trapshooters in Colorado. The appointments generally were such as to suggest that no better place could be found for the holding of the Grand American Handicap, putting all competing cities on their mettle.

#### At San Francisco.

The initial Pacific Coast Handicap was held in San Francisco, Sept. 15, 16 and 17, and the enthusiastic Slopers confidently believe that it, with all its splendor, will prove but an infant, compared with future similar events, and pray for many happy returns. The San Francisco Trapshooting Association, our members and a large section of the populace vied with each other to make it an epoch, giving the sport a longitude from which future events will be measured. President Ed. Donohue, Secretary A. M. Shields and Treasurer C. A. Haight made everybody feel at home. As the contestants were of the cream of the profession, East, West and South, of course, the event was educating in the highest degree, each securing and giving points which will bear fruit in future. No plus ultra to date was the univarsal verdict, with loud response from the Amen corner. The Interstate Association's system evoked unstinted praise, and was pronounced the model for the future. "Praise for Sir Hubert is praise indeed," for the Slopers themselves are not beginners. The purses were unanimously pronounced the most liberal ever tendered Pacific Coast shooters. On the closing day the attendance of spectators was more than 1,500. That seed was sown in good ground was apparent to pessimists, if any were present.

#### The Future.

During the past thirteen years we have confined our work almost entirely to territory east of the Mississippi River, and now it would seem to be wise to work the field west of that river. Our experience this season in Colorado Springs and San Francisco indicates that the territory is already "white unto the harvest," and we have but to shake the plum tree to realize. Our initial tournament on the Pacific Coast accomplished too much of mutual benefit to be allowed to lie fallow, and should be followed by one or more tournaments there next year. I would strongly advocate the making of the Pacific Coast Handicap an annual affair, and I have a sanguine belief that the time will not long until it will be only second to our other great event—the Grand American Handicap.

#### In Conclusion.

I again tender our members my hearty thanks for their unflagging support, and though virtue may be its own reward, I fervently wish them something more tangible. In this I include the sportsmen's journals for their unremitting courtesy and encouragement.

Very respectfully submitted,

ELMER E. SHANER, Sec'y-Mgr.

Applications for the Grand American Handicap of 1906 were read, the applicants being Denver, Indianapolis, Chicago, and Columbus. Each application was accompanied by recommendations, and set forth the advantages of their respective claims. By invitation, Messrs. A. E. McKenzie and E. H. Tripp addressed the meeting in behalf of Denver and Indianapolis respectively. A petition with over 500 signers was presented in behalf of Chicago. The matter was discussed at great length, but no action was taken at this time.

By invitation, Mr. J. A. Haskell delivered a very interesting address, which was well received and approved. President Bennett, in a few well-chosen words, thanked Mr. Haskell for giving the Association the benefit of his views.

Letters advocating class shooting at the Grand American Handicap tournament were read, as were several communications touching on other subjects, all of which were received and ordered filed.

By resolution it was decided that hereafter the club or association on whose grounds the Grand American Handicap is held must use an equal number of sets of traps made by the different members of the Interstate Association, automatic or expert, at the makers' option, and to throw the targets made by said members, in their respective traps.

The next business taken up was applications for membership, and the Austin Cartridge Company, of Cleveland, O., was duly elected a member.

A recess of five minutes was then taken, after which the meeting was again called to order by President Bennett, to consider the election of a board of seven directors, Messrs. Waters and Park being appointed tellers. Messrs. Haskell, Barrell, Keller, Bennett, Durston, Tatham and Parker were declared elected.

Upon motion the meeting adjourned at 6 P. M., to meet at 10 A. M. the following day.

The adjourned meeting was called to order at 10:40 A. M. Dec. 15, with President Bennett in the chair. The roll call showed the following members present: Union Metallic Cartridge Company, by A. C. Barrell; Winchester Repeating Arms Company, by Irby Bennett; Parker Bros., by W. F. Parker; E. I. DuPont Company by J. T. Skelly; the Marlin Fire Arms Company, by J. Howard Marlin; the Peters Cartridge Company, by T. H. Keller; Hoyt Metal Company, by W. P. Markle; Chamberlin Cartridge & Target Company, by Paul North, and the Lefever Arms Company, by A. H. Durston. The following were represented by proxy: Tatham Bros., by W. P. Markle; Laffin & Rand Powder Company, by J. T. Skelly; Remington Arms Company, by A. C. Barrell, and the Hunter Arms Company, by T. H. Keller.

New business was at once taken up where left off. It was decided to change the policy of the Association, and to hold four tournaments, on lines similar to the Grand American Handicap, which were by the Tournament Committee decided as follows: One in the East, one in the South, one in the West (between the Mississippi River and Salt Lake), and one on the Pacific Coast.

These sections were defined by geographical limitations. Eastern section to be east of Buffalo and Pittsburg; southern section to be south of the Ohio River and east of the Mississippi River; western section to be west of the Mississippi River and east of Salt Lake and Ogden; Pacific Coast to be west of Salt Lake and Ogden.

It was resolved that each and all contestants of future Grand American Handicaps, who have not shot in that event prior to 1906 shall be required to send in with their respective applications a specific statement of their respective general averages through the six months prior to said application. In case said contestant is a club member, his statement of said general average is to be certified as correct by his club secretary. Any other contestant shall be required to divulge his general average as above set forth, if required so to do by the Secretary-Manager of the Interstate Association.

A committee by resolution was appointed to investigate the situation as it relates to rifle and revolver shooting, and report to the Interstate Association the feasibility of the adding that kind of competition to Interstate Association interests. The members of this committee are as follows: Col. J. G. Ewing, Wilfrid Hartley and W. R. Clark.

Grand American Handicap matters were then taken up, and it was decided by the stockholders' meeting that the Grand American Handicap of 1906 would be held in Indianapolis.

It was decided to hold two championship events, one for amateurs, the other for professionals, in connection with the Grand American Handicap, the conditions in a general way to be as follows: 150 targets, 18yds. rise, use of one barrel, entrance \$5, and open to the world.

Mr. A. W. Higgins, in view of his long and efficient connection with the Association, was unanimously elected an honorary member.

It was resolved that the Tournament Committee be authorized to provide for State Association tournaments, on application, a trophy to be contested for in team contests of four men to the team, and four individual trophies for the members of the winning team. The team trophy to become the permanent property of the club, and the individual trophies to become the permanent property of the individuals winning same. The condition of giving the trophies is that each member of the Interstate Association be given an advertisement in the programme of the tournament.

A vote of thanks was tendered to the sportsmen's journals, honorary members, for the assistance they have given the Association in keeping its work prominently before the general public.

The Board of Directors elected the following officers for the ensuing year: President, J. A. Haskell; Vice-President, W. F. Parker; Treasurer, A. C. Barrell; Secretary-Manager, Elmer E. Shaner.

The directors appointed the following committees: Tournament Committee—Paul North (Chairman), Irby Bennett, A. C. Barrell, T. H. Keller, W. P. Markle, J. T. Skelly and A. H. Durston.

Handicap Committee—Elmer E. Shaner (Chairman), W. K. Park, B. Waters, C. M. Powers and W. D. Towns.

Trophy Committee—A. W. Higgins and Edw. S. Lenthion.

The Tournament Committee decided to hold a tournament respectively in May, June, July, August and September, and to add moneys to the programme of the different handicaps scheduled.

The meeting adjourned sine die, at 5 P. M., with all business fully covered.

WESTERN TRAP.

Cincinnati Gun Club.

Dec. 16 was cloudy and dark, and the poor light caused some of the crackerjacks to drop a little. The weather on Dec. 15 was stormy, rain, sleet and snow falling all day, so that no shooter had courage enough to visit the grounds to shoot in the Clements trophy contest. To-day fifteen members were present, and Leever finished high gun, 47. A good programme of probably 100 targets will be offered as an attraction on New Year's Day, at which time it is likely the ownership of the cup offered some time ago by Arthur Gambell, will be decided. Faran and Harig are in the lead, being tied on a straight score of 25. No one has tackled Gambell's latest "sure thing." Seems funny, too, when it is the same as finding money. Stanley Rhoads has promised to stir the Columbus boys up to accepting the team match proposition made by Gambell. Dayton shooters have not yet responded, though one would think they would be the first to take favorable action, as they have such a bunch of good ones to select from. Wm. Randall and J. E. De Wire will hold a turkey shoot at Mason, O., Dec. 20, at which some of the crack shooters of the State will be present. There will be 15-target events with two fine, dressed "turks" as prizes in each event. The shoot will take place, rain or shine, snow or blow, as there will be ample shelter. The supply of turkeys will hold out, and they are all good ones.

On Dec. 10 the following scores were made in the Ackley trophy contest, in addition to those shot on the 9th: Bleh (20) 14, 13, 17-44; Gambell (18) 15, 11, 17-43; Randall (18) 13, 13, 17-43; Miles (16) 13, 13, 16-42; A. Sunderbruch (16) 9, 12, 16-37; Littleton (16) 7, 8, 12-27; Ben Rhoads (16) 1, 7, 8-16; Tuttle (16) 4, 4-12.

To-day's scores:

Clement trophy, 50 targets, handicap:

Leever, 16 .....	47	Miles, 16 .....	37
Swede, 16 .....	45	Dull, 16 .....	36
Black, 16 .....	44	Herman, 18 .....	34
Harig, 19 .....	44	Falk, 16 .....	33
Williams, 17 .....	42	Mieninger, 16 .....	31
Bullerdick, 16 .....	39	Offner, 16 .....	18
Maynard, 17 .....	38	Hulvershorn, 16 .....	17

Team match, 25 targets:

Gambell .....	21	Harig .....	22
Williams .....	20	Maynard .....	17
Herman .....	20-61	Bullerdick .....	18-57

Ohio Notes.

Ed. Rike issued the following challenge: "I will shoot any man in the city (Dayton), nobody barred, 100 targets, on the N. C. R. grounds, \$10 entrance. Will shoot Rolla Heikes, with the condition that he allows me a handicap of 10 extra targets to shoot at."

Seventeen shooters took part in the contests of the Cleveland Gun Club on Dec. 9. The weather was very foggy, and not favorable for big scores. Doolittle was high man in the fob contest at 50 targets, with 49. Floro second with 47. McVeigh and Stanley third with 42 each. Sanford 41, Spencer 38, Ong 28, Tobey 40, Wallace 33, Rattle 39, Tamblin 37, Andrews 26, Jackson 36. In the cup contest Doolittle was also high man with 93 out of 100. This is the fifth time he has won the cup. Spencer was second with 87. Hopkins 77, and Freeman 70. This cup is emblematic of the championship of northern Ohio, and is open to any shooter in northern Ohio. The contest is at 100 targets, and is held on the second Saturday of each month; entrance \$2. Out of 175 targets shot, Doolittle missed but 10. Spencer broke 146, Freeman 90 and Hopkins 101 out of 130. Tobey and Rattle shot at 95 each and broke 80 and 76 respectively.

The Moire Antique Fishing and Gun Club, of Cincinnati, held their annual game dinner at the club house on the White Water River on Dec. 10. Many kinds of game were served, including choice bear steaks from the Rockies. I. N. Price was chef, W. A. Mitchell toastmaster. Among those present were Joe Wyss, who celebrated his birthday; Steve Bender, A. P. Lawhead, H. Ransick, Joseph Murdock, Charles E. Fish, M. Streibig, G. D. Price, Doc Wilder, Chas. Utrich, Cal Crim, Gus Hildebrandt, Luther Parker and George Rogers.

The sport enjoyed at the Dayton Gun Club's grounds on Dec. 14 will not soon be forgotten by either shooters or spectators. The shoot was under the management of Zenas Craig, which is the same as saying that things went along smoothly, and this was the case. The weather was fine, the sun a little too bright in the morning, perhaps. The traps worked perfectly, and no hitch occurred in any of the contests, the shooting off of ties lasted until approaching darkness forced the boys to stop. Twenty-four shooters took part in one or more of the nine 10-target events, all shooting from 16yds., 50 cents entrance in each event. Twenty-seven turkeys were offered as prizes. First prize in each event, a 15 or 16-pounder; second prize, a 13 or 14-pounder; third prize, a 12 or 13-pounder, and fourth prize, a 12-pounder. Two prizes were offered in the first event, four in the second, and three in each of the other seven events. The winners were as follows, in order named. First event, James McConnell and Cain; second event, Cord, Ike, Mille; third, Smyth, Craig, Rike; fourth, Craig, Hanauer, Heikes; fifth, Craig, Lindemuth, Oldt; sixth, Lindemuth, Heikes, Oldt; seventh, Heikes, Lindemuth, Whitacre, Oswald; eighth, Cain, Lindemuth, Rike; ninth, Craig, Lindemuth, Whitacre. Smyth won first in the third event on a straight score of 10. In the last event Craig and Rike tied for first on 10 straight, and the former won the shoot-off. The shoot-off for second was miss-and-out, Lindemuth winning with 4 straight. Heikes 3, Hanauer 1, Cain 1, Schwind 1, Oswald 0. For third,

miss-and-out, Whitacre 5, McConnell 5, Ike 3, Cord 1, Lewis 0. Whitacre and McConnell tied, and in the shoot-off, the former won, 5 to 4. Cain was high gun for the day with 79 out of 90. McConnell 74, Rike, Oldt and Hanauer 72 each, Schwind 70, Smyth 67, Oswald 67, Hodapp 63, Schaerf 56. The following shot at 80 targets: R. Heikes 70, Ike 67, Cord 57, Craig 70, Keller broke 40 out of 70. Out of 60 targets each, Lindemuth broke 52, Watkins 50, Curphey 45, Lewis 39, Whitacre, Miller and Ruff broke 34, 33 and 20 respectively out of 40. H. Heikes and Darst each broke 14 out of 20.

Michael J. Schwind has accepted Ed. Rike's challenge to any Dayton trapshot, for a 100-target match, \$10 a side. The match will probably take place early in January, when Rike returns from a business trip to New York. The race will be a hot one, and the winner can bank on having some one of the following bunch after him for a similar match: Miller, Oswald, Craig, Lindemuth, Watkins, Cord, Kette, McConnell, Smyth, Hanauer, Kempert, R. Heikes, all of Dayton, or, if he will take an outsider, he may have to reckon with Ben Downs, Wm. Poole, Charley Young, A. W. Ryan, W. H. Batdorf, Ed. Holding, Harry, Wils Kirby, or H. A. McCaughey, of Springfield, New Paris, Troy and other nearby places.

The Pillars Gun Club, which recently lost their club house by fire, will be located on Tusculum Heights, occupying what is known as the Harcourt residence, final arrangements having been made on Dec. 14. Tusculum Heights is a suburb of Cincinnati, and the property acquired consists of twenty-two acres, with buildings which are in fine condition. Their old club house was on Madison road, and the change is a good one in many respects. The club has a number of good shots on its membership roll, but confines its shooting to its own grounds, seldom sending a team to compete with others, except annually to Dayton.

Stan. Rhoads, of Columbus, O., has made his mark as a trap-shooter, and it is a high one, and this year he made a try for top score as a hunter of big game. In a letter to Arthur Gambell he says: "Had a great trip up North. Left here the 9th of Nov. and returned on the 22d. Went sixty miles north of Sault Ste. Marie. Killed a moose as big as an elephant, 8ft. 4in. high at the shoulder, and horns spreading 59in., with a web 15 1/2in. across. I had to pack the head a little way on our way out, so I know exactly what it weighs, about 150lbs. the first 100ft., and two tons thereafter and gaining. Up a hill it weighed 4,627lbs. exactly. Had sin. of snow and 4in. of ice over everything. Slept out in a small tent and cut down 5 acres of hard wood to burn in five days—then got cold. Got six deer, about fifty partridges and a few big, pure white rabbits; one wolf and a big lynx. If there had been anything else in the woods would have got it, but guess that's all there was in the five days we were out."

In Other Places.

The Fairmont, W. Va., Gun Club held a shoot Friday, and it was such a happy affair that the members spent the evening at the Jackson Hotel, where they feasted, played social games, and altogether had a most enjoyable time.

When the annual banquet of the Consolidated Sportsmen's Association of Grand Rapids is held, which will be in the latter part of December, or the first of January, there will be a proposition submitted to move the shooting park to the Fifth Avenue Golf grounds. Mr. W. B. Jarvis, together with Charles Greenway, will investigate the grounds, and submit his report at the meeting. High waters have greatly interfered with the shooting at the old grounds, to say nothing of the mosquitoes that get you going through the timber thitherward.

In the gun club shoot held at Canon City, Colo., first of the month, Thomas Blunt, of Florence, was high with 70 out of 75. A. W. Peterson, of Denver, and J. J. Armstrong, of Buena Vista, tied on 69. Mr. Frank Dixon was next. George Rohrer, the well-known shot, formerly of Oklahoma, now of Colorado Springs, rather cleaned up the boys with his 15 straight. Mr. J. M. Killen, of Pueblo, was a good second. Messrs. R. F. Knight, Will Waldo and A. A. Parker were the best of the home club members. Altogether the shoot was a success, and much enjoyed by all present. It is reported that at least 300 spectators were out during the day, many of whom remained all day. Many of the citizens took occasion to compliment the members on the success of the shoot.

Friday and Saturday were the days set apart by the members of the High School Gun Club, at Kalamazoo, Mich., for their annual hunt. Cloverdale was the place chosen to drive the game from its quarry.

J. H. Rice, of the Houghton, Mich., Gun Club, was a three-time winner at the last shoot, having annexed the 10-target event, the handicap and the club's cup. There was a small attendance, but the shooting was lively.

Wilson W. Bell, one of the steady shots of the Hoopston, Ill., Gun Club, won the medal at the last shoot held by the club for this season.

It is pleasing to note that the holiday shoot of the Canton, Ill., Gun Club proved that many of the members were able to visit the traps that day as well as to eat their turkey dinner. The members claim that as the day was raw and cold, it was an ideal day for the game of target shooting.

Last Friday, when the Freeport, Ill., Gun Club met, there were not enough members present to make the scores interesting, so no scores that were made will count on the medal.

A raw, bleak wind prevailed when the members of the Elwood, Ind., Club, met Thursday for their shoot, yet some fine scores were made. Mr. Curtis, one of the enthusiasts, made best score, 44 out of 50; Mr. Lansberry, who is a new shot, made 42. Mr. McClure tried 100, and rounded up 82.

The shoot at Fred Wilson's, Newark, O., Thursday last, was largely attended, and the contest was interesting. Those who shot best carried off the fowls. The others carried away regrets with their poor scores.

At Princeton, Ill., there was a great race for turkeys and fowl on Thursday last. Jake Wagner was leading, as he carried away eight of the fat birds.

Shooting at Akron, O., Thursday last, Scott and Dunn were high guns. Shooting at 100 targets, W. W. Wohlwend broke 85, I. Kepler 86, Dunn 87.

D. E. Helton, Thomas Douglas, W. J. Hiller and Wm. McKinley were the winners at the Ogden, Ill., shoot. Together they got a dozen species of game.

There was a large attendance at the La Junta, Colo., Gun Club Thursday last. Scores showed offishness. H. M. Wasser won the medal on 18 out of 25.

Way up in the fairly cold region of Minnesota, the national holiday found a large delegation of shooters out to bust the targets and win prizes. Shooting in a chilling southwest wind, all went through with 50 targets. Scores: E. W. Bird 37, O. Welles 32, Ben Bird 32, Altenberg 31, Church 30, Hicks 30, Powers 30, Donohy 28, J. L. Palmer 28, E. Christianson 27, Neben 26, Brant 25, Joe Buchanan 23, Ganshirt 24, Evert 19, S. M. Camrigh 19, Beard 18, Henry 18, Tonner 14, H. Camrigh 14, R. C. Christianson 13, C. W. Moore 13, Boyer 9, Goetz 6.

You know that things grow big in Kansas. Well, members of the Forest Park Club attended a shoot at Atchinson, and they brought home a wagonload of turkeys, some of which were said to weigh as much as 30lbs. each.

Ben Cramer held a shoot in the northeastern part of the town of Gilman, Ill., at which George Bieher, the champion of the county, was best man. Christ. Krub came next, and then Herman Rosalius came next. John Humphrey, one of the old school, was present, together with Ebert Saathoff, Ben Cramer, George Reitz. The participants had plenty of fun, and the manager made money. There will most likely be a shoot held about Christmas. Jack Carley, Ed. Bushman, Ed. Wilson were others from Gilman who were among those who shot also.

The following gentlemen took part in a shoot held at Fort Worth, Tex., last Thursday: A. B. Moore, Bob Durrett, J. M. Ellis, Ed. Towns, Hugh King, G. H. Berge, James S. Day, F. M. Lawson, Ben Lawson, Dan Lawson, G. M. James, P. B. James, Walter James, J. R. High, R. M. Dean, W. G. Newby, J. W. Childress, Dr. W. R. Howard, Dr. S. J. Lawrence, J. C. Vigal, George W. Carlton, G. K. Bradburn, J. A. Kee, P. L. Stephenson, W. L. Coleman, G. W. Lague, Bod Durrett and W. C. Cantrell. All were so delighted that arrangements were made to shoot at same place on Christmas Day.

The Corro Gordo, Ill., Gun Club has not been heard from for some time, but it came forth during the holiday awakening, and opened up with both shotguns and rifles. It is hoped that Mr. Smith will keep the club going in the future.

The Brayton, Ia., Gun Club, while holding a shoot last week, found out that Dr. W. R. Kaob was "Heap Big Indian." Never having shot at a target, he was sure he would not "bust" a single one. Neither he did, at the start, but he caught on, and at the end won out over all with 10 straight. Jens Christoferson won the first event, 4 out of 5. Then the Doctor, Inrood Birk, George Frederickson, John Larsen, Chris. Hoegh, Peter Hoegh and Peter Beck, all tied, and on the shoot-off the above-mentioned Doctor shot them all out on a miss-and-out.

Many years ago there was often shooting matches held at McPherson, Kans. There is where J. A. R. Elliott first smashed the mud pies with his 10-gauge. Last week there was a fowl shoot in the vicinity of McPherson.

The shoot held by the Cripple Creek, Colo., Gun Club, at the

Mineral Hills ground, Sunday last, was noted for the high class marksmanship. The honors for best average went to Tom Daly, who defeated Beryl Tolman in the tie shoot off, averaging over 90 per cent. This club proposes to put the grounds and traps into good condition and then hopes to hold a team race with Colorado Springs Gun Club.

The shoot last Sunday, held by the Penn Square Gun Club, Norristown, Pa., attracted many of the Pennsylvania wing shots. The birds were a lively lot, and being aided by a high wind, made straight scores impossible. At 15 birds, Henry scored 13, Hall 13, Jackson 9, Rieff 8, Harner 8, White 7. Miss-and-out: Jackson 6, Henry 5, Hall 5, Rieff 4, Warner 3, Gellar 2.

Thanks were extended by the officers to those who braved the elements at the last shoot held by the Carroll, Ia., Gun Club last Tuesday.

Quail shooting in the vicinity of Union, W. Va., is reported to be n. g. this fall. The birds appear to be all last year's breeding. Rabbits are plentiful and are said to increase five pounds in weight for each mile they are carried; so that bird hunters generally taboo his Bunnysnip.

Lockport, Ill., gunners usually get together during the annual holidays and enjoy themselves contesting for prizes. This year will not be an exception, and some of their friends will surely be on hand.

Carlville shooters are not unmindful of the opportunities for shooting during the holiday season, and all who are in practice for same join for the occasion.

During the practice shoot held at Tacoma, Wash., the shooters keep huddled about two huge log fires when not shooting, to keep warm, as there was snow on the ground. The sun made a bad light, and yet some good scores were made. Many of the shooters had not shot since the August tournament.

At Houston, Tex., the Palestine Gun Club gave a shoot at which Capt. G. E. Bartlett, the crack rifle shot, gave an exhibition.

Shooting at clay targets recently at Leipersville, Pa., Edward McLoughlin, Michael McLoughlin, James F. Dougherty and Jas. McCloskey each shot at 12 targets, with the result that not a single target was broken.

The Downs, Ia., shoot was well patronized, even if the prizes were no larger than turkeys and geese.

The shoot at Moosehead, Ia., held Wednesday last, was not well attended, owing to the bad weather.

Jake Schuchert held a shoot Saturday at the ball park in Belle Plaines, Ia., which was reported a big success, and records were good.

At Connersville, Ind., the members of the club met Monday evening and made preparations for a pigeon shoot to be held during the holidays.

F. E. Wright, W. H. Sherman, William Kennedy, John Norton, Justice J. C. Morch, George B. Stack, J. H. Donnelly, E. H. McKie and Fred Peck, members of the Canvasback Gun Club, of Sacramento, Cal., broke the record by returning with the limit bag of ducks, 450, as a result of a day's shoot.

Peter Risser is the crack shot of Panola, Ill., as he won the biggest prizes at a recent shoot held there.

Bert Wagoner, of Lenox, Ill., reported that he attended the Lonetree shooting match and came off victor.

Though far away from the oyster beds, the Greeley, Colo., trap shots lately had a contest for a supper. The shoot was such a pleasant affair that another will be held Christmas.

Report comes in that Marquette, Kans., has organized a gun club, with C. O. Baird, President, and J. F. Royston, Secretary.

The Keystone Gun Club, of Lebanon, Pa., together with members of other organizations, propose to hold a parade on New Year's Day. There will be prizes offered by the merchants for the most unique dress, etc. If it proves a success, then it is destined to be an annual affair.

Members of the Marshalltown, Ia., Gun Club propose to hold a shoot and invite any and all to meet with them on the holiday shooting day.

The Cherokee, Kans., Gun Club hold a business and social meeting the first Wednesday night of each month. E. A. Perry is President, and J. M. Davey, Secretary.

When that new gun club gets on to its legs in Wichita, Kans., it is proposed to call it the Big Three. Of course, it will be pretty big if W. C. Williams and Ed. O'Brien hang about it much.

Pop Heikes lately visited the Toledo, O., Gun Club, and the boys entertained him at the traps.

A team hunt was successfully carried out at Forest City, Ia., lately, the chosen sides slaying rabbits as their objective sport. M. J. Johnson and L. Pearce were the captains. Two hundred and fifty-four rabbits were brought in. Mr. Johnson fell into the river, and came near drowning, and when he was loading the bag into the wagon, became so excited that he forgot his gun.

Chas. Tourtillot was presented the trophy given by the Rich Hill, Mo., Gun Club for the highest average during this season.

Members of the Mt. Pleasant, Ia., Gun Club have started their contests for the Dr. Cook trophy. Fred Fairchild was the winner at the last shoot, with 21 out of 25 targets.

The Boydston, Pa., Gun Club will hold a shoot Dec. 23. Only 12-gauge guns and No. 8 shot will be allowed.

John F. Weiber and Howard Schlichter, of Allentown, Pa., last Tuesday shot at 20 live birds, and the latter won, 19 to 18.

The McHenry, Ill., Gun Club is fast coming to the front, as another shoot was held there Dec. 14 and 15.

There were fifteen shooters at the Butte, Mont., Rod and Gun Club grounds Sunday last. Nickey made 4 clean scores, and thus he won points in the cup contest. He is now one point ahead, having 6. Conrarr, of Livingston, is next with 5.

The last shoot held by the Elwood, Ind., Gun Club was of such interest that another will be held on Christmas Day. The club members are endeavoring to purchase their old grounds, which they claim to be the best in the State.

Montclair Gun Club.

MONTCLAIR, N. J., Dec. 16.—Events 1, 2, and 3 were for a box of shells, gun to be held below the elbow. Event 4 was for a silver meat fork; event 5 was for a box of cigars, ties to be shot off in the following event. Messrs. Batten, Holloway and Boxall were the winners.

On the 30th the club will hold a silver shoot. Frank Butler and Billy Heer will be present. There will be shooting on the morning of Christmas Day.

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6

E. WINSLOW, Sec'y.

New Haven Gun Club.

NEW HAVEN, Conn., Dec. 13.—Good weather favored a good attendance at the regular monthly shoot held at Schuetzen Park. Mr. C. B. Bristol, famous as a shooter of rare skill, won the carving set, the first prize, with a score of 24.

PUBLISHERS' DEPARTMENT.

Proctor's.

Seats are reserved at all the Proctor theatres, both afternoon and evening. Patrons may have these tickets mailed to them upon sending check or money order, or they will be held in reserve at the box office until the performance required. Telephone communication will receive prompt and courteous attention. Seats for the four New York houses are on sale at all principal hotels and newsstands.

There is now on exhibition at the establishment of E. Vom Hofe, the dealer in fishing tackle at 95 and 97 Fulton street, New York, a superb fish, which will interest all anglers. This is an Amber Jack, taken with rod and reel, which weighs 92 pounds, and is thus the record fish of this species. The specimen has been mounted and colored to the life, so that it appears as if just taken from the water. It has thus an especial interest for angler and naturalist alike, and is well worth seeing. Mr. Vom Hofe extends an invitation to all anglers to inspect the fish.

"What did old Gruff say when you told him you would like him to find you an opening in his office?" "He showed me the door."—Baltimore American.

# FOREST AND STREAM.

## A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$3 A YEAR. 10 CTS. A COPY. }  
SIX MONTHS, \$1.50. }

NEW YORK, SATURDAY, DECEMBER 30, 1905.

VOL. LXV.—No. 27.  
No. 346 BROADWAY, NEW YORK.

*The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects.*

Announcement in first number of FOREST AND STREAM, Aug. 14, 1873.

### NOTICE TO SUBSCRIBERS.

Beginning with Jan. 1, 1906, the subscription price of "Forest and Stream" will be \$3.00 per year; or \$1.50 for six months.

All subscriptions now on our books which have been paid at the \$4.00 rate, and which run for any period into 1906, will be extended pro rata to conform to the changed price.

### ANNOUNCEMENT.

WITH the issue of January 6, which will be the first number of the sixty-sixth volume, several important changes will be introduced in the style of FOREST AND STREAM. In keeping with the pronounced tendency of the day we shall adopt a page of reduced size and one which has been determined upon not only because of its much greater convenience in the reading, but because it is more adapted than the present one to purposes of illustration. Of illustrations there will be largely increased use. That, too, is in line with the progressive journalism of the hour. The subjects to which the FOREST AND STREAM is devoted offer abundant scope for illustrating, and with the new departure it will be our ambition to make the pictorial features a fitting complement of the reading columns, and thus to give the paper a new and added interest.

In its changed form the FOREST AND STREAM will be a regular weekly issue of forty pages, with the issue of the first week of each month increased to fifty-two pages. This will give two volumes per year of 1,112 pages each, or 2,224 pages for the year.

Beginning with January 1 the subscription price will be \$3.00 per year.

These changes are all in the way of a better, brighter, handsomer paper. The new FOREST AND STREAM will be received as an acceptable and appreciated advance over the old.

Among the illustrated papers which will appear in early issues will be:

AN ELK HUNT IN WYOMING.

A TRIP WITH REINDEER IN LAPLAND.

RATTLESNAKE LODGE—A North Carolina Mountain Home.

SPORTING IN CHINA.

TREES IN WINTER—A Series of Simple Studies of our Familiar Trees.

INDIAN SNOWSHOE MAKING.

THE LOG OF A SEA ANGLER.

THE BIRDS OF DEATH VALLEY.

A DANCE AT SAN JUAN.

SKI RUNNING.

A WINTER IN FLORIDA. (In the issue of Feb. 3, which will be a Florida number.)

CLIMBING MOUNT POPOCATEPETL.

PICTURES OF CHEYENNE LIFE.

### PRIZES FOR GAME HEADS.

THE FOREST AND STREAM offers three prizes of \$20, \$10 and \$5 respectively for the best moose heads secured in the year 1905 in the hunting grounds of the United States and Canada.

It offers also three prizes of \$15, \$10 and \$5 respectively for the best white-tail deer heads taken in the hunting season of 1905 in the United States or Canada.

The heads will be judged from photographs submitted to the FOREST AND STREAM. In estimating their merits the two qualities of size and symmetry will be taken into consideration. With the photograph of each head must be sent a memorandum of the place and the time of its taking and the name of the person taking it. The competition will be open to amateur hunters only; and with this single restriction it will be open to the world. There are no entrance fees. The photographs submitted will be the property of FOREST AND STREAM. Entries for the competition must be made not later than Jan. 15, 1906.

### THE FINE ART OF FLINCHING.

FLINCHING is a common affliction among shooters, field and trap. It is a very serious handicap to the afflicted one who is performing at the traps. When he flinches he commonly scores a miss, although there are some men who, from long experience in flinching and quick recovery of position, instantly readjust themselves for another attempt, then not infrequently succeeding in scoring a hit. However, the odds against a successful shot are many in the greater number of cases. By its much important time is lost. Not the least circumstance of the ensuing delay is the much greater distance gained by the target and the increasing change of flight when it is in the last part of its parabolic curve. The long shot, if successfully made after a flinch, is quite likely to be spectacular and to win the applause of the onlookers, but, nevertheless, it is not good nor winning trapshooting.

Good form at the traps consists in breaking the targets at the earliest moment possible after they take flight at the call of "pull." By practice, the shooter acquires a habit of firing when the targets are at a certain uniform distance from the traps, and also with a certain uniform degree of quickness, which is called his "time." Some shooters, the experts in particular, may have the same quick time for any flight, right, left, straightaway, high or low. Some fairly good performers have a kind of mixed time, dwelling a trifle longer on some one particular flight than on others, generally the right quarterer, if the shooter be right handed, the left quarterer, if the shooter be left handed.

The "time" of a shooter as a whole is referred to as slow or quick, accordingly as he breaks the targets far from or near to the traps. Owing to differences in nerve force, physical power, and keenness of vision, some shooters can aim and fire much more quickly than others. Nearly every shooter is sharply distinct from every other in his shooting mannerisms such as position, holding, "time," etc. Now, let the shooter acquire the pernicious habit of flinching and his organized methods are disrupted. His "time," so essential to good performance, is shattered; his position is modified or changed, which introduces another element hostile to success; his temper, however, equable under ordinary conditions, is likely to rise to the torrid point, and his vocabulary is likely to be enriched by strange words of marvelous emphasis.

Many causes are attributed to the instantaneous shrinking called flinching, which occurs at the moment when the shooter pulls the trigger, or at the moment when he attempts to pull it. Although the shooter may be strong as a Hercules, his trigger finger may absolutely refuse to respond to his will if he flinches. Communication then between brain and finger are the same as if severed. The shooter himself is frequently not aware of the trigger finger's disobedience till the attempt to fire is completed, as shown by his leaning forward smartly to take the expected recoil, and the loss of balance forward when there is no explosion and therefore no recoil. Sometimes, quickly recovering, the shooter will make a second attempt, resulting, perhaps, in a second flinching. If the trigger finger obeys the dictates of the will, coincidentally with the pull of the trigger, the whole body may flinch, and the shot, though well aimed up to the moment of firing, may fly wild of the mark. In bad cases, the shooter almost buckles up, and then the load may go into the ground a few feet ahead of him, or wide of the mark at all events. Thus there are various degrees, from mild to severe.

