CC BY-SA 4.0 Niccolò Caranti

Did you know...

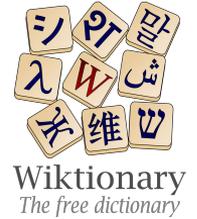

- ... the **Wikipedia infrastructure** is run by the **Wikimedia Foundation**, an American nonprofit charitable organisation?
- ... and we are ~370 people?
- ... and we have no affiliation with Wikileaks?
- ... all content is managed by volunteers?
- ... we support 304 languages?
- ... Wikipedia is 18 years old ?
- ... Wikipedia hosts some really really weird articles?
- ... which can't be read in Turkey (2017) nor China (2019)?

Wikimedia Projects

VICIPÉID
An Chichlipéid Shaor

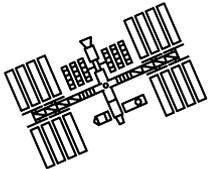

Wikimedia Infrastructure

- ✿ **Open source software**
- ✿ 2 Primary Data Centres
- ✿ 3 Caching Points of Presence
- ✿ ~17 billion pageviews per month*
- ✿ ~300k new editors per month
- ✿ ~1300 bare metal servers

* it's complicated

Site Reliability Engineering

- * Datacenter Operations
- * Data Persistence
- * Infrastructure Foundations
- * Service Operations
- * Traffic

The SRE team is a **globally distributed team** of 26 people responsible for developing and **maintaining** Wikimedia's production systems

The Foundation has more SREs in other teams as well!

