Compling 32-bit program on 64-bit gcc

- gcc -v
- gcc -m32 t.c
- sudo apt-get install gcc-multilib
- sudo apt-get install g++-multilib
- gcc-multilib
- g++-multilib
- gcc -m32
- objdump -m i386

TOC: Search libraries using -L and -1 only

- Example source code and dependencies
- Making shared libraries
- Making an application
- Running an application

TOC: 1. Example source code and dependencies

- Example source codes
- Function dependencies
- Direct and nested dependencies of a binary
- Example summary using -L and -1

Example source codes of foo(), bar(), foobar()

1. foo.c

```
#include <stdio.h>

void foo(void)
{
    puts(__func__);
    // puts("foo");
}
```

2. bar.c

```
#include <stdio.h>

void bar(void)
{
    puts(__func__);
    // puts("bar");
}
```

3. foobar.c

```
extern void foo(void);
extern void bar(void);

void foobar(void)
{
   foo();
   bar();
}
```

4. main.c

```
extern void foobar(void);
int main(void)
{
   foobar();
   return 0;
}
```

 $https://stackoverflow.com/questions/49138195/whats-the-difference-between_rpath_left and the stackoverflow.com/questions/flowerflow.com/questions/flowerfl$

Function dependencies of foo(), bar(), foobar()

```
main() \rightarrow foobar()
foobar() \rightarrow foo(), bar()
```

```
main() in prog
foobar() in libfoobar.so
foo() in libfoo.so
bar() in libbar.so
```

Direct and nested dependencies of a binary

binary	direct dependencies	nested dependencies	
libfoobar.so	ightarrow libfoo.so, $ ightarrow$ libbar.so		
prog	ightarrow libfoobar.so	ightarrow libfoo.so, $ ightarrow$ libbar.so	

Example summary using -L and -1

Make two shared libraries, libfoo.so and libbar.so:

```
$ gcc -c -Wall -fPIC foo.c bar.c
$ gcc -shared -o libfoo.so foo.o
$ gcc -shared -o libbar.so bar.o
```

Make a third shared library, libfoobar.so

```
$ gcc -c -Wall -fPIC foobar.c
$ gcc -shared -o libfoobar.so foobar.o -L. -lfoo -lbar
```

Make prog that depends on libfoobar.so:

```
$ gcc -c -Wall main.c
$ gcc -o prog main.o -L. -lfoobar -lfoo -lbar
```

Execute using LD_LIBRARY_PATH

```
$ export LD_LIBRARY_PATH=.
$ ./prog
foo
bar
```

TOC: 2. Making shared libraries

- Making libfoo.so, libbar.so
- Using -L
- Making libfoobar.so

Making libfoo.so and libbar.so (1) summary

• Make two shared libraries, libfoo.so and libbar.so:

```
$ gcc -c -Wall -fPIC foo.c
$ gcc -c -Wall -fPIC bar.c
-c -fPIC foo.c
-c -fPIC bar.c
```

Making libfoo.so and libbar.so (2) no dependencies

```
$ gcc -c -Wall -fPIC foo.c
$ gcc -c -Wall -fPIC bar.c
```

- <u>neither</u> foo() <u>nor</u> bar() does depend on other user functions
- no need to specify direct dependencies thus, -1 was not used
- as a result, no NEEDED entries in the .dynamic section for direct dependencies that are specified by a user

 $\verb|https://stackoverflow.com/questions/49138195/whats-the-difference-between-rpath-like the theorem and the stack of the$

Making libfoo.so and libbar.so (3) NEEDED entries

```
$ gcc -c -Wall -fPIC foo.c
$ gcc -c -Wall -fPIC bar.c
```

- no NEEDED entries except lib.so.6
- libc.so.6 was not explicitly specified by a user
- i.e., -1 was not used

```
$ readelf -d libfoo.so | grep NEEDED
Tag Type
0x00000000000000001 (NEEDED)
```

```
Name/Value
```

Shared library: [libc.so.6]

Name/Value Shared library: [libc.so.6]

 $\verb|https://stackoverflow.com/questions/49138195/whats-the-difference-between-rpath-like the theorem and the stack of the$

Using -L

- the -L option (-Ldir) tells the <u>linker</u> (1d)
 to search dir for libraries to <u>resolve</u> dependencies
 that are specified by the -1 option
- the <u>linker</u> (1d) searches the -L directories, in their command line order;
 - eg. when mulitple -L options are used like -Ldir1 -Ldir2 dir1 is searched first, then dir2
- then it searches its <u>configured</u> <u>default directories</u>, in their configured order.