The causes of it have many times been the subject of earnest discussion by trapshooters. Inasmuch as the trigger finger refuses to act at the moment it should do so, in response to the command of the will, it is a direct and plausible inference that the trigger is not properly adapted to the peculiarities of the finger, hence the abundance of advice enjoining that the trigger be straightened or crooked. Or it may be that the diagnostician locates the trouble in the gun stock, which then needs to be made longer or shorter, or the comb needs building up or cutting down. Nevertheless, the flincher continues to flinch.

The true cause of flinching is the punishment inflicted on the shooter by a gun which is ill-fitting; or by a load which is too powerful, and the recoil consequently too punishing for the shooter to withstand without severe and harmful shock. Men whose physique is powerful

and whose nervous system is vigorous and steady, can withstand much more punishment or shock than others not so endowed; but, in any case, the amount of punishment they can endure is relative. There is no shooter who will not flinch if hurt enough or shocked enough to make an impress on his nervous system.

The remedy lies in removing the cause. If the gun is ill-fitting and pounds the face or finger of the shooter, the stock should be changed till the evil is eliminated. If the load is so great that the shooter cannot withstand the recoil without flinching, then it is obvious that he should use a lighter load. In short, if the cause of punishment is removed, the cause of flinching goes therewith.

### PROTECTING THE FOREST RESERVES.

THE River Improvement Commission of the State of New York has lately been holding hearings in relation to the attempts to dam certain Adirondack rivers, and so to overflow parts of the State Forest Reserve for the purpose of supplying power to private parties. Such overflowing would result in the destruction of the forests on the lands so overflowed. Two members of the State Legislature, Senator Malby and Assembly-Merritt, both of St. Lawrence county, have appeared before the Commission as attorneys for the power interests. A number of individuals and representatives of corporations have appeared before the Commission, urging the view that it has no authority to grant privileges of this nature. The case appears to be clear.

When the people of New York, by their delegates assembled, revised the Constitution of the State in 1894, they prohibited, by Article VII. of the Seventh Section, any use of State lands for such purposes. The language of the provision referring to this particular matter is as follows: "The lands of the State \* \* \* constituting the Forest Preserve, shall be forever kept as wild forest lands, \* \* \* nor shall the timber thereon be sold, removed or destroyed." This language would seem to be unmistakable, and unsusceptible of more than one interpretation; and it may be assumed that if the matter goes so far the courts will hold to the plain common sense interpretation of the constitutional provision.

The Hon. Joseph H. Choate has submitted an opinion on behalf of the Association for the Protection of the Adirondacks, which is exactly on these lines. He says:

"Nothing could be more plain, explicit and conclusive than the language used in this constitutional provision. Upon its face and in actual substance it was plainly designed as a restraint upon the power which had previously existed in the Legislature and was carefully contrived for the effectual protection of the Forest Preserve and the timber thereon from just such inroads as are indicated in the question submitted, under legislative authority, whether direct or indirect.

"It is not possible to mistake the meaning of the language used, nor is it capable of more than one interpretation. Any improvement attempted [under the law creating the River Commission] which prevents the lands of the State from being kept forever as wild forest lands and necessarily causes the destruction of timber thereon is absolutely prohibited, and under no plea of necessity or change of policy or public welfare can the effect of the constitutional provision be evaded. The people assembled in convention in their fundamental capacity in framing the amendment and in its subsequent adoption must be deemed to have taken all those things into consideration and to have determined that, so long as the constitutional provision lasted, its terms should be obeyed and the policy embodied followed."

This opinion is of the greatest interest to all the friends of the Adirondack region. It was generally believed that the measures taken at the time of the constitutional convention in 1894 had resulted in safe-guarding the Forest Preserves to the State of New York, but while it is now evident that only eternal vigilance will protect them, it is also evident that the persons interested in their preservation are growing more numerous day by day.

## THE SPORTSMAN TOURIST

### In the Lodges of the Blackfeet.

#### The Story of a Crow Woman.

Is-sáp-ah'-ki—Crow Woman—as the Blackfeet named her, was an Arickaree, of a tribe which, in the days of Catlin, who visited the tribes in 1832, lived some distance below the Mandans, on the banks of the Missouri. Like the Mandans, they lived in a village of mound-like earth-covered lodges, surrounded by a strong and high palisade of cottonwood logs stuck endwise into the ground. They were members of the widely scattered Pawnee, or Cad-doan family, but they had been long separated from the parent stock. They could converse with the Crows, who are related to the Gros Ventres of the village. Their own language—like the Mandan—was an extremely difficult one for an outlander to learn. The Crows and Arickarees were at times on terms of friendship, and again there were long periods when they were at war with each other.

The Crow Woman married early. She must have been a very handsome girl, for even in her old age, when I knew her, although wrinkled and gray-haired, she was still good looking. She had lovely eyes, sparkling and mischievous, and her temperament was a most happy one. After many and bitter experiences she had at last found, with her good friend Mrs. Berry, a haven of peace and plenty which was assured to her so long as she lived. This is the story she told me as we sat before the fire-place, that winter night so many years ago:

"We were very happy, my young husband and I, for we truly loved each other. He was a good hunter, always keeping our lodge well supplied with meat and skins, and I, too, worked hard in the summer planting, and watering as they grew, a nice patch of beans, and corn, and pumpkins; in the winter I tanned many robes and many buckskins for our use. We had been married two winters, summer came, and for some reason the buffalo left the river, all except a few old bulls, and remained away out on the plains. My people did not like to hunt out there, for we were only a small tribe; our men were brave, but what could a few of them do against a great band of our many enemies? So some were content to remain safely at home and eat the tough meat of the straggling bulls; but others, more brave, made up a party to go out where the great herds were. My husband and I went with them; he did not want me to go, but I insisted upon it. Since we had been married we had not been separated even for one night; where he went I had sworn to go also. Our party traveled southward all day over the green grassed plain; along toward evening we saw many bands of buffalo, so many that the country was dark with them; we rode down into a little valley, and made camp by a stream bordered by cottonwoods and willows.

"Our horses were not very strong, for always at night they were driven inside the stockade of our village, and, feeding daily over the same ground outside, they soon tramped and ate off the grass; they had no chance to become fat. Some enemy or other was always prowling around our village at night, and we could not let them remain outside and wander to where the feed was good. From our camp by the creek we started out every morning, the women following the men, who carefully looked over the country and then went after that band of buffalo which could be most surely approached. Then, when they had made the run, we rode out to where the great animals lay and helped skin and cut up the meat. When we got back to camp we were busy until evening cutting the meat into thin sheets and hanging it up to dry in the wind and the sun. Thus for three mornings we went out, and our camp began to look red; you could see the red from afar, the red meat drying. We were very happy.

"I was proud of my husband. He was always in the lead, the first to reach the buffalo, the last one to quit the chase and he killed more of them—always fine fat animals—than any other one of the party. And he was so generous; did anyone fail to make a kill he would call to him and give him one, sometimes two, of his own kill.

"On the fourth morning we went out soon after sunrise, and only a little way from camp the men made a run and killed many buffalo. My husband shot down nine. We were all hard at work skinning them and getting the meat in shape to pack home, when we saw those who were at the far end of the running ground hurriedly mount their horses and ride swiftly toward us with cries of 'The enemy! the enemy!' Then we also saw them, man men on swift horses riding down upon us, their long

war bonnets fluttering in the wind; and they were singing the war song; it sounded terrible in our ears. They were so many, our men so few, there was no use in trying to make a stand against them. We all mounted our horses, our leader shouting: 'Ride for the timber at the camp; it is our only chance. Take courage; ride, ride fast.'

"I whipped my horse as hard as I could and pounded his sides with my heels; my husband rode close beside me also whipping him, but the poor thing could go only so fast, the enemy were getting nearer and nearer all the time. And then, suddenly, my husband gave a little cry of pain, threw up his hands, and tumbled off on to the ground. When I saw that I stopped my horse, got down and ran to him and lifted his head and shoulders into my lap. He was dying; blood was running from his mouth in a stream; yet, he made out to say: 'Take my horse; go quick; you can outride them.'

"I would not do that. If he died I wanted to die also; the enemy could kill me there beside him. I heard the thunder of their horses' feet as they came on, and covering my head with my robe I bent over my husband, who was now dead. I expected to be shot or struck with a war club, and I was glad for whither my dear one's shadow went there I would follow. But no; they passed swiftly by us and I could hear shots and cries and the singing of the war song as they rode on into the distance. Then in a little while I heard again the trampling of a horse, and looking up I saw a tall man, a man full of years, looking down at me. 'Ah,' he said, 'I made a good shot; it was a long ways, but my gun held straight.'

"He was a Crow, and I could talk with him. 'Yes, you have killed my poor husband; now have pity and kill me, too.'

"He laughed. 'What?' he said, 'kill such a pretty young woman as you? Oh, no. I will take you home with me and you shall be my wife.'

"I will not be your wife. I will kill myself,' I began, but he stopped me. 'You will go with me and do as I say,' he continued, 'but first I must take the scalp of this, my enemy.'

"Oh, no,' I cried, springing up as he dismounted. 'Oh do not scalp him. Let me bury him, and I will do anything you say. I will work for you, I will be your slave, only let me bury this poor body where the wolves and the birds cannot touch it.'

"He laughed again, and got up into the saddle. 'I take your word,' he said. 'I go to catch a horse for you, and then you can take the body down to the timber by your camp.'

"And so it was done. I wrapped my dear one in robes and lashed the body on a platform which I built in a tree by the little stream, and I was very sad. It was a long, long time, many winters, before I took courage and found life worth living.

"The man who had captured me was a chief, owning a great herd of horses, a fine lodge, many rich things; and he had six wives. These women stared very hard at me when we came to the camp, and the head wife pointed to a place beside the doorway and said: 'Put your robe and things there.' She did not smile, nor did any of the others; they all looked very cross, and they never became friendly to me. I was given all of the hardest work; worst of all, they made me chip hides for them, and they would tan them into robes; every day this was my work when I was not gathering wood or bringing water to the lodge. One day the chief asked me whose robe it was I was chipping, and I told him. The next day, and the next, he asked me the same question, and I told him that this hide belonged to one of his wives, that to another, and so on. Then he became very angry, and scolded his wives. 'You will give her no more of your work to do,' he said. 'Chip your own hides, gather your share of wood; mind what I say, for I shall not tell you this again.'

"This Crow chief was a kind man, and very good to me; but I could not like him. I turned cold at his touch. How could I like him when I was always mourning so for the one who was gone?

"We traveled about a great deal. The Crows owned so many horses that after camp was all packed and lodge poles trailed, hundreds and hundreds of fat, strong animals were left without a burden of any kind. Once there was talk of making peace with my people, and I was very glad, for I longed to be with them again. A council was held, and it was decided to send two young men with tobacco to the chief of the Arickaree and ask that peace

be declared. The messengers went, but they never returned. After waiting three moons (months) for them, it was thought that they had been killed by those whom they went to visit. Then we left the Elk River (Yellowstone) and moved to the upper part of Dried Meat River (Musselshell). This was the fifth summer after my capture. It was berry time and the bushes were loaded with ripe fruit, which we women gathered in large quantities and dried for winter use. We went out one day to some thickets on the north slope of the valley, some distance from camp, where there were more berries than at any other place we had found. There had been trouble in our lodge that morning; while my captor—I never could call him my husband—was eating, he asked to see the amount of berries we had gathered; his wives brought out their stores, the head woman five sacks of them, the others two and three each. I had but one sack, and another partly full, to show. 'How is this?' the chief asked. 'Has my little Arickaree wife become lazy?'

"I am not lazy,' I answered, angrily. 'I have picked a great quantity of berries; and every evening I have spread them out to dry, covering them well after sunset so that the night dew would not injure them; but in the morning, when I have removed the covers and exposed them to the sun's heat, I have found many, very many less than I had placed there. This has happened every night since we came to camp here.'

"That is strange,' he said. 'Who could have taken them? Do you women know anything about it?' he asked his wives.

"They said that they did not.

"You lie,' he cried, angrily, rising from his seat and pushing his head wife back out of his way. 'Here, little woman, are your berries; I saw them stealing them'; and from the head wife he took two sacks, from the others one each, and threw them over to me.

"Oh, those women were angry. They did not speak to me all that morning, but if looks could have killed me, then I would have died, for they scowled at me all the time. When the chief drove in the horses each caught the one she wanted and rode out to the berry patch.

"The five kept close together that day, leaving me to go by myself; and if I went near them they would move away to some distant bushes. Some time after middle day they began to move toward me, and in a little time they were at work all around close by. Still they did not speak, nor did I. My little sack was again full; I stooped over to empty the berries into a larger sack; something struck me a terrible blow on the head; I fell over and knew no more.

"When I came back to life the sun was setting. I was alone, my horse was gone, and my large berry sack was missing; the small one, empty, lay by my side. I was very dizzy, very sick. I felt of my head; there was a great swelling on it, and much dried blood in my hair. I sat up to better look around and heard some one calling me, the tramp of a horse, and then the chief rode up beside me and dismounted. He didn't say anything at first, just felt of my head carefully, and of my arms, and then: 'They said that they could not find you when they were ready to return to camp; that you had run away. I knew better. I knew that I would find you here, but I thought to find you dead.'

"I wish I were,' I said, and then for the first time I cried. Oh, how lonely I felt. The chief lifted me up into his saddle and got on the horse behind me, and we rode home to the lodge. When we went inside the wives just glanced at me quickly, and then looked away. I was about to lie down on my couch by the doorway when the chief said: 'Come here, here by my side is now your place. And you,' to his head wife, giving her a hard push, 'you will take her couch by the doorway.'

"That was all. He never accused his wives of attempting to kill me but from that time he treated them coldly, never jesting nor laughing with them as he had been used to doing. And whenever he left camp to hunt, or to look for stray horses from his herd, I had to accompany him. He would never leave me alone for a day with the others. Thus it came about that when he prepared to go with some of his friends on a raid against the northern tribes I was told to get ready also. It did not take me long; I packed myawl, needles and sinew thread in a little pouch, made some pemmican and was ready.

"We were a small party, fifteen men, and one other woman, newly married to a great war leader. It was not proposed to make any attack upon our enemy, but to

travel cautiously through the country and raid the herds of the first camp we found. We went on foot, traveling by night and sleeping during a part of the long, hot days. After many nights we arrived at the Big River (Missouri) above the falls, right opposite where the Point-of-Rocks River (Sun River) joins it. Daylight had come; looking up the valley of the little river we could see the lodges of a great camp, and band after band of horses striking out into the hills to graze. Near us was a coulee where grew thick clumps of willows, we hurried to hide in them before we would be seen by any early risers of the strange camp.

"The men held a long talk, planning just what to do. They finally decided that it would be best for us to all cross the river and then, after taking some of the best horses in the camp, strike out eastward instead of recrossing right there. By going east for some distance before crossing back, it was thought that the enemy, should they follow us, would think us Crees or Assinaboines. On some high, dry, well-grassed place we were to turn and head for home. There the enemy would lose our trail, and keep on in the direction we had been traveling, while we could go homeward by easy rides, without fear of being overtaken.

"Soon after nightfall we crossed the river, going up the shore until we found a couple of big logs left by the high water. The men rolled them into the stream, lashed them together, placed their weapons and clothes and us two women on the raft and then, hanging on with one hand, and paddling with the other and kicking hard, they soon got it safely across. As soon as we were landed they took off the lashings, pushed the logs out into the current, and carefully washed out our foot prints on the muddy shore. We had landed just below the mouth of Point-of-Rocks River, at the edge of a choke cherry thicket, and there we two women were told to remain until the men returned. Each of them was to enter the camp for himself, cut loose such horses as he could, and all were to meet as soon as possible at the thicket there. They started off right away, and we two sat down to await their return. We talked a little while and then fell asleep, for we were both very tired from our long journey, and at no time had we slept as long as we wished to. After a time I was awakened by the howling of some wolves nearby; I looked up at the Seven Persons (the Great Dipper) and saw by their position that it was past the middle of the night. I aroused my companion and we talked again for a time, wondering why none of the men had returned, saying that perhaps there was some late dancing, or gambling, or feasting in the strange camp, and that they were waiting until all would be quiet before entering it. Then we slept again.

"The sun was shining when we awoke, and we sprang up and looked about us; none of our party had returned; we became frightened. We went to the edge of the brush and looked out; away up the valley we could see the horse herds again, and riders here and there traveling on the hills. I felt certain that the men had been discovered and killed, or had been chased so hard that they could not return to us. So, also, thought my companion. We believed that as soon as night fell again some of them would come for us. There was nothing for us to do but remain where we were. It was a long, long day. We had no food, but that did not matter. My companion was terribly worried. 'Perhaps my husband has been killed,' she kept saying. 'Oh, if he has what shall I do?'

"I know how you feel,' I said, 'I, too, once had a dear husband and I lost him.'

"But don't you love your Crow husband?' she asked.

"He is not my husband,' I replied. 'I am his slave.'

"We went to the river, washed ourselves and then returned to the edge of the brush where we could look out and sat down. My companion began to cry. 'Oh,' she said, 'if they do not return here, if they have been killed, what shall we do?'

"I had already thought of that, and I told her that far to the east on the banks of the Big River my people lived, and I would follow it until I found them. There were plenty of berries; I could snare the brush rabbits; I had flint and steel and could make a fire. I was sure I could make the long journey unless some accident happened. But I was not to attempt it. Some time after middle day we saw two riders coming along down the edge of Point-of-Rocks River, stopping here and there to get off their horses and look at the shore, they were trapping beaver. We crawled back into the center of the brush and lay down, terribly scared, scarcely daring to breathe. The thicket was all criss-crossed by wide buffalo trails, there was no good place to hide; if the trappers should enter it? They did, and they found us; and one seized me and the other took my companion. They made us get up on their horses and brought us to their lodges. All the people crowded around to look at us. This was not new to me, and I just looked back at them, but my friend covered her head with her robe and wept loudly.

"This was the Blood tribe of the Blackfeet. I could not understand their language, but I could hand talk (the sign language). The man who had captured me began to ask questions. Who was I, where was I from, what was I doing down there in the brush? I told him. Then

he told me that his people had surprised a war party sneaking into camp in the night, had killed four of them, and pursued the others to the breaks of the river below, where they managed to get away in the deep, dark cut coulees.

"Was one of those you killed,' I asked, 'a tall man who wore a real bear's (grizzly) claw necklace?'

"He made the sign for yes.

"Then my Crow chief was dead! I cannot tell you just how I felt. He had been good to me, very kind. But he, or those with him, had killed my young husband; that I could not forget. I thought of his five wives; they would not miss him, all the great horse herd would be theirs; they would be glad when I, too, did not return.

"You have seen Deaf Man, the Blood who was here talking with me to-day. I lived in his lodge many years, and he and his wives were very kind to me. After a time I could think of my own people without crying, and made up my mind that I would never see them again. I was no longer called a slave, and made to do the work of others. Deaf Man would say that I was his youngest wife, and we would joke about the time he captured me. I was his wife and happy.

"So the winters went and we grew old, and then one summer when we were trading in Fort Benton, whom should I meet but my good friend here, who had come up on a fire boat (steamer) to join her son. That was a happy day, for we had played together when we were children. She went at once to Deaf Man and pleaded with him to let me live with her, and he consented. And here I am, happy and contented in my old age. Deaf Man comes often to talk with us and smoke his pipe. We were glad of his visit to-day, and when he went home he carried much tobacco, and a new blanket for his old wife.

"There, I have told you a long story, my son, and night fell long, long since. Go to bed, for you must be up early for your hunt to-morrow. The Crow Woman will awake you. Yes, these Blackfeet gave me that name. I hated it once, but have got used to it. We get used to anything in time."

"But wait," I said. "You did not tell me all. What became of the others of your party when you were attacked by the Crows?'

"I did not mention that," she replied, "for even to this day I do not like to think nor speak about it. There were many, many bodies scattered along the way of flight, scalped, naked, bloody, and dreadfully hacked up. Few escaped."

[TO BE CONTINUED.]

## Reeser.

My first acquaintance with Reeser was brought about through a trip for trout when a friend and I stopped with him over night at his little cabin near the mouth of a mountain trout stream. After this I stayed with him frequently and learned to know him well. His house was very small, but kept scrupulously clean by his big, good-natured wife, who was also an excellent cook. To see her climb the ladder to the loft at night always reminded me of a bear climbing a tree. I reached Reeser's cabin late one evening in the spring, and after supper my companion called me to one side and insisted that we must hitch up at once and drive seven miles to a village, where there was a little country hotel. On inquiry, I found that he believed that the dish of meat that we had eaten for supper had been the family cat. He argued that meat in such queer little chunks could come off no other animal. But he finally quieted down and we had a pleasant evening, and he ate many a meal afterward of Mrs. Reeser's cooking.

Reeser's spare room was so nearly the exact size of the bed, which was a tight fit for two fishermen, that his guests usually undressed and dressed in bed. This room was on the first floor, and I was much disturbed one night by a fierce squeaking that went on all night under different parts of the house. My curiosity was satisfied in the morning, however, when I learned that Reeser was taming a mink that spent most of its time under the floor. He also kept for several years a large, white duck that fished for trout and that was very skillful at catching under the stones the smaller trout that passed up the stream beside the house. Reeser's standing joke was to offer to lend this duck to the unsuccessful fisherman of the party.

Reeser himself was a small, gray-whiskered man, whose well-worn clothing so harmonized with the woods that I am sure that the trout always mistook him for a stump when he stood still. His movements were never violent, and his severe exertions were confined to his trips up the mountain brooks after trout. He seldom fished in the main creek, and I am of the opinion that he did not know how to fish where the water was big. But he was a passed-master of the art of fishing a brook with bait. He was never in a hurry, had infinite patience in maneuvering to get to the right place without being seen, and knew in just what part of the pool a trout would be. I stood behind a bush one day and watched him, and I could not help thinking that he must be in some way related to the water animals. He was so quiet and stealthy in his movements, his colors blended into his surroundings so perfectly, he looked so cunning and so capable of beating the trout at its own game, that I wondered how any fish could escape him. He had great contempt for the town fisherman who arrayed himself in brilliant attire and then went plunging along the stream like a colt. He fished with a comparatively stiff rod and

always jerked toward the bank, so that the little trout fell into the bushes when not well hooked.

Reeser used some stock phrases, and had a few superstitions that were amusing to the stranger. A man who worked systematically and got along well always "done things in rotation" for him. If asked what luck on a trout stream, he usually said that he caught "risin' of seventy," and then quit because "enough's enough." He usually prefaced his strongest statements with the clause, "I ask you good morning." He believed that there was a silver mine back in the mountains that was occasionally revealed in the night by a floating light in the vicinity, and he told of a ball of silver that had been found lying on top of a rock up one of the mountain streams. He thought that the Indians had worked the mines and that their ghosts still guarded it. He also knew of a bed of loose rocks on a mountain side under which ice lay all summer long within a few feet of the surface.

There were many rattlesnakes in the mountains around his cabin, and while not much afraid of them, he still had a wholesome respect for them. He believed that they had regular crossings from one mountain to another, and he would frequently show me in the morning in the dust of the road a track where one had crossed. Once he put his little dog on such a track and soon brought to bay in the bushes a large, yellow rattlesnake. I began to think after this that he knew snakes. This dog was once bitten in the lip by a large rattlesnake that he was watching to grab and shake, and he cured himself by burying in the moist earth under the house. When a heifer on the mountain side would bawl out suddenly, Reeser would say that a rattlesnake had struck at her and would hurry away to see what damage had been done.

He did not hunt much, but occasionally in squirrel season he would visit what he called a "chestnut orchard" on a bench near the top of the mountain, and from which he would return with great stories of the black and gray squirrels to be seen there. He was always fond of impressing a strange fisherman with the number and ferocity of the bears in the neighborhood, and near nightfall, in the presence of the fishermen, would order Tommy to see to it that the sheep were well penned up, so that the bears would not carry them off. He was continually telling of some one who had seen "signs of a bear," but I never knew him to kill anything larger than a catamount, numbers of which infested the mountains surrounding his little valley.

Time has dealt leniently with him, and I suspect that in season he is still stealing along the mountain runs, dropping his book loaded with angleworms into the little pool under a log or the root of a tree and snatching out of its home the unwary little trout, and that when the cold winter shuts him up in the house with nothing to see out doors but the black hemlocks against the white mountain sides and the blue sky, he snuggles close to the old wood stove and waits impatiently for spring while he dreams his fishing pleasures over again; or, like the ancient mariner, lures the chance visitor into listening to his long-winded accounts of his adventures on the waters, or how they did things "up in Culley," where his boyhood days were spent.

CHAS. LOSE.

## The Biography of a Bear.—XIII.

We broke camp the following morning at an early hour, caught up our horses and were soon on our way back to Summit Spring. Our bear, Jack, seemed delighted to be rolling away in the wagon again. We took care to have our tobacco and other groceries out of his reach, as since his prolonged excursion of two days before he was unusually voracious. Bread, with the short allowance of meat we could spare him, did not wholly satisfy his increased appetite, and we had observed him supplementing his rations with frogs, and now and then a water-snake from the swamp.

There were plenty of deer and not a few bear in the vicinity of our last camp, but the jungles, forest, and the rocky gorges and cañons, together with some steep mountain sides, made the region a difficult hunting ground. But it was mainly the spirit of unrest, a restless energy that prompted us to keep going, together with the fascination of continued surprises in the way of mountain and forest scenery. Enochs in particular was never content to remain in one place longer than twenty-four hours, or such a matter. We had killed little game, none of us having secured even a fair sized buck, although we had seen the tracks of many large ones. We did not remain in one camp long enough to hunt successfully. It has been my experience that it is a difficult thing to establish a camp in a real wilderness without alarming most of the game. It will disappear and remain hidden for some time, and it is necessary for the successful hunter, as a rule, to learn the range and runways.

We had learned of a lake known as Manzenita Lake, lying at the base of Mt. Lassen, about fifteen miles south of us, and we decided to go to it. We still yearned for some big trout, and we had been told that this lake was so full of them that they had difficulty in getting water enough to keep them from being thirsty. To reach it with our wagon we had to return to a point on the main road, below Summit Spring, where we camped that night and the day following. We caught some more small trout in the headwaters of Cow Creek, and in the evening Dick and I watched a "salt log" a few rods from our camp and the road. This log had been salted two years before—several auger holes having been bored into it and filled with salt. The holes had been nearly gnawed out by deer and no salt was now visible, yet deer and many of them still gnawed and licked there, as was evidenced by the ground having been cut into dust by their hoofs. We watched the log from a scaffold in a tree, but no deer came until it was too dark for us to see them. We only heard them snapping brush, now and then snorting as though they suspected our presence. The mosquitoes tried to carry us away after sucking most of our blood, to which Dick at last objected and we got down out of that and went to camp.

Jack had repeated his bath in the tank and had another wild run in the timber, but he did not again climb the big pine as we feared he might. During the remainder of our trip he took the alternate camping and traveling as a matter of course, and did not again stray far from camp. We tried to keep a red flannel collar upon his neck so that if he was seen at large by any hunter he would—or he might—be recognized as a tame bear. But he did not like decorations and persistently pulled them off and lost them until our supply of flannel ran out. After that we chained him to a tree or the wagon when he was likely to stray, or when we all left camp at one time. He followed us well enough when we allowed him to go along, except that he could not be induced to hurry any. He was not sufficiently civilized to hurry unless he found it important to do so from his own point of view. He persisted in lingering wherever he found nooks and crannies that he wanted to explore—and these he found nearly everywhere. His elegant leisure was too slow for us. He was inclined to please himself here and now, while we were more or less, according to our training, addicted to rainbow chasing.

To reach Manzenita Lake we left the Tamarack road and followed an ancient and dim wagon track through forest and over very rough ground for eight or ten miles. In places we had to use ropes to keep our wagon from overturning, like a turtle, and we had to use the ax to cut our way through dense undergrowth in others. When we reached the Shingletown region we again found traveled roads going to various mills and "Shake camps." Shingletown is a lumbering camp—but at that time it had its name from the shingle or shake-making industry. Shakes are clapboards, generally split or riven, and their manufacture has been the cause for the destruction of many of California's noblest trees. None but the very finest and largest sugar pines were used in this region for shakes. Trees of the thriftiest growth, often six to eight feet in diameter are felled by the shake maker, and from these he uses but a small portion of the butt of the tree that is free from knots, pitch or curls; the balance of the tree is left where it falls, to eventually burn, and destroy perhaps a hundred other trees. Often trees are cut to make two or three thousand shakes, worth to the maker \$5 to \$10, while if sawn into lumber it would be worth in market as many hundreds of dollars. Often these great pines are cut down and they are found to not "split well," and in this case they are left and others selected. The timber of California and the Pacific Coast, worth billions of dollars to commerce, is not, or has not been of sufficient consequence to the States or to the Government to warrant them or it in having a single competent commissioner to supervise its protection or conservation to any noticeable degree. Enough of it has been needlessly destroyed by incompetence (incompetent lumbering methods), and by forest fires that are generally preventable at comparatively little outlay, to have paid the national debt. It has sometimes been pointed out that the tendency of State and Federal government has been to appoint commissioners who are notably conspicuous in political sciences. For forest conservation a single backwoodsman in a flannel shirt, and any kind of pants—even bloomers—would be worth a thousand politicians, and he would do his duty for less money.

We tried several old roads before we found the right one leading to the lake. We passed several clearings where ranches of one kind or another had been undertaken—perhaps not noticeably overtaken—and we saw several very beautiful natural meadows. At one of these upon a small stream we camped for the night. There was a dairy here, with the milkhouse built over the little stream, and we were supplied with all the ice-cold milk, cream and butter that we could use. Some children had lots of fun feeding Jack milk. They gave it to him in small installments in a pan, and when he lapped the pan dry and held it while he bleated for more the children yelled with amusement. They filled him so full of milk he slopped over, like a tank.

We camped at the roadside and in the morning we found the tracks of a very large bear in the dust within fifty feet of our beds. A native examined the tracks and told us they were "old Clubfoot's tracks," giving us the further information that Clubfoot was a grizzly, and that he prowled about that vicinity sometimes for "quite a spell." None of the local hunters had up to that time been able to kill him, although there was a standing reward of \$10 on his head. He had killed some hogs and a calf or two. He was big game, but he had a wide range of forest, mountain and jungle in which to hide by day, and from which to pay his visits by night. We did not return his call, notwithstanding the pending reward. None of us, except Enochs, wanted him—and Enochs did not want him eagerly enough to manifest dangerous symptoms. We were not afraid of bear—it was not that—but we could not afford to sit up nights to protect our bacon, so we moved on and reached the lake that afternoon.

We found Manzenita Lake to be a beautiful body of water about a mile and a half long by half a mile wide, its waters being crystal clear and very cold, but the surroundings were rocky and barren. One or two clumps of trees near its shores offered shade from the burning rays of the sun. Under one of these groups of pines, where the ground was carpeted with the resinous needles, we again set up our tent, at the upper end of the lake. A stream of icy water from the snows upon Mt. Lassen—a stream that we could jump across at any place, emptied into the lake near us, and a stream of the same apparent volume emptied out of it at the further end.

A few rods to the west was a smaller lake—little more than a pond—which, I believe, had been made by the diversion of a portion of the stream into a natural depression by an old settler, Dr. Stockton. This old pioneer had a cabin near it, and with him was a still older man whose name was Cap.—that was all we knew or learned of it. Stockton was over seventy, while Cap. was older—somewhat under a hundred and seventy, I hope. They were a wonderful old pair, living here with this wonderful and mysterious lake all to themselves, save for the rare intrusion of some hunting or camping

party. We had dealings with them which will crop out hereinafter.

After we had arranged our camp and provided for the horses, I explored the lake shore a little way and found an old flat wreck of a rowboat. After bailing it out, I estimated that it would float about half an hour, and then dive unless it was again bailed out. That is, it would float if skillfully handled. When it was not bailed out promptly it would go under, and when it was bailed out it wanted to go over. When it floated, it wanted to do that bottom up. It was a boat that was hopelessly discouraged or dissatisfied with its lot, and it tried to evolve into an umbrella or a balloon. When I manned it personally, and shoved off a little, it did unexpected things suddenly, about which I endeavored to express my indignation, with considerable emphasis—but I could only do so at a disadvantage.

A man cannot deliver finished orations when his legs are shooting about at vascillating angles, and when he is likely to dive, with impartial celerity, either forward or backward into ice water. That boat would shoot my legs one way, and then when I got them back with commendable agility, it would shoot them in two or three other directions, without any appreciable notice, constancy or method. When I tried to say things, my mouth would slam to and chop my phrases into miserable fragments, signifying nothing. I was so disappointed with myself that I at length sat down in the thing, when fully aware that in place of a seat it had nothing in it but four inches of ice water and sand. Thereupon I got out of it and hunted up Enochs and told him I had found a boat. I urged him to go and try it and see how—how exhilarating it was to float upon the limpid placidity of the bosom of the lake, where he might see himself outlined clearly in the crystal tide. But Enochs was too soggy, and he would not. Perhaps I appeared a little to agitated and wet. At any rate, he said that when he went in to swim he took off his clothes, or words to that effect. In my disappointment I told him that was all right, and that he could take his clothes off or keep them on, for all I cared. And I believe I added that nothing he could do improved him any, in appearance or otherwise.

We were about to get up a two-handed riot when old Cap. came along, and his formidable personality diverted our attention. Cap. looked like the Old Man of the Sea, and we found that he really was one of them—a genuine old salt cast up by the sea, high and dry enough. When he hailed us, he did it before he landed in haven, and as if he were hailing a ship in a fog. His old legs lurched about as though he was on the deck of a small ship in a very heavy gale. Everything he said savored of salt water, and he had not forgotten to wear a loose belt and hitch up his trousers at about the regulation interval. I am not fluent in nautical terms and I neither comprehended nor can I now recall those used by Cap. with precision. He hailed us as mates, wanted to know where we were bound and whether Jack manned the mizzen top-gallant, the jibboom, the fo'castle or the spanker. His wide old face wrinkled all over with benevolent furrows, and he knew well the inimitable art of making himself interesting and welcome against all the disadvantages of his personal appearance and his uncouth voice and gruff manners. He was deaf, quite so—in one ear he said—but we could never distinguish that one was more so than the other. Later we found that the Commodore, as he designated Dr. Stockton, was very deaf in both ears, and that the old fellows had long since given over conversing with each other freely. They saved their energies to devote themselves to others.

We tried to answer some of old Cap's questions, and he would nod with satisfaction now and then; but when we asked questions, his replies were so irrelevant we wondered whether he heard anything or not. In my opinion, he heard very little we said. He guessed at it by watching our lips or our gestures and attitude. When we asked where he lived, he replied:

"O, I blew in here tryin' for another port. Sailed 'round the Horn in '48; never signed to cast anchor in a pile o' mount'ins two hunder' miles from deep water. This pond's deep enuff for a ship, but it's nothing but a rocky cove without a chance to git to open water."

We asked several times about the fishing in the lake, but it was only after we had made a good many gestures that he seemed to comprehend, and when he did, he left us abruptly and rolled away in the direction of his cabin. We did not understand this until he returned in a few moments with two fine trout, weighing four or five pounds. They were magnificent fish and nicely dressed. We tendered him a dollar for them and he hesitated and then firmly refused to accept more than fifty cents.

"Commodore an' me have plenty of fish. Our pond is full of them. There's plenty of 'em in the lake, an' you might get 'em with a gig. They don't bite any tackle that we know of."