Application Layer

@kosiaris • @manjiki

CC BY-SA 2.0 Arthur Dunn

MediaWiki

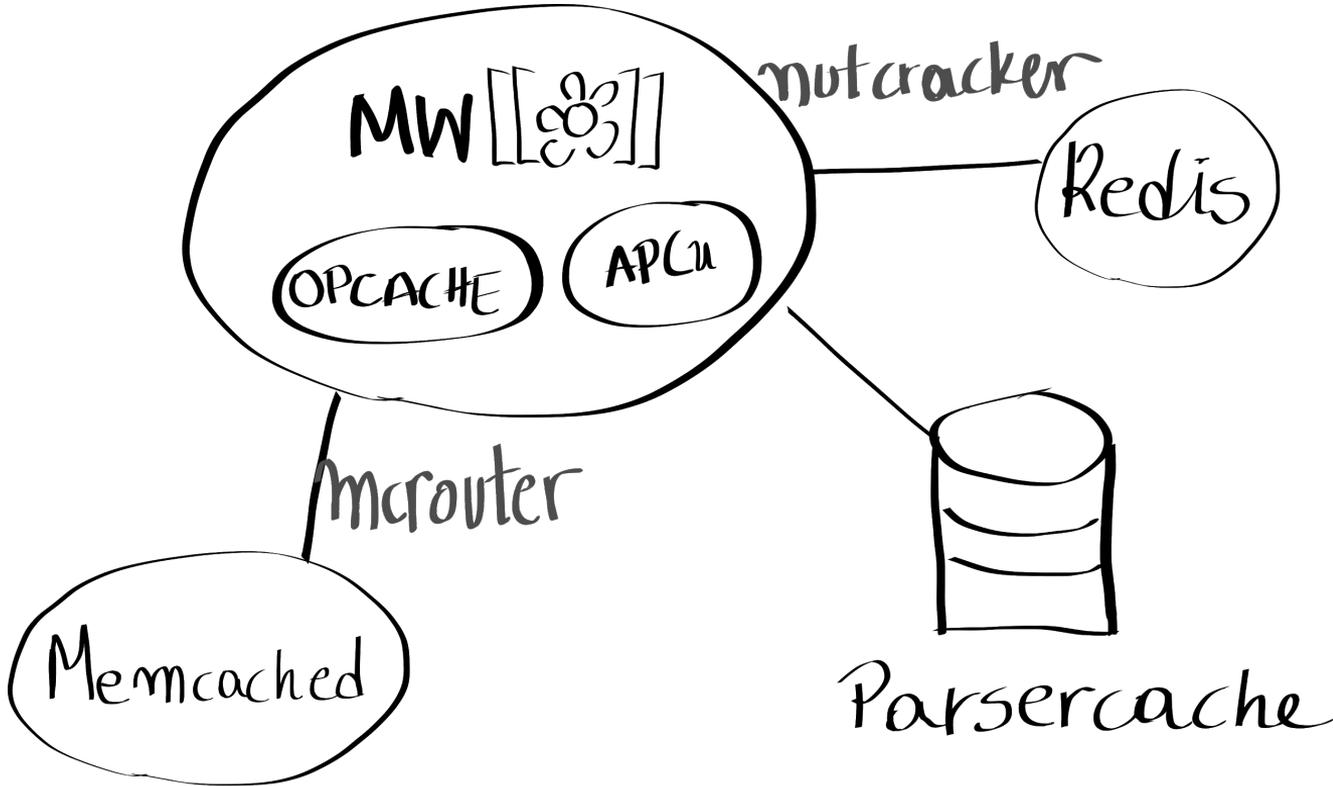

- * Our core application
- * PHP, Apache, MySQL. Yes.*
 - * PHP7.2 since Sept 2019
- * Wiki web pages - app servers cluster
- * API cluster
- * Jobrunners/Videoscalers cluster

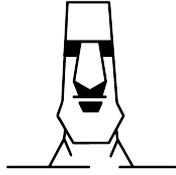

MediaWiki is a **free** server-based software, licensed under the **GNU GPL**.

It is an **extremely powerful**, scalable software, and a feature-rich wiki implementation that uses **PHP** to process and display data stored in a database, such as **MySQL**.

* it's complicated

<Parsoid>

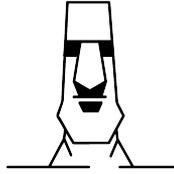

From a Monolith to Microservices

2019

Graphoid RestRouter
 MCS MediaWiki ORES
 Proton Changeprop Citoid
 Thumbar Parsoid Mathoid sessionstore
 termbox eventgate

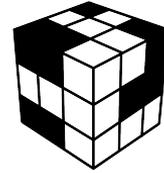

WIKIMEDIA
FOUNDATION

From a Monolith to Microservices

- * Elasticity
- * Hardware fault mitigation
- * Deployments
- * Migration is not easy, and still ongoing

Microservices!

- * Thumbor
- * Mathoid
- * ORES
- * Mobile Content Service (MCS)
- * And many more

Thumbor is used for imagescaling

Mathoid renders LaTeX, and returns JSON with PNG, SVG or MathML renderings of the formula

ORES scores edits using Machine Learning (anti-vandalism effort)

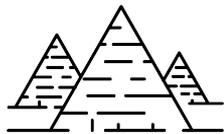

MCS modifies page content on the fly, tailoring it for mobile

Kubernetes

@kosiaris • @manjiki

Public Domain

Kubernetes

- * Bare metal
- * Calico as a CNI plugin
- * Helm for deployments
- * 2 clusters + 1 staging one
- * Docker as a CRE

We have been running it successfully for the last 2 years! Currently, 11 services on it. Got a pipeline in the works.

Powers all mathematical formulas on Wikipedia!!!

