## CHAPTER 4. ECONOMIC

SID-JAPANESE MANDATED  
ISLANDS

2 Dec 47

## I. GENERAL

## 1. DOMINANT ECONOMIC CHARACTERISTICS

The meagre resources of the Mandated Islands make them of little economic importance from the military standpoint.

The agricultural food resources of the islands are only sufficient to support the small native population. Plentiful supplies of breadfruit, coconuts, taro, papaya, mango, bananas, and similar food products are available without cultivation throughout the year. Fish are plentiful in the waters surrounding the islands and in the atoll lagoons, including bonito, mackerel, tuna, and other species.

Under the Japanese administration of the islands, copra production was expanded and phosphate extraction developed. The sugar industry in the Marianas, and fishing and collection of a variety of marine products in the Palau area, were likewise developed on a large scale. The value of production in some of the major industries in 1938 was as follows:

Production of Major Industries, 1938

Agriculture and livestock	4,872,000 yen	\$1,412,880*
Forestry	4,018,000	1,162,000

Forestry	4,018,000	1,165,220
Fishing	6,662,000	1,920,380
Manufactured goods (including sugar)	28,909,000	8,383,610
**Mining	3,500,000	1,015,000

\*Dollar figure based on exchange rate of 1 yen equals 29 cents.  
 \*\*1935 figure.

Phosphate is the principal mineral extracted from the Mandated Islands. The largest phosphate reserves are on Angaur; but phosphates of varying quality are found in the neighboring islands of Peleliu, Tobi, Sonsoral, Pulo Anna, Fais, Gaferut, and Ponape in the Carolines; Ebon in the Marshall Islands; and Saipan, Rota, Tinian, and Agrihan in the Marianas. Phosphate extraction from Angaur in 1939 was 143,420 tons, whereas the total production of the

## I. GENERAL

## 1. DOMINANT ECONOMIC CHARACTERISTICS (Continued)

Mandated Islands was estimated to be 281,541 tons.

Bauxite has been found in the lateritic region of Palau, Yap, and Ponape. In 1938, the Japanese mined 30,000 tons, yielding 7,500 tons of aluminum. The estimated output for 1939 was 100,000 tons of ore with a yield of 25,000 tons of aluminum. It was stated that the bauxite deposits were sufficient to supply the needs of Japanese industry for 20 years. Small quantities of iron have been found in Yap, and Ponape, and deposits of low grade coal in the south and west of Babelthuap. Manganese occurs in the north of Babelthuap and on Saipan, asbestos on Yap, and fireclay on Peleliu.

Sugar is cultivated and refined only in the Marianas, one fifth of the land being devoted to sugar cane. Under a government subsidy program and with the use of indentured labor, the Japanese were able to produce 58,560 metric tons of sugar in 1937, and in addition 19,053 metric tons of molasses and 1,026,432 gallons of alcohol, including alcoholic drinks.

An important agricultural product of the Mandated Islands

tens of ore with a yield of 25,000 tons of aluminum. It was stated that the bauxite deposits were sufficient to supply the needs of Japanese industry for 20 years. Small quantities of iron have been found in Yap, and Ponape, and deposits of low grade coal in the south and west of Babelthusp. Manganese occurs in the north of Babelthusp and on Saipan, asbestos on Yap, and fireclay on Peleliu.

Sugar is cultivated and refined only in the Marianas, one fifth of the land being devoted to sugar cane. Under a government subsidy program and with the use of indentured labor, the Japanese were able to produce 58,560 metric tons of sugar in 1937, and in addition 19,053 metric tons of molasses and 1,026,432 gallons of alcohol, including alcoholic drinks.

An important agricultural product of the Mandated Islands is copra. About 125 square miles, or three fifths of the cultivated land, are planted in coconut palms for the production of copra. In the Marshall Islands, the copra plantations are most numerous, although coconut palms are plentiful throughout the area in the low, sandy coastal lands. Copra production in 1938 totalled 14,938 tons.

In regard to forestry, the Japanese government recommended the planting of teak, Ceylon cinnamon, Casuarina, mahogany, and acacia in the mandate areas. The most important timber in the Palau district are sandalwood, Amui, kashimoroku, and mangrove which is commonly used for charcoal.

## CHAPTER 4. ECONOMIC

SID-JAPANESE MANDATED  
ISLANDS  
2 Dec 47

## I. GENERAL

## 1. DOMINANT ECONOMIC CHARACTERISTICS (Continued)

Fishing is important both in the subsistence economy of the natives and in the commerce of the islands. Commercial fishing was concentrated in the Falsu area, the total catch in 1937 being 14,021 metric tons valued at 4,970,460 yen (\$1,441,433 at the rate of 1 yen equals 29 cents).

Foreign trade during the years of Japanese administration was limited to an export-import trade with Japan. Products of the sugar industry became the most important export item, superseding the former importance of copra and phosphate. The import items from Japan were mainly used to provide for the Japanese officials and indentured labor and to maintain the limited industry of the islands.

The proportion of trade with foreign countries was negligible in prewar years, only 4.7% with respect to exports and 3.5% with respect to imports being with countries other than Japan.

CHAPTER 4. ECONOMIC

SID-JAPANESE MANDATED  
ISLANDS  
2 Dec 47

I. GENERAL

2. FUTURE PROSPECTS

Due to the limited resources in the former Japanese Mandated Islands, it is not anticipated that the islands will become economically important. Scarcity of native labor and inadequate fresh water supplies, other than rain water, are serious handicaps to the development of these islands.

supplies, other than for  
development of these islands.