The old man insisted that many kinds of bait and flies had been tried, but not half a dozen fish had been taken, as long as he had lived there, with hook and line. He said we were welcome to the use of the boat, and that we could get a gig by calling at the cabin. This gig we got in the evening, and it proved to be a spear with a long pole handle, a very crude three-tined spear, dull, and with a barb or two broken.

Enochs surprised us by showing some knowledge of boats. He directed the overhauling of the old flat-bottom, calked it up somewhat, put in a seat, and got a pair of paddles at the cabin that served to propel it some. We found that the boat was adapted to two persons—two only. Three were too many, and one was only half enough. With two in her, one had to lean to starboard and the other to larboard, or port. At first this was a difficult exercise, but after we got the hang of it, and knew just how far to lurch, we could keep her from going bottom up by strict attention to the matter. The proper handling of the paddles was also an art peculiar to the outfit, for they did not fit the boat in any particular. Nevertheless, Enochs and I rowed twice across the lake, and Dick and I rowed half way around it, and crossed it after dark. These adventures were reckless affairs, and that we were not drowned is no fault of ours.

Many parts of the lake were dotted with what seemed to be stumps or mere snags, and we judged the water to be shallow in these places. We found, as we rowed out on our first voyage, that these were stumps—but they were some of the tallest we had ever found. I think we could see the bottom clearly at a depth of a hundred feet, and in the places where the stumps broke the surface we could, in rowing by them, look down the trunks of immense trees and see that they were still rooted to the bottom. There were hundreds of these trees about the shallower portions of the lake, standing upright as they had stood when alive and growing. Now they had rotted and broken off at the surface, while the trunks had stood submerged for an unknown period. Most of these trees were as white as stone, and appeared to be somewhat petrified.

As we floated over the deeper parts of the lake the white forest below us in the clear water receded, pitching deeper and deeper, until the white trunks blended in the blue unfathomed depths. We saw many fish, none other than trout, and some of them very large ones. The water was so clear, and all our movements so visible, the first we saw were all deep down and quite shy. It was intensely fascinating to gaze down into this submerged forest, and when we failed to see bottom there was something sufficiently appalling about the prospect. At one time we found that our dangerous craft was not progressing. We did not realize this for some time, and we pulled away at the paddles with a funny, crawling sensation. When we did realize it we forgot all about the funny part of it. We now ascertained that we were hung up on a submerged treetop where we could see no bottom, and we were about midway in the lake. In our efforts we were at all times in danger of staving the bottom out of our rotten boat, in which case we could imagine nothing to prevent our going to the bottom of the lake, frozen first, and then drowned. The freezing would not take long, and the drowning would not matter so much—but the thought of the combination was disheartening. About the time we began to feel somewhat religiously inclined we got off, for a wonder, and we rowed ashore with as much judgment and skill as we had left. We had been so much absorbed in this adventure that we really felt relieved to get out upon a big rock, and from that we had some notion of climbing into a tree. Water as deep as this lake, and as cold, looks well at and from the surface. As for us we could see no personal advantage in the point of view in the bottom of it. At that time, if I had been assured, or even told, that I would float across this lake in about the same place and in the same boat, in absolute darkness, about midnight, I should have set out for home if I had to walk. If I gave the matter second thought, I believe I would run most of the way.

We wanted some of those fish, and after supper that night Dick and I prepared to spear some of them. We fixed a basket out of wire to attach to the prow of the boat, while we collected some splintered pitch-pine for torch material. We took what appeared to be a good supply of the pitch, and Enochs having agreed to remain in camp and keep the fire going so that we would know our location from time to time, we got our spear and cast off in the boat. We proposed keeping in shallow water, as there only could fish be speared.

We fixed our pitch-pine in the prow, set fire to it, and found that it worked nicely, lighting up the clear water for yards about the boat. We could see every object and pebble to considerable depth, and in the shallow water we could scarcely tell that there was water between us and the bottom. Dick, by careful manipulation of the oars, could keep the boat steady now and then, while I stood at the bow with ready spear. We could soon see trout darting about and frequently one would lie still as if dazed by the light, but between the task of keeping the torch burning, dodging the almost stifling smoke, and maintaining an upright position, I found this project also required tact, mixed up with a good deal of labor. Finally, directly ahead, I saw a fine fish holding still, the fire blazed up nicely, the water was very shallow, and I shot the spear at him with such success that I brought him into the boat very gracefully, and even Dick grunted that it was well done.

As for me, I now saw how easy and nice this thing of gigging them was. Soon we saw several fine ones in a little deeper water apparently, and I began to get interested very much. The fish—the largest of three or four—looked like he might weigh five or six pounds, and I could almost feel him on the spear, in the anticipation.

"Slow up, Dick, pull in a trifle—now—no, pull out a little—a little more—now, steady!" And at that instant, with deadly aim, I shot the spear well abaft of where the fish appeared to be, as the tendency is always to overshoot. The spear cut through the water like a knife, but neither the fish nor the bottom was where I expected them to be. In fact, neither spear nor pole came in contact with anything, but I would really like to see some one else go into the water like I went into it. The boat tipped at the right instant the wrong way, and then it tipped back at the wrong instant the right way, and, as I failed to reach the bottom with the spear, I dived for bottom without it. Cold? Words, mere words are very insipid! Yet I could stand the cold for a moment, and even the wet, but the undignified part of it, the humiliating impetuosity with which I scrambled out of that, merely to keep myself from drowning, was horrible! I shiver as I set down the fact in this history. I would have omitted it—I should have done it—I even wish I had!

The only thing that kept Dick from laughing himself into a spasm, was the way in which I clutched that boat and got back into it. He had all he could do to hold her from going over. After I had been in the boat awhile, here came the spear. It bobbed up more serenely than I did, after failing to find bottom. There was no fish on it, and I am satisfied that, if he was not scared to death, the fish escaped. I put on my coat, and wished I had half a dozen more of them. Then I rowed the boat in an effort to keep warm, while Dick wanted to try his hand at the spear. I wanted very much to see him do it, and I was almost interested enough in a little scheme I had with regard to tipping

## Lost in the Woods.

Editor Forest and Stream:

The very entertaining contribution your friend Horace Kephart, in reply to Mr. Manly Hardy, "On Not Getting Lost in the Woods," inspires me to inject a few observations into the discussion.

The expression "lost in the woods" is susceptible of different interpretations. Mr. Hardy evidently refers to the "tenderfoot" in a state of panic and such mental perturbation that he could not utilize woods signs if he knew them, and probably would be incapable of using a compass if he had one. It is quite vain to offer instructions or advice to such a man, who is liable to lose the use of his rational faculties, other than the advice offered by Mr. Hardy, to remain in reach of his moorings. On the other hand, experienced woodsmen when roaming through unfamiliar forests, must frequently, if not usually, lose all idea of direction on cloudy days, being without a compass, except by the adventitious aid of woodcraft lore. But such men under such circumstances do not lose their heads, but go about in a rational way to utilize all available sources of information to determine the cardinal points.

In a recent number of FOREST AND STREAM it was related by a contributor that an Indian guide in New Brunswick had journeyed some thirty miles through the wilderness and found his way to camp, using the direction of the wind as his only guide.

Mr. Kephart, in his condemnation of "sweeping generalizations," falls into somewhat of the same error himself in his allusion to the moss on the trees in the Mississippi River bottoms. He says that in these great forest tracts of the overflowed country the trunks of the trees are clothed uniformly all round with moss as high as the last spring overflow reached. I cannot speak by the card about the more northerly portions of these bottom lands, with which Mr. Kephart is perhaps more familiar; but as applicable to the overflow regions of Mississippi, Louisiana and lower Arkansas, his statement is wholly in error.

There is one variety of tree in these swamps that presents exactly the contrary conditions, this is the honey locust. The trunks of these trees are perfectly clean up to the "high-water mark," above which they are usually clothed with a fine white moss, or bark growth of some kind, the lower margin of which makes a sharply defined water mark.

My own observation is, that on the ridges and higher portions of the overflowed lands, where cane or dense undergrowth prevails, there is no distinction as to the growth of moss on one side or the other, because the

protection afforded by the undergrowth prevents a differentiation of the drying effects from the sun's heat. But in the low, open swamps, where the trees stand out clean without such protection, the differentiation of the moss growth is very pronounced, so that looking northward the tree trunks in moss have a light color, which, viewed in the opposite direction, they present a decidedly dark appearance. I have on more than one occasion used this guide when the marks were so plain that "he who ran might read."

My own experience teaches that even when in a perfectly cool mental state and in full control of the reasoning faculties, the mind is liable to strong delusions when in strange woods, in the impressions formed as to directions. This is manifested in the proneness to doubt the correctness of the compass when the direction indicated is diametrically opposite to the impression which has possession of the mind, requiring a considerable mental effort to persuade oneself to turn about and take the "back track."

I remember that on one occasion, when a party of us were embarking on a steamboat for a camp hunt, an old and experienced woodsman gave us the parting injunction, "Boys, don't accuse your compass of lying."

Skipping to another subject, I wish to refer to a dog recently encountered which presented a well defined case of "bilateral" color markings, the only case that I remember to have seen. This was a young dog of uncertain breed, of a generally tawny color, and on each side, both before and behind the shoulders, were very dark curved bands, perfectly symmetrical in size, shape and position, on the opposing sides. Is this phenomenon very unusual or not?  
COAHOMA.

## Three Mice in a Bottle.

EX-SHERIFF DELL LEWIS came to the city last evening from his San Pedro Valley ranch on a business mission. They have lately been tearing down some old buildings on the ranch and putting up new ones. In the course of a part of this work a nest of mice was dug up under a stable and killed. A little later a beer bottle was encountered in which were three mice so large that they could not get out of the neck of the bottle. The theory advanced by the ex-sheriff is that the mice were put in the bottle when young by the mother and that they grew to proportions that would not allow their departure before attempting to get outside. Pursuing the subject further the ex-sheriff tells that since the bottle has been dug up it has been visited daily by mice with food for the prisoners.—Bisbee (Ariz.) Record.

the boat at the proper time, to keep me warm, wet as I was. But at this juncture we found we had lost and burned all the pitch and our torch was going out.

This discovery became more and more disconcerting as we looked in vain for the light of the camp-fire, which we could not see. We had been so occupied with watching for fish, trying to spear them, and with the general results, we had failed to take any notice whatever as to our course. We relied upon the camp-fire to give us our bearings at any time, and now it failed us just as our pitch had given out. To make our position more hazardous the boat was leaking badly, while the shore, as far as we could see, was so lined with stumps and snags we could not approach it anywhere that we could land. Before our light failed us entirely, I told Dick to row into open water as much as possible. I raked together a few splinters of the pitch and blew these into as much of a flame as I could.

Finally, the last of the pitch flickered out, the night closed down in utter darkness, for clouds hid even the stars. I commenced striking matches while I directed Dick to row as steadily and slowly as he could. Neither of us had ever been in a similar predicament. Whenever I struck a match, the dark water now showed no bottom, and we both felt that we were somewhere about the center of the lake.

Suddenly, in the very direction we were moving, I saw a little bunch of sparks float upward as if a stick had fallen in a fire, and I urged Dick to pull as evenly as possible straight ahead. After some time I saw a few more sparks float upward, still at considerable distance, and we kept the boat moving as directly as we could.

After what seemed a long time, and we could see no more sparks, we shouted repeatedly but got no response. We were about worn out with our work and anxiety, while I was chilled to the center—when the boat struck against something head on. I lighted about the last match and came near overturning the boat in my emotion at seeing a bunch of reeds that I recognized as being within a hundred feet of our proper landing.

We sent her ashore in a hurry, took our single fish with us, and in five minutes we were stirring up the last embers of our fire at the camp. Enochs was snoring placidly in his blankets, with Jack and the dogs sprawled about promiscuously. When we got the fire going, Enochs roused a little and said:

"Yew get a-n-y foosh, a-n-y frish?"

## Woodlot Forestry.

### Simple Directions for Caring for the Wood Supply on the Farm.

THROUGHOUT a large part of the Eastern States nearly every farm has its woodlot. From that woodlot, which is often all that remains of the vast forests which originally clothed the region, the farmer supplies his own needs. It furnishes him with fuel, fence posts, rails, poles, and even with timber, boards and shingles to keep the farm buildings in repair. A well-managed woodlot is therefore a very valuable part of the farm, and the sum total of all farm woodlots represents a very large national asset.

The U. S. Forest Service has for some years devoted special attention to the needs of woodlot owners. Its co-operation is offered to all who would have advice on the management of woodlots, and many thousands of acres of farm forests are now actually cared for under practical systems of forestry which it has recommended.

As a general rule, but little care is devoted to the woodlot. It is left to shift for itself, is often used too freely for the pasturage of live stock, and is rarely guarded from fire or forest enemies. When wood is needed but little discretion is exercised in the choice of trees, and no need is felt of providing for the renewal or improvement of the stand.

Yet it is decidedly a simple matter to care for the woodlot. The owner need not burden himself with any very elaborate system. Nor need he, in most cases, reduce the amount of timber which he cuts. Eventually, of course, he can cut more, for more will be grown. The first requirement of the ordinary woodlot is protection, and the second, selection in cutting.

Fire is the chief enemy of the woodlot. Fires damage the larger trees, starting hollows in the butts or weakening them until they begin to die in the tops, reducing their value when cut; but the greatest harm is done to reproduction and the growth of young trees. Running over the forest soil, they consume the litter and kill the seedlings. The forest soil becomes too dry to encourage the germination of tree seeds. Even if seedlings succeed in finding root and begin to flourish, the next fire destroys them.

Fires may easily be kept out of the woodlot with a little care. They are often started to improve the grazing and pasture. This is certainly poor policy. While the grazing may be improved for a few years, the woodlot is often permanently injured. It is generally a poor plan to expect land to produce grass and wood at the same time. Neither will do well, and the owner will be paying taxes on land which he only half uses. Grazing animals often do much injury to the woodlot. They browse upon young growth and trample it down. They also pack the soil with their hoofs, destroying its power to retain moisture and encouraging the en-

trance of grass. Grazing should be watched, and should be permitted in the woodlot only when such harm will not result.

In cutting, the first thing to look out for is the young growth. The whole point of forest management is to have new trees of the most useful kind take the place of the old, just as soon as possible after they are cut. One thoughtless stroke of the ax will get rid of a fine sapling half the size of a man's wrist, if it is a little in the way, and a dozen years of growth is lost. On the other hand, the cutting of a good tree may simply open room for worthless trees to take its place.

In some regions care must be taken not to permit the crown cover to become too open. In a good forest the soil will be soft and moist, and this soil condition is essential if the trees are to thrive and make good growth. Opening the ground to the sun dries out the moisture, and often burns out the young growth as though by fire, while the trees tend to become branchy if they stand too far apart.

Past neglect has produced many woodlots in which the healthy trees of the best kinds are choked with unsound and dead trees and trees of inferior kinds. For such cases improvement cuttings are needed. It will pay to spend the time and labor necessary to remove the dead, crooked and diseased trees, together with the weed trees, so that the remaining stand may be composed of good timber trees in sufficient number, under conditions favorable for their best development. This can be done gradually, as the material can be utilized.

When once the improvement cutting has brought the woodlot into businesslike shape, further operations should be made with a view to reproduction and a lasting supply. Care should be taken in felling, working up, and hauling out wood to do as little damage as possible to young growth. If reproduction is to take place from seed, the proper location of seed trees must be considered.

Where the forest is composed mainly of such trees as oak and chestnut, which sprout well from the stump, it may be advisable to cut most of the good-sized trees, over a part of the woodlot, for the purpose of raising a crop of sprouts. Such sprouts grow rapidly and produce good poles, posts, and ties at a comparatively early age. But the stumps should be cut low and slanting, so as to prevent rotting and secure strong and numerous shoots.

There are a number of thinning systems, some of which may suit the requirements of one woodlot but not those of another. By a careful reading of Bulletin No. 42 of the Forest Service, entitled "The Woodlot," the owner can familiarize himself with these and choose which ever one his own woodlore and observation suggest as the best. Or, should the owner desire a special plan for the management of his wood lot, he should make application to the Forester, U. S. Department of Agriculture, for the co-operation of the Forest Service.

## Ringnecked Pheasant and Carp.

In a conversation with Mr. Fullerton upon the subject of game refuges and closed seasons, etc., he spoke of the experience with the importation of pheasants a few years ago into Oregon. He tells me that Mr. Denny either brought or sent eighteen pheasants from China and turned them loose in Oregon. How many years the season was close on them I do not know, but Mr. Fullerton informs me that during the past open season 50,000 of these gamey birds were brought to bag.

It is only a question of a few years when they will begin to work their way East and fill the coverts to repletion, making an agreeable addition to our pheasant or partridge, as it is known in the Eastern States.

An influx of these birds will go far toward making up for mistaken importations of the English sparrow and buffalo moth, but were they to become as numerous as the wild pigeons once were they could never counter-balance what is in store for us because of the importation of the German carp.

Between the English sparrow and the German carp, the latter is the greater calamity. As the carp spread over the lakes, rivers and brooks the trout, bass, etc., must necessarily begin to disappear.

The carp is here to stay. Legislation, seines and even a bounty of \$1 per carp will not free our waters from their presence. They are a fixture. They cannot be driven from our waters any more than can the sparrow be exterminated. I do not think that the voracious pickerel, if placed in carp waters, would hold their own against them, or even keep the balance. It may be a matter of years, but the home of the trout, bass, whitefish, lake trout, wall-eyed pike, etc., will feel the influx of the carp and the carp will prevail. Our streams and lakes in time are bound to be infested with carp, just as the remote prairie villages have their hordes of sparrows that not many years ago were tried as caterpillar exterminators in a small experimental way in New York city. The sparrows got there and everywhere else, and so will the German carp. Like the pox, they will be always with us, only more so to the extent of many millions increase each year. Mary Ann, showing a disposition toward a change of diet as she sat at the table, was tersely informed by her father to "sit down and eat beans like the rest." So its only a question of time, if we must have fresh-water fish, when we must forego whitefish and sit down and eat carp "like the rest."

There may be carp centers where by a vigorous campaign of incessant seining they might be exterminated, but I doubt it. They are as sparrows of the waters and will multiply as the sands of the sea. You can never hatch enough pickerel to down the carp. I agree with all Mr. Starbuck says, but how the remedy of extermination can be practically applied I cannot see. In a fresh-water fish food sense I think the carp is nothing less than a calamity, and every straw floating in the wind goes to so indicate.

When it does come to the time that carp stuffed with garlic and onions and garnished with sauerkraut becomes our standard fresh-water fish, then we must cast our lines seaward and thank the Lord that carp cannot thrive in the sea.

It is true that a few men are making a living from handling carp, and the poor immigrant of New York and Boston is getting cheap fish. There is no question about this, but is it not making the public at large pay a heavy penalty for the present benefit of the few?

If the carp does not belie his reputation for multiplication, he in time will bodily supplant our present fresh-water fishes. And when carp become so numerous, as they will certainly become, that it will not pay to catch them, then what?

In the East when salmon were plenty and inhabitants comparatively few, it was expressed in the indentures of apprentices that they should not be fed salmon more than so many times a week. Salmon were cheap and plentiful in those days.

I never think of carp but the incident of the choking of Harvey's Canal near New Orleans comes back to me. The brackish water drove the buffalos into this canal in such numbers as to make it possible to throw them upon the banks by means of a pitchfork. They were packed so thickly into the canal that the fish suffocated. And when the wind blew toward the city it smelled as if the Barren Island Company had started rendering menhaden in the suburbs.

The Board of Health was at its wits' ends and I believe that they only succeeded in getting relief when they cut the levee and allowed the Mississippi to flush the canal and carry the millions of stinking buffalos into the Gulf to feed the sharks. And for opposition to race suicide the buffalo is not to be compared to the carp.

There are great days ahead for the fresh water streams and lakes—and some of us may live to see carp crowded over Niagara Falls because the lakes won't hold them. A little far fetched, perhaps, but not without some foundation.

One thing is certain, the men who introduced the English sparrow and the German carp never by popular vote will be awarded a niche in the Hall of Fame or receive a Nobel prize.

CHARLES CRISTADORO.

### The Minnesota Season.

AITKEN, Minn., Nov. 30.—*Editor Forest and Stream:* The open season on deer for 1905 is about closed; will close, in fact, without further event in the hunting line for a great snow storm is on. Eighteen inches has fallen and the storm still continues with two days of open season left. This ends all shooting on game until Sept. 1, 1906.

By the way, there is one game bird that nests all about us yet we get no chance at it. There must have been at least a dozen pairs of woodcock nesting on our place, yet

by Sept. 1 they have gone. Thus through July and a part of August we can flush a woodcock in almost any old place; when the time comes that the gun is free from thrall there is not one to be found. Woodcock and jack snipe were the only kinds of game plentiful this year. We had some very pretty snipe shooting and there was no limit to the field, but a couple of afternoon shoots satisfied the demand. An all-summer flood drove all other kinds of game completely out. Prairie chickens disappeared almost entirely. Ducks were in fair quantities but hard of access on account of the impassable condition of the country. Our greatest excitement came in the deer season, though for hunting weather it was a complete failure. A few days before the opening there was a good tracking snow and soft weather, which makes a perfect condition. By the 10th, opening day, it was all gone, then came heavy rains, filling all the low places with water. Over this a thin shell of ice formed and that condition held until the last few days, when there came heavy rains again, filling everything with water. Into this came nearly two feet of snow, so that one traveling the woods sinks through the snow and on into the water beneath. So ends the season of 1905.

E. P. JAQUES.

### Translator.

MR. HALLOCK'S reference to southern California in the current issue set me to looking out the window, and instead of seeing the great white sheet of snow that covers everything, I saw waving palms amid bowers of roses. I saw orange trees heavily laden with the golden orbs in company with groves of lemons. There were trees in bearing and trees in blossom, and the air was heavy with the odor of the blossoms.

How ruddy and golden are the oranges peeping out from beneath the rich green foliage! How easy almost to reach out and pick one from the tree!

The larks in the adjoining meadow have been chorus-ing joyously, and now a pair of mockingbirds have perched amid the orange trees and are fairly making the welkin ring with their melody. We hear the robin note, the catbird, the canary, the bluebird, and now and then imagine a faint attempt at a mallard in a quack that finishes the melody. The very larks are outdone at their own music by the mockingbird and become quiet listeners like ourselves. How the music rolls from tree to tree! There is no cessation, for as one bird stops another begins where he left off.

We sit within the bower and find every sense of our body gratified. The eye is charmed by the clustering roses, the palms and the golden orange-laden trees. The sense of smell is gratified by the combined odor of the rose mingled with the blossoms of the orange and lemon. The ear is drinking in sweet music such as no orchestra can produce. The warm and balmy sun comforts every nerve in the body and the sense of taste is met with the

ripe and luscious orange, which we have just picked in the fullness and richness of its maturity from the tree above us. And the mockingbirds sing on—and then there is silence. Once more and we see nothing but one great sheet of snow that mantles the earth as we gaze out the window. The view of fairyland had vanished. But in southern California the mighty Pacific still rolls in upon the sands singing night and day its dirge-like music. The brilliant sun, tempering the ozone-laden breezes from the ocean, instils life into the earth and the things upon and inhabitants thereof. This is all going on as it has gone on for years and will go on for years to come, only we are not there at the present writing to enjoy it.

CHARLES CRISTADORO.

### The Drumming of the Grouse.

*Editor Forest and Stream:*

In the Evening Star, of Washington, D. C., of Dec. 5 I see taken from your paper an article which emphatically decides the manner of the drumming of the ruffed grouse. Now, I am not an authority on birds, know but little of them, but when a lad I watched every live thing on the mountains near where I lived, and it so happened that I found the nest of a ruffed grouse, and the drumming log of the male, some four or five rods distant. Nearby was an old hemlock with bark hanging about it, and of this, one morning early, I made a hiding place within eight or ten feet of the drumming place, which was always between two knots.

I crept into this and lay in it sometimes five hours before the old fellow joined the hen and went off for food. He drummed only when she was laying, never while sitting, that is, so far as I could see. His manner was this. He straightened up very tall, threw his head and neck back, brought his wings in front of the body, and struck the hard, thick muscles of the heavy part of the wings together, at the same time pouting somewhat like a pouter pigeon. He always began—bum—bum—bum—bum, and then on. The first three strokes were deliberate, quite a fraction of time between them, pausing at the third stroke long enough for another stroke, and seemed to listen attentively. Sometimes during this interval I heard a faint cry, as if from the hen, then he began in earnest, going faster and faster, until the eye could see nothing but a streak, making as many as a hundred strokes, and stopping so suddenly as to almost throw him from the log.

I saw this several mornings, until one day I happened to hit a piece of my shelter in my eagerness to see him plainer, when he stopped, stretched out his neck, looked at me an instant, and then he flew far out into the forest and never drummed on that log again.

I only tell you what I saw; it is many years ago, but I was a close student of birds and animals, having no other books to study until war time. If this helps out any problem, I am glad.

H. A. DOWSON, M.D.

### Camp Life in Georgia.

THE boats were ready, two of them, one a long, roomy batteau, which carried the mess chest containing coffee, sugar, a pound or so of best tea, self-rising flour, pilot bread, smoked bacon, mess pork, a couple of hams, cans of fruit, bag of dried peaches, potatoes, a goodly showing of onions, for what would the duck shooter do without this aromatic vegetable, salt and pepper, also a bucket of lard and one of butter, enough of all these to supply four hungry men for two or three weeks. Then came the camp kit bag of heavy canvas, which could boast of a big camp kettle, a couple of mess pans, Dutch oven, frying pan, waffle irons, pot hooks, tin dishes, plates and cups, knives, forks and spoons; next a couple of axes lashed together, blades protected in leather caps, a camp hatchet, some nails, ball of strong twine. There are lots of things handy in camp, and when all the walking is to be done in a boat they may as well be carried. There was a tent large enough to accommodate the party, the box containing the extra ammunition found place, plenty of blankets, two rubber overcoats and two rubber blankets, in fact, everything to insure comfort in all kinds of weather. My friend and I had a kit bag between us containing extra clothing, for the duck shooter must not only go warmly clad, but be prepared to change his clothing, as he is often exposed to a drenching rain-storm, or an involuntary bath in the river. The batteau carried all this plunder neatly stowed and was captained by the irrepressible Joe, our cook.

The second craft was built with a sharp bow, plenty of room amidships, flat-bottomed and arranged for two shooters to sit "for'ard" in the cockpit, one behind the other; the shooter aft to rise and shoot, the one for'ard to keep his seat and shoot. A second fifteenth-amendment paddled this boat sitting in the stern; a big-headed, thick-lipped negro, with an enormous mouth and overrunning with good nature, his name was Alex. The stars were beginning to pale in the east, when with boats and plunder loaded on two wagons, we left the old town fast asleep, directing our course south for Horse Creek, five miles distant, a small, rapid stream, on which we would launch our boats and be carried to the Savannah River three miles below the city of Augusta, Ga., and 175 miles by river above the city of Savannah.

"Dick, it will be 11 o'clock before we can get ready for the start. What say you if we have dinner on the bank right under those trees, and while Joe is getting it ready we will launch the boats and have all in ship-shape ready for the start," said Mr. Mac.

This arrangement was carried out. Joe soon had hot coffee and flapjacks, and shortly after 11 o'clock we were

prepared to run the rapid and dangerous Horse Creek. My friend, with Joe in the shooting boat well loaded, started a hundred yards in advance. A few moments later Alex and I, in the heavily laden batteau, swirled away from the bank, waving a good-by to the teamsters, and instantly found ourselves doing battle with a narrow stream and powerful current of water, sharp points of land armed with fallen tree tops, snags and partially submerged stumps and logs. It was very exciting, and the pace was tremendous; each man armed with a strong paddle; place one at bow and one at the stern. As the craft would sweep around one point, the next on the opposite side would appear. Great skill and coolness were necessary to successfully run these points, to say nothing of the hidden dangers in the way of stumps and snags a few inches under water. The banks on either side were very high, offering few if any places to land and rest.

The distance had been two-thirds run and I began to congratulate myself that we would get through safely; when rushing round a particularly dangerous point we saw a fallen tree projecting nearly half way across the stream and only about three feet above the surface; I struck my paddle in the water to go round the tree, and Alex at the stern paddled to go under it. In an instant we found our mutual mistake; I had only time to dodge the branches as the batteau swung by and under the tree top expecting the next moment to go over or at least have all duds swept overboard within reach of the terrible trunk. At this instant my paddle broke short off. I looked back; the batteau had swung under the tree and its motion was for a moment arrested; Alex had risen superior to the situation and grasped the tree trunk in his powerful arms, vainly endeavoring to stop the batteau and force its bow into slack water to the right bank near the roots of the tree. It was of no use, the powerful current carried the heavily loaded boat against Alex's feet and legs with such force as to literally boost him up and over the tree trunk and drop him in the water head first. The whole thing was so quickly and completely done, and the situation of the ducky so supremely ridiculous, I simply rolled off my seat in a paroxysm of laughter. I sat up and laughed, stood up and laughed, laid down and laughed. If one weak effort on my part would have saved the boat from total wreck I would have been utterly unable to have made that effort. I imagine that to my last hour I will not forget the expression on that darkey's face as he paused for one brief moment over that tree trunk, head down, eyes protruding, and as large as doorknobs with fright, his enormous feet, encased in No. 12 shoes, high in the air gyrating in a vain and frantic endeavor to save himself, his big hands stretched out within a few inches of the water and his fingers working with the energy of despair. He took the plunge in fifteen

feet of icy water with a yell of anguish. Coming to the surface near the batteau, fortunately, he grasped the side and clambered in—a soaked, frightened nigger. Seeing my face and quickly realizing the situation, the air was at once filled anew with vocal explosions that might have been heard a mile.

"Well, Alex, get in the bow of the batteau and I'll go aft, and we will soon reach the river. You must do something to get warm. We will make camp at 4 o'clock or so somewhere below Sandbar Ferry."

The exciting journey was recommenced, and in a short time the broad waters of the Savannah were reached where the leading boat was found awaiting us. The cause of delay was explained, and provoked mirth from the whole party. Joe had no time or opportunity to moralize then.

The river current was not fast; we floated and paddled until nearly 4 o'clock, then camped on the sandy beach fifty yards from the river. Stakes were driven and boats securely fastened, the tent put up in a trice, gun cases and camp plunder housed, the fire was soon glowing and dinner well on the way, and presently Mr. Mac and I were seated for Joe's camp dinner. Before the meal was finished rain began to fall, and drove us inside the tent. Soon the short winter day ended and night shut down like the lid on a pot, amid a dismal pouring rain. The camp-fire was kept up and the end flaps of the tent partially opened. We sat on our blankets, smoked and talked of to-morrow's work and about where we would begin to find the ducks. Nine o'clock found us sound asleep, thoroughly tired out, sleeping a sleep known only to those who court the open air, the woods, the fields and the streams.

The camp on the river beach was comfortable. I awoke once during the night and heard the rain pouring on our canvas roof. The thought of the dismal and wet condition of things outside made me more appreciative of the warmth and snugness of things inside.

Six o'clock I immediately arose and indulged in the usual "matinal walk over" the darks, which, in due time and in the usual course of affairs, turned them out. Hastily dressing and going out I looked upon a dull leaden sky and dismal rain. The wind blew the mists and rain in from the river with bone chilling force. Pools of water here and there surrounded the tent, the trees were dripping and the cornstacks in a neighboring cornfield looked woebegone and despairing in their wet and stripped condition. A crow sitting in the branches of a persimmon tree gave a despairing croak and shook his sable plumage in disgust. The camp-fire refused to burn, and only spluttered after Joe's patient and vigorous efforts to start it.

A dismal camp, a dismal scene and a dismal company.

"What are you going to have for breakfast, Joe?" asked Mr. Mac from in the tent.

"Dunno, Marsa Mac, I spex—"

"Scaip, scaip, scaip."

"Snipe by all that's good, over there in the old cornfield. Snipe for breakfast."

I rushed in the tent and uncased my 12-gauge. Alex opened the ammunition chest and supplied us with cartridges loaded with No. 10 shot. All three of us tumbled up the bank and over the fence, Alex to assist working the birds down.

Twenty steps from the fence three birds flushed. Mac made a fine double shot, and I missed with my right barrel, but knocked the bird over with a second shot. We separated 150 yards, the birds rose within fair range, and by the time the field was crossed we had bagged eight and a half brace of fine fat birds. Had our dogs been with us we could have worked the ground thoroughly and added more to our score. Returning to the camp we found breakfast about ready.

Assisted by Mac and myself, Joe presently had half a dozen birds spitted before the glowing coals, and not many minutes elapsed before they assumed that tender and beautiful brown color which pronounced them cooked.

Although the rain still came down, the camp presented a cheerful appearance. A roaring fire in front of the tent gave a genial warmth. Our wet canvas coats had been exchanged for dry cord jackets. The mess chest, converted into a table, was placed just inside the tent opening. Mac and I seated ourselves to discuss broiled snipe, fried potatoes, breakfast bacon, hot coffee and waffles. Then we smoked, watched the fire, the rain and the dull sky, wishing most heartily the rain would cease, for the situation was such as to make it of no use to go further down the river until the wind changed and the weather cleared up a little.

The manner of shooting ducks on the Savannah is different from any method practiced in other parts of the country; the weather should be cold and clear. The waterfowl will be found feeding and preening themselves under the bending willows and bushes close to the edge of the water, or, as the boat rounds one of the points of this notoriously crooked river, flocks of mallard, teal, broadbills, widgeons and occasional black ducks will suddenly be met with swimming in the open water, or close to the bank, and often twenty to thirty-five yards from the boat, thus offering fine shots and good sport as they take wing.

All day long the rain continued to pour, and when night closed in there appeared to be no signs of a clear-up. Flocks of ducks and occasional bunches of geese were observed from time to time during the day, high in air, flying southward, following the course of the river, causing anticipation of sport ahead.

Snug in our blankets that night we were lulled to sleep by the incessant drumming of the rain on the canvas, little thinking that before cock crowing our camp would witness the greatest stampede and fleeing before a rush of water within our memory and experience as duck shooters. It does not take one of those narrow Southern rivers long to get well on the rise, and those unfortunate enough to be in its path have little time to save life and property.

We slept on, all unconscious that the river was rising, stretching out its long, watery arms nearer and nearer, hungry to engulf and exterminate us.

It was about 2 A. M. when Mac awoke and was instantly electrified by the sound of rushing water, known only too well by him. Springing from the tent and toward the river a glance at the nearness of the water, imperfectly seen through the rain and darkness, showed the peril of camp and inmates.

My first intimation of danger was being seized by the feet and dragged from the blankets.

"Dick, Dick, for heaven's sake get up; get on some clothes."

"Alex, Joe! Alex, Joe! Alex, Joe! Alex—confound those niggers; can't they awake? Get a club and pound them!" I was by this time thoroughly aroused and frightened; jumping on the poor darks with pile-driving force I called: "Get up, get up, tumble out, the river, men! the river! Secure the boats if not too late! Ah, the boats! what will we do if they are gone?" The darks realized the situation, and, terror-struck, sprang toward the river in the direction of the boats. Mac lit the lantern; it gave but a faint light in that great darkness; the confusion and excitement was tremendous. A minute of breathless suspense as Alex and Joe disappeared in the gloom.