Message Queueing

@kosiaris • @manjiki

WIKIMEDIA
FOUNDATION

CC BY 2.0 bootbearwdc

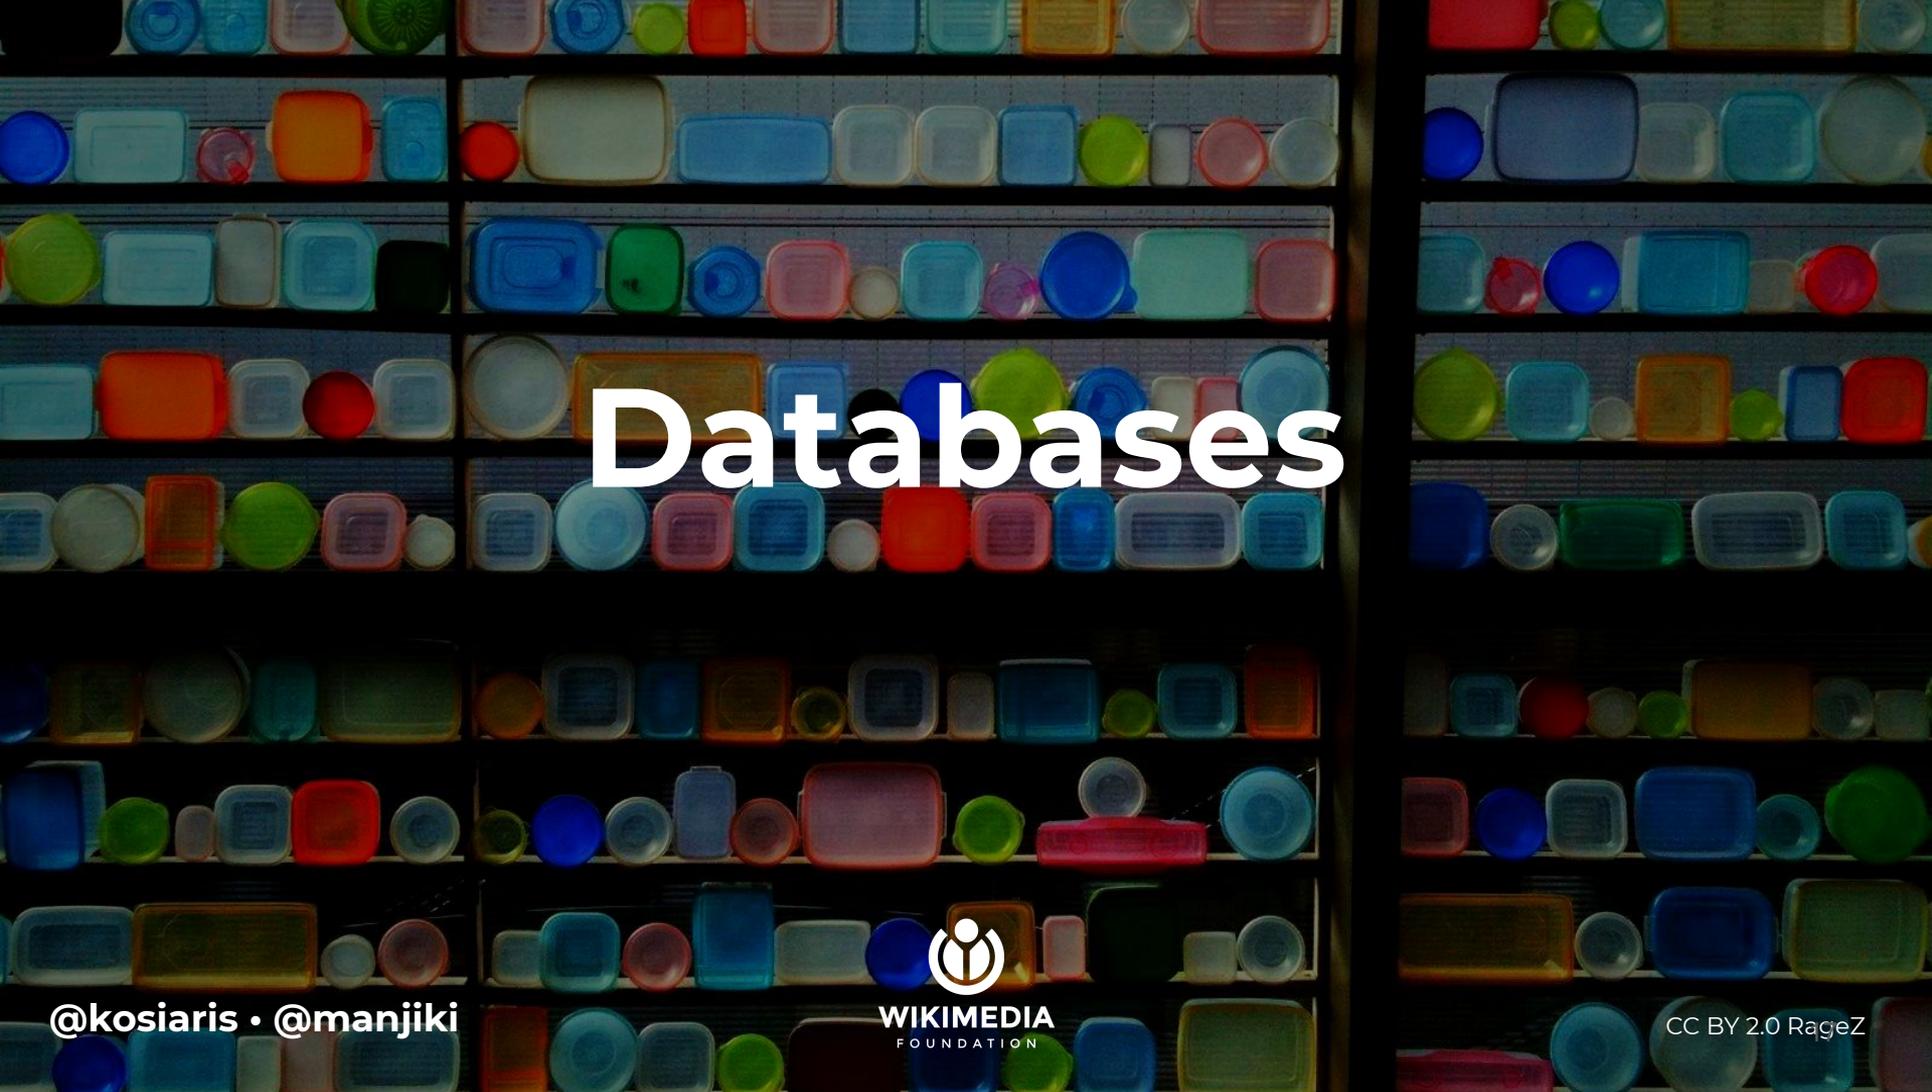

Message Queueing

- * Yes, we use Apache Kafka
- * We are sending events like:
 - * wikitext templates refresh
 - * edge caches purging
 - * cross wiki links
 - * create new thumbnails
 - * re-encoding videos to open source formats

Apache Kafka: stream processing platform for real-time data feeds

One message queue to rule them all; started as a service for Analytics only. Now, it is our de facto solution.

Databases

@kosiaris • @manjiki

CC BY 2.0 RageZ

MariaDB*

- * Database clusters are divided into sections
- * Sections have masters and replicas*
- * MediaWiki reads from replicas and writes to master
- * Clusters:
 - * Wikitext (compressed)
 - * Metadata
 - * Parsercache