"Are the boats safe?"

No answer. A moment more and our worst fears almost realized.

"Can you reach the boats?"

Then through the night and storm came the cry: "We's got 'em bof, an' we's wase deep in de wata, mighty good dem stakes wuz druve so good or we'd nebba seen des ere boats no mo, we's comin', we's a-comin'."

Presently the brave fellows came towing the little ships. I had started a fire and kept adding fuel, the blaze leaped up lighting the scene and showing us a maddened, seething torrent advancing quickly on us.

The tent was struck and two men working to each boat piled camp plunder and duds generally into them. It was quick work necessarily, the water was already up to the camp fire, I jumped into the shooting boat and seized a paddle, Joe followed suit. At this instant the bulky form of my friend, armed with the frying-pan and a pair of boots (the last load) waded toward the batteau and stepped in. We were comparatively safe now. As the water rose we pushed the boats toward the bank of the cornfield as near as we could calculate until they grounded. This operation was repeated until morning. Daylight found us a short distance from the bank and 150 feet from the site of our camp.

Safe in the boats, when the paddling and pushing toward the cornfield began. We were not long in discovering the ridiculous position in which we found ourselves.

Here we were, pursued by a dangerous flood, in the middle of the night in open boats, in a torrent of rain, in pitch darkness, soaked to the skin, waiting anxiously for the dawn. Who would not give up all he hath and go a duck shooting? Rugged men, frail men, weak men and strong men face dangers by sea and river in open boats,

in all kinds of weather, day and night, under the most trying circumstances, and all for the pleasure and excitement of duck shooting; go year after year and grow more rugged as they are exposed to the weather and breathe the pure, life-giving air. On the bosom of the river, on the heaving sea, in the grand old forests and the fields, bathed in the sunlight, fanned by the breezes, blown and tossed hither and yon by the gale. In all this is found the elixir of life—the true fountain that old Peter Parly looked for in vain, in which he might bathe and renew his youth.

Yes, here we were awaiting the dawn, and the morning that would bring a cup of hot coffee, and, we hoped, clear or clearing weather. The boats were a few yards apart; steadily the water rose, and steadily pushed toward the high bank of the cornfield. The rain had almost ceased; at 4 o'clock the wind had changed around to nor'west by nor'. Soon a star appeared; presently a number of them. We filled our pipes with renewed hopes, smoked and chatted. The muse of music moved Alex, and he began one of his unrivalled plantation melodies, keeping time with his hands and feet. We all joined the chorus, and the dark Southern forest away across the waste of waters caught up and re-echoed the sound in a multitude of reverberations.

By dozens the stars came out, the clouds drove on and away until at last the blue firmament of heaven reigned supreme over the storm king. As the millions of lights began to pale in the heaven we turned our eyes toward the east and beheld the first faint streaks of dawn. Pushing the boats to a landing, a fire was started. Joe, assisted by Alex, proceeded to get breakfast, Mr. Mac and I the while getting things in the boats in some sort of order. Soon Joe served us with coffee, hot biscuits and broiled ham. After the "darks" had eaten and all camp plunder made ship-shape, guns were limbered up, ammunition bags filled, the boats pushed off on the hurrying waters, and in an instant we were whirling southward on the bosom of the flood.

My friend and Joe in one boat taking the lead, Alex and myself in the other 300 yards to the rear. Perched on the mess-chest with my 12-gauge comfortably and handy across my knee I watched the heavily-wooded shores as we hurried on and on; it was grand, the speed, the situation, and the spice of danger exhilarating. At times our craft would pass near the shore; the great swamp oaks loomed up, stretching out their long arms, covered with funereal moss hanging from every stem and branch in long, mournful festoons swaying to and fro with the wind.

Hundreds of cypress knees could be seen, many cane brakes, and deep, dismal swamps, places that suggested reptiles of every description in the hot days of summer.

Again the river broadens, and we would be floating on a lake; looking at the extent of land under water, told how many acres of rich bottom land were available to the cotton planter, land dear to his heart and eyes—land that no white man can work—or even stay over night on in the summer—without contracting a fatal fever. So interested was I in this boat ride I had almost forgotten about shooting until Alex's sharp, quick cry of "Mark um dey iz comin' down the ribber." One, two, three, four—nine mallards. Alex's strong arm guided the boat inshore; on they came, evidently looking for a place to rest. Now their green heads can be seen glistening in the sunlight. Aiming well forward of the leader I pulled, killed the duck next to him and missed completely with my second. Away down the river came the muffled boom of a gun. "There, Alex, Mr. Mac has an unlooked-for shot, and I reckon he has a bird or so. Sel-dom he misses a fair shot." "Ship ahoy! Where away?" "How many ducks did you kill?" "One," said I. "How many have you?" "Three." "Good enough. A bird apiece for dinner."

"I reckon, Dick, we had better go into camp now, there is no use to try for even decent shooting at this stage of the water, the ducks are away back in the woods and will not appear until they are obliged to follow the receding water. If we go further good ground will be passed over."

We camped at once on a high bank, a pleasant spot, with plenty of firewood handy. An hour or so later we were discussing toothsome mallard and eating only as hungry shooters can eat.

Saturday, Sunday and Monday found us in camp waiting for the river to go down. Sunday evening there was a very perceptible diminution in the water. Monday morning showed us we must make ready for an early start on Tuesday. Tuesday morning, shortly after day-break found us under way; Mr. Mac, Alex and myself in the shooting boat and Joe in the batteau loaded with the camp plunder, half a mile back.

Mr. Mac took his seat forward with his 12-gauge lying in his lap; Alex seated in the stern, paddle in hand, ready. I stepped in and seated myself behind Mac and gave Alex the word. Smoothly and silently the craft fell down with the easy current skirting the willows close to the bank. Everything was propitious for a good day's sport, water and weather. Silently for half a mile we floated when Mac's sharp eyes detected a bunch of mallards forty yards away under the willows, an instant after I saw them. Alex's strong arm kept the boat on her course with scarcely a ripple, like a phantom we glided on toward the birds; twenty-five yards was reached and the ducks, alarmed, sprang from under the willows presenting their sides, a fatal position. Quickly selecting a bird I fired, and instantly covering another to my left, towering up among the water oaks. As I glanced along the rib of my gun there were two ducks in line, as the trigger was pressed two fine mallards pitched forward and down (takes a long time to describe a few seconds' work). In the same glance around I saw Mac make a beautiful shot with his second barrel. The duck, a fine mallard drake, flew straight away forty yards perhaps, and curved into the left. At the report the bird fell, killed dead in the air, and lay motionless on the water, showing perfect aim of the shooter. Scores of ducks were now flying, mallard, teal, spoonbills, wood ducks and an occasional black duck.

We hugged the point we had now reached and well screened took the wing shots as they were presented. A bunch of teal flying low and thirty yards away left seven of their number behind; next a flock of mallards boldly charged our position, and in the confusion of the retreat forgot to carry off the field three dead and two wounded,

An old mallard drake flying down stream fifty miles an hour bowed an humble obeisance to Mac's left barrel, and was retrieved by Alex—a splendid shot. A very large flock of mallards, twenty or so, next made an attempt to dislodge us by a flank movement from the shore side; we saw them just in time. For an instant the situation looked serious for us, but, alarmed at the close proximity of the enemy, our fire was delivered with such effect as to destroy their line and place six of their number *hors de combat*. Mac and I both made fine double shots on this flock. It was magnificent sport, and continued for half an hour or so.

A lull now occurred in the firing, and as we had almost made up our minds to drop down the river to the next point opposite—"Mark! Mark! fo' de lan' sake flatten out; Mark, down de ribber," came in a nervous whisper from Alex.

We looked and counted seven Canada geese coming straight up the river, twenty feet or so above the water, and by all indications looking for a good spot to alight.

We had all crouched low, and with suppressed excitement watched the great birds fly up within a hundred yards of us and strike the water with loud honks of satisfaction. That they had not seen us was evident.

Now commenced a season of patient waiting and watching on our part for the geese to swim within range, and a tantalizing indifference on their part as to how long we should wait. Ten, fifteen, twenty minutes passed; still they swam, dove, fussed and washed themselves. At last the leader gave the signal, "Shoreward," then, with heads erect and stately motion, they made for a point not forty yards below.

The old gander was leading.

Suddenly, as if overcome  
With a feeling of fear or wonder,  
Like as if the dread presence of death  
Hovered in the air,  
He paused,

and gave a brief and penetrating glance over our way; the wary birds had discovered us—discovered something that bid him stretch his pinions and at the same instant give the alarm note that sent the whole flock into the air.

Something impelled me to look back at the instant the birds left the water, and there was Alex, partially elevated on one of the boat seats, in the excitement, to observe the movements of the geese he had allowed himself to be seen.

Slowly we drifted, and some distance further on we crossed to the opposite side; rounding the point further down we came on a flock of greenwing teal and bagged five. Keeping to this shore for half a mile further we boated eleven ducks, six mallards, two woodducks and three black ducks, and had a number of shots that we failed to score. Drifting, looking for a good camping place, we rounded a sharp turn and came upon a flock of broad bills, swimming at the mouth of a small creek. They rose from the water only twenty yards distant. Mac killed two in beautiful style, right and left barrels, as they flew straight away right and left quartering. I missed an easy single bird with my first and killed two with my left. At this instant turning to give Alex some instructions, he was staring at the sky, mouth open, eyes glistening. I turned and in time to see Mac make a magnificent shot and bring down a Canada goose. Retrieving our game, we landed and prepared for camp. Nine o'clock found us in our blankets sleeping a sleep not enjoyed under a roof.

I now can hear the sighing of the wind in the pine tops and the rippling of the river that lulled me to sleep that night.

The next morning, invigorated by such perfect rest, walking to the margin of the water, bathed head and neck and watched the sun rise gloriously, giving tokens of another fair day.

Dropping further down the river, we had some good point shooting, after which a landing was made on the Esty plantation, Georgia side. While Joe was getting dinner the rest of us selected and prepared the ducks we wished to send up the river by the next boat. The little steamer was expected at the landing below us by 6 or 7 o'clock.

We had just finished dinner when she rounded the point in a cloud of resinous smoke. Alex and Joe put off and delivered the ducks, the steamer moving up for the purpose of receiving them.

Quiet once more reigned in camp; pipes were filled, the right kind of a camp-fire made up that would last until bedtime; lounging on our blankets we gave up to the solid enjoyment of the hour, recounting the exploits of the day.

A week or so longer we had fine sport, and when a few miles above the city of Savannah we disembarked at one of the steamboat landings and with the next steamer north loaded boats, camp equipage homeward bound.

Brown as berries, strong and hearty, we returned to the prose of life. DICK SWIVELLER.

### Prince Louis in the Canadian Camp.

THE following is the text of the letter received by Harry V. Radford, secretary of the Canadian Camp, from H. S. H. Rear Admiral Prince Louis of Battenberg, written from Gibraltar, announcing the latter's acceptance of active membership in the Camp:

REAR ADMIRAL'S OFFICE,

Second Cruiser Squadron,  
H. M. S. "Drake,"  
Gibraltar, 4th December, 1905.

SIR:

I beg to acknowledge with thanks the receipt of your communication of 20th ultimo, informing me that I had been elected a member of the Canadian Camp.

I request that you will be good enough to express to the Advisory Board the pleasure I feel in accepting the honor thus conferred upon me. I am, Sir,

Yours faithfully,

LOUIS BATTENBERG.

Harry V. Radford, Esq.,  
212 E. 105th Street,  
New York, U. S. A.

Prince Louis, who is an ardent sportsman, has camped, fished and hunted big game in Canada. He was invited to join the Camp during his recent visit to this country, and his informal acceptance was received at that time through President G. Lenox Curtis.

## Deer Hunting in Wisconsin.

THE last twenty days of November is a very busy time for deer in the northern half of Wisconsin. I have given account of my hunting trips the past four seasons, except the last one, and with your kind permission will here recite how we went and did it during the season just closed.

Our party was made up, as last year, and we camped on Lost Creek, some three miles out from Sayner, on the Chicago, Milwaukee & St. Paul Railroad, near the camp of last year. The station of Sayner is building up, and now boasts a lodging house and a grocery store, though the deer seem to be annoyed very little by this intrusion, and the territory adjacent to this branch of the C., M. & St. P. Railway will furnish sport for hunters for years to come. My friends had preceded me by four days, and when Mr. John Surges, who is this year caretaker at the summer house of Mr. Backus, of Chicago, and who chanced to be at the station with his team, landed me and my duffle at our tent door about 3 P. M., I found my friend, Dr. Mackey, keeping house. The boys had selected a sheltered spot in a pine grove, where were dead stumps and stumps for fuel for our two sheet-iron stoves. Hedrick, prior to my arrival, had investigated the wood question, and laid stress on the virtue of pine stumps. A couple of days later, when I turned my attention in that direction and found how easily they were lifted from their sandy beds, how readily they yielded to the ax and were divided into all sorts of shapes and sizes suitable for both kindling and keeping fire, and the amount of virtue they possessed owing to the resin they contained, I went after them root and branch, so to speak, and I vowed a vow, to-wit: If in the wisdom of Providence, my lot should again be cast in a pine country, for long or short, I should ask nothing better for fuel than pitch-pine stumps from an old chopping. Why settlers haul them into large heaps and fire them I don't know, unless that it is easier to buy coal than split stumps.

The boys had found something beside stumps, for they had two fine bucks, a duck and some rabbits hanging on a pole, and were out looking for more. It is a habit our boys have that of looking for things when they get up there in the woods, and one can't blame them when one stops to think what the privilege costs in coin of the realm. We look for a desirable place to camp, where game can be found, as well as wood and water. Finding these, we are content; and to see us eat, oh, my! If a man don't eat while camping out in that northern pine country, it's because—well, there is no negative side to the question. There is meat in abundance—porcupines when nothing else—and some people contend that hedgehog is as good eating as other porkers.

Tuesday morning about 2 A. M., Hedrick got up and struck a match, but slipped back to bed. It seemed to me only a few minutes until he was up again, and this time stayed up, the hour being 5 o'clock. Bender was the second man up, and soon thereafter both stoves were roaring and mush was sizzling in the frying pans. The Doctor was always the last to throw off the night robes, and he not infrequently accompanied it with some mild reflections on the fast life certain people seemed disposed to lead. Breakfast over, we were soon hitching on our hunting outfits, and after learning in what direction others were going, I planned a circle, crossed the creek and followed the wagon road down to Big St. Germain Lake, then turned up the Lost Lake road to the chopping south of the lake, then skirted the woods to the northwest, coming back to camp on the old timber railroad, which the boys dubbed Peggy. Peggy was an abandoned road, the bed of which was full of ties from which a good many spikes protruded, hence the name.

On the circle I saw some tracks, but no deer. The earth was dry, the weather fine and the walk a pleasant one of about four miles. After dinner we all went west and then north in something of skirmish line order. I was at the east end of the line in the Glen Brook wagon road, and Spahr was in the woods a half mile to the west. He shot a rabbit and scared a deer, which came by Journey, who got a couple of running shots. I ran down the road and clambered on to an uprooted tree, thinking the deer might run off across my front if the boys did not get him, but instead I got a glimpse of him back south of me in the timber filled with hazel brush, but got no shot. After we went to camp, a dog belonging in the neighborhood took the trail, ran the deer around our camp and on east. The dog came to our camp after dark, and I clubbed him until he left.

The weather was warmer now, and in the night a light rain began to fall, changing to snow, and Wednesday we had about one-half inch of snow, which served for tracking. Hedrick and Spahr went west, Bender and Mackey remaining in camp, while Journey and I went north up the Sayner wagon road. Before we reached the green woods, Journey turned out to the left, the understanding being that we would swing around to the west and south to meet Hedrick and Spahr, who were to go west, then north. Just as I got where I could see into a small ravine, which the road crossed, where there was a deer crossing in the thick woods, I saw a spike buck going west. He had crossed the road and was walking leisurely along a deer trail. I waited until he came into a small open space, then whistled. He stopped, partly facing me, and the next instant tumbled over backward with a ball that hit the left jugular near the shoulder and lodged against the skin of the right shoulder. It was the most killing shot I ever made at a deer. Journey came, and we dragged the deer down the road to camp. We had been out less than an hour, but saw where two deer had crossed the road about 400 yds. from camp since we passed along, one having walked quite a distance in the wagon road. I remained in camp, boiled beans and bacon and stewed peas for dinner. The afternoon tramp brought only tired legs.

The boys skinned out the shot shoulder from the deer I had killed, and we had fried venison for supper.

Thursday we hunted west, Journey getting a chance shot at a small deer, which we followed to Plum Creek, where it took water, fooled us for a time, and then slipped off for the heavy timber westward, Journey and Spahr following for about a mile.

Friday, the 17th, we got a fine doe near camp. In the afternoon four of the boys hunted a mile east of camp, Spahr getting a shot and wounding a doe, which they

followed until dark. We put in all of Saturday looking for that wounded doe. For a while the brush-covered hills looked like clusters of diamonds, every twig being covered fully its own thickness with frost. Then the sun shone in over old St. Germain, and the picture became a memory. In the afternoon, after the Doctor had had a shot at a deer slipping through a thicket, and Spahr had worn himself and the trail both about threadbare, I called to him, and proceeded down between two ridges on one of which I saw the Doctor some 500 yds. west of us. Spahr didn't hear me, or didn't heed, and I went on until I got tangled up in a boggy place covered with shrubbery and logs. I stopped to decide whether I should back out or go on at the risk of wading through knee-deep muck. I thought I might run a rabbit out, so took a step over a log, when rip-tear! went two deer; and by the time I squared around, I could see only a streak going north, which was off to my right, the most inconvenient direction, of course, for me to shoot. I took two snaps at the deer; then the Doctor opened up and threw four balls at them in rapid confusion. The Doctor was shooting with a peep sight, and the boys contended that evening that he was liable to shoot anywhere within twenty feet of the deer. If Spahr had come at my call he would have been in line, and those deer would, without doubt, have suffered another broken leg or two, if nothing worse, for Spahr is a rapid and fairly accurate shot, though it does seem from the number of broken legs charged up to him that his .40-75 has a penchant for shooting low.

Sunday, the 19th, was an Indian summer day. I made a rabbit and squirrel stew for dinner, and we enjoyed the camp and rested mostly.

Monday, the 20th, I stayed in camp during the forenoon, got up wood and prepared dinner. Then, in the afternoon took a turn around the big swamp east of us, but saw nothing. The other boys met like success. The ground was dry, the sun shone, the air was warm, but the deer were non-est.

Tuesday, the 21st, Spahr, Journey, Mackey and I all went down the Eagle River road, scattered and hunted east, between the swamp and Big St. Germain. Spahr and Mackey were in the Lost Lake road; between me and the lake, while I was on a log on a ridge, and Journey was north of me. I saw two deer coming from the west, through the brush. They ran across the grass plot back of the old brown cabin and down toward the lake beyond the cabin. They were some 400 or more yards from me, and thinking we might corner them in the brush near the lake, I called to the boys; but they could not understand, and Spahr ran back west right to the spot the deer crossed, looking toward me all the time, while the deer were beyond him. The upshot of it was the deer ran off east along the shore of the lake. Then I wished I had got in some shots while they were in sight, though clearly out of reach of my .38-40. We continued our hunt on east, then north by west, and when approaching Lost Creek, where we had a foot-log, we got our fifth deer, which we took on to camp.

In the afternoon we all went back across the foot-log, drove south, scared up the three-legged doe again very near where I had disturbed her and another one, ran her into the lake, then let her get away into the hills.

Wednesday, the 22d, we all started down Lost Creek, Spahr and I on the right, the others on the left. In a tamarack swamp, filled with brush of every description a small deer jumped, went behind an upturned root, and on like a gray streak. I jerked my gun up and took a snapshot, then yanked another cartridge into the chamber, but I saw no more of the deer.

We twisted about the swamp and thickets, but saw no more, and went to camp for dinner. After dinner Hedrick started out, carrying a ladder about ten feet long, which he said he meant to climb when he got it in position. I think he did stay out there most of that afternoon, but I recall that he was generally in the push afterward. I often think of the fine places one finds from which to shoot, but I note that they are have-beens. They may be on well-used deer trails, but watch them and you get tired and sleepy, for the deer don't use them in the daytime, and in the hunting season especially. I took a long walk among the burned-over hills east of Big St. Germain, then back north by west to camp, through hardwood timber and via Peggy. All I shot was a big white rabbit.

Thursday, the 23d, we all lined up on the Sayner road some 200 yards apart, and made a half circle west, south and east to camp. We found nothing but a grouse, from which Bender clipped the head with his .38 Winchester, and a rabbit I shot with my revolver. The weather threatenend rain, there was no sign of deer, and we wished for snow that we might locate them. Nothing daunted, all but Bender, who had a headache, and I, who had taken the outside of the circle in the forenoon, went over east into the timber for an afternoon hunt. They got some shooting at a doe and fawn and brought the fawn to camp. A light rain set in and continued all night, with much wind.

All day Friday the wind howled and shook mist from the clouds, and toward night the temperature dropped. The boys made an evening hunt in the woods east, but got nothing. Rain turned to snow.

Saturday, the 25th, we hunted east of the big swamp and did some tracking in the light snow. At one place Hedrick and I saw where a wolf had been chasing a rabbit, and in the end the small deer we were following fooled Hedrick completely. He tracked it down to Lost Creek, where it landed out in the water on the jump, and he concluded it had crossed the creek, so whistled us all in to the foot-log, where we crossed. Spahr and I went up the creek to pick up the deer trail, but could not find it, though we searched the bank for several hundred yards. The deer must have gone up the creek some distance and returned to the swamp on the same side it left.

The next day I made a long jaunt east some three miles through hardwood and came back on a road running east to Found Lake. Two young men who are spending the winter at Found Lake came up with me. They were going out to the little store at Sayner station for supplies, and one was pulling a hand sled. I got back to camp for dinner and rested during the remainder of the day.

The following day we scoured the woods east of the big swamp thoroughly, followed some deer trails in the light snow, but got nothing save a couple of rabbits.

While I was standing on a stump a mink came racing by. Just as it was opposite me I jerked my gun to my face, hoping it would see the movement and stop long enough for me to shoot its head off, for it was a large black one and its pelt worth some \$4. It saw the movement, but instead of hesitating, it turned like a streak of lightning and simply flew back to an old root and was out of sight.

In the evening rain began to fall, turning to fine snow, and in the night I told the boys we were likely to be buried before morning. At 4 A. M. I was awakened by a yell from Bender. We all got out and shoveled the snow off the tents, which were giving way under the heavy load. The earth is yellow sand, and the rope stakes will not hold as they do in clay soil. The snow in the open choppings was about ten inches; in the green woods, where much of it lodged on the branches, it was not more than five inches; but down in the swamps, where the creepers, moss and brush held it up, it was knee-deep. About 8 A. M. Journey and Spahr started down the west side of Lost Lake, while Bender, Hedrick and I crossed the creek and took the road along the east side of the creek, our intention being to disturb any game that might be sheltered in the swamp thickets along either side of the creek. While we were on the ridge between the creek and the big swamp basin on the east three shots were fired by one of the boys on the west side. Hedrick and I stopped and waited, looked and listened, but could come to no conclusion as to what was happening or where Spahr and Journey had gone. So I went back up the road, recrossed the creek and followed Journey's tracks down along the creek until I came to where he had turned suddenly and gone westward across a chopping. I followed his trail until I came on to Spahr's tracks and the trail of a deer that had jumped from its bed and gone off southwest through the thicket on the southeast of Bass Lake. Then I tried to let Hedrick and Bender, who were yet over east of the creek, know what was taking place, but could not locate them. So I went on down the creek and soon met Journey, who with Spahr had turned back after following the deer over south of Bass Lake, and finding that Spahr had missed. The boys turned back toward camp for the walking was very exhausting, and I, too, turned and crossed a windfall of small uprooted trees at the outlet of Bass Lake, shaping my course for the hill where Spahr jumped the deer, beyond which the old Peggy road led to camp. While divided over some logs that lay crosswise, with both feet buried in the snow and bog, a rabbit scooted out from under me and lay sprawled under a log about eight feet distant. I took the rabbit along with me, and when I came to the hill back-trailed Spahr's deer, for it seemed to me a peculiar circumstance that a deer should be lying up on that shelterless, chopped-over hillside in deep snow, when 200 yards further on there was a comparatively safe retreat and good shelter. Yes, even at the foot of the hill there was a fringe of brush and vines bordering Bass Lake. But here that deer had made a second bed within 100 yards.

Now, I have followed deer some, and I stopped and asked myself, "Where is the other deer?" Some one might ask, what other deer? You have only mentioned one. Do deer always go in pairs? No, not always. But something influenced that deer to lie down up there on the bleak hillside in eight inches of snow. She didn't like it so got up and pattered on to the farther point of the hill. The something would not come, so she lay down again. I went on the back trail some further and here it was made plain. A second deer had come up the hill from down by the lake jumping on three legs, the fourth leg uselessly swinging from side to side, the sharp toes cutting circles in the snow. Spahr didn't see this deer for she went off northwest, while the one he shot at was farther east and he was shooting and looking southward. I followed her trail across Peggy and on west of the old lumber camp wagon road, then turned off to camp. This was the evening of our hunt, and we had to leave the three-legged deer to the mercy of the wolves.

I was in camp sixteen days, all of which were filled with rollicking boyish pleasure. Among the shots I got were one at a rabbit's head twenty-seven steps, and another at a partridge walking. In the first instance the ball from my gun cut the throat of the rabbit, and in the second the partridge's head had just disappeared behind a tree and I caught a quick bead and lifted the back off the bird without musing up the meaty part. One of the quickest and most accurate shots I ever made.

We took in all seven deer, one duck, three partridge, a dozen rabbits and some pine squirrels. The latter we shot with a target gun among the pine shrubs around camp. Game wardens must have taken it for granted that we were on our good behavior, for none made themselves known to us. Neither were we annoyed by other hunters, and if settlers' dogs had stayed out of our hunting grounds everything would have been ideal and we would have taken more deer. G. W. CUNNINGHAM.

### Guide and Kaiser.

HAMAR, Norway, Dec. 7.—*Editor Forest and Stream:* The article, "Kings Afield," in the FOREST AND STREAM of Nov. 25, reminds me of an amusing incident happening to Kaiser Wilhelm on one of his trips to Norway.

He had decided that he wanted to shoot a reindeer, but as they won't consent to being "driven," like the German stags, he had to stalk them like any other common human being, and had secured the services of an old hunter and mountaineer as guide.

They had found a bunch of deer and were stalking them, the guide ahead and the Kaiser a little distance behind, when the old fellow thought the Emperor was making too much noise and angrily turning around shook his fist at him. At this the Emperor was rather surprised, and his attending officer was about paralyzed. It was taken all in good nature, however, and within a short time he had his reindeer. CHR. G.

THROUGH the escape recently of a large number of jack rabbits from a preserve on the Country Club's grounds, Eastport, L. I., the adjacent covers are now filled with game. The rabbits belonged to Dr. Parker a member of the club, who was fond of hunting them with hounds.

## Adirondack Deer Hunting.

NEW YORK, Dec. 23.—*Editor Forest and Stream:* I am astonished to read that the New York Legislature is in favor of a return to the barbarous and unsportsmanlike custom of hounding deer in Essex county. This is a matter that should interest every resident, past and present, of our grand, historic, old county, and your paper should publish some letters showing both sides of this subject.

This question came up in a similar way last year and aroused such a torrent of indignant protest from sportsmen all over the State that it was quickly laid aside. Now its hydra head appears again and its sponsors, hanging on by their eyebrows, as it were, in their attempt to scale the battlements of intelligent public opinion, seek as an excuse that Essex county is now exempt from the State bear law, and that hounding of deer is allowed on Long Island.

We all know that Essex was excepted after a long and bitter fight because bears were quite numerous there and protection to the sheep industry was urged. It forms no precedent for hounding deer at all.

The slaughter and maiming of men and animals on Long Island under the name of sport, during the few days of hunting there is referred to in terms of horror by all good citizens, and the cellar is about the only safe place for non-combatants and their families while the insane orgy rages to the merry sound of horn and hound.

Our local Chapter of the K. W. Y. A. A. (Kno-what-u-aim-at), composed mostly of natives of Essex county or summer residents owning lodges there who hunt deer and are bound by a solemn pledge never to shoot a human being in the woods, at a meeting yesterday unanimously decided that each member should do all in his power to prevent a return to hounding deer. The advocates of this proposed change and the Fish and Game Commissioners will hear from our members.

I believe that this is merely an expedient to determine the will of the people in advance of legislation upon the subject, and that it has the support of a few local hunters or indifferent men who have not the skill or patience to hunt deer like sportsmen, but who prefer to shoot or club the unfortunate creatures in the water when in an exhausted condition, and afterward eat their flesh when unfit for human food.

Not a single reason set forth for the proposed return to hounding will stand calm investigation by people acquainted with the facts. Nothing can be adduced to show that the county as a whole would be benefited. One result would be the driving of many deer into adjoining counties, and the moose and elk, not to mention brother Rodney West's caribou, upon which so much money has been expended, would be scattered and lost. The former would keep right on to Canada as they did years ago.

The fact that Essex county is rough and mountainous is one of the strongest reasons for maintaining it as a natural game refuge. There is much hounding done in certain remote but well-known sections of the county at present, in defiance of the law. Does any sane man believe that a future licensing of this butchery of deer would decrease the amount of hounding done? The deer would simply have to stand a double drain.

Still-hunting and hounding do not work together well. After about a month of the former such deer as have eluded the sportsmen who can shoot are then to be harried from their late retreats by dogs, driven to the ponds to be shot or clubbed to death and, in the event of escape, often to perish miserably from the effects of chilling after the run.

Remember that consideration for the greatest good of the greatest number of the entire citizenship of our State should govern legislative deliberation in this matter.

Our good friends and relations of the north must not think that they alone are interested in the preservation and increase of the deer supply. No warmer

champions of Essex county exist than those of us exiled here in the great city who are chained by the cares of business life for a large portion of the year.

Surely, we can look upon the subject of deer hounding with as clear a vision as our brethren of the farms and villages in that favored section of the world. I am certain that the present law will be continued in force and, I expect, will rigidly punish all future violations.

PETER FLINT.

## North Carolina Game Conditions.

RALEIGH, N. C., Dec. 21.—*Editor Forest and Stream:* The bear hunters in Western North Carolina in the high mountain region are now having a great amount of sport, and from Jackson county comes the news of the killing of twelve bears in a few days, some being very large specimens. Some fine ones have been secured and mounted at the State museum here, where the exhibit of the fauna of the State has been made remarkably complete by Curator Brimley. This feature of the museum is found to be very instructive and attractive and the curator has promised the writer to deliver a lecture there in January in the great hall in which the specimens are so admirably shown.

News comes from Greensboro, which is in the center of the district which is so much visited by northern sportsmen who for years have been leasing lands for hunting privileges, that prices of leases are to be advanced. The old price has been the payment of taxes, amounting to about three cents an acre annually, but last year some of the wealthy men themselves offered an advance figure, this being ten cents an acre, and of course they obtain leases. This news of course got abroad among the landowners. Many of the old leases expire this year, several of the lessees having lodges on their preserves. One man has 30,000 acres, and he will now have to pay \$300, while formerly he paid only \$50. One of the large holders is Samuel Spencer, and his lease is expiring. He does not have a hunting lodge, but uses his private car, as the Southern Railway traverses his large hunting preserve. W. G. Brokaw, of New York, two years ago bought outright 3,000 acres of land and besides this leased about 15,000, in addition of which he has invested over \$10,000 in a lodge, barns, stables, kennels, etc. There are over twenty hunting lodges in that section of the State and the owners spend a great deal of money. In fact, it is said that every partridge they kill costs them \$10, but, of course, they do not mind this, money being no object to such sportsmen.

The writer is making arrangements for an illustrated lecture by Secretary Gilbert Pearson of the State Audubon Society at Pinehurst sometime in January or February, before the great number of wealthy northern people who will be at that noted resort. Pearson is one of the most delightful lecturers in that country, and has the soul of the true artist as well.

There are some complaints by sportsmen that partridges are very hard to find. The birds are all fully grown now, and they stay pretty close to the densest cover in their vicinity, along branches, particularly where there is a good supply of bamboos and blackberry bushes. There are a great many hunters this year, and a lot of the country people shoot extremely well. They buy good guns and know how to use them, too. Birds are sold here by the killers at from 10 to 12½ cents, though in some cases they bring as much as 15 cents, and the farmers have in a good many cases caught on to the fact that the woodcock is an extra fine bird, and want 20 cents for him. This is a big change from a few years ago, when they used to throw off the head of a woodcock in order to pass him off as a partridge. I can remember the time when birds used to sell from 5 to 7½ cents. I do not hear of much trapping this year, though a report comes from Lillington that live birds have come from there for sale, and I have notified Secretary Pearson about this. The weather has been very rough on the coast to the great delight of duck hunters.

FRED. A. OLDS.

## A Trip to North Carolina.

ALONG in the late summer I was talking with one of my law partners about a trip to North Carolina for quail. As he was a North Carolinian, he at once wrote to Mr. Isaac Tull, of Kinston, N. C., a friend, to ask if he could accommodate a small party. The response was prompt; that the season opened Nov. 1, and he would take us. The party of five was soon made up, and on Oct. 30, we left Newark at 10 o'clock at night with dogs and guns, and left business behind.

Next afternoon at 3:50 we were at Goldsboro, and at 4:10 were on a branch railroad for Kinston. When we arrived at Kinston, we were met by Isaac and Edward Tull, both college graduates and two of the best fellows in this world. The first thing was a trip to the County Clerk, who had kept his office open for us and gave us each a license for \$50 of money of the realm. This officer had none of the acidity of northern office-holders, but was as courteous as he could be. Then we climbed into a large three-seated wagon and went out to the Tull homestead, some three miles distant. Mrs. Tull met us at the door and gave us a hearty welcome.

Next morning the hunting began. Twenty-seven coveys of quail were raised the first day, and it was great shooting. There were so many birds we were all careless, and only thirty-one birds were brought in that night. Each day of shooting brought its own special pleasures and delights. I can see it yet, the pleasant days, the eager dogs, the joyous call, "Did you get him," and I long to drop legal papers and go back and stay. Several coveys of young birds were found, but not shot at.

On Saturday we had dinner at Kinston with Mr. Sugg, who is the Register of Deeds. We met his wife and son, and a delightful family they proved to be. Every one we met had the time for inquiries as to our visit and well wishes for our success. I cannot stop until I mention a barbecue, a pig roasted over hot coals from 6 A. M. until 4 P. M.; but when that barbecued pig was in one's mouth, the wait was forgotten. I can't forget Mr. Sessions, with his kindly help, and "Hism," with his unending good humor.

KING.

## Boston Notes.

BOSTON, Dec. 23.—*Editor Forest and Stream:* The sportsmen's show, which will open next Monday, promises to be excellent. One of the sights everybody will wish to see is the yoke of buffalo from Corbin's Park to be driven by Ernest Harold Baynes.

Several Boston gunners are reported to be securing immense bags of ducks at Currituck and other southern resorts, in some instances several hundred birds to a gun having been killed in a week's shooting. If permitted to live till next season some of those birds would fall to New England shooters.

In Bristol county our partridges may be hunted until Dec. 15, and the number left at the end of the season in that county is bound to be very small. So far as the shooting season for upland birds is concerned, our North Attleboro friends would be glad to have the season the same as in the other counties.

The Eastern Massachusetts Association is to have another fox hunt on Dec. 30, when the members are notified to meet for that purpose at Wilmington.

CENTRAL.

## National Motor Boat and Sportsmen's Show

NEW YORK.—*Editor Forest and Stream:* The National Motor Boat and Sportsman's Show will open at Madison Square Garden Feb. 20, and continue up to and including March 8. This promises to be the greatest show of this kind ever held in this country, judging from the unusual number of applicants for space, which applications include nearly all the old exhibitors and many new ones.

J. A. H. DRESSER, Manager.

# SEA AND RIVER FISHING

## Dan Claussen—Sealer.

And never a law of God nor man  
Runs north of Fifty-three.

"THAT'S right, except always as to citizens of the United States," said Dan Claussen as I finished the quotation. "There is no law up there for anybody, except Uncle Sam's boys. We are obliged to rest on our oars and lose money while subjects of other countries go home with the goods all the way from Thirty-five, North."

We were talking seals and sea otter. That is Dan's business; a seal and otter hunter, one of the best in the North Pacific and Behring Sea, having been at it for over twenty years. His blue eyes are yet steady and keen and can distinguish a seal or otter on the water while his mates are uncertain and waiting for the report of the man with the glass. Then, too, he has the trick of the double shot and is a thorough sailor also. That is why he can get a lay at any time for from \$4.50 to \$5 for each seal, and from \$25 to \$30 for each otter he kills. The schooner in which Dan had sailed for the Far North had been turned back by a revenue cutter, and I was up in his cosy little flat in Center Place, San Francisco, to welcome him home. We were in the sitting room; his wife was in the kitchen sousing the supper dishes in the hot suds in the sink, while she sang to the little ones playing on the floor. She was content, for Dan was at home; but,

for that matter, she always knew he would return, and that confidence had brought Dan home more than once when his mates gave up and dropped into the sea—but that comes later in the story. Now, it was after a good supper. Dan was in a comfy chair, his slippered feet in another. He had just finished relating an incident of his last voyage in the now famous Carmencita, the crew of which had attempted to raid the seal rookeries on the Kormandorski, or Copper, Islands and had been repulsed, the Russians killing one man, Walter York, of Missouri, and wounding boat-puller Friedlander. It was then I quoted the couplet and he continued:

"The wisdom and far-sightedness of the founders of this Government was not all the spellbinders would have us believe. If John Quincy Adams had been put wise and not got off on the wrong foot and butted into the argument between Russia and England back in 1822, it is more than likely that now there wouldn't be any modus vivendi, Paris Tribunal, Joint High Commission, Pelagic Sealing—tommyrot and Americans might be permitted to take fur seals in our own seas without having the humiliation of seeing Canucks, Kanakas, Japanese, Russians and Britishers come in and kill them and get away with the pelts while we are not even allowed to hunt. That's right. Every captain of a sealing schooner has in his cabin books on the sealing industry and keeps posted right up to date on all that is going on in his line. Sealers are never in a

hurry unless chased by a revenue cutter with a six-pounder mounted forward, and in the long days and nights up there in the heave and settle of the sea I have read and studied the question pretty thoroughly, and this is the way it figures out.

"In 1821 Czar Paul issued a proclamation declaring the Behring a closed sea, a Russian sea. To this England objected in a way, not seriously, however, Lord Londonderry, the premier, sending a polite little note to the Czar, saying that England would rather he wouldn't, or something equally as emphatic. There the matter rested until our John Quincy Adams learned what the Czar was up to, and then there was something doing right away. John Quincy took a hand and sent word to the Czar that America would not stand for his proposition for a minute, that the Behring was an open sea and free water. The Duke of Wellington succeeded Lord Londonderry and backed up John Quincy and between them they jammed the Czar into admitting that his jurisdiction over the Behring Sea extended no further than the range of his shore cannon.

"We bought Alaska from Russia in 1867, and in a year or two after we farmed out the sealing privileges in the Behring Sea to the Alaska Commercial Company for \$50,000 per year and a royalty of \$2 for every seal killed. The rookeries were then on islands off the Alaskan Coast and the Pryloff, or Seal Islands, north of the Alutian chain of islands. Sealers from all over the Pacific flocked there and to the Russian rookeries

on the Kormandorski Islands and along Saghalien, the Kuriles, Kamchatka and the Japanese coast. In one year, I have forgotten the exact date, they took 142,000 skins while the Alaska Company took less than half that number. This led to rapid decrease in the herds and a great howl from the company paying for the exclusive privilege of seal fishing in the Behring Sea. The United States sent revenue cutters up there and seized a lot of sealing schooners, among them being a number of Canadian vessels. This raised a howl from Canada and England and led to the meeting of the Paris Tribunal in 1893 to settle the question. In the meantime the Alaska Company's lease had expired, in 1890, and we re-leased to the North American Commercial Company for another twenty years at \$60,000 per year and a royalty of \$2.62½ for each skin.

"They did not do a thing to us in that Paris Tribunal of 1893. We laid claim to all of Behring Sea as part of Russia's possessions transferred to us by our purchase of Alaska; that the Czar had claimed the Behring as a closed sea; we had bought it from him and were entitled to its complete control. Those Britishers didn't do a thing but take down some musty old papers, brush off the dust and show us that seventy years before that, America had denied Russia's claim to a closed sea; that, on the contrary, we had declared for and maintained an open sea and free water, limiting Russia's jurisdiction to a cannon shot from shore. Now, what could we do in the face of that? Nothing but sit down and be quiet. All we got out of that was a closed season from May 1 to July 31, and a sixty-mile zone around the Pribiloffs for five years; later we had to pay Canada nearly \$500,000 for her vessels seized by our cutters.

"Pelagic sealing, you know, is hunting seals in the open sea while they are on their way to and from their rookeries. We wanted England to aid us in stopping that, but she would not do it; then we wanted the use of firearms prohibited; England halfway agreed to that, but never enforced it. Now, here is the situation. America forbids its citizens to engage in pelagic sealing, other nations do not. America forbids its citizens to use firearms in hunting seals; other nations do not, although England partly agreed to the proposition, but never seals the arms of an offending schooner like America does. America forbids the killing of female seal; other nations do not. America has forbidden the importation of seal skins; other nations have not. America is the only nation policing the sealing waters; England sends a small man-of-war up there once in awhile that steams around and then goes into some port and lays up. We are driven out of our seas by our own revenue cutters, while subjects of other nations are permitted to come in and kill and send away the pelts. This is the fifth time now I have been turned back by the cutters. We take out sealing papers for the north and sail away. Up there we are met and turned back by the cutters. For this I now have five claims against the Government for the loss of as many season's product. America is sitting meekly and quietly with folded hands, while other nations are robbing her of untold millions. A few of us are striving to get our share, sometimes we escape the sea police that America keeps up there to protect the seals for other nations, and sometimes we do not.

"Up on the Pribiloffs the seals calve about the first of July and it is a month or more before the young are able to care for themselves. During that time the female seals range far our after fish; that is why the sixty-mile zone was established for five years. Along in August and the first of September the herd begins to take to the water and start south through the passes of the Aleutian Islands. No one knows how far they go, but I have often picked up some of the herd on the way north in the spring as far south as 43°. That will be along early in March, and by May they are nearing their rookeries again. It is peculiar, but a fact, that the Russian seals do not come east of the 180th meridian, nor do the seals of the Pribiloffs and Alaska go west of it.

"In going on a sealing cruise we generally start along the latter part of January or early in February and expect to pick the herd on the way north along the coast about 43° or 45°. In the fall coming down they keep to the deep water, but returning they circle in to the coast. The ordinary schooner of to-day is 90 or 100 feet long, about 25 feet beam and 8 feet depth of hold. Some are, however, much smaller, and I have cruised in 20 and 40-ton boats. In otter hunting, we use even smaller craft in order to slip into inlets in the coast.

"The rig of a sealer like I have described will be two masts with main and fore courses, gaff topsails, jibs and staysails. The time was when we did not have to carry so much canvas, but nowadays it takes a big spread of cloth to catch enough wind to leave a cutter. Generally such a craft would carry a crew of thirty men, all told, three men for each of the eight boats, the captain, two mates, cook and helper and cabin boy. The boats are clinker-built double-enders, 20 feet long and about 4½ feet beam, in which a small mast can be stepped and a jib set on the stay. These boats are manned by three men each, the hunter, the boat-puller and boat steerer; the two latter are allowed fifty cents each for every seal killed by their hunter. For the past few years I have had the same boat-puller and steerer. When I get my lay, I hunt them up and they ship with me. They know my ways and I know theirs, and I do not even have to speak when caution is necessary; if we have a successful season, I also pay them something from my earnings in addition to that received from the owners.

"Say the lookout picks up the herd some morning along about 45° north, the word is passed and the eight boats go over the side. In each boat there are two shotguns with cartridges carrying buckshot, 21 pellets to the load; a five or ten-gallon keg of water and a box of provisions and a compass. The location of the herd is given, the captain lays a general course, and the boats give way. We often range from 15 to 25 and 30 miles from the schooner, sometimes a fog comes down and then—

"Seals go in bands of from three or four to thirty or forty, but a herd may consist of tens of thousands. In the old days I have seen the sea fairly alive with them

for miles. They can sleep right on the water, while an otter does not. If a seal is asleep a first-class boat-steerer can run within six or eight yards without waking it. When the old bulls give the alarm the herd in hearing goes under water. The double shot is a trick and requires quick action on the part of the hunter. If two seals are close together the boat-steerer brings them in line for the hunter who fires at the one ahead or furthest away and instantly depresses the muzzle of the gun and plugs the nearest one. At the first shot he fires directly over the nearest one which always throws up its head at the whistle of the shot, and then dives; that is the second which the hunter must utilize. When the herd goes down, we go on in the same general direction to pick up others or to meet the first when it comes up, if it does. If I see I am going to have a busy day I set my two men to skinning when I have six seals in the boat; an ordinary fur seal will weigh about 125 pounds. A good skinner will strip the pelt from one and have the carcass overboard in five minutes. He runs the knife around the tail flipper, then rips the pelt up the belly to the jaw, passes the knife around each of the forward flippers and then begins skinning much as one does the carcass of a steer. The pelt comes away easily, and after reaching the flippers, they are poked through the holes and the skin is taken from the head. When we return at night the skins are counted and the captain and mates salt and put them away.

"Of course, I am speaking of pelagic sealing, hunting in the open sea, and it is against the law for Americans to do that, but not for other nations. We follow the herd up the coast until we sight a cutter and then—Killing seals at the rookeries is easier than knocking a pig in the head at the slaughter houses and is sheer butchery. You can read all about it in books, what I am telling now is known only to the men engaged in it.

"Sea otter hunting is more dangerous than seal hunting, and of late has become a losing proposition. Sea otter are almost extinct along the Pacific Coast from Mexico to Alaska. I saw an otter skin once that sold for \$1,000 in London, the raw pelt, too; it was a beauty though, fur unusually thick and the color lighter than the blue of a maltese kitten. The best skin I ever killed sold for \$500. I remember the time when sea otter were plenty. Off the Cherikoffs in '87 we run on to a herd of about 400. It was late in the afternoon, and the captain, who happened to be with one of the boats, signalled to return quietly to the schooner. He said we would not scatter the herd that night, it was so late that we could hope to get only a few, but we would be out bright and early in the morning. Well, sir, do you know that the blasted Indians from Cherikoff got on to the herd some way and went into it with their lances. The next morning we could not find a single otter.

"Otter range differently on different coasts. Off Japan and Kamchatka we find them well off shore in deep water, but on the American coast they are found close in shore in and on the kelp. Some carry six to eight boats on an otter hunting cruise, but in my experience four boats are enough. In hunting otter we use the ordinary, high-power repeating rifles, one never gets near enough to use a shotgun. The four boats leave the schooner abreast and about 400 yards apart, which formation they keep for miles. If an outside boat sights an otter it pulls or sails within shooting distance and the hunter fires; if he misses and the otter dives, the boat is driven rapidly ahead 200 yards or more beyond where the otter went down. The next boat pulls to where the otter was last seen; the third boat pulls straight ahead even with the first boat and the fourth pulls even with the one behind, thus forming a square in which the otter is sure to come up, as they never stay down over five minutes. The signal, when an otter is sighted, is the raising of on oar perpendicularly.

"I have been lost on the sea nine times. Were you ever adrift in an open boat in a fog on the Arctic? Well—all right, say when—here's hoping you may never be. The wife out there always expects me to come home, and, knowing that she has that confidence, it has strengthened me when other men stronger than I have dropped off. It is lonely, that North Pacific and the Behring; you are away out of the trade routes and know that if you are picked up it will be an accident or a direct act of Providence.

"I was one of the crew of the C. G. White that sailed from San Francisco in '90 for the Kormandorski group, the Behring and Copper islands, probably the first schooner to fit out here for sealing on the Siberian coast. We reached the vicinity of the islands all right, twenty men, all told. As I said the seals of the Siberian coast seldom if ever cross the 180th meridian, but range south from their rookeries and return in the spring. The herd was pretty well north when we picked it up one fine morning. We were then about forty-five miles off Copper Island. Six boats put out, three men to the boat, leaving Captain Hagman and the cabin boy in charge of the schooner. We caught up with the herd all right, but about 10 o'clock in the morning a strong southeast wind came up, kicking up a nasty sea. We saw we could not return to the schooner and thought to ride out the blow until she could come along and pick us up. A little after noon a thick fog settled down, and we could see scarcely a boat length ahead. A few minutes before it shut down, I had signalled the others to turn and run for the lee of the islands, then about twenty-five miles away. My boat made the lee all right, and we laid there in the dense fog all that night, all the next day and the greater part of the next night. We had become separated from the other boats and I had heard nothing of them. Late the second night the fog lifted and away off to southward I saw a riding light. Our provisions were all gone, and we were down to our last pint of water. We pulled for the light and found it to be on the schooner J. Hamilton Lewis, Captain Alexander McLean—yes, this same captain of the Carmencita who has been causing all the row lately. I told him there were five other boats with three men each lost somewhere in the vicinity, and we cruised about for three days before we picked them up, four of them. Poor fellows, they were about all in. Their water was gone and they had had nothing

to eat but raw seal meat for three days. One was dead and two wounded, shot by Russians. They told us that the five boats had approached the islands, seeking shelter, but the Russian guards, thinking it another raid, opened fire without warning. One man dropped in a boat shot through the head, another was shot in the breast and another through the leg. Four boats immediately put about for sea, they contained the dead and wounded; the fifth boat signalled its distress and was permitted to land. I heard afterward that they were fairly well-treated until they could be sent to the mainland. We kept a sharp lookout for our schooner, but failed to raise her and Capt. McLean abandoned his summer's cruise and stood away for San Francisco. He said the men he had picked up were in sore straits and there would be mourning in eighteen families if he did not make port before the C. G. White. You see, we had cruised about and, failing to see any sign of wreckage, concluded that the captain and cabin boy had abandoned the search. McLean is a driver and, Lord, how he did send the Lewis down from 55° north. The little White beat us in three days, Captain Hagman and the boy bringing her all the way alone, watch and watch. There was weeping and wailing among the families supposed to be lost, but when I walked into my house the wife looked up, gave a little sob, and said: 'Oh, Danny, I knew you would come, and told others so.' Hagman had poked about in the fog for the two days and when it lifted and he failed to see us he thought we had gone down. He never had any idea that we would make the lee of the islands in that strong southeaster.

"Some owners would send the sealers out in any kind of an old tub. Nowadays I take a look over the vessel before I ship, but in 1889 I was not so cautious. That was the season I sailed in the Mary Deleo. The first little blow started her seams. We had patent pumps that were geared to from 1,400 to 1,600 strokes every four hours; we kept that up for the seven months we were out in that old hulk. When we came back and she went on the ways, I heard that it was found her seams had been caulked with half-inch rope and pitched over. I never investigated the truth of the report; I feared it might be true, and I did not want to meet the owners.

"In the nineties I was in a schooner that was driven head on by a gale into the rocks south of Drake's Bay. Some of the crew launched a boat. It was swamped before it got a length from the vessel, and a few of those aboard reached the rocks. I with others went to the rigging, for the sea was breaking over the deck. She began breaking up and heeled over until the high seas reached us. Now and then a man would go. You could see his white face and clenched jaws through the black of the night, a sea would strike us and when it passed he would be gone. Do you want to know what held me to that rigging all that night? It was the thought of my wife knowing I would come home. When morning dawned I was alone in the rigging.

"Two years later I was lost in the fog in my otter boat south of the same spot. I was picked up by a schooner bound north, and the next day, opposite Drake's Bay, I had the captain put me off in my boat, as I was confident that I could make the bay. The bar was breaking, my boat was capsized, and I was dashed up on the rocks. I stretched and climbed, slipped back into the water, climbed again and was drawn back by the waves and climbed again, until I reached the highest part of the rocks, and even there the waves would sometimes break over me. I held on, and in the morning was taken off. Not many yards below I could see the rotting hulk of the schooner in which I was wrecked two years before.

"Another season I was hunting otter off Gray's Harbor. I was in one boat alone, and we had two other boats out with two men each. There was a gale come on, and our little schooner was driven into the breakers on the bar before the two men on board knew what was coming. They managed to drive her through, however, and made the harbor. I was driven inside the breakers and into the surf, but could not make the entrance to the harbor. The shore, a few yards away, was a precipitous rock, and to be dashed against that meant death, so I had to hold my boat between the breakers and the surf, for to have been hit by a breaker would have been as equally fatal. By yells and signs I directed the other men where to come and how to hold their boats. On the approach of a breaker, they were to do as I did; pull away toward shore as far as they dared and when the wave broke, row toward it with all their might to keep from being carried ashore. They did it as long as their strength held, but after four hours they, one by one, failed to get far enough away from the breakers and were swamped within plain view. For five hours I held my boat there. All the time I kept saying over and over to myself, 'The wife will be waiting for me to come,' and by God I held.

"During the sealing season we figure that a hundred men are lost from all the boats. That is what Myladies' sealskins cost—the lives of 100 men each year. Things happen in the north and along the Japanese and Siberian coasts that never get into the papers.

"Were you ever caught in the Black Current off the Japanese coast, a high sea running from the northwest, typhoon coming from the southeast and black night coming down? No; then may God keep you out of it. I was once, in the taut little schooner Kate and Ann. That was April 24, 1894; the glass dropped to 28.20, and if you don't know what that means, ask any old sea captain. A terrible northwest gale raged until 10 in the morning, then shifted and a typhoon came up from the southeast right against a sea that a landsman would say was mountain high. The typhoon broke at 6 P. M., and all that time we were riding with only a goose-wing mainsail and everything lashed down, preventer sheets on the boom and the wheel lashed and the men slipping about the wallowing deck with bights of rope around their waists. Time and again we were buried under the smother, but we always come up; but once we caught and hung and thought we were gone. We would have been if it had not been for the captain. We had two boats on the poop, and a heavy sea breaking over the stern filled the boats as the schooner heeled; the weight of the water in the boats held the

little craft down and the next sea would turn her turtle.

"Smash those boats!" yelled the captain, and we tumbled and rolled to the poop, caved in the boats and smashed the bulwarks to let out the water and righted just as the next wave slipped under us. In our company that morning were five big, new 100-ton schooners; when the typhoon broke they were nowhere to be seen, and were never heard of again. Each vessel with its crew of thirty men had gone down. Off Vancouver, 1887, I rode out a hurricane in a little 40-ton schooner when two big 3000-ton square-riggers went down, the St. Stephens and the Harvey Mills.

"There is another thing up there that puts the fear of God into the soul of a sealer, and that is the Killer or Sca Wolf. Some say it is a species of grampus, others a species of whale; but we call it the 'Killer.' They are about half the length of a whale, from twenty to thirty feet, have teeth about three or four inches long and an inch through and a fin eight or ten feet long on the back. I have seen them swallow whole sea lion calves, weighing from 75 to 100 pounds. Two or three of them can get away with a big whale. If a seal boat gets in the vicinity of those killers, or even one of them, it gets away as quickly as possible. Many men and boats have disappeared in fair weather and have never been heard of again. A killer does not hesitate to attack a small boat and, striking it amidships, will hurl it ten feet or more in air. The blood of the seals bailed out of the boats attracts the killers, they come for the boat with a rush, and it's 'lost at sea' for that boat's crew. Frequently a ship or steamer comes to port, the passengers of which will have a thrilling story about witnessing an encounter between a thresher or killer and a whale; that they had seen and heard the resounding whacks of the attacking party's flukes against the back and sides of a whale. To sealers and whalers this is amusing. In the first place, the tongue of a whale is the point of attack, and in the second place, when a whale is attacked, he goes down deep, and he goes fast and stays down until he is away from the scene of danger. What they saw was a cow whale lobtailing with her calf. The calf stands on its head and swats the old cow across the back with its tail. They will play on the surface of the water in this manner for an hour at a time, swimming around in a kind of a circle.

"I have been sealing and otter hunting since early in the eighties, but there is nothing in it any more. The otters are disappearing, and Americans have no rights in the North Pacific and the Behring Sea. An American goes up there and is chased out by the revenue cutters of his own country, while sealers of other nations give him the laugh and keep right on killing. It looks like a land job for me from now on, though I may make a last try for otter down the south coast."

Dan was in that raid of the Carmencita on the Russian rookeries on Copper Island last season, but he will not talk about it for publication. The man that headed that raid was Captain Alexander McLean, who, six years before, had picked up him and his mates after they had been adrift in the Behring Sea in open boats for two days and nights and then abandoned his cruise and brought them home. Hence Dan does not care to say anything that might cause his rescuer and former captain any inconvenience, inasmuch as his alleged backers are under indictment from the Federal grand jury in San Francisco for illegal sealing, and there are two similar indictments against McLean, who is still at sea. There is one man, however, who will talk, and that is Oscar Wazschoff, mate of the Carmencita, whom McLean marooned on Clayoquot last April.

"McLean has a grudge against the Russians," says Wazschoff, "and, mark you, he will play even. I don't know where his grudge began, but I think, maybe, it was what he saw in the boats when he picked up Dan Claussen and his mates fifteen years ago off Copper Islands.

"When we cleared from San Francisco we had a provisional register from Mexico to take a cargo from Victoria to Acapulco, but even a plow-tail sailor coming aboard would have known that that was a bluff. Thirty good men forward, Big Alec McLean aft, and a rack full of repeating rifles in the captain's cabin didn't look like we were going after a load of pine lumber. We stood away for Attu, the most westerly of the Aleutian group and cruised about until along the latter part of August, until the killin' season was well over on Copper Island. I can't say the trip was uneventful, for events were happening every little bit in the fo'c'sle and on deck. Nearly all the thirty men were discharged soldiers from the Philippines; there was not over half a dozen men in the lot that knew how to hand, reef and steer, but they knew the smell of burnt powder and could handle a .30-30 smokeless. There was more liquor aboard than we could have drunk in a year if we laid off and let the Carmencita work her own way about; there was something for Big Alec and the sober ones to do, quellin' events as they happened, frequent, too.

"It was a thick, murky morning along the last of August when we laid to about fifteen miles off the Coppers. The eight boats went over the side, three men in a boat, each boat with three pairs of oars, compass, provisions, water and three repeating rifles. You see, Alec had figured that there wouldn't be anybody on the island but the agent and a few Indian sealers, Russia being some busy on the mainland and having need of men who could handle a rifle. We run through the murk to within 300 yards of the island before the fog thinned, and we could see all the boats pretty well bunched with two in the lead. We could hear thousands of seals barking and the roar of the surf, but could see no signs of human life on the island. All at once a fellow by the name of de Smidt, in the lead boat, threw up an oar with his coat on it and begun to signalize us. We could not make it out, but we saw his boat put about and then the boat-puller in Dan Claussen's boat tumbled to the bottom. The next minute the 'put-put-put' of bullets through our clinker-built boats and little thin curls of smoke from behind the rocks put us wise as to what was doin'. I ain't a sayin' just what went on next, all I know is that I didn't fire no shots; I heard afterward that some of the devils in the boats

wanted to make a spurt and charge the island, but it would have been suicide, as not a man could have reached the island alive. We didn't see a man on the island and put back to the schooner with Walter York, of Missouri, shot through the mouth and a boat-puller by the name of Friedlander, shot in the calf of the leg. Poor York lived until we reached Seattle, where he died in a hospital.

"I was mate of the craft, and on the way back Alec and I had some differences and arguments, and he put me ashore at Clayoquot with two others. He come ashore in an hour or so with three pairs of irons to take us back to the schooner; he was pleasant about it, but we wouldn't go back. He tried to get the provincial constable to go away to some quiet place for half an hour and give him a chance to take us back, but we had put the constable wise to the fact that the Carmencita was a sailin' without papers, and he would not stand for Alec's work, though I will admit there was somethin' doin' in Clayoquot before he give us up. The Dora Siewerd took us off and brought us to Vancouver."

As a result of that trip, four well-known San Francisco men are under indictment for conspiracy to defraud the Government, and in addition to conspiracy, Alexander McLean is charged with seal poaching. His alleged backers have been arrested and released on \$3,000 bail.

McLean is the original of Wolf Larsen in the "Sea Wolf"; a typical rover, 45 years old and of Scotch parentage. He was born on Cape Breton, and was mate of the clipper ship Santa Clara when 21. For nearly a quarter of a century he has roamed the ocean and knows the currents of the North Pacific and the Behring Sea better than the seals he tracks across the waters. He was cruising off the shores of Alaska with his brother in a little seven-ton sloop twenty-two years ago, and since that time has been a seeker for pirate's treasure in the islands off Central and South America; has run contraband cargoes for rebellious States and into belligerent ports, and has followed the seal and otter. When he put to sea from San Francisco a year or more ago under a temporary Mexican register to carry a cargo from Acapulco, he did not go there but headed into the north, a staunch craft under him, a rack of repeating rifles in the cabin and thirty good men forward. Recently he was obliged to put into Victoria for supplies and to dispose of his seal skins. His crew libeled his catch for their wages, and he is held for extradition on the part of the American authorities.

## Hiawatha's Fishing.

(Borrowed from Longfellow.)

By "The Amateur Angler" in the London Fishing Gazette.

"THE Song of Hiawatha" is probably known to most of your readers, but it struck me that as a Christmas yarn a short epitome of the story and a few extracts from the chapter on fishing may serve to refresh the memory of those who have read it in bygone days, and be of passing interest to those who have not.

Hiawatha was a personage of miraculous birth, who was sent among the North American Indians to clear their rivers, forests, and fishing grounds, and to teach them the arts of peace. The scene of the poem is among the Ojibways, on the southern shore of Lake Superior. As the story is easily convertible into prose, I shall string my extracts together by prose mostly in the words of the poem.

"Ye whose hearts are fresh and simple, who have faith in God and nature, listen to this simple story; ye who sometimes in your rambles, through the green lanes of the country, read this song of Hiawatha." Wenonah the beautiful was the daughter of Nokomis. Her mother had warned her not "to stoop down among the lilies, lest the West Wind, Mudjokeewis, should come and harm her." But she heeded not the warning, and the West Wind came at evening and found the beautiful Wenonah; he wooed her with his words of sweetness, till she bore a son in Sorrow—

Thus was born the child of wonder, Hiawatha, but his mother died, deserted by the false and faithless West Wind, and the wrinkled old Nokomis nursed the little Hiawatha, and brought him up. Once the little boy saw the moon rise from the water, and whispered, "What is that, Nokomis?" and she answered:

"Once a warrior, very angry,  
Seized his grandmother, and threw her  
Up into the sky at midnight;  
Right against the moon he threw her,  
Up into the sky at midnight;  
'Tis her body that you see there."

Time passed, Hiawatha became a man, and he determined to build himself a light canoe that should float upon the river like a yellow leaf in autumn. So he went to the Birch-tree, and said, "Give me of your bark, O, Birch-tree," and the tree with all its branches, rustled in the breeze of morning, saying, "Take my cloak, O, Hiawatha!" Then he called upon the Cedar, "Give me of your boughs, O Cedar! my canoe to make more steady," and the terrified cedar whispered, bending downward, "Take my boughs, O Hiawatha!" Then he went to the Larch-tree, and the Fir-tree, and last of all to the Hedgehog for quills to make a girdle for his beautiful boat, and so the birch canoe was builded in the valley by the river, and it floated like a yellow water-lily, and Hiawatha sailed down the rushing Taquamenah, and cleared its bed of root and sandbar.

And now we come to the time when Hiawatha went a-fishing. He went

Forth upon the Gitehe Gumees,  
On the shining big sea water,  
With his fishing line of cedar  
Of the twisted bark of cedar,  
Forth to catch the sturgeon Nahma,  
Mishe-Nahma, King of Fishes,  
In his birch canoe exulting  
All alone went Hiawatha.

Down in the depths he could see the fishes swimming; the yellow perch, the sahwa, the shawgashee, the crawfish; on the bows of the canoe, with tail erected, sat

the squirrel, Adjidaumo, and on the white sand of the bottom

Lay the monster, Mishe-Nahma,  
Lay the Sturgeon, King of Fishes,  
Through his gills he breathed the water,  
With his fins he fanned and winnowed,  
With his tail he swept the sand floor.

There he lay in all his armor, plates of bone upon his forehead, with spines projecting. Above him came Hiawatha sailing in his birch canoe, with his fishing line of cedar.

"Take my bait!" said Hiawatha,  
Down into the depths beneath him,  
"Take my bait, O Sturgeon, Nahma!  
Come up from below the water,  
Let us see which is the stronger!"  
And he dropped his line of cedar  
Through the clear transparent water.  
Waited vainly for an answer,  
Long sat waiting for an answer,  
And repeating, loud and louder,  
"Take my bait, O King of Fishes!"

The sturgeon, Nahma, lay quietly fanning the water, till wearied of the call and clamor, he said to the pike, the Maskenozah, "Take the bait of this rude fellow, break the line of Hiawatha!" Hiawatha felt the loose line jerk and tighten, and it tugged so that the birch canoe stood endwise, like a birch log in the water; but Hiawatha was full of scorn when he saw the pike coming nearer and nearer to him, and he shouted through the water, "Shame upon you! You are but the pike; you are not the fish I wanted, you are not the King of Fishes!" Then the sunfish seized the line of Hiawatha, swung with all his weight upon it, made a whirlpool in the water, till the water flags and rushes nodded in the distant marshes. "Esa! Esa! shame upon you! you are Ugudwash, the sunfish, you are not the fish I wanted."

At last Nahma heard the shout, and challenge of defiance, and

Up he rose with angry gesture,  
Quivering in each nerve and fibre,  
Clashing all his plate of armor,  
Gleaming bright with all his warpaint;  
In his wrath he darted upward,  
Flashing, leaped into the sunshine,  
Opened his great jaws and swallowed  
Both canoe and Hiawatha!

Naturally, you would think, this is the end of Hiawatha! but not a bit of it. Here is another Jonah, in the sturgeon's belly; how he fared, he and his faithful little squirrel and his canoe, and how he got out, must be told in his own words:

"Down into that darksome cavern  
Plunged the headlong Hiawatha,  
As a log on some black river  
Shoots and plunges down the rapids,  
Found himself in utter darkness,  
Groped about in helpless wonder,  
Till he felt a great heart beating,  
Throbbing in that utter darkness,  
And he smote it in his anger,  
With his fist, the heart of Nahma,  
Felt the mighty King of Fishes  
Shudder through each nerve and fibre.  
Heard the water gurgle round him  
As he leapt and staggered through it,  
Sick at heart, and faint and weary."

Then Hiawatha drew his canoe crosswise, fearing that in the turmoil and confusion he might be hurled forth from the jaws of Nahma and perish. The squirrel, Adjidaumo, frisked and chattered gaily and toiled and tugged with Hiawatha, till the labor was completed, and Hiawatha thanked his little friend, and then it was that he christened him, and said the boys should henceforth call him Adjidaumo, Tail-in-air.

And again the Sturgeon, Nahma,  
Gasped and quivered in the water,  
Then was still, and drifted landwards  
Till he grated on the pebbles,  
Till the listening Hiawatha  
Heard him grate upon the pebbles,  
Knew that Nahma, King of Fishes,  
Lay there dead upon the margin.

Hiawatha heard a clang and flapping, a screaming and confusion as of birds of prey contending; he saw a gleam of light above him, shining through Nahma's ribs, and the glittering eyes of seagulls gazing at him through the opening, and he heard them saying to each other, "Tis our brother Hiawatha."

And he shouted from below them,  
Cried exulting from the caverns:  
"O ye seagulls! O my brothers!  
I have slain the Sturgeon, Nahma;  
Make the rifts a little larger,  
With your claws the opening widen,  
Set me free from this dark prison,  
And henceforward and forever  
Men shall speak of your achievements,  
Calling you Kayoshk, the seagulls,  
Yes, Kavoshk, the noble scratchers!"

Then the wild and clamorous seagulls toiled with beak and claws, and made the rifts and openings wider in the mighty ribs of Nahma, and thus they released Hiawatha.

Hiawatha called his grandmother, old Nokomis, and pointing to the sturgeon, Nahma, lying lifeless on the pebbles, to hold her that he had slain "The King of Fishes."

"Drive them not away, Nokomis,  
They have saved me from great peril  
In the body of the sturgeon;  
Wait until their meal is ended;  
Till their craws are full with feasting—  
Then bring all your pots and kettles  
And make oil for us in winter."

Three whole days and nights did it take Nokomis and the gulls to strip the oily flesh of Nahma—

"Till the waves washed through the rib-bones,  
Till the seagulls came no longer,  
And upon the sands lay nothing  
But the skeleton of Nahma."

## The Charms of Brook Fishing.

BY EDWARD A. SAMUELS.

WHILE to the ordinary mind fishing for trout has but one meaning, to the experienced angler it has a great multiplicity of conditions which are so varied that the recreation is as full of changes as are the waters in which it is pursued. So great is the variety one hardly realizes all the different phases that exist in this most enjoyable sport.

He who follows the mountain brook to its very source in pursuit of the beautiful fish which inhabit its waters, finds altogether different conditions from those which offer to the angler who casts his fly upon the pools of the larger streams, and both differ as greatly as does their environment from those of him who follows the fascinating sport that is to be found on the bosom of the placid lake, in whose depths lurk the gorgeous-hued leviathans whose capture is to him the acme of piscatorial enjoyment.

Broadly speaking, the various phases of trout fishing are almost limitless, but technically, they may all be included in brook, river and lake angling, each of which possesses peculiar charms quite separate and distinct from those of the others.

Among my angling friends are some who find their greatest enjoyment in following the meanderings of the crystal water brook down mountain sides, through forests in which their noisy prattle finds many an echo from trees and ledges and wild, rocky shores, and thence to the flower-covered meadows in which the stream flows more quietly but always with an abundance of delightful nooks and ever-changing beauties. In such brooks the trout that are obtained are not of large size, but their coloration is always beautiful, and though comparatively small they may be, they possess the gamy qualities which the larger fish exhibit, and the angler who returns at night with well-filled creel feels a degree of satisfaction, such as is not always enjoyed by many of his brothers of the angle who obtain their sport in different waters.