MariaDB: fork of MySQL, migrated from MySQL in 2013*

Have a go at

<https://quarry.wmflabs.org>

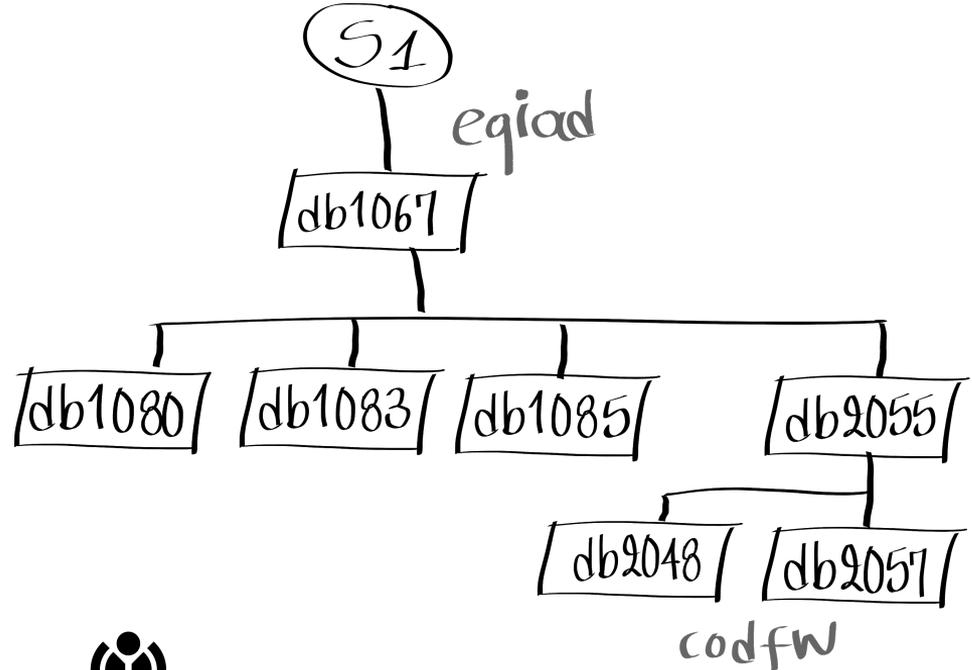

* it's complicated

MariaDB

- * Online schema migrations*
- * Cross DC replication
- * TLS across all DBs
- * Snapshots and local dumps for Backups

- * ~570 TB total data
- * ~150 DB servers
- * ~350k queries per second (qps)
- * ~70 TB of RAM

* it's complicated

Elasticsearch

You guessed it right, we use it for search.

That box on your top right.

Run by a team surprisingly called
Search Platform!

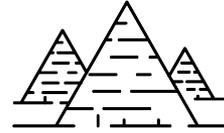

Storage

@kosiaris • @manjiki

CC BY-NC 2.0 Gail Thomas

Swift

- * All our media are stored on Swift
- * It has frontends
... and backends
- * 1 billion objects
- * ~390 TB of media!

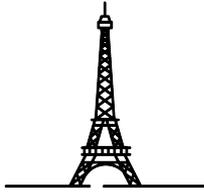

OpenStack Object Storage: a scalable storage system that stores and retrieves data via HTTP

Traffic

@kosiaris • @manjiki

Public Domain

Network

Network

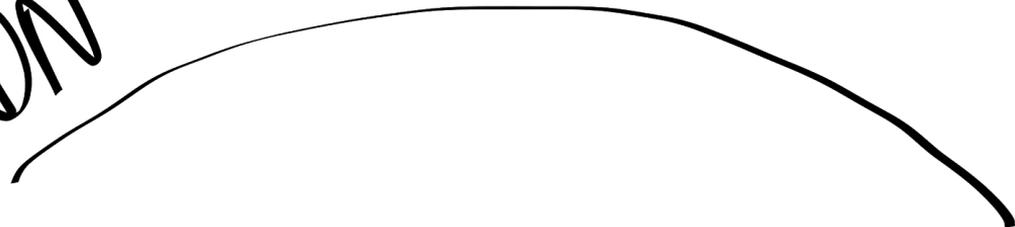

It's complicated

LVS

CDN

gdnssl

Network

- * We have our own content delivery network
- * We direct traffic to a location on demand (via GeoDNS)
 - * Pooling/Depooling DCs
 - * 10 min TTL
- * LVS as a Layer 3/4 Linux loadbalancer*