I have other friends, also, who care but little for brook fishing, but find their keenest enjoyment upon the pools of larger streams and rivers upon which the fly may be cast or the minnow deftly thrown and played in the deeper recesses of the dark and foam-flecked water. One gentleman of my acquaintance, in fact, declaring that in his opinion it requires as much sportsmanlike skill to cast the minnow successfully as it does to employ the feathered lure. There are still others who are not satisfied with either brook or river fishing and are content only to rise and conquer the larger fish which are found in the deep water.

I have for many years partaken of the pleasures that are found in all these methods, and it seems to me as I bring back to memory all the enjoyment that has fallen to my lot that if I were asked which is the most delightful of them all, which affords the keenest pleasure and arouses all the love for nature which in me lies, I should say they are found in the greatest intensity in that which is ordinarily classed as brook fishing. And I have been devoted to the use of the fly for nearly a half century at that. Brook fishing is not scientific angling in the ordinary acceptance of the term; it does not tax the skill and patience of him who casts the fly, nor does it mean a prolonged and stubborn battling, such as is to be had with the denizens of the lake, but it has a singular charm that is quite indescribable.

The delights of brook fishing have been well portrayed by some of the master minds of the world, and one could easily fill a volume with selections from those eloquent and poetic writings; I shall not, therefore, attempt here to add to what has already been penned, but I cannot refrain from offering one brief extract from a charming description that I find in one of my most cherished books, "Salmonia, or Days of Fly-Fishing," printed in London in 1828. The author's name is not given, he subscribing himself simply as "An Angler." In treating of the charms of brook fishing, he says:

"How delightful in the early spring, after the dull and tedious time of winter, when the frosts disappear and the sunshine warms the earth and the waters, to wander forth by some clear stream, to see the leaf bursting from the purple bud, to scent the odor of the banks perfumed by the violet and enamelled, as it were, with the primrose and the daisy; to wander upon the fresh turf below the shade of trees, whose bright blossoms are filled with the music of the bee; and on the surface of the water to view the gaudy flies, sparkling like animated gems in the sunbeams, while the bright and beautiful trout is watching them from below; to hear the twittering of the water-birds, who, alarmed at your approach, rapidly hide themselves beneath the leaves of the water lily, and as the season advances, to find all these objects changed for others of the same kind but better and brighter, till the swallow and the trout contend, as it were, for the gaudy May fly, and till in pursuing your amusement in the calm and balmy evening, you are serenaded by the songs of the cheerful thrush and melodious nightingale, performing the offices of paternal love, in thickets ornamented with the rose and woodbine."

Brook fishing possesses one peculiar quality in that it may be enjoyed by every one; it requires no elaborate and expensive outfit of flies and all the other paraphernalia which are deemed necessary by the scientific angler, for the country lad, equipped with alder pole and tackle of the simplest kind, may equal the success obtained by the most experienced angler; the æsthetic part of his nature may not be awakened like that of the older and more thoughtful fisherman, but the enjoyment that falls to him is as keen as is that of the other. In brook fishing I always enjoy the companionship of one of these lads, and I have found in his free and artless chatter an endless fund of information concerning the denizens of the woods and fields and waters, information such as is acquired only by the keen-eyed observer whose young life has been spent among them.

One of the many varied experiences which have fallen to me in this line comes back to memory with

all the freshness of a recent happening, although it occurred nearly a half century ago. I was spending a short vacation in the little town of Gilead, Maine, to which retired spot I had penetrated while engaged in my favorite study of ornithology. The farmhouse in which I made my headquarters was located quite near the Androscoggin River, which, at that point, flowed in a stately movement through most picturesque surroundings. The farmer's son, Eugene, a bright lad of about sixteen years of age, often accompanied me in my rambles in search of rare birds and their nests and eggs, and I am free to confess that a large share of my success on those outings was owing to his quickness of vision and knowledge of the habits of the feathered songsters of that neighborhood. One day as we were rambling through the woods in which a noisy brook was making its course in the direction of the river, I noticed as I stooped to obtain a drink, a trout darting from the shadow of the bank on which I rested and disappearing in a shaded nook further down the stream.

"That was a nice trout, Eugene!" I exclaimed. "Are there many in this brook?"

"Oh, yes," he replied; "and if you would like to give them a day, I will go with you and show you where they may be found."

Of course, I replied I would be glad to accept his offer, for fishing was then, as it is now, almost a passion with me. Among my belongings was a lance-wood bait-rod which almost always accompanied me in my ornithological outings, and I had a small kit of fishing tackle which usually found a place in my traveling bag.

On returning to the house, I set up my rod and arranged my line, etc., and early on the following morning we started for the headwaters of a brook which flowed down the side of a spur of the White Mountains and emptied finally into the Wild River, which debouches into the Androscoggin near Gilead. What a glorious June morning that was! I shall never forget it; my young guide was familiar with all the paths and good roads which traversed that portion of the forest through which our route lay, and he was ever on the alert to point out to me some rare and beautiful forest flower or woodland bird or adroitly hidden nest.

At length we reached the place which he deemed best for the beginning of our sport, and in a short time our hooks were baited and dropped into the water.

Eugene's rig was a peeled alder sapling, line and hook ganged on silk-worm gut, which I had furnished him from my abundant stock, such hooks not having before come into the possession of the country lad. A landing net was not needed, and as for a creel, the young man had a covered wicker basket slung by a strap from his shoulders, and he carried our luncheon in a haversack which hung by his side.

At the point where we began fishing the brook was hardly more than a tinkling rill which musically flowed among the rocks on the mountain side; that trout should ascend through the many shallow places and rapids to this secluded spot seemed almost incredible, but that they had done so I soon proved, for in the first little pool in which I dropped my lure the bait was quickly seized by a fish, which, when landed, seemed disproportionately large for such a diminutive stream; it was but little more than six inches in length, but it was as gorgeously attired as are any of the famous gaudily hued denizens of the Laurentian lakes.

During the entire length the brook consisted of sharp pitches, sometimes several rods in length, at the bottom of which were quiet little nooks and pools which were often a foot or more in depth, but which were generally so shallow it would seem almost impossible that trout should inhabit them.

The shallowness of the water, however, was sometimes more apparent than real, for the reason that it was as clear as that which flows from a spring and was almost as bright and sparkling; it was, in fact, an ideal mountain trout brook, such as one finds in the greatest perfection in New England and the Middle States. When we began fishing, Eugene proposed that we should alternate in taking the lead, each falling to the rear on landing a fish; this arrangement met my approval, for "share and share alike" is a fair proposition, in brook fishing at any rate, and I have known of more than one good day's sport being spoiled by the greediness of an angler who was never satisfied unless he was in the lead.

An so down the varied reaches of that beautiful stream we followed, each succeeding the other as he added to the common stock another of the gamy little denizens of the brook. At many points it was a hard brook to fish, for to reach the pools one had to perform no little amount of rock climbing, but fortunately, these rough places were followed by considerable intervals of smooth water which often flowed among shrubbery and even through a young forest growth which afforded an agreeable shade and protection from the rays of the sun, which, on the mountain side, often seemed more fervid than we could have wished.

The whole forenoon was spent in fishing the upper two miles of the brook, for we did not hurry nor neglect any promising spot. Half the success in brook fishing lies in the thoroughness with which it is done, and oftentimes more fish are passed by careless haste than are taken; this I have proved on more than one occasion, when with a companion I have been out upon a brook, for, seeing his eagerness to get ahead, I have voluntarily fallen to the rear and, fishing carefully the pools which he passed by, I succeeded in creeling more and better fish than fell to his rod. At noon we halted in a little grove of hardwood trees for lunch, and after that was eaten, we stretched ourselves upon the bed of soft and springy moss to enjoy a little siesta and listen to the songs of the birds who had found an abiding place in that little grove.

Among them was a vireo, my favorite among all the feathered inhabitants of the woods; tame and unsuspecting was the little fellow, and hovering about us sometimes but a few yards away, he permitted us to examine him in his neat attire of cap of ashy blue, coat of bright olive green, and waist-coat of unsullied white.

I love the song of this beautiful bird, for it always seems to me to be the expression of calmest, quietest

content, and all his movements are marked by grace and elegance.

One of my greatest pleasures when rambling in the woods is to recline on a grassy knoll and watch this little songster, and as I watch I wonder whose pardoned spirit lives within his little body, and wish that if there is any truth in the doctrine of transmigration of souls I might be good and favored enough to some time hence become a vireo. All the summer long, in sunshine and in storm, from early morn to dewy eve, his sweet soliloquy, his beautiful warble is heard—soliloquies of peace and good will for all the world.

Ah, the vireo is almost an angel among the birds, and all should do him reverence. See the little one how busily he keeps employed, searching each leaf, each bud and twig for dainty morsels of insect food, and as he moves among the foliage, now leisurely poising on some waving branch, now fluttering at the end of some leaf-capped twig, how like a little elf does he appear.

Before resuming our fishing my young guide removed the trout from his basket, and, after washing them in the cold water of a nearby spring, he replaced them in the hamper, putting beneath and laying upon them some moss which he moistened in the spring; forty-seven there were in all, and so nearly of a size were they it would have been difficult to select one from the others.

As we descended the brook it gradually increased in volume, being fed by a number of springs along its course; the pools became larger and deeper also, and the trout seemed to be more numerous, but their size did not differ from that of the fish we had taken in the pools above; whether or not they were all of one season's growth could only be conjectured. Possibly the fish of that brook never attained a larger size, and we did not succeed in landing a half-pound trout until we reached the lower pools near the point at which the brook emptied into the wild river.

Our catch that day numbered eighty odd fish, and I do not remember of ever having seen a more beautiful collection of the typical brook trout.

The same species when taken in the deep water of the lakes loses much of the symmetry and grace and exquisite markings of the little brook inhabiter; the trout we capture in the rivers and larger streams also lose much of the elegance of form and beauty of coloration. It is in the pure water of the brook only that the ideal spotted trout is found.

Our fourscore fish, small though they were, filled Eugene's hamper to overflowing and they made a load of no trifling weight, as I discovered, when, to relieve the lad of his burden, I threw the strap over my shoulder and carried the basket a part of the way home.

Poor Eugene! He was a good boy, a brave and manly lad such as we find on the farms all over New England; he was studious withal, and his ambition was to acquire an education which would enable him to embark in one of the learned professions. But the great Civil War came, that awful struggle which cost the country so much of blood and treasure they never could be reckoned, and Eugene's life, like that of many thousands of other young men who were as bright and manly and as full of ambitious dreams of the future as he, was freely given in response to what he considered to be the demands of patriotism and duty.

## A Venture in Eels.

EARLY in September nearly all the eels in the central water shed of Pennsylvania turned their noses away from the ponds and streams in which they had been spending the summer and began wriggling down the Susquehanna River toward the sea, filled with an irresistible instinct to seek salt water for the purpose of spawning. It mattered nothing that before them in the long reaches of the Susquehanna there lurked dread danger of capture; that cunning devices by the thousands were set along the route for their ensnaring to gratify a wondrous human passion for their flesh, or that the vast majority in yielding to the compelling impulse were going to their death from exhaustion consequent upon the act of reproduction.

By thousands and by millions they sinuously swam their way down the Susquehanna. Tons upon tons were entrapped in fish baskets and entangled in nets; but thousands of tons escaped to fulfil their destiny in the salt water of the Atlantic. On one cloudy night soon after the run began a boat might have been seen in the shallows on the Susquehanna. It was being poled silently and skillfully among the deep shadows of overhanging trees near the shore. The man who did the poling stood in the stern and kept a sharp lookout ahead. He seemed to have an air of expecting to see every moment something he did not want to meet, for his face was livid with fear and anxiety.

In the bow crouched another man who grasped in his right hand a pole about six or seven feet long, at one end of which was fastened an iron contrivance closely resembling a small, straight, tined dung fork. There was no look of apprehension on his face, only eager expectancy as he peered alertly into the water illuminated by the flare of a light fastened on an iron rod set in the bow of the boat. The boat itself was long, narrow and punt shaped at both ends, a boat of a type common on the Susquehanna.

The boat was poled silently and without a word being spoken by either men for perhaps ten minutes, when the man who was propelling the craft spoke.

"It's a bully night fur eels, Jake, 'n ef we're let alone we'll make a haul." "An why shouldn't we be let alone?" retorted Jake, testily, "we ain't doin' nothin' but spearin' a few eels, an here's a peach," making a swift dart with the implement in his hand. The next instant he swung aboard a large wriggling eel impaled on the prongs.

For the next half hour the two men were too busy to talk or whisper. Every few minutes the man in the bow would lean quickly forward, make a swift thrust with his spear, and almost as regularly toss a bleeding eel aboard the long, narrow craft. He had no time for conversation, and the other man was too much occupied in properly poling the boat and keeping it well within the shadows of the bank. Curiously enough also, he kept the bow of the boat as much as possible toward the short, as though anxious that

the light of the big lamp should not shine out full on the broad waters of the river.

When for any reason it became necessary to point the nose of the craft toward mid-stream, it was invariably for the smallest possible space of time and in such a manner apparently as to attract the least attention. This fact, coupled with the evident anxiety of the pole man whenever the maneuver was necessary, might have led even a casual observer to believe the men were anxious to conceal their doings from the world.

But two or three hours passed without any craft or person, save their own and themselves making an appearance, so the lines of anxiety on the face of the poleman slowly disappeared and smiles of satisfaction took their place. He even occasionally ventured on a rough pleasantry when his partner missed a good plump eel.

Indeed, he not only made no protest, but promptly obeyed a signal given him when they rounded a sudden bend to sheer off into the deeper water and nodded his head in agreement to the muttered words: "There'll be no one about this time o' the night, so we'll have a shy at somethin' better."

"Somethin' better" was soon impaled on the pitchfork-like prongs. It was a queer looking eel. Not so long, and in shape quite different.

The poleman gave a low, hoarse chuckle. "That there's a scaly kind o' eel, Jack."

"Wot," said the other in a tone of surprise, but with the lowering of an eyelid, "isn't it an eel?"

"You know durn well it ain't," responded the other, "you know durn well it's a six-pound salmon."

"Well," answered his companion, "here's another to keep him company, an' fur luck."

This quick accession to the supply already in the boat nearly made the poleman forget himself, for he made the preliminary motion for the utterance of a howl of joy, but restrained himself in time, and he spoke instead, "I tell you, Jake, there's nothin' like giggin' to get fish."

"You bet," answered Jake, emphatically. "Beats nets all to bits. Gigger kin git more fish in one night than a netter in two. Say, what do you say to workin' a little more into the channel? Safe enough, I reckon."

Jake was about to respond affirmatively, but just then there came floating out across the water the sound of a couple of loose stones rolling down the embankment of the river. Two or three more followed immediately. Both men gave a lively start of affright. All thought

of the channel and gigging was abandoned. Like a flash the gig light was extinguished, and with one or two sturdy silent thrusts with the pole, the boat was pushed under a thick mass of underbrush which leaned far over the water's edge. Breathing quickly in evident fear, the two men held the boat still and waited for what might happen next, and every minute or two their hearts jumped at the sound of more stones rattling down the side of the bank.

At length Jake whispered, "I can't stand this no longer. I'm going to see wot's up."

So saying he stealthily crept ashore and wormed himself silently away through the underbrush. To his companion it seemed an hour before he came back, and when he did there was a broad grin on his face.

"We're a couple of chumps, Bill," he said. "It was nothin' but a mus' rat tryin' to climb the bank."

"Jus' the same, Jake, I'm jus' skeered plumb stiff, an' I have enough giggin' for one night. Let's light out an' go home?"

"Don't make a monkey of yourself," said the other, gruffly; "there's another hour's good fishin' yet to be done before we gets the load we promised 'Monk' Maguire, down at the hotel. There ain't no call to be skeered this time o' night of anybody."

Unwilling Bill listened to the words of Jake, and he resumed his poling. After this the eels came rapidly until even Jake declared himself satisfied, and putting out the light had the boat run into the shadowy shore, where the two began straightening things preliminary to going home.

No fear seemed to affect either at this time, and they became so busily engaged, that when their boat was lightly touched by some solid substance, they failed to notice it; but something an instant after did bring them to a sense of their surroundings. It was the quick incisive voice of a man.

"Well, boys, been fishin'?"

With a yell of fright, both men sprang to their feet nearly overturning the boat as they did so. With bulging eyes they stared into the smiling faces of two men standing in a boat alongside.

"Gosh!" exclaimed Bill and Jake simultaneously, "fish wardens!"

"Just so," nodded one of the strangers, pleasantly, "an' we're glad to meet you at this solem hour o' the night. It was lonely for Charlie an' me here on the river all alone by ourselves, an' seein' that as we've fallen in with such pleasant company, we'll go together

all the way down to Wellston, an' in consequence, we'll be easy on you before the Squire to-morrow mornin'. We'll say nothing about the mess of eels you've got, an' only call it twenty-five for giggin' an' ten apiece for them eight salmon an' three bass. That'll make a hundred and thirty-five an' costs. Of course, all this is providin' you make no fuss, an' pay up at the Squire's desk without kickin' in the mornin', otherwise, we will have to put the tenners on each eel, an' that'll be no joke, I'm thinkin', when I survey the number you've got."

"Good Lord!" groaned Bill, "why didn't we light out after them mus' rats got to stirrin'; mus' rats always brings bad luck. Where'n blazes are we goin' to raise one hundred an' thirty-five plunks to pay our fine with? That's what I'd like to know? I guess it's me for a hundred an' thirty-five days in quod, les' the old woman has 'em in her stockin'. Damn giggin' anyhow, an' fish wardens, too."

W. E. MEEHAN.

### Dipping Herring Galore.

NORFOLK, Va.—Uncle Sam's "jackies" have a way of their own to catch fish for keeps. They don't always use nets, nor haul seines. Indeed, they scorn appliances of all sorts! They only just hang on by the rail and let the bounding billows do the rest.

A case in point was when the United States steam collier Lebanon came into the Capes at Norfolk one day last week, when it was blowing so hard. She ran into a school of herring, which rather enjoyed the churning sea, and dipped so heavily into one wave that she shipped eight barrels.

W. H. SEABURY.

### The Angler's Inn Song.

Bright be the board, by Friendship crown'd,  
The hearth love-lights burn warm and clear;  
Enough for me if there be found  
The hostel's very ready cheer.  
Next to that humble home endear'd  
By all the toil it cost to win,  
What shall we place beside or near't?—  
Trust me—on second thoughts—an Inn.

I've dwelt a day in grandeur's halls,  
And nights of pleasure have been mine  
Within the cot's o'er-ivied walls,  
As 'mid the city's gaudy shine;  
But there's a charm, with home but shared,  
To pride and freedom both akin—  
Lord of yourself, that coin's well spared  
That buys and keeps it at an Inn!

—Sir Walter Scott.

# YACHTING

## Lavinia's 1903 Cruise.

THE following is an account of a cruise made in the sloop Lavinia from Essington, Pa., to Plymouth, Mass., and return:

Lavinia is a centerboard sloop of 10 tons register, 35ft. over all, 13ft. breadth, 3ft. 6in. draft, with board up. The cabin is large and commodious, with double transoms on either side 12ft. long and the usual centerboard trunk and table arrangement. Forward, on the starboard hand, is a toilet room and the same space to port is occupied by an ice-box, dish lockers and sideboard. At the after end are the clothes and provision lockers. Forward, under the deck, is the galley and accommodations for one man. The extreme peak is taken up by the oil tank and chain locker. The cockpit is circular, seating eight comfortably. Aft of the cockpit, under the deck, are the water tanks, holding 80 gallons. She carries mainsail, single jib, gaff and jib topsails.

She is enrolled in the fleet of the Philadelphia Y. C., whose anchorage is at Essington. By looking at a map you would hardly think Essington much of a yachting center, but the Philadelphia Y. C. can compare very favorably with any in the East, even if it has not their natural advantages. The club is located some 20 miles from the head of Delaware Bay and the same distance from salt water. The river is only one to two miles in width, with a fair depth of water in the vicinity of the ship channel, but owing to the shallow water near the shores and in the small creeks, which are the only refuge in case of storms, a shallow centerboard boat is preferable and consequently that type prevails. The tide runs at the rate of three to four miles per hour, but this cannot be considered a disadvantage, as it often does the work of an engine in bringing one home, provided the proper calculations are made on the changes of the tide.

Long before I became the proud owner of Lavinia, a cruise had been considered from Philadelphia to Plymouth, Mass., my home, and return. During the winter months I would visit the yard where Lavinia was hauled out for the winter and gaze with jealous eye on her powerful form, at the same time picturing myself aboard of her in a strong breeze with lee-rail awash.

After final negotiations had been made and the boat was turned over, no time was lost in getting her in commission, for it was then the latter part of April and we had planned to take our cruise on July Fourth, a date which had been particularly selected on account of the moon, which proved of valuable assistance. My chum, Bo, had already signed as first mate and each Saturday and Sunday found us busily at work burning off paint, varnishing and making general preparations. By May 30 she was ready for the first trial spin. Our spare time during the week was spent in discussing what we would need to take for the trip.

We were determined to be prepared for any emergency, as the trip around Cape May and Cape Cod could not be considered lightly, especially in a boat of that size. In addition to the regular anchor with chain operated by a windlass, a spare anchor was carried on the port bow, for which we had 30 fathoms of 3in. cable. We were

also provided with fog horns, rockets, complete set of charts, on which we had marked the course carefully, barometer, etc., and a generous supply of provisions.

The party consisted of Bo, first mate and cook, and his wife; Schmaltz, brother of the captain, second mate, and his wife, and the captain. Schmaltz, who resided in Boston, was to join us at Atlantic City, it being our intention to sail to Atlantic City the Saturday before the Fourth of July in order to save time. None of us had any experience in sailing in the open, but had followed small boat racing for some years on the Massachusetts Bay and Delaware River.

It was 2:20 P. M. on June 27 that we dropped our mooring off the club house, our objective point being Atlantic City, a distance of about 115 miles. We had hopes of reaching our destination by Sunday night, that is, if we sailed day and night and had any luck with the winds. The wind was light S.W., giving us a dead beat down the river, but the tide was with us and Chester and Wilmington were soon passed. At 6 P. M. we reached Delaware City, which marks the head of Delaware Bay. Here the wind died out and the tide having turned, we were forced to anchor and wait for a breeze, or the tide to turn in our favor. At 1 A. M. a light S.W. breeze sprang up and we were soon under way again.

Delaware River is not difficult to navigate at night, a most complete system of range lights making it impossible to deviate from the course. It is well, however, to sail a course parallel to the ship channel in order to avoid the traffic. We took this opportunity to test our compass, which we had adjusted as accurately as we could, by comparison with the course of the various range lights and found it to be very nearly correct.

All night we beat to windward and by morning Reedy Island was astern and we were fairly well out in the bay. At 10 o'clock Sunday morning the wind again petered out and, the tide being against us, we dropped our hook just south of Bombay Hook light. It was not until 2 P. M. that we again got under way. The wind still held to the S. and with the aid of the tide we made good time. Up to this time we had paid little attention to our chart, as one of our crew had some experience sailing in the bay, but owing to a miscalculation on his part, we touched with our board. After this incident we referred to our charts at frequent intervals.

At 6 P. M. we were off Egg Island Point, 57 miles from Essington and 18 miles from Cape May. We decided to stand over for the Cape, but after covering 4 or 5 miles, the weather began to thicken and it was thought best to run into Maurice River Cove and anchor for the night.

The wind had now freshened considerably, and we had all the canvas we could swing to, but we did not care to reef so near our anchorage. At this juncture we ran into the oyster beds, the cove being a noted oyster ground and were constantly bearing away, or luffing up to avoid the stakes, which marked the beds at intervals of a few feet. We anchored astern of an oyster schooner about 2 miles off shore and soon had things made snug for the night.

Bo had whetted our appetites with descriptions of a

juicy steak, which he was to prepare for dinner, but upon opening our ice-box found to his disgust that it was dog meat, the office boy having evidently exchanged packages with another purchaser. After letting out an extra 5 fathoms of chain to make Lavinia ride easier, all hands turned in, resolving to make another trial in the morning, although we were all due at our various places of business.

Monday morning we turned out early and found it raining hard, and the prospects for clearing looked poor, indeed. Various oyster boats were making out into the bay, so we decided to make a start, anyway. As usual, the wind was dead ahead and light at that, so little progress was made. At noon we ran into a severe thunder squall, forcing us to anchor and drop everything. This killed what little wind we had, and it being 3 P. M., which made it impossible to reach Atlantic City before dark, we turned about and ran for Maurice River, where the boat was left in charge of an old sea captain.

The following Friday the entire party previously mentioned, left Philadelphia at 5 P. M., arriving at Maurice River two hours late in a driving rainstorm. The captain was waiting for us, and after paying him for his trouble, we rowed out to the boat and obtained oilskins and sails to keep the ladies dry. Finally all hands, including our various bundles, were safely aboard, and after hasty luncheon we turned in for the night. Sleep was out of the question, for we were located in a particularly favorite haunt of Jersey's renowned and far-famed mosquitoes.

At 1 o'clock the first mate hauled us out and we started down the river for the bay, which we did not reach until 6 P. M., owing to the lack of wind. At 10 o'clock we got a favorable slant and soon had the Cape in sight. Just before reaching this point an ugly squall was encountered. We luffed up and anchored and lowered our sails, but not until the captain ascended the mast in record time to clear the peak hails, which had gotten fouled. After the squall was over we made sail and ran down to the Point, where we anchored for lunch. There being an ugly chop on, the ladies did not partake of this meal. Lunch was soon over and we again got under way.

The wind had hauled to the N.E., making it a beat up the coast, but was strong and fresh. By dusk we had passed Wildwood and were abreast of Anglesea. Sailing lights were soon in position and we started on our first night's sail in the open. The course was chosen about 4 miles from shore to avoid the numerous fish pounds with which the Jersey shore is adorned. Bo prepared one of his famous dinners, but he was the only one who enjoyed it.

All night we beat up the coast and morning found us off Atlantic City, 40 miles from Cape May. The wind had hauled again to the S.W., giving us a free sheet and topsails were soon bent and drawing. From Atlantic City north the Jersey coast is very barren and dismal, the monotony of the sand hills being only occasionally broken by a life-saving station or a summer resort. Numerous wrecks were passed, bringing vividly to mind the dangers of this coast during the winter months.

Off Asbury Park our tender broke away, the painter having chafed through on the taffrail. We at once hauled on the wind and by making a couple of short tacks soon had our boat again in tow. By this time the wind had materially freshened and the sea was making, giving us quite a little trouble with our tender. At 6 P. M. we rounded Sandy Hook, having run 80 miles from Atlantic City since morning. The wind being favorable it was decided to run up New York Bay, although we were somewhat doubtful about doing so, owing to the traffic in the Narrows. Coney Island looked like a Fairyland, as we passed, gorgeously illuminated with electric lights. At 10:20 we dropped anchor off Staten Island Y. C., which ended a remarkable day's run. The entire party was pretty well tired out, and all hands were soon asleep, assisted, no doubt, by the patter of the raindrops on the cabin top.

Monday morning dawned cold and dreary. After breakfast Schmaltz and the captain went ashore for a fresh supply of provisions. At 9 o'clock it cleared and we started across the bay for East River, which was not reached until noon, the wind having again failed us. Numerous snapshots were taken of the various boats that we passed. A tug towing a small schooner hailed us, a line was passed and we were soon going up the river at a lively rate, making our way in and out in a skillful manner among the traffic, which was particularly congested at this time. Off Riker's Island our tow dropped us and a light S. breeze carried us around Throg's Neck into Long Island Sound. We had been prepared for a glorious surprise upon entering the Sound, but the beauty of the surroundings surpassed our wildest imagination. Dotted with numerous sailing and steam craft of the most modern type, it looked indeed like a yachtsman's paradise, especially in comparison with the muddy Delaware.

As we passed New Rochelle we saw Reliance at anchor, but we did not run in close to her, as we had little time to complete our long journey. Upon sighting later some large sloops in the distance, the temptation proved too strong for us and we deviated from our course in order to get a better view and possibly some photographs. They proved to be sloops of the 51ft. class, and we again stood up the Sound.

The wind continued from the S.W. and we laid our course E.  $\frac{1}{2}$  N. for Faulkner's Island. At dusk we came dangerously near being run down by the steamer Dimock. This course was held all night, each man taking a trick at the wheel, and by Tuesday morning we had Faulkner's Island astern. The wind held to the S.W. all day, and at 3 P. M. we ran through the Race. Passing to E. of Fisher's Island, we stood by Watch Hill and sailed our course due E. for Point Judith.

Bo thought it best to put in at Newport for the night, but the wind still held true and it was decided to try and reach Vineyard Haven by morning, a distance of 61 miles.

Off Point Judith we encountered heavy seas and were forced to lower our peak to ease Lavinia up a bit. At midnight the wind dropped again, but the sea continued lumpy, proving too much for Schmaltz, who lay in the scuppers, wishing he was ashore. Bo took the wheel and the captain spent the remainder of the night fending off the tender, which threatened to come aboard with every following sea. Schmaltz being incapacitated, we were shorthanded and neither of us got any sleep all night. By morning we were well up Vineyard Sound and the sea had subsided.

For the past three nights we had had little or no sleep, and it was with difficulty that we kept awake, but the excitement and our realization of the importance of absolute vigilance when in strange waters at night, no doubt prevented our dozing. At daybreak we were off Tarpaulin Cove and stood for West Chop, which we could make out in the distance. Schmaltz had recovered by this time, the ladies, tried to cheer us up by a hot and dainty breakfast.

Vineyard Haven is a quaint little town, having an ideal harbor with deep water. The shores are dotted with cottages aiming more to comfort than expense. Altogether it seemed an ideal home for the yachtsman of modest tastes.

After putting some provisions aboard we again got under way and at 9 o'clock rounded East Chop and headed E. by S. from across Rip Shoal Lightship. Quite a number of schooners kept us company as well as numerous tugs with barges in tow. We were becalmed after passing Cross Rip for several hours, and Bo and the captain took this time to make up for lost sleep. A breeze from the S.E. reached us at 2 P. M. and we stood over for Handkerchief Shoal.

Those on board the fleet of big schooners, which must at least have numbered fifty boats, often hailed us and asked where we were bound. Among the schooners was an old, dilapidated looking hulk with the distinguished name of Thomas B. Reed. Heretofore we had passed every schooner with ease, but this hooker went by us as if we were anchored.

We soon passed Handkerchief Shoal Lightship and altered our course for the Lightship off Monomoy Point. Instead of going to the E. of the southerly lightship off Pollock Rip, we headed for Pollock Rip Shoals Lightship, the chart giving us plenty of water for our boat. Schmaltz swore he saw bottom on several different occasions, but it must have been imagination on his part. Although the wind became somewhat lighter we still made good time, and by dark were well off Chatham. All were now in good spirits and our trials of the previous night were wholly forgotten. The moon showed clear and bright, and it was an ideal evening at sea. We had expected a rough trip around the Cape, but it proved the most pleasant of our journey north.

By midnight Nausett Beacons were passed, and at 2 P. M. we were abeam of Cape Cod Light. Here the wind flattened much to our disgust, for we had pictured ourselves by early morning anchored in Plymouth Harbor. Little or no progress was made during the remainder of the night. In the morning we were still off Cape Cod Light and there was no prospect of any wind. Thursday morning was spent in cleaning up and polishing brass in order to create as favorable an impression as possible when we reached port. A supply of fish lines would have helped us pass the time. By noon we had nursed our boat in the catspaws, passed Race Point Light and steered our course W.  $\frac{1}{2}$  S. for Gurnet Light, which marks the entrance to Plymouth Harbor.

At 2 P. M. a light E. breeze sprang up, sheets were

LAVINIA.

started and we set our topsail. A haze had settled on the bay, making it difficult to see more than a mile ahead. At 4 o'clock the captain sighted land from the spreaders and the haze lifting with the increasing wind we could make out the Gurnet over our port bow. It was dead low water when at 5 P. M. we passed the red light and started to beat up the 50ft. channel to the town. There was hardly room to get headway on before we had to come about to avoid running aground, but by careful navigation and quick handling of the sails we reached the Plymouth Y. C. The harbor master directed us to an anchorage and we dropped our mainsail for the first time since leaving New York.

The trip from Maurice River to Plymouth, a distance of 424 miles, had been made in six days, with practically a day lost off Cape Cod. No time was lost in getting out to the house, where we were welcomed with open arms. We were royally entertained Friday and Saturday, at the same time making up for lost time on mother's cooking.

Friday was spent in a pleasant sail about the Gurnet and later in the harbor, which proved equally unpleasant, owing to the shallow water and numerous bars on which we grounded many times but always managed to get off.

Realizing that our return trip would consume more time, as the chances were we would have head winds all the way (the prevailing winds at this time of the year being southerly), it was decided to start back Saturday afternoon, when the tide would be favorable. Saturday morning was spent in getting our supplies and filling the water tanks. In warping up to the dock Schmaltz fell overboard while trying to fend off and promptly hugged a pile to avoid getting wet. It would have been better had he got a ducking, for the pile was covered with barnacles, which badly lacerated his arms. The captain of a tug bandaged them in cylinder oil. In renewing our ice supply we noticed that a portion of the ice still remained which we had put aboard in New York. We had a most generous supply of mother's cookies, doughnuts and jam.

To prevent the tender from giving trouble on the return trip an outrigger was constructed similar to a yawl's bumpkin, by fastening a pole 6ft. long to the taffrail and securing the inboard end to the deck. It was kept in position by lines fastened to either side of the stern, enough play being given so as not to allow the boat to bring up too abruptly. The painter of the tender was passed through a ring at the end of the pole and led inboard to a cleat on the deck, which allowed the boat to run up within a foot of the stern. This scheme proved very satisfactory, in spite of the fact that it was criticised by the crew, as it did not present a very ornamental appearance.

Our glowing accounts proved too much for the Little Man, who packed his grip and came aboard to sail with us as far as Newport. At 2 P. M. Saturday we bade our friends good-by and started on our long return journey. The wind was S.W., giving us a reach to the Cape, which we rounded at 5 P. M., a marked contrast to the time consumed in previously crossing the bay. Little Man lost no time in learning the mysteries of the wheel and compass and enjoyed himself to such an extent as to refuse to turn in for the night. It was a glorious evening and by morning we were off Pollock Rip Lightship, the breeze having held true all night. During the night we passed very close to several schooners, which were indiscreet enough not to carry riding lights. Off Pollock Rip the wind again failed us and we bobbed around in the sea watching the various lobster men haul their pots. At 11 P. M. a S.W. breeze sprang up and we made Vineyard Haven by 4 in the afternoon. Some of the party donned their shore clothes and visited Cottage City, which proved most interesting. Upon our return we found the cook had really outdone himself in preparing dinner.

Monday at 4 P. M. the captain and Little Man got under way and started for Gay Head, which was reached at 10 o'clock, beating all the way. Up to this time we had a most interesting race with a cruising schooner about 60ft. on the waterline and proved more than a match for her until the breeze flattened and we encountered the heavy seas off Gay Head. Here we met with

our first disappointment of the return trip, which, however, proved not to be the last. Off Cuttyhunk we were again becalmed, the sea continuing to run very high, and, to cap the climax, it started to pour. Schmaltz and the captain remained on deck and tried to make headway in the falling wind without success, the rest of the crew huddling below pretending to enjoy it.

The spirits of the party were now at a very low ebb, for there was no hope of reaching Newport that night. The much-tabooed subject of gasolene engines in connection with sail yachts was again brought up. It had been touched upon and not lightly when off Cape Cod, but the gasolene engine was destined this day to be discussed in such a manner that any manufacturer would gladly have paid a round sum for the conversation in detail merely for advertising purposes. Under the present circumstances and the fact that none of us had any actual experience with auxiliaries, you can imagine the argument was somewhat one sided and wholly in the engine's favor. Such glowing descriptions of the ease of operation combined with remarkable speed were presented, and there being no decisive opposition argument, one was led to believe that the running of an engine consisted in simply pressing a button and the engine doing the rest. The subject was dropped by the announcement that there was a breeze evidently coming our way. This was proved to be the case and the wind was of sufficient force to require a reef, which was promptly put in. Good headway was made for a time, but when we reached Sakonnet Point at dusk, the wind again died out. In vain we tried to make headway in the gentle zephyrs, which occasionally renewed our hopes, but it was not until after midnight that we got a good breeze from the N.W., and at 4 A. M. we entered Newport Harbor, a tired and disgusted lot. The Little Man stood in the hatchway all night ready to lend a hand, although we had pleaded with him to go below and rest.

We remained at Newport all day to recuperate and spent most of the time lolling around on deck and taking snapshots of the beautiful yachts in the harbor. The race between the Newport 30-footers proved very interesting. All hands turned in after dinner, as we wished to make an early start in the morning. We might as well have slept late, for owing to lack of wind, we were until 8 o'clock trying to work our way out of the harbor. It was a grand morning and several snapshots were taken of the beautiful residences which are located on the cliffs on either side of the harbor entrance. Later we ran into a breeze and beat up the Narragansett shore, admiring the beautiful summer homes with their green lawns. Porpoises played about the boat in numbers and several attempts were made to get a photograph of one in the air.

Point Judith was rounded at 11 o'clock in company with a 30-footer, and from here on we had an interesting race, which terminated in that boat luffing up and putting in a reef. Although it was blowing pretty stiff from the S.W., we held on for a time, when we, too, luffed up and put in one reef. The tide turning made the sea very rough, and at times Lavinia jumped her 13ft. bowsprit under water, materially stopping her headway. No solid water was shipped on deck, however, the flaring topsides forward throwing the spray in sheets to either hand. The conditions growing worse instead of better, and seeing no possibility of reaching calm water to leeward of Fisher's Island before darkness set in, we turned about and ran for Newport Harbor. The sea was so rough that even by jacking our boom up as high as practicable it was difficult to keep it out of the water. Although all hands were kept busy handling the boat, we took time to watch a whale playing and spouting about a quarter of a mile on our starboard hand.

It was at this time that our towing device gave out and we were afraid that the tender would fill. The boat fairly flew through the water, touching only the high places, as the second mate remarked. Not seeing any boats in the breakwater at Point Judith we decided to run on to Newport. After passing Point Judith, to alter our course it was necessary to gybe, which we feared to do in the heavy gale, so came about. At this moment an enormous wave came down on us and we thought surely would break over the deck. The order was given to "Hold on

everybody," but to our surprise it simply lifted us high above the surrounding seas and we filled away on our course without accident.

Not a word was said after we dropped anchor in Newport Harbor, for we felt that our entire day had been spent for naught, and we had little enough time in which to reach our destination. Bo's call for supper cheered us up a bit. Although our turning back had been criticised by some of the crew, we were glad later in the night, when a fierce storm came up in which many of the yachts about us dragged anchor.

Four o'clock Thursday morning we started again, hoping for better luck, but were forced to put in two reefs just to the north of Point Judith. After getting under way, when catting the anchor Schmaltz lost his new hat, which he had previously told us cost \$3.50, but now that it was lost, the amount quickly swelled to \$6. Off Point Judith we found the conditions even worse than the previous day, and although Lavinia made good weather of it with two reefs, we put in back of the Breakwater, together with several other yachts and coasting schooners. We spent the rest of the day in tidying up ship and overhauling the rigging. We also rowed over to the stone wall which forms the Breakwater, to watch the heavy seas dash against the rocks. A dozen lobsters were procured from the nearby fishermen and consigned to the cook's pot. We were sure that we counted these carefully, when we put them alive in the ice-box, but were one short when we again looked, and could never account for its disappearance.

The tide turned in our favor at 2 P. M. and we decided to leave the Breakwater. The wind had then blown itself out and the sea was now like a mill pond. By morning the tide had carried us about 5 miles, but it was not until 10 o'clock that we got a S.E. wind and New London was reached about 2 o'clock in the afternoon. Here we got supplies and again started on our way. The arrival of the advance guard of the New York Y. C. fleet, which were to rendezvous here the following day, made a most interesting picture as we left the harbor. No sooner had we got fairly well out into the Sound when we had bad luck again. This time the wind died out and the tide took us down fast toward Race Point Light,

the water being too deep to anchor. Bottom was found, however, as we neared the shore and we did not get away again until midnight. We had a close fetch down the Sound for a start, but later the wind hauled more to the E., giving us a close reach. Topsails were immediately set, but a strong puff parted the seizing at the foot of the topmast stay and we had to take in the jib topsail. The seizing was replaced with a light manila line, and we had our sail drawing again without losing much time. Later, the wind increased and we were obliged to take in our topsail again.

At noon of the 16th we could make out the towering canvas of the 90-footers, leading the New York Y. C. fleet and they were soon upon us. The yachtsman who has never witnessed the New York Y. C. fleet under way has yet to have his fondest hopes realized. Imagine, if you can, the finest fleet of steam and sailing yachts in the world of all types and dimensions headed by the giant 90-footers and ending in the less conspicuous 30-footers in a strong breeze, each yacht with all canvas set and lee-rail awash, flanked on one hand by a procession of steam yachts, running almost at full speed to keep up with the leaders. Such is a beggarly description of a panorama, which in passing is only met with silence and amazement, at the same time deeply imprinting on the mind a picture never to be forgotten. The fleet was soon well astern and reluctantly we continued on our way, every now and then casting a last look at the disappearing yachts.

The wind now hauled more to the E. and with started sheet and the increasing wind we went along at a lively clip. The weather now looked threatening and gave promise of a storm. Faulkner's Island was reached and we decided to run for Bridgeport, 29 miles distant, and put in for the night. New Haven had been considered but it was somewhat out of our course. A haze settled down on the Sound, hiding the land, and it began to rain heavily. We took our last bearing from Faulkner's Island and steered our course due W. for Bridgeport. This course was held until 4:30, when the storm broke. The sea was as rough as we had encountered off Point Judith, and although we had already dropped our peak, it was necessary to drop our mainsail and run under the

jib alone. Three reefs were immediately put in in case it was necessary to claw off a lee shore. The wind now came in gusts, taking the tops off each wave. A steam yacht could be made out to port, making bad weather of it. With difficulty the crew kept their feet, so badly were we tossed and pitched about in the trough of the sea. It was impossible to tell where we were in the thick fog. We had held a true course from Faulkner's Island, and, judged from the speed we made, that we must be near Bridgeport.

A point of land could be made out in the haze ahead, and it was a question if we could weather it, having only the jib set. The jib sheet was eased off as much as possible and still keep the sail full. The point was finally rounded, but with little room to spare. A small steamer appeared in sight and was soon lost in the fog. We could now make out the shore with the chart and felt sure it must be Stratford Point. After following the shore for some time a tall chimney of Bridgeport could be made out and a heavy load was lifted from our minds. We managed to work our way into Bridgeport Harbor, following closely the buoys, and anchored back of the Breakwater for the night, when we rode out one of the worst storms of the season. After numerous visits to the sideboard our circulation was restored, and with our wet clothing exchanged for dry, we felt most comfortable in our little cabin that night. The storm continued all night, and we felt thankful indeed that we were safe in harbor.

Sunday morning, July 19, dawned bright and clear and no time was lost in getting under way, for we intended to make New York by night. Good time was made until noon, when we were becalmed off Lloyd Neck for several hours. At dusk we reached Riker's Island, having had a good breeze during the afternoon. Bo had to be in Philadelphia Monday morning, and as the little wind we had was fair and the tide was with us, we decided to try and run down through Hell Gate, it being impossible to get a tow. Our mistake was soon realized, for the wind died out and we were soon at the mercy of the tide, which runs in all directions through Hell Gate, and, furthermore, we were in danger of being run down by passing vessels. At the head of Governor's Island the cap-

# HOUSEBOATS AND HOUSEBOATING

BY ALBERT BRADLEE HUNT,

Yachting Editor of Forest and Stream.

A volume devoted to a new outdoor field, which has for its purpose three objects:

**First**—To make known the opportunities American waters afford for enjoyment of houseboating life.

**Second**—To properly present the development which houseboating has attained in this country.

**Third**—To set forth the advantages and pleasures of houseboating in so truthful a manner that others may become interested in the pastime.

Illustration from "Houseboats and Houseboating."

The book contains forty specially prepared articles by owners and designers of well-known houseboats, and is beautifully illustrated with nearly 200 line and halftone reproductions of plans and exteriors and interiors. The most interesting chapter is devoted to houseboating in England, where the sport is one of the most delightful features of outdoor life.

The book has been carefully prepared by Mr. ALBERT BRADLEE HUNT, a well known authority on the subject.

The work is printed on a heavy coated paper, and is bound in olive green buckram. The price is \$3.00 net.

(Postage 34 cents.)

The book will make a unique and most attractive holiday gift.

FOREST AND STREAM PUBLISHING CO., - 346 Broadway, New York.

tain got into the skiff and towed the boat into the East Channel, where we anchored for the night. Here Bo and his wife left us to take the train for Philadelphia, and, after trying in vain to obtain a tow, we turned in.

At 5 A. M., Monday morning, we again tried to get a tow, but seeing no chance, we decided to drop down the river with the tide. There was no wind, and slow progress was made. After passing Governor's Island, we became badly tangled up with the numerous ferry-boats, but got clear of them, with no more than a severe shaking up. Upon reaching the bay, a fine S.E. breeze sprang up, and in short time we were again anchored off the Staten Island Y. C. Here Schmalz and his wife bade us good-bye and the Little Man and Captain spent the remainder of the day in cleaning up ship. This may be called really the end of the cruise, but as the trip to Philadelphia from this point is somewhat interesting, I will give that to you also.

Little Man agreed to remain with the boat, while the Captain went to Philadelphia to adjust some business matters and obtain a crew to take the boat back to Atlantic City. Owing to business complications, Bo could not get away, and being an exceptional hand, his loss was greatly felt on this trip. After no little trouble Burt and Mr. A. agreed to go the Friday following, and Little Man was relieved from his duties and returned to Boston.

Burt and Mr. A. had never been aboard this craft before, which naturally threw more work on the Captain, as it takes a certain length of time for even a good hand to learn the ropes, as all yachts have their own peculiarities. At 9 o'clock we dropped down through the narrows with the tide, there being but little air stirring. We rounded Sandy Hook about 11:30 and steered our course down the Jersey shore. Toward morning a breeze sprang up from the N.W., making it a close reach, but we made excellent time. The crew were divided into watches, but owing to their unfamiliarity with the boat and sailing at night, the Captain remained on deck until morning.

Saturday morning the sunrise gave promise of a beautiful day, but the wind dropped fast, and at 9 A. M. we were becalmed off Sea Girt.

No breeze put in an appearance until nearly noon, this time from the S.E., making it a beat down the coast. At 3 P. M. we sighted Barnegat, which is about fifty miles from Sandy Hook. By this time the wind had increased in force, and it looked a bad night ahead. We had not intended to put in at Barnegat, for various yachtsmen of experience had advised us that it was un-navigable, even for boats of shallow draft. As we neared the entrance to Barnegat, small yachts could be seen making their way in and out the bay, and we closely observed their course. By the time we reached the light all the yachts had gone inside, and we steered our course as near as we could judge to the point where they headed in and found the buoy which marks the entrance. We eased our sheets and ran into the bay, picking up each buoy in turn, and had no difficulty in selecting our course. In beating back of the light in the very shallow water, we stood over a little too far and touched bottom, but by getting out the spare anchor, we warped her off and anchored for the night. After Burt and Captain paid a short visit to shore, which was swarming with mosquitoes, we turned in for the night, expecting to reach Atlantic City the following day without difficulty.

Sunday morning dawned bright and clear, but the wind was blowing with great force from the S.W. We put in two reefs before starting. No sooner had we left the bay, than the wind flattened and the reefs were shaken out. We carried this sail for a couple of hours, when a bad squall from the N.W. forced us to anchor and put in two reefs. We were then off Beach Haven, and the wind being light for the remainder of the afternoon, Atlantic City was not reached until 7:30. The inlet is very difficult to make unless one is familiar with the water, especially in the dark, when the buoys which mark the channel could not be seen. Off Heinz Pier we anchored and we swung our light to attract attention, which was answered by a small launch, which kindly showed us the channel into the inlet, where we anchored for the night. Burt had very foolishly left his arms exposed the entire trip, and they were now in such condition that he suffered severe pain. We put him ashore immediately, that he could consult a physician and it was weeks before he fully recovered.

Monday morning Mr. A. and the Captain, after some difficulty, warped Lavinia up to the anchorage of Atlantic City Y. C., who courteously cared for the boat until our return.

Owing to the light airs on the following Saturdays and Sundays, which were the only time we had to bring the boat around to Philadelphia, we did not leave Atlantic City for several weeks and then our destination was Ocean City, about ten miles south of Atlantic City. Our boat was left in charge of Burt, who was spending his summer's outing at Ocean City, it being decided to make the trip around Cape May on the following Saturday. It was with difficulty that a crew was obtained, and the Captain was finally obliged to depend on George and Harold, two office assistants, to bring the boat around to Philadelphia. George had had some experience, having been one of the party in sailing to Maurice River from Philadelphia, but Harold had never been aboard a sailing craft before.

On reaching Ocean City the wind was blowing with so much weight from the S.W., that it was deemed advisable not to make a start until Sunday morning early. Consequently, Sunday at 4 o'clock we weighed anchor and in the light S. breeze run out to the bar, where our course shifted so that we had to beat to windward. The wind was so paltry that we made practically no headway, but at 10 o'clock we had succeeded in crossing the bar and were becalmed in a heavy sea off Ocean City. The rough water, together with the extreme heat proved too much for the crew, who were sick for most of the day. At 1 o'clock the Captain got under way and beat down the Jersey coast toward Cape May Point against a very light S. air. By dark we had reached Anglesea, and the crew being tired, turned in for the night, leaving the Captain the only one on deck. Off Wildwood we ran into a fish pound and after getting the boys out of their bunks, we got clear, but with a badly torn mainsail.

These fish pounds are a menace to yachtsmen at night, inasmuch as they are not lighted and are impossible to make out in the darkness until you run directly on them.

Off Cape May Light we were again becalmed until 4 o'clock in the morning, when a S.E. breeze took us around the Cape. To make time, we set our light sails; but off Cross Ledge Light we were again becalmed. Here we anchored and spent the entire afternoon in playing cards on the cabin top in the shade.

At 6 P. M. we got a strong S.E., which carried us at a fast clip up the river, and by 1 o'clock we had passed Reedy Island and were off Delaware City. It looked now as if we would reach our mooring off the club house by morning, but luck was against us, and at Wilmington we were again becalmed. This time we were anchored, and all hands turned in for a much needed sleep. At 6 o'clock in the morning there was no sign of wind and George was rowed ashore to make a train for Philadelphia. At 10 o'clock, on the change of the tide, we got a fair wind, and at noon we picked up our mooring off the Philadelphia Y. C.

The trip around Cape May had been most discouraging, owing to the lack of wind, and we were very glad to reach Philadelphia.

## Men Who Live on Lightships.

MEN who live in a gale of wind all their lives, yet suffer one of the most uneventful existences in the list of human occupations; who welcome the sight of a passing sail, yet are bored at each other's presence; who toss at anchor almost within sight of land, yet seldom know what their fellow-beings are about; whose stout craft, in stormy weather, held nose down to the waves by fathoms of heavy anchor chain, toss and roll and suddenly burrow through the center of mountainous waves—these are the men who kindle their warning lights in lightships over the danger spots along Uncle Sam's coast.

Once the Diamond Shoals vessel, off Hatteras, was compelled to stay out five months before its relief came. The crew of tough sailors almost went crazy. Three months of this sort of imprisonment is all that any sane person can stand. So the crew mutinied.

It was a trivial matter, springing from the nervous irritation of all hands. The captain reproved the mate for playing cards with the sailors, and declared that it was a sacrifice of dignity and discipline. The mate brooded over the matter, and told his troubles to the engineer, who immediately joined him in a committee of two to tell the captain that he was putting on airs. Out jumped the captain's revolver. Up jumped the engineer and mate in time to grab the weapon before it went off. The crew sympathized with the mate; and the captain was a prisoner aboard his own vessel until the relief ship came.

The mutinous crew sailed their craft back to Norfolk in a forgiving mood, and all hands save the mate relieved the strain on their nerves by going ashore and getting uproariously drunk. When the inspector visited the ship he found it deserted by every one except James Adams, the mate, who was reasonably sober, considering. James, therefore, was forgiven for his mutiny and promoted to be captain of the ship. The captain was discharged, in spite of the fact that he had been at sea two months longer than usual in one of the heaviest seas known off the Capes. The Government will not tolerate a captain who gets intoxicated under any circumstances.

The men on the ships will tell you that before they have been on the vessel ten days they will have become so bored with each other's company that they actually feel murderous. For a few days at the start they play checkers and chess, with an occasional game of cards. Soon they tire of that. They try smoking and reading. But the Government changes their libraries only once a year, and so the supply of unread books is soon exhausted. In winter, especially, the visits of the light-house tenders are often a month apart. The sailor who gets a copy of the latest newspaper is the most popular man on the ship for the time being. When it is time for shore leave, the men are scarcely on speaking terms. "Looke here," says one sailor to another, after they are ashore, "I see quite enough of you on the ship. If you come near me now I'll knock your block off!"

Ten days, later, however, when these men meet for another shift of duty, they are as glad to see each other as though they had not met for years. And they are loaded down with an assortment of parcels which would make the most hardened commuter blush.

Nantucket Shoals Light Vessel No. 58, which went down in the big blow last Monday while being towed to port, has had a stormy history as any vessel in the service, and Capt. James Jorgensen, her commander, has cheated the sea of its human prey on numberless occasions. The Nantucket station is one of the most dangerous, as well as the most important in the service. Examine the Government map and you find a dozen or more lightships—Hen and Chickens, Sow and Pigs, Pollock Rip, and others—near shore or under the lee of islands; but the Nantucket Shoals, which Nantucket Lightship guards, are fifty miles out into the open ocean, just where the nor'easters, rounding New England's elbow, pound the waters into perpetual furies. Even in fine weather, the cross-currents keep the anchored vessel tossing. In stormy weather—well, No. 58 has often shipped her anchor and been driven miles away from her station by a killing gale. Five years ago, this very day, she was taken in tow 200 miles off the Capes of Delaware by the steamship Luciline, after fighting a nor'easter for six days with leaking boilers. Nine years ago Capt. Jorgensen was blown into Block Island, and the Evening Post printed an exclusive interview with him, which, no doubt, with a few details altered, would fit perfectly the recent (and final) storm experience of his sea-worn craft. Here is part of it:

"The sea began to roll down upon us in mountainous waves, and the wind whistled through our rigging with fearful velocity. The men on watch found it difficult to remain on deck. The spray which drenched the deck nearly blinded them. The snow fell in such thick clouds that we could not see the length of the ship. The barometer began to fall steadily about 8 o'clock in the morning, and reached the lowest point I have ever seen—28.95-100. The wind certainly blew more than eighty

miles an hour all day and long into the night. The tide was running at a ten-knot clip, and between the force of the tide and the fury of the storm the ship was almost continually on her beams ends.

"We were all obliged to remain below, except the watch, who lashed himself to the mast. The ship was rolling and pitching so furiously that we should have been pitched into the sea if we had ventured from below.

"We had 180 fathoms of chain attached to a 7,000-pound mushroom anchor. The water was about 30 fathoms deep. The weight of the chain cable would pull the high bow of the boat into the mountainous waves as they broke, and, when the waves sank again, into the trough of the boiling sea the boat would follow, until it seemed that we were bound not to stop until the bottom was reached.

"A few minutes after 10 o'clock, the ship descended into the trough of the sea until the water seemed to rise in a wall nearly 50ft. high on either side of us. Down went our staunch ship until suddenly she was thrown high in the air by the combined pressure of wind and water, and, when she fell again into the trough of the sea, we had slipped the mushroom anchor and were adrift at the mercy of the elements.

"Steam was got up as soon as we could manage to walk around, and the crew got sail enough on her to keep her head up to the wind. But soon the canvas was torn to shreds, and away we went before the fury of the gale.

"At daybreak next day nothing could be seen around us except water, which swept by in huge waves. All day we drifted before the gale, but toward evening sighted land, which we made out to be Block Island. It was slow work getting into port, but we succeeded in doing it."

No. 66 is the regular ship on the Nantucket Shoals station, and No. 58 was only the substitute which went on relief when No. 66 steamed up to New Bedford to coal. Both were steel vessels, but No. 58 was smaller and older. To have her blown off her station was so common an occurrence that the New Bedford folk never feared for the safety of their lads at sea under ordinary circumstances. But when that pathetic, half-finished wireless message came out of the darkness and the storm on Monday last, "Send help from anywhere—" the old salts predicted rightly that this would be the last voyage of old No. 58 with a commander who never called for help until he was convinced he must.

The wireless was once an agent in a tragedy for Captain Jorgensen. In January, 1902, there had been a period of storm, and communication had been interrupted for a number of days. When it was re-established, the first message which came out of the mist was from the captain's home in Braintree, Mass. It read:

"Christine is dying; come home."

Then immediately came a second message:

"Christine is dead."

There were other messages explaining that Christine, the captain's daughter, had died of lockjaw as the result of vaccination. The hardy old captain was frantic, and would have set out for the shore at once, but the storm was too heavy. All next day and the next he paced the deck, realizing the impossibility of reaching land, yet hoping against hope that somehow the elements would grant him that one boon, to reach Braintree in time to bury his child. Still another day passed, and it was not until the following morning that a liner bound inward to New York hove to in the distance and managed to take the grief-stricken father off. Two days more and he had reached home—in time. As the crow flies it is more than 100 miles from Nantucket Shoals to Braintree. It took Captain Jorgensen a full week to go from one to the other. \* \* \*

Most of the men on the lightships are married men; and, strange as it may seem, the demand for this sort of service is unusually good. The outside ships, such as Diamond Shoals, Sandy Hook, Scotland, Fire Island and Nantucket, have fourteen men besides from one to three wireless operators, where wireless is used. The captain receives \$1,000 a year for his services, and the sailors \$30 a month.

While the Nantucket ship has the interesting task of sighting incoming European steamships and lighting them on to Fire Island, the Diamond Shoals ship has attracted more attention than any other because it has a unique American feature, namely, a powerful electric searchlight which shoots a geyser of flame straight up into the heaven as far as the eye can reach. Kipling, in his recent story of an eight-hour airship flight from London to Quebec, has the location of the cities marked by vertical pillars of light which shoot their rays even up to the mail-packet "lanes," one and two miles above the surface of the earth.—New York Evening Post.

POWER BOAT FOR ROBERT GALLOWAY.—Mr. Robert Galloway, of Memphis, Tenn., has commissioned the Huntington Mfg. Co., of New Rochelle, to build for him a cruising power boat 97ft. over all, 17ft. breadth and 3ft. draft. The boat will take the place of Daisy, the boat Mr. Galloway had built at Tom's River, N. J., in 1904. The new boat will be fitted with two 50 horsepower gasolene motors and she will have a small schooner rig. Mr. Galloway will use the boat north during the summer and go south in her in the winter. Her gasolene tanks have a capacity of 600 gallons, and the same amount of water can be carried. Two boats will be swung on davits.

The houseboat designed by Messrs. MacConnell & Cook for Mr. George Inness has been launched at Milton Point shipyard and will shortly leave for Tarpon Springs, Fla. The auxiliary twin-screw cruiser building at the Robertson yard, City Island, is having engines installed and will shortly leave for the South. The deep-sea cruising yawl which Messrs. Higgins & Gifford are building in Gloucester from Messrs. MacConnell & Cook's design, is now in frame. The yacht is building under Lloyd's survey for the 13A1 class and is the first sailing yacht of the class to be built under their registry in this country. The firm is designing a 50ft. auxiliary yawl for Mr. C. K. Wooster, of Chicago, and a steam auxiliary schooner for the Commercial Cable Company for its Pacific service.

DESIGN FOR A 59-FOOT WATERLINE SCHOONER—SAIL AND CABIN PLANS—DESIGNED BY FRED D. LAWLEY, 1905.

### A 59-Foot Cruising Schooner.

THERE is now building at the yard of the George Lawley & Son Corp., the 59ft. waterline cruising schooner, the sail and cabin plans of which we publish in this issue. The design is from the board of Mr. Fred D. Lawley whose work has attracted so much attention during recent years.

The boat was designed for cruising primarily, but it is expected that she will have a good turn of speed, and her owner, whose name has not been given out, expects to get his share of the prizes in the class racing.

The plans show a particularly handsome craft, and in appearance she is the smartest looking boat of this type Mr. Lawley has yet turned out. For a vessel of 59ft. waterline she has unusual accommodations; in fact, she has more room below under a flush deck than any sailing yacht of her inches we have seen. Not only has the boat an unusual number of cabins, but they are all of good size.

The companion stairs lead to a good-sized steerage or passageway, which gives access to all the owner's and guests' quarters.

The after cabin is 7ft. long, and it extends the width of the vessel. On each side are wide berths with transoms in front. A bureau is placed against the after bulkhead, and at the foot of each of the berths are hanging closets. Overhead is a skylight, and over each berth in the side is a port hole.

A bathroom 5ft. long separates the after cabin from the owner's room, which is on the starboard side. The bath is fitted up with the most modern open plumbing. The owner's room is 9ft. long, and it is fitted with a double berth, a desk, a bureau, a transom and a large hanging closet. Two port holes are placed over the owner's berth, and there is a skylight overhead,

On the port side of the passage are two single cabins and a toilet. Both rooms are 6ft. 3in. long, and each has a berth, a transom and a bureau. Port holes light and ventilate both these cabins, and the toilet room.

The main saloon is nearly 11ft. long, and it is most attractively and completely fitted up. Besides the transoms, there is a fireplace, lockers, buffets, etc. In either side there is a port hole, and overhead a skylight.

Next forward is the galley. It is 9ft. long and is unusually roomy. Here are to be found all modern appliances and fittings. On the starboard side of the galley is the captain's room. The forecabin is 12ft. 6in. long with accommodations for eight men.

The boat's rig is a liberal one. Two boats will be carried on the davits. The dimensions are as follows:

Length—	Over all .....	92ft.
	L. W. L. ....	59ft.
Overhang—	Forward .....	20ft. 6in.
	Aft .....	12ft. 6in.
Breadth—	Extreme .....	20ft.
Draft—	Extreme .....	11ft.
Freeboard (top of rail)—	Forward .....	7ft.
	Least .....	4ft. 3in.
	Aft .....	5ft.
Sail Area—	Jib .....	522 sq. ft.
	Staysail .....	412 sq. ft.
	Foresail .....	825 sq. ft.
	Mainsail .....	2241 sq. ft.
		4000 sq. ft.

### Boston Letter.

WITH THE NEW CLASSES.—Although there has been considerable agitation over the building of new boats to rate under the new uniform rule of measurement, the amount of practical development has been exceedingly small, so far. There is one 22-rater building at the yard of Messrs. Burgess & Packard, at Marblehead, but so far as is known, the only other development of the class in Massachusetts waters has been on paper. Two 55ft. schooners are sure, one having been finished and the other now building, and there is some prospect of another for the same class. These boats should make fine racing and considerable valuable data should be obtained from their season's work. It is not any too soon to start in on the smaller classes, if boats are to be built for them, for the sooner one or two boats are under construction, the sooner will others be forthcoming; and there is plenty of room in the shops now for the building of new boats. If classes under the new rule are not favored by new boats for the coming season, we shall have to fall back on the data to be obtained from the older boats. There seems to be a general tendency to waiting until somebody else has built and the work of the boats noted; but it is strange that there has been no hesitancy in building boats of freak dimensions and form, likely to be a drug on the market, when in the case of a boat built under the new rule, the worst that the owner could get would be a substantial cruising craft that could always demand a reasonable percentage of the original cost.

IN THE OLDER CLASSES.—It has been decided by the Y. R. A. of Massachusetts to retain the three popular classes, and the Cape cats and sailing dories, although adopting the new uniform rule for yachts up to 40ft. rating. In none of the older classes is there any marked

activity in the building of new boats. There are building two new 22-footers, and it is expected that nearly all of the older boats in the class will be racing throughout the season. With these the class will make a very respectable showing and of the three popular classes of prescribed waterline length will be the most active. It is not known that any new boats are building for the 18ft. and 15ft. classes. There will not be nearly as many boats in the general racing in the 18ft. class as in past seasons, the decline in this class pointing more or less directly to complete extinction. The 15ft. class seems likely to drift along and out in the same manner as the 18ft. class. Two new Cape cats are forthcoming, and there is every likelihood of good sport in this class. The fever of renewed life is on and the owners of boats in the class, and their friends who race with them, are very enthusiastic. It is likely that some new sailing dories will be built. The field in this class is very large, and even when boats are sold, they continue to race in Massachusetts waters, so that the class is not likely to lose in interest. The boats are economical in first cost and in maintenance and the racing of their forms a most excellent school for the generations of yachtsmen just starting out.

Mr. Edward Stanwood, of Boston, is having a launch built at the yard of Hodgdon Bros., East Boothbay, Me. She will be used in the vicinity of Squirrel Island, Me., where Mr. Stanwood has a summer home.

A 55ft. cruising launch is being built for Mr. Harry Friend of the Boston Y. C. She will be used at Marblehead.

JOHN B. KILLEEN.

British Letter.

THE BIG CLASS.—In my last letter I stated that efforts would be made to form a class from among the present handicap boats to sail under Y. R. A. rules and time allowances, instead of being handicapped as hitherto. The idea has emanated chiefly from the minds of the owners, many of whom are dissatisfied with handicap racing, and is therefore likely to be carried out. The new cutter building at Camper & Nicholson's, Gosport, for Mr. Young will have a keen opponent in Mr. Kennedy's five-designed White Heather, which is to be turned into a cutter so as to meet the new boat on equal terms. As these two vessels are of much the same size, and White Heather is only two years old, some pretty racing should result between them. It would be interesting to have Bona back in her original cutter rig, but, as far as one can tell, there is little likelihood of her being out at all next season unless she finds a new owner. One thing seems pretty clear, and that is, that the day of first-class out-and-out racers has gone by, that is to say, in future owners will insist on having vessels built with a due regard to strength of construction, and the fever of excessive overhangs seems to have considerably abated. All the most recent cruiser-racers have been vessels with quite moderate overhangs. They are fine, able ships, dry and seaworthy, sound and strong, and have given every satisfaction to their owners. Now, that the present rating rule has only two more years to run it is improbable that any pure class racer will be built over 52ft. rating, for there is sure to be some change or modification in the rule in the near future, and a proper rule of scantling restrictions will be brought in at the same time. The hand-box system of construction is fortunately doomed, but not until it has well-nigh brought about the destruction of class racing. It is pleasant to note, moreover, that the Yacht Racing Association is waking up to a sense of the damage it has done to the sport by its persistent apathy and neglect of its obvious duties for many years past, and that it now seems inclined to make up in some measure for its delinquencies. The future success of yacht racing will, however, depend quite as much upon the efforts of the owners as upon the Y. R. A. Owners have realized this to some extent already and will realize it still more when they discover how much their words will weigh with the governing body. It is chiefly if not wholly due to the efforts of yacht racing owners that the racing fixtures have been placed upon such a satisfactory basis for next season; it will be due entirely to the owners if a Y. R. A. class is formed from the pick of the fine fleet of handicap yachts, and it is directly due to the refusal of owners to build flimsy vessels that scantling restrictions are being framed at Lloyds in conjunction with some of our leading designers. All these are moves in the right direction and tend toward the revival of class racing, which should never have been allowed to die out.

THE SMALLER CLASSES.—Mr. Burton, the most energetic owner in the 52ft. class, has brought forward a scheme for consideration by the Y. R. A. whereby it is proposed to allow a certain margin on either side of the rating of a class rater, so that a certain elasticity may be allowed to owners and designers for subsequent alterations to a boat in case she does not turn out as successful as could be wished. As matters stand at present, boats are built right up to the rating, since no time allowance may be given to boats which are below, and those above cannot compete at all until they are reduced. The consequence is that boats are calculated so near the class rating that there is practically no margin to play with, and a boat which is the least bit slower than the others is a failure. It is hoped that if a small percentage were allowed, either in excess of or short of the class rating, it might be possible to alter such a boat as to bring her up to the level of the others. Of course, a boat so altered would either receive or give time according as she was made smaller or larger, according to Y. R. A. scale. The older hands, of course, cry out against such a drastic alteration, but the owners themselves are generally in favor of the change, which, after all, is only going back to the old rule of a few years back, as far as the boats below the rating are concerned, and is merely spreading the allowance in the opposite direction for boats in excess of the class measurement. Mr. Burton clearly points out that the present system of building right up to the rating and making the first boat past the post a winner is not satisfactory, for, as he says, he is the only owner in the 52ft. class who has built more than one boat during the last four years. It is almost certain that Mr. Burton's idea will be put into practice. There are rumors of two new 52-footers, one from Fife, of Fairlie, and another from designs by Mr. Charles P. Herreshoff,

Both reports, however, require confirmation. The Solent classes will probably turn out in much the same strength as last year.

E. H. KELLY.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

DEATH OF FREDERICK P. SANDS.—After an illness of about ten days Frederick P. Sands died at his home in Newport, R. I., on the afternoon of Dec. 22. Mr. Sands had been in failing health for some time, and although his death was hardly looked for, it was doubted if he would ever fully regain health again. Mr. Sands was one of the best known yachtsmen and trapshooters in the country. Yachting loses one of its staunchest supporters through the death of Mr. Sands. He was a member of the New York Y. C. and for several years he was in charge of that organization's station at Newport. As Vice-Commodore of the Rhode Island Y. C. he made one of the best flag officers that club ever had. Mr. Sands was also a member of the Warwick and Newport Y. C.'s and the Narragansett Bay Racing Association. He was one of the founders of the Newport Yacht Racing Association. During his life he owned the sloops Peri, Waif, Daffodil, Lizzie L. and Evelyn, and the Fife cutter Uvira. Mr. Sands was fifty-two years of age.