gdnssd: GeoDNS is written and maintained by one of us

peering: interconnection with other internet networks

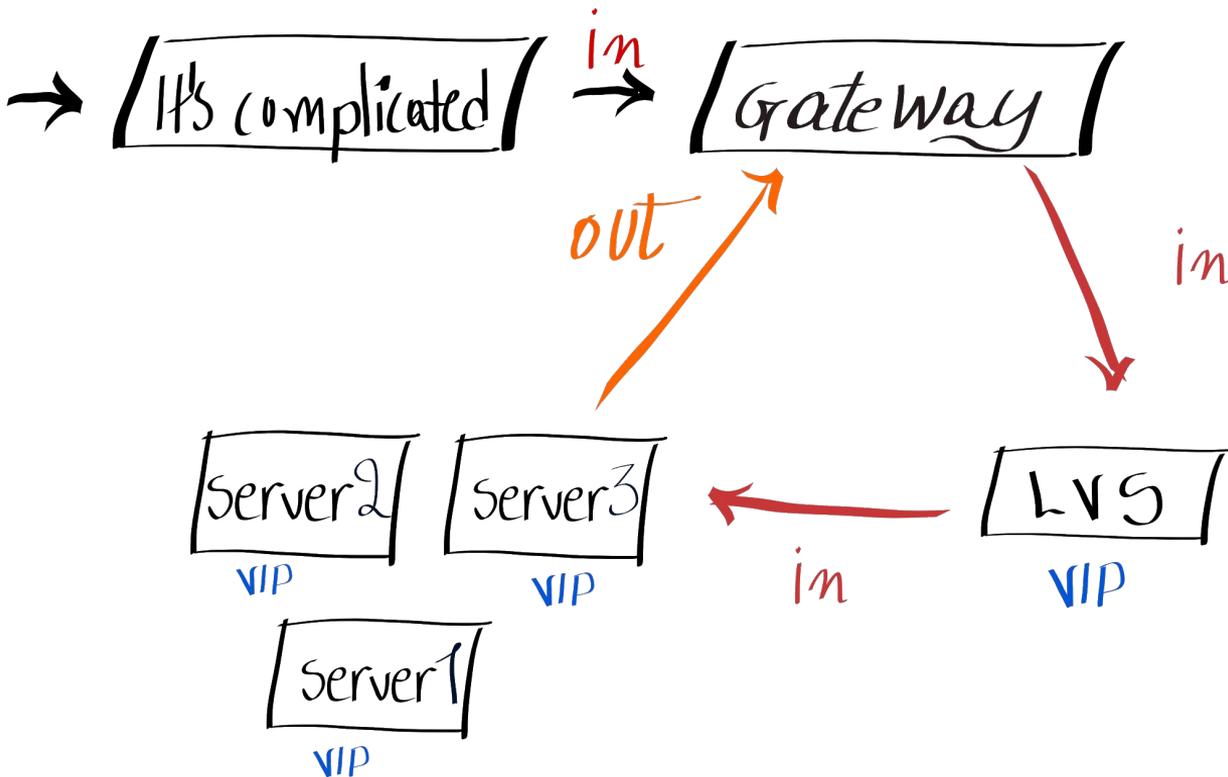

Linux Virtual Server: an advanced L3/L4 load balancing solution for linux, supports consistent hashing