SPEED LAUNCH FOR J. C. KING.—The Electric Launch Co., of Bayonne City, N. J., is building a high speed launch for Mr. John C. King, of New York city. The boat, which will be used at Palm Beach this winter, is 35ft. over all and 5ft. 6in. breadth. She will be fitted with a 50 horsepower, four-cylinder gasoline motor, and the builders guarantee a speed of 20 miles an hour. The boat will be known as Topsy.

C. VANDERBILT, N. Y. Y. C.'s NEW COMMODORE.—The New York Y. C. held its sixth general meeting at the club house in West Forty-fourth street on Thursday evening, Dec. 21. Commodore Bourne presided, and after hearing the reports of the various officers and committees, the election of officers took place. Mr. John B. Buchan read the report of the Model Committee. It was most interesting and was well received. Commodore Bourne, after serving three years, declined renomination and his term of office expires with the year 1905. Commodore Bourne has proven himself to be one of the best flag officers the club has ever had, and under his guidance the club has forged rapidly ahead. Before turning the chair over to Rear Commodore Vanderbilt, Commodore Bourne made a short speech in which he thanked those members who had accorded their hearty support and said he would support the club quite as enthusiastically now that he had returned to the fore-castle as he ever had while in command. Mr. Vanderbilt thanked the members for electing him their commodore, and said that while his predecessors had established a very high standard he hoped with their support to make his administration a most successful one. No new members were elected. The officers elected are as follows:

- Commodore—Cornelius Vanderbilt, steamers North Star and Mirage and sloop Rainbow.
- Vice-Commodore—Henry Walters, steamer Narada.
- Rear Commodore—Seymour L. Husted, Jr., schooner Crusader.
- Secretary—George A. Cormack.
- Treasurer—Tarrant Putnam.
- Regatta Committee—Oliver E. Cromwell, H. de B. Parsons and Ernest E. Lorillard.
- House Committee—Thomas A. Bronson, Hunter Wykes and George A. Freeman.
- Committee on Admissions—Henry C. Ward, Tracy Dows, Edward F. Whitney, George A. Ade and Alexander S. Cochran.
- Library Committee—T. O'Connor Sloane, John H. Cole and George A. Armour.
- Model Committee—James Douglas Sparkman, Paul Eve Stevenson and Abert Bradlee Hunt.
- Committee on Club Stations and Anchorages—William H. Thomas, Henry H. Rogers, Cord Meyer, Augustus C. Tyler, Charles Lane Poor, Maximilian Agassiz, Alfred C. Harrison, Henry C. Ward, William Lanman Bull, J. Harvey Ladew and Paul G. Thebaud.

SALES AND NEW ORDERS.—Messrs. MacConnell & Cook have made the following transfers: The launch Queen Bess has been sold to Mr. W. C. Perkins, of Providence, R. I. Queen Bess is in Florida, and the new owner will take possession there for the Florida season, after which he will bring the yacht north. The gasoline launch Osprey, owned by the commodore of the Harlem Y. C., has been sold to Mr. Jacob Smith, of New Rochelle. The auxiliary Cape Cod catboat Lorraine, owned by Mr. E. V. Rosemond, of New York city, has been sold to F. T. Brenzle, of the United States Navy; also Onaway sold to Mr. William Roth, of New York city.

Canoeing

Officers of A. C. A., 1906.

(Assumed office Oct. 1, 1905.)

- Commodore—H. Lansing Quick, Yonkers, N. Y.
  - Rear-Commodore—Matthias Ohlmeyer, Francis H. Leggett & Co., 128 Franklin St., New York.
  - Purser—George S. Morrissy, 73 Mercer St., New York.
  - Executive Committee—William A. Furman, 846 Berkeley Ave., Trenton, N. J.; Louis C. Kretzmer, Schepp Building, New York; Clifton T. Mitchell, 46 E. Sedgwick St., Germantown, Pa.
  - Board of Governors—Robert J. Wilkin, 211 Clinton St., Brooklyn.
  - Racing Board—Daniel B. Goodsell, 36 Washington Sq., New York.
- ATLANTIC DIVISION.
- Vice-Commodore—Woolsey Carmalt, 82 Beaver St., New York.
  - Rear-Commodore—Matthias Ohlmeyer, Francis H. Leggett & Co., 128 Franklin St., New York.
  - Purser—George S. Morrissy, 73 Mercer St., New York.
  - Executive Committee—William A. Furman, 846 Berkeley Ave., Trenton, N. J.; Louis C. Kretzmer, Schepp Building, New York; Clifton T. Mitchell, 46 E. Sedgwick St., Germantown, Pa.
  - Board of Governors—Robert J. Wilkin, 211 Clinton St., Brooklyn.
  - Racing Board—Daniel B. Goodsell, 36 Washington Sq., New York.
- CENTRAL DIVISION.
- Vice-Commodore—Henry R. Ford, 45 N. Division St., Buffalo, N. Y.
  - Rear-Commodore—Edward H. Demmler, 526 Smithfield St., Pittsburgh, Pa.

- Purser—B. Irving Rouse, 981 Lake Ave., Rochester, N. Y.
- Executive Committee—John S. Wright, 519 West Ave., Rochester, N. Y.; Lyman T. Coppins, 691 Main St., Buffalo, N. Y.; Jesse J. Armstrong, Rome, N. Y.
- Board of Governors—Charles P. Forbush, 164 Crescent Ave., Buffalo, N. Y.
- Racing Board—Harry M. Stewart, 85 Main St., E. Rochester, N. Y.

EASTERN DIVISION.

- Vice-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.
- Rear-Commodore—Frank S. Chase, Manchester, N. H.
- Purser—Edgar Ward, 112 Highland St., West Newton, Mass.
- Executive Committee—Daniel S. Pratt, Jr., 173 Devonshire St., Boston, Mass.; Arthur G. Mather, 84 South St., Medford, Mass.; H. L. Backus, 472 Lowell St., Lawrence, Mass.
- Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; Herman D. Murphy, alternate.

NORTHERN DIVISION.

- Vice-Commodore—J. McDonald Mowat, Kingston, Ont., Canada.
- Rear-Commodore—James W. Sparrow, Toronto, Canada.
- Purser—Russell H. Britton, Gananoque, Ont., Canada.
- Executive Committee—Charles E. Britton, Gananoque, Ont., Canada.
- Board of Governors—John N. MacKendrick, Galt, Ont., Canada.
- Racing Board—J. McDonald Mowat, Kingston, Ont., Canada.

WESTERN DIVISION.

- Vice-Commodore—John A. Berkey, St. Paul, Minn.
- Rear-Commodore—Lucien Wulsin, The Baldwin Co., 142 West Fourth St., Cincinnati, O.
- Purser—Wade Hampton Yardley, 49 Pioneer Press Bldg., St. Paul, Minn.
- Executive Committee—George H. Gardner, 149 Kennard St., Cleveland, O.; Augustus W. Friese, The Journal, Chicago, Ill.
- Board of Governors—Henry C. Morse, Peoria, Ill.
- Racing Board—Frank B. Huntington, 90 Shchoygan St., Fond-du-Lac, Wis.

How to Join the A. C. A.

"Application for membership shall be made to the Treasurer, F. G. Mather, 164 Fairfield Ave., Stamford, Conn., and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

A. C. A. Membership.

NEW MEMBERS PROPOSED.

Central Division—C. T. Johnston, Oakmont, Pa., by Frank C. Demmler.

Rifle Range and Gallery.

Fixtures.

Feb. 12-17.—Grand Rapids, Mich.—Indoor Twenty-two Caliber Rifle League of the United States tournament. Chas. J. Otis, Cor. Sec'y.

March 12-17.—New York.—One hundred shot indoor championship.

Zettler Rifle Club.

GEORGE SCHLICHT, the veteran marksman, was high man in the 100-shot match, held on the Zettler ranges in West Twenty-third street, New York city, Dec. 19, and W. A. Tewes made the best 50-shot score, while the bullseye prize also went to Tewes. The result at 75ft., offhand:

One-hundred-shot match:

George Schlicht	240	243	243	245	242	245	246	243	238	244	—2429
Owen Smith	235	243	245	242	238	243	247	242	247	243	—2425
Dr T F C Mehlig	228	237	244	239	238	243	240	241	233	242	—2385
H D Muller	239	243	235	237	234	235	235	239	239	240	—2366

Fifty-shot match:

W A Tewes	249	245	246	247	249	—1236
Louis Buss	239	243	245	244	246	—1217
C G Zettler	244	241	238	238	238	—1199
C Zettler, Jr.	243	238	232	241	239	—1193
H D Muller	245	243	234	234	234	—1190
Louis Maurer	235	239	232	234	245	—1185
A P Fegert	233	240	241	237	232	—1183
Barney Zettler	230	240	225	235	233	—1163
G Bernius	230	230	232	226	231	—1149
H C Zettler	231	231	240	236	236	—1134

Bullseye target, degrees:

W A Tewes	25½	L C Buss	38
Dr Mehlig	28	H D Muller	48
Barney Zettler	33½	C G Zettler	53½
A P Fegert	36	G Bernius	30½
H C Zettler	37½		

New York Central Schuetzen Corps.

D. SCHARNINGHAUS made the best score on the ring target in the shoot held Dec. 20, at 75ft., offhand, while A. P. Fegert was high on the bullseye target, which calls for one shot only. The scores in full follow:

Ring target, 20 shots:

D Scharninghaus	480	Pruno Eusner	450
H D Muller	479	F Schroeder	431
A P Fegert	478	H A Ficke, Sr.	423
Felix Kost	477	G Dettloff	413
G A Viemeister	476	J M Leonard	408
Chris Gerken	475	H Roffmann	410
C Ottmann	474	D O Wiehmann	398
F W Wessel, Jr.	467	H Von der Lieth	394
Jacob Hess	465	H Brummer	387
H A Ficke, Jr.	455	H D Schmidt	354
J Von de Lieth	451		

Bullseye target, degrees:

A P Fegert	33	G A Dettloff	95½
C Ottmann	44	D Scharninghaus	106
J M Leonard	46	F W Wessel, Jr.	108½
Chris Gerken	49	D O Wiehmann	114
Felix Kost	60	H Von der Lieth	121
Jacob Hess	63	H A Ficke, Sr.	129
G A Viemeister	83½	H D Schmidt	151
H D Muller	95	F Schroeder	231

New York City Schuetzen Corps.

The weekly shoot was held Dec. 21 on the Zettler ranges in West Twenty-third street. The best two scores of 10 shots each at 75ft., offhand, follow:

Aug Kronsberg	242	238	480	L Gleichmann	218	213	431
A P Fegert	238	234	472	L Bentz	215	208	423
R Busse	230	240	470	L Schultze	206	214	420
J Fuger	228	237	465	E Stein	204	216	420

B Eusner	224	223	447	G Bach	177	204	381
C Schroeder	216	230	446	A Reilstein	168	196	384
H Raddloff	220	220	440	C Stover	148	144	292

Indoor .22 Caliber Rifle League.

GRAND RAPIDS, Mich., Dec. 23.—For your publication, I wish to report that the prize list for the League tournament, Feb. 12 to 17, will be made somewhat larger than first announced.

The championship match will have twenty-five prizes, from \$10 to \$100. The continuous match will have thirty-five prizes from two to seventy-five dollars, and the bullseye contest will have fifty cash awards from one to fifty dollars. The honorary target event, which will be open to members only, has not been determined beyond the fact that it shall be equally attractive for all prospective competitors. Programmes will be ready for distribution about Jan. 10.

CHAS. J. OTIS, Cor. Sec'y.

# U. S. Government Ammunition Test

Accuracy test of Krag-Jorgensen .30-Caliber Cartridges held at Springfield Armory by order of the Ordnance Department, United States Army.

TESTED—Ammunition of all the American Manufacturers.

CONDITIONS—10 and 20 shot targets, muzzle rest.  
10 and 20 shot targets, fixed rest.

DISTANCE—1,000 yards.

RESULT and OFFICIAL REPORT: **U. S. Cartridges excelled all others**

MANUFACTURED BY

## UNITED STATES CARTRIDGE CO.

LOWELL, MASS., U. S. A.

Agencies: 497-503 Pearl St., 35-43 Park St., New York

114-116 Market St., San Francisco

### Trapshooting.

If you want your shoot to be announced here send a notice like the following:

#### Fixtures.

- Dec. 28.—Edgewater, N. J.—Palisade G. C. all-day shoot. A. A. Schoverling, Sec'y.
- Dec. 29.—Lakewood, N. J., G. C. all-day shoot. H. Ely Havens, Sec'y.
- 1906.
- Jan. 1.—Poughkeepsie, N. Y., G. C. all-day shoot. Wm. J. Perkins, Sec'y.
- Jan. 1.—Brooklyn, L. I.—Bergen Beach G. C. tournament. H. W. Dreyer, Sec'y.
- Jan. 1.—Mount Kisco, N. Y., G. C., all-day shoot. A. Betti, Capt.
- Jan. 2.—Killarney, Man.—Live-bird championship of Canada.
- Jan. 16-19.—Hamilton, Ont., G. C. annual winter tournament. Ralph C. Ripley, Sec'y.
- Jan. 17.—Poughkeepsie, N. Y., G. C. annual tournament. A. L. Traver, Capt.
- Jan. 22-27.—Brenham, Tex.—Sunny South Handicap; \$1,500 added for amateurs. Alf Gardiner, Mgr.
- Jan. 25.—Edgewater, N. J.—All-day tournament of the Palisade G. C.; \$50 added. A. A. Schoverling, Mgr., 2 Murray street, New York City.
- Feb. 22.—Brooklyn, N. Y., G. C. all-day tournament. A. A. Schoverling, Mgr.
- March 14-16.—Iowa State Sportsmen's Association annual tournament. C. W. Budd, Sec'y.
- May 16-17.—Auburn, N. Y., tournament. Knox & Knapp, Mgrs.
- May 24-25.—Montreal, Can.—Canadian Indians' first annual tournament. Thomas A. Duff, High Scribe.
- June 12-14.—Fairmont, W. Va.—Tenth annual tournament of the West Virginia State Sportsmen's Association, under auspices of Fairmont Gun Club; \$1,000 added to purses. E. H. Taylor, Mgr.; Ed. O. Bower, Sec'y-Treas.

The Poughkeepsie Gun Club has arranged a programme of ten events for their tournament to be held on Jan. 1. The totals are 180 targets, entrance \$13.60. Shooting will commence at 11 o'clock.

The next contest for the championship of Delaware is set for New Year's Day. Mr. A. B. Richardson, of Dover, is the holder. Mr. Edward Banks, of Wilmington, Del., is the challenger. It is difficult to wear a championship halo in Delaware without soon having it jammed or smashed.

Mr. E. C. Griffith, of Pascoag, R. I., was high average at the third weekly shoot of the season, at Wellington, Mass., on Wednesday of last week. Mrs. W. K. Park, wife of Mr. Will K. Park, the able editor of Sporting Life, was a visitor, and displayed her usual ability by breaking over 40 straight and scoring over 95 out of 100. Dr. Gleason scored 99 out of his first 100 shot at, but in the sweepstakes averaged 96 per cent. Mr. Griffith scored 97 out of his 100. In the 100-target match the scores were: Griffith 97, Gleason 96, Roy 93, Smith 88, Wheeler 84, Rule 92, Temby 79, Kirkwood 96, Mrs. Park 93, Frank 94, Jordan 89, Burns 82, Craighton 55, Webster 25. Capt. O. R. Dickey's winter shoots, held on Wednesdays, are popular and well patronized. The next regular shoot will be held on Jan. 3.

At a shoot held in honor of the distinguished visitor, Mr. Fred Gilbert, who is famous as an orator with shotgun skill as a mere incident, some high scores were recorded. Nothing otherwise was to be expected, for, besides the famous Mr. Gilbert, there were the famous Messrs. Squier, Banks, Skelly, Foord, Richardson, DuPont, German, McKelvey, and others. Messrs. Gilbert and Squier tied for high average on 95. Messrs. Banks and Richardson were second with 92. Mr. Skelly was third with 91. A notable feature of the shoot was a squad performance. The members were Messrs. Gilbert, Squier, Richardson, Banks and German. They broke 74 out of 75. The goose-egg being the personal belonging of Mr. Gilbert, concerning which there were many solicitous inquiries as to the manner in which he did it. These happenings were at Wilmington, Del.

BERNARD WATERS.

#### Hood Waters Wins Turkeys.

BALTIMORE, Md.—The West Arlington Gun Club held a handicap shoot for turkeys at its new grounds, Hayward avenue, near the Reistertown road, Saturday afternoon, Dec. 23. There were eleven shooters, and five events; four at 15 targets and one at 10. Hood Waters won high honors, and three turkeys, running 30 straight in the first two events.

The first event was at 16yds., the winner being handicapped 2yds. for each victory. The second event Waters shot from 18yds. and won. The third from 20yds. and was high with 13. The fourth and fifth events he shot from 22yds.

Capt. Malone had evidently not recovered from the "licking" the Perryman boys gave his "team," as his feet seemed glued to the 16yd. mark.

The West Arlington Gun Club is a new organization, and for young shooters made a good showing. The scores:

Events:	1 2 3 4 5	Events:	1 2 3 4 5
Targets:	15 15 15 15 10	Targets:	15 15 15 15 10
Waters	15 15 13 10 6	Sampson	11 11 12 10 10
France	13 11 12 11 8	Watkins	11 8 12 14 7
Chelf	13 12 13 10 7	Waldes	0 5 5 3
Moxley	11 12 10 10 7	Eyler	9 7 ..
Jas Malone	14 11 .. 11 8	Biddle	.. .. 9 7 ..
C Malone	11 11 7 12 8		

#### Sheepshead Bay Gun Club.

SHEEPSHEAD BAY, L. I., Dec. 21.—A few shooters participated in the different events.

Events:	1 2 3 4	Events:	1 2 3 4
Targets:	10 15 15 15	Targets:	10 15 15 15
Montanus	7 14 13 14	Dreyer	.. 11 12 ..
Williamson	8 14 .. 10		

Club shoot; all withdrew in favor of Montanus.  
Montanus, 5.....23 Cooper, 9.....17  
Williamson, 8.....20 Sweeney.....13  
Dreyer, 13.....16 Lafayette.....1  
E Voorhies, 5.....19

Prize events, 15 targets, handicap:  
Montanus.....22 21 Cooper.....21 25 14  
Williamson.....23 24 15 Sweeney.....17 14 ..  
Dreyer.....23 23 14 Lafayette.....1 ..  
Voorhies.....24 23 12

#### Cincinnati Rifle Association.

THE following scores were made in regular competition by members of this Association at Four-Mile House, Reading road, Dec. 17. Conditions, 200yds., offhand, at the Standard American target. Roberts was champion for the day with a score of 84. The day was ill-fitted for the making of good scores, it being murky and dark the whole day. The scores:

Roberts	84 84 82 80 80	Hofer	81 78 75 75 73
Payne	84 83 83 82 82	Freitag	76 74 70 69 68
Hasenzahl	84 82 82 82 82	Drube	78 .. .. 68
Bruns	83 83 82 81 78		

A turkey shoot will be given on Dec. 31, to which all are invited. Pool shooting for amateurs and experts separately. Rest and offhand.

#### Montclair Gun Club.

MONTCLAIR, N. J., Dec. 23.—The handicaps apply only in event 2. Owing probably to bad weather to-day, only eight men were in attendance at the monthly shoot for the silver cup. The best scores were made in event 1, which was for practice. Bush and Boxall each broke 24 out of a possible 25.

In event 2, the cup event, 50 targets, handicap, Bush made the best net score, breaking 40 out of 50, but Boxall, with his handicap of 4 added birds, made a score of 43, and was declared the winner for the month.

Event 3 was won by Cockfair with 22 net to his credit. The club hold a silver shoot on the afternoon of the 30th, at which time Mr. Wm. H. Heer, of Concordia, Kans., will shoot with the club.

Events:	1 2 3	Events:	1 2 3
Targets:	25 50 25	Targets:	25 50 25
Batten, 2	17 35 12	Boxall, 4	24 43 19
Bush, 0	24 40 19	Winslow, 4	16 42 18
Allan, 2	23 38 ..	Moffett, 4	18 40 16
Cockfair, 0	18 39 22	Holloway, 6	11 32 ..

Dec. 25.—Some seventeen men were present to-day at the silver shoot of the club, seven events being run off. Events 1, 2, 3, 4 and 5 were for silver prizes, there being three prizes each in events 1 to 4, and two prizes in event 5. Winners of prizes in events 1 to 4 were penalized in event 5, the winner of a first prize losing 2 points and the winner of a second prize losing one point in the fifth event. Ties to be shot off in following event.

Messrs. Boxall, Beck, and Cockfair won first prizes; Messrs. Moffett, Bush, Force, and Boxall second prizes, and Messrs. Bush, Batten, Soverel and Moffett third prizes. Boxall was also winner of the prize for general high average, a box of cigars. Events 6 and 7 were for practice only.

Events:	1 2 3 4 5 6 7	Events:	1 2 3 4 5 6 7
Targets:	10 10 10 10 10 25 15	Targets:	10 10 10 10 10 25 15

E. WINSLOW, Sec'y.

#### Wawaset Gun Club.

WILMINGTON, Del., Dec. 18.—The shoot was held in honor of the renowned champion, Mr. Fred Gilbert. The programme had a total of 100 targets for the six events, divided into four 15s and two 20s. Mr. Luther J. Squier and F. Gilbert tied on 95 for high average, a feat of which Mr. Squier may justly feel proud. Mr. A. B. Richardson, of Dover, champion of Delaware, and Mr. Ed. Banks, ex-champion of that State, tied on 92 for second high average. Mr. James T. Skelly was third with 91. Mr. Wm. M. Foord was not in his usual good form. The scores follow:

Events:	1 2 3 4 5 6	Shot	
Targets:	15 15 20 15 15 20	at.	Broke.
Gilbert	14 14 20 14 15 18	100	95
Squier	15 15 18 15 14 18	100	95
Richardson	10 14 20 15 13 20	100	92
Banks	13 13 17 15 14 20	100	92

Robinson	.. .. 9 10 ..	30	19

#### Northern Kentucky Gun Club.

BELLEVUE, Ky., Dec. 17.—The shoot of Dec. 17 was attended only by Alfred Gowling and a few others, as the snow and slush made it so disagreeable under foot. Their scores have not been reported to the secretary.

Since the organizing of this club by some of the leading citizens of this vicinity, it has at this date become very popular in this vicinity. A great number have already joined. Others have given their signatures; to join at a date later on. This club has been very prosperous for this time of the year. But it accounts for itself, as we know this club has got the proper pushers behind it.

On Dec. 9 there was an average attendance, with some new faces present at the club grounds, Newport, Ky., known as the East Newport Ball Park, on St. Thomas Car Line, twenty minutes' ride from Fountain Square, Cincinnati, O. The participants had to be content with 5 degrees below freezing weather, which made matters uncomfortable. Capt. Gowling carried off high honors. Those at the shoot were as follows:

	Shot at.	Broke.		Shot at.	Broke.
A Gowling	50	48	Back	50	30
Cunningham	50	35	Hill	50	36
Kiefer	50	30	Furhman	50	39
Dameron	50	38	Walker	50	29
Meyers	50	33	Kosters	50	43
Young	50	37	Emig	50	27
Riley	50	38	Gould	50	40
Fostner	50	32			

GEO. W. FROST, Sec'y.

### DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Palisade Gun Club announce a shoot to be held on their grounds at Edgewater, N. J., Jan. 25.

The club house of the Sheepshead Bay, L. I., Gun Club, was robbed of many articles of value last week.

The Secretary, H. Ely Havens, informs us that the Lakewood, N. J., Gun Club has fixed on Dec. 29 as the date for an all-day shoot.

The Montclair, N. J., Gun Club will hold a shoot on Dec. 30, at which the Western artists, Messrs. Fred Gilbert and W. H. Heer are announced to appear.

Mr. and Mrs. Wm. M. Foord spent last week in Brooklyn, the guests of Mr. and Mrs. J. A. R. Elliott. So we are informed by our esteemed correspondent "A Social Tramp."

In the Philadelphia Shooters' League series, Dec. 23, Meadow Springs defeated S. S. Whites, 214 to 207; Clearview defeated Florists, 209 to 183; Highland defeated Merchantville, 197 to 149; Lansdale defeated Media, 213 to 187.

There is brewing a State contest between teams of Maryland and Delaware. If Perryman can suffocate all attempts at desertion in this contest, if happily it is arranged, Delaware will have the struggle of its life, in a trapshooting sense.

In the second contest between teams of Perryman and Baltimore Shooting Association, the former won by a score of 669 to 599. There were seventeen men to each team. Each man shot at 50 targets. Messrs. Banks and Richardson, of Perryman, scored 48 each and were high.

In the weekly shoot, at the Point Breeze race track, Philadelphia, Pa., last Saturday, there were ten contestants in the event at 10 birds, \$5, handicap, of whom three, McDonald, Churchill and Aiman, scored 9 and were high. Two 5-bird sweepstakes were also shot.

WESTERN TRAP.

At Butte.

BUTTE, MONT., Dec. 14.—Some of the finest shooting ever witnessed in this Western mountainous country was that of the members of the gun club when they met yesterday to contest for the powder trophy and the Confarr medal.

The best shooting was done by Nickey, who made the record by the remarkable score of 190 straight. This was made in four events of 25 each, and gives him just that many points to his credit on the cup.

Besides this, some quite phenomenal shooting was done during the afternoon by others. Mr. Confarr was on his mettle, getting in on the medal and other trophies with top-notch scores. He made 25 straight three times, but fell away to 22 the last time up.

Now, honestly, did you ever read of such scores by club members at a home shoot? There were eighteen straight 25s, twelve 24s and many 23s. Suppose, for instance, that some other club shoot the same scores and see how they will compare.

For the Twoby medal: Confarr 25, Nell 19, Matthewson 19, Drumgoole 17, Carson 24, Nickey 22, Smith 21, McGivern 22, Morley 23, Goddard 23.

Massillon Gun Club.

Mr. F. A. Brown won the Massillon, O., Gun Club trophy, a fine silver cup, which was decided at the shoot held here Dec. 15. This shoot has been running two years, and has been conducted under the handicap system.

At 25 targets, D. Reed, Sr., 18, Brown 18, McLain 14, Carr 20, Murrells 18, Beck 11.

Ohio Notes.

A NUMBER of Dayton sportsmen visited Lewisburg on Dec. 18 to witness an elk hunt in Uncle Joe Wilson's park, and the victim was a big buck elk of his herd.

M. J. Schwind has accepted Ed. Rike's defi, and the 100-target match will be shot on the N. C. R. grounds at Dayton.

The Goshen Gun Club proposes to send a team to do up the Cincinnati boys on New Year's Day.

The officers of the Rohrer's Island Gun Club, Dayton, held a meeting on Dec. 21, and it was decided to give an elaborate banquet in connection with the annual meeting, which will be held the latter part of January for the election of officers.

Alert Gun Club.

THE Alert Gun Club, of Phillipsburg, N. J., held Dec. 20, the largest tournament ever held in this section, and was attended by not only two squads of the best professionals in the world, but by the best amateurs from different clubs in this State as well as New York and Pennsylvania.

The weather man was good to us, and gave us one of the finest days that could be manufactured by him for this season of the year.

The management used every means in their power to make this tournament one that would be remembered by all shooters who attended, and believe that every shooter left the grounds with the feeling that they were well taken care of.

As can be noted from the scores below, forty-two shooters participated in the shoot. Six thousand targets were thrown during the day, and everybody was off the grounds before 5 o'clock.

The Dutch lunch which was served to the shooters seemed to be very much appreciated by all.

Messrs. Gilbert and Heer gave one of the finest exhibitions of target smashing ever seen in this section, and at the end of the twelfth event it was seen that each man had lost only 8 targets.

As to amateurs, we had them of the right sort, and from many different places, such as Allentown, Bethlehem, Bangor, Pen Argyl and Philadelphia, in Pennsylvania; Pattenburg, Plainfield, Round Brook, Newark, Trenton, Riegelsville and Jersey City, in New Jersey; and also Brooklyn and New York City.

Mr. Howard Schlicher, of Allentown, Pa., took with him the honor of first amateur average. Mr. Kelly, of New York, took the second amateur average, and Mr. J. F. Pleiss and E. F. Markley, of Easton, Pa., divided for third amateur average.

The following are the scores:

Table with columns: Events, Targets, and names of shooters with their scores. Includes names like Elliott, Heer, Apgar, Gilbert, Squier, Welles, I. H. Keller, Jr., Glover, Butler, Piercy, Gano, and E. F. Markley.

Table with columns: Names of shooters and their scores. Includes names like Kelly, Stubblebine, Pleiss, H. Schlicher, A. Hile, H. E. Snyder, Dr. Matthews, C. N. Miller, A. D. Tunis, I. Hahn, O. Skeds, H. Anders, Dr. Lucky, N. L. Clark, J. Young, F. Henry, H. J. Woodward, J. Cron, E. Sitgreaves, W. R. Frome, Alert, Jones, Somers, W. H. Maurer, Francotte, Housman, Richards, Hellyer, Hamlin, and Kendig.

You should see the Jerseyites eat sauerkraut and pork. We had doctors on hand in case of accidents—Dr. Lucky, Plainfield, N. J., and Dr. Matthews, of Trenton, N. J.—both shot through programme.

The motto of our club is, "If we treat you right, tell others; if we don't, tell us." Mr. Geo. Piercy seemed to be at home with Pleiss—both German. They seemed to have the floor most of the time when speaking in their favorite tongue.

Perryman Outshoots B. S. A.

BALTIMORE, Md.—Perryman also won the high gun honor through Banks and Richardson.

"We may live without poetry, music and art, We may live without conscience, we may live without heart,"

The theory that "home ground" has its advantages, was set aside Wednesday, when the Perryman (Md.) Gun Club defeated the Baltimore Shooting Association for a second time in a team match at the B. S. A. traps.

There were seventeen men on each side. The score was 669 to 550. Perryman, in addition to carrying off the match, also took individual honor of high gun, Banks and Richardson each scoring 48; while Chew was high for the Baltimore team with 45.

Table with columns: Names of shooters and their scores. Includes names like Waters, Chew, Moxley, J. R. Malone, Dixon, Sampson, Sparks, DuPont, Bowen, C. Malone, Philbrook, France, Silver King, Chelf, Cottman, Gilford, Baskerville, Banks, Foord, McKelvey, Richardson, German, McHugh, Cord, R. F. Mitchell, Morgan, P. Mitchell, De Haven, McCommons, L. Towner, Baldwin, Turner, Sutton, and Chapman.

There were two extra events, 25 targets each; first extra before the team match; second extra after. The scores:

First extra: Banks 21, German 22, McKelvey 17, Cord 19, Morgan 17, Mitchell 15, Waters 22, Turner 17, P. Mitchell 20, De Haven 20, Sutton 15, Dixon 16, Cottman 16, Bowen 22, Moxley 19, Sparks 19, Malone 22, Sampson 17, France 19, Foord 22, McHugh 17.

Second extra: Foord 17, German 23, Banks 21, McHugh 16, France 15, Sampson 15, Waters 20, Mordecai 19, Moxley 19, C. Malone 21.

Malone's team was handicapped in several ways. The day was "cold and dark and dreary," and some of Baltimore's best shooters, who promised to join the team, failed at the last minute to materialize.

The prettiest shooting was done by Mr. Edward Banks. Although the targets were not rotating well, he centered every bird.

One of the visiting sportsmen suggested having a shoot in front of the doors of some of the "stay at homes," to see if they would have energy and interest enough to watch the event from their windows, where the temperature was 72 and it would not be necessary to leave the depths of a Morris chair.

The little village of Perryman seems to be able to supply more shooters from "long range" than Baltimore can, with a population of over half a million, and the club grounds only thirty minutes' ride from the center of the city.

A State shoot, ten-man teams, Maryland vs. Delaware, is contemplated. Date not yet arranged.

A SOCIAL TRAMP.

The Sunny South Handicap.

BRENHAM, TEXAS, Dec. 18.—The Sunny South Handicap, to be held here Jan. 22 to 27, promises to be a great success, and the largest attended shoot ever held in the South.

As to amateurs, we had them of the right sort, and from many different places, such as Allentown, Bethlehem, Bangor, Pen Argyl and Philadelphia, in Pennsylvania; Pattenburg, Plainfield, Round Brook, Newark, Trenton, Riegelsville and Jersey City, in New Jersey; and also Brooklyn and New York City.

On Jan. 29, 30, 31, there will be a three-day shoot at Bay City, with \$300 cash added, at the close of which a big duck hunt is the programme, and there are plenty of ducks there, and the boys can shoot until their guns are hot.

Following this, on Feb. 6, 7, 8, will be the Grand Southern shoot at Houston, with \$500 cash added, making a complete circuit.

There will be something doing in the Lone Star State, and everybody who attends these shoots will be given a good time.

The noble art of finching is discussed on our editorial page to-day.

THE MANY-USE OIL

cleans out powder residue. Lubricates, never gums; 2oz. bottle, 10c.

The Effect of Shot Striking Game.

IN connection with the experiments which are being recorded in the Field on the patterns resulting from the employment of different charges, I have been requested to state from anatomical considerations the effects of shot striking game in different parts.

head, may wound one of the large blood vessels, either artery or vein, and the blood may be poured into the windpipe, which may be wounded at the same time by the same shot. In this case suffocation ensues, and the result is a towering bird, a phenomenon which never occurs after a shot in the brain, as is often erroneously imagined.

In ground game the vital parts are similarly located. A shot in the brain is instantaneously fatal, and as a quadruped proceeds by the action of the hindlegs, any injury to the nervous system in the spinal cord must necessarily destroy its power of motion.

The organs in the chest are much less protected than they are in the bird, inasmuch as the pectoral muscles are of much smaller size, and the heart, lungs, and large blood vessels are necessarily more exposed to injury.

It often happens with all kinds of game birds, and more particularly with rabbits, that a shot which will eventually produce fatal results is not immediately effective. A rabbit will drag itself along the ground for many yards when severely wounded, and will escape into its hole.

It must, of course, be understood that the shooter is not in a position to exercise any discretion as to the particular part of a bird or animal's body which his pellets will strike.

At Wellington. WELLINGTON, Mass., Dec. 20.—The third of the regular Wednesday afternoon shoots on grounds of the Boston Shooting Association was held on above date, the weather being fine.

Table with columns: Events, Targets, and names of shooters with their scores. Includes names like Griffith, Gleason, Roy, Smith, Wheeler, Rule, Tamby, Kinkwood, Mrs. Park, Frank, Freeman, Bartlett, Jordan, Woodruff, Burns, Craighton, and Webster.

West Virginia State Sportsmen's Association.

SISTERSVILLE, W. Va., Dec. 19.—Will you kindly announce to the shooting world that what promises to be the greatest shooting event ever held in this section of the country will be the tenth annual tournament and meeting of the West Virginia State Sportsmen's Association, which will be held on the grounds of the Fairmont Gun Club, Fairmont, W. Va., June 12, 13, and 14, 1906.

The affair will be under the personal direction of Mr. Ed. H. Taylor, of the DuPont Powder Co., which is sufficient guarantee that everything possible will be done for the comfort and convenience of all visitors.

PUBLISHERS' DEPARTMENT.