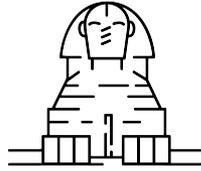

pybal: LVS manager, developed in-house

* it's complicated

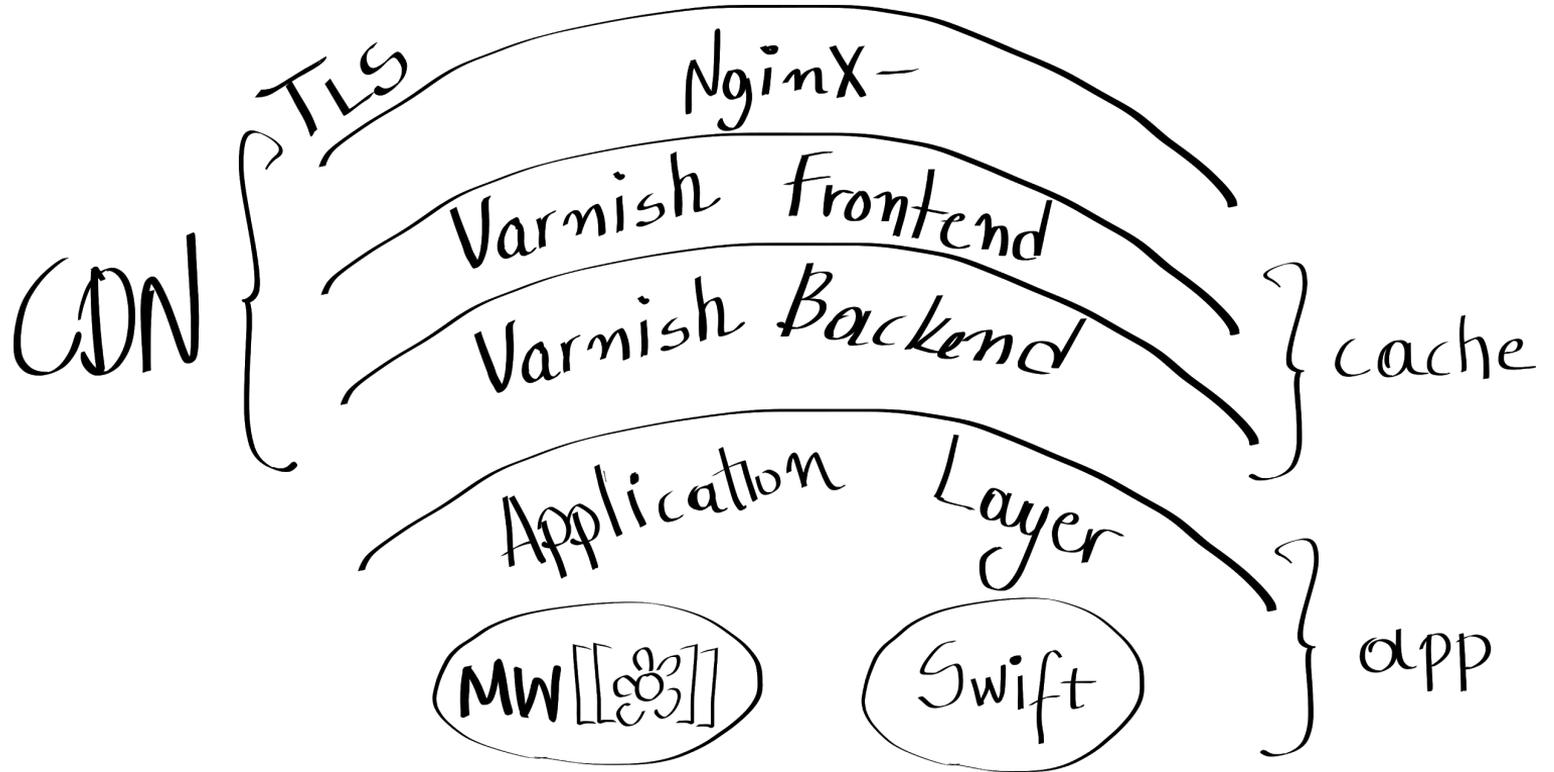

LVS-DR

CDN

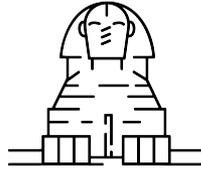

CDN

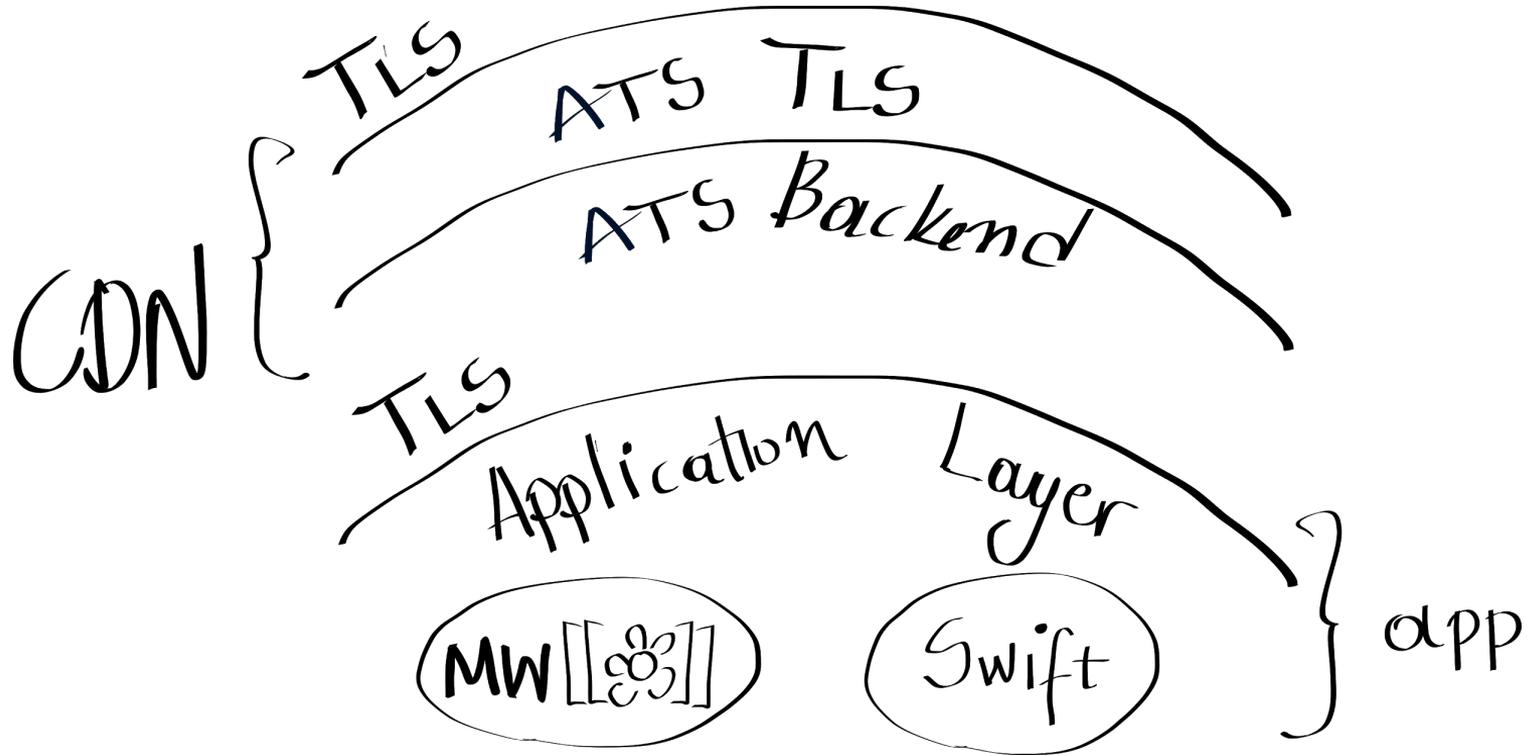

- * Nginx- for TLS termination
- * Varnish frontend
 - * in memory
- * Varnish backend
 - * local stores
- * Varnish text
 - * HTML, CSS, JS etc
- * Varnish upload
 - * media, media, media

Nginx-: Highly performant HTTP webserver/proxy with excellent TLS support

Varnish: Reverse HTTP caching proxy

CDN (coming soon)

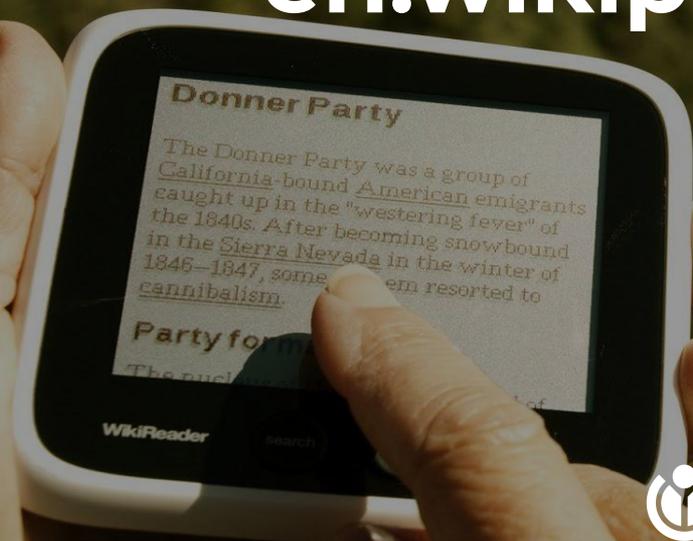

CDN (coming soon)

- * ATS TLS
 - * in memory
- * ATS backend
 - * local store (SSDs)
- * ATS text
 - * HTML, CSS, JS etc
- * ATS upload
 - * media, media, media
- * **ACME-chief**

Apache Traffic Server: Reverse and forward proxy with excellent caching support

ACME-chief: handles all the process of issuing and renewing Let's Encrypt certificates (dns-01)

Managing to Manage

@kosiaris • @manjiki

GETTY IMAGES

Managing to Manage

- * Infrastructure as code
- * Configuration management
- * Kubernetes
- * Testing/CI/CD
- * Orchestration tooling

Puppet: configuration management system for servers/services

...~50k lines of puppet code

...~100k lines of Ruby/ERB

Cumin: in-house automation and orchestration tool

A close-up photograph of a squirrel with brown and grey fur, holding a walnut in its paws. The squirrel is looking directly at the camera. The background is a soft, out-of-focus green and grey.