 $\verb|https://stackoverflow.com/questions/49138195/whats-the-difference-between-rpath-linearity and the stackoverflow of the stack of the$

Making libfoobar.so (1) summary

Make a third shared library, libfoobar.so
 that depends on the first two (libfoo.so, libbar.so)

```
$ gcc -c -Wall -fPIC foobar.c

$ gcc -shared -o libfoobar.so foobar.o -L. -lfoo -lbar
-c -fPIC foobar.c
-shared foobar.o -L. -lfoo -lbar
```

Making libfoobar.so (2) NEEDED entries

```
$ gcc -c -Wall -fPIC foobar.c
$ gcc -shared -o libfoobar.so foobar.o -L. -lfoo -lbar
  • direct dependencies were specified by -lfoo -lbar
  • these dependencies were recorded as the NEEDED entries
     in the .dynamic section of libfoobar.so
     NEEDED [libfoo.so] \leftarrow -lfoo
     NEEDED [libbar.so] \leftarrow -lbar
$ readelf -d libfoobar.so | grep NEEDED
 Tag
            Туре
                                         Name/Value
  0x0000000000000001 (NEEDED)
                                         Shared library: [libfoo.so] <---
  0x0000000000000001 (NEEDED)
                                         Shared library: [libbar.so] <---
  . . .
```

https://stackoverflow.com/questions/49138195/whats-the-difference-between-rpath-like the difference-between-rpath-like the difference-betwee

Making libfoobar.so (3) if -L. is omitted

```
$ gcc -c -Wall -fPIC foobar.c
$ gcc -shared -o libfoobar.so foobar.o -lfoo -lbar
```

- if -lfoo and -lbar are specified without -L. being specified,
 - even though direct dependencies (libfoo.so and libbar.so)
 were specified
 - if where to find the necessary libraries (the current directory) was not specified, error messages is displayed

Making libfoobar.so (4) error messages

```
$ gcc -c -Wall -fPIC foobar.c
$ gcc -shared -o libfoobar.so foobar.o -lfoo -lbar

/usr/bin/ld: cannot find -lfoo
/usr/bin/ld: cannot find -lbar
collect2: error: ld returned 1 exit status
```

- if -L. is not specified, error messages is displayed
- saying that the direct dependency libraries
 (libfoo.so and -libbar.so) could not be located
- the linker (1d) didn't know where to look to resolve -1foo or -1bar thus were not able to resolve them

TOC: 3. Making an application

- Making an application prog that uses libfooba.so
 - Not specifying nested dependencies
 - Warning and error messages
 - Using -L and -1 to make an application

Making an application prog that uses libfoobar.so (1)

• make a program prog that depends on libfoobar.so:

```
$ gcc -c -Wall main.c
$ gcc -o prog main.o -L. -lfoobar
```

- libfoo.so and libbar.so are the direct dependencies of libfoobar.so, and thus the nested dependencies of prog
- only direct dependency is specified (-lfoobar)
 with the correct search path (-L.)
- nested dependencies are <u>not</u> specified (-lfoo -lbar) but <u>libfoo</u>.so and <u>libbar</u>.so can be found in the specified search path (-L.)

Making an application prog that uses libfoobar.so (2)

make a program prog that depends on libfoobar.so:

```
$ gcc -c -Wall main.c
$ gcc -o prog main.o -L. -lfoobar -Wl,-rpath-link=$(pwd)
```

- only direct dependency was specified (-lfoobar)
 with the correct search path (-L.)
- nested dependencies were <u>not</u> specified (-lfoo -lbar)
 but can be handled by -rpath-link=\$(pwd)
 - libfoo.so and libbar.so are the *direct* dependencies of libfoobar.so, and thus the *nested* dependencies of prog

Creating **NEEDED** entries

make a program prog that depends on libfoobar.so:

```
$ gcc -c -Wall main.c
$ gcc -o prog main.o -L. -lfoobar -Wl,-rpath-link=$(pwd)
```

- in the .dynamic section of prog
 - direct dependecy specified by -lfoobar was recorded as NEEDED entries
 - nested dependecy, even though specified by -lfoo -lbar, are not recorded as NEEDED entries

```
$ readelf -d prog | grep NEEDED
  Tag
             Type
                                           Name/Value
                                           Shared library: [libfoobar.so] <---
  0x000000000000001 (NEEDED)
  0x0000000000000001 (NEEDED)
                                           Shared library: [libc.so.6]
```

NEEDED entries and nested dependencies (1)

- libfoo.so, libbar.so
 - these are the direct dependencies of libfoobar.so
 - thus, these are the nested dependencies of prog
 - when libfoobar.so was made, its direct dependencies were specified with -lfoo -lbar
 - this allows the direct dependencies of libfoobar.so to be recorded as NEEDED entries in the .dynamic section of libfoobar.so

Not specifying *nested* dependencies

although -lfoo and -lbar are not specified,

```
$ gcc -c -Wall main.c
$ gcc -o prog main.o -L. -lfoobar
```

- by looking into NEEDED entry of the .dynamic section of libfoobar.so,
- the linker (1d) detects the nested dynamic dependencies but they were <u>not</u> specified with -lfoo -lbar
 warning: not found libfoo.so, not found libbar.so
- the linker (1d) did <u>not</u> resolve the *nested* dependencies because they were <u>not</u> specified

```
error: undefined reference to foo, undefined reference to bar
```

 $\verb|https://stackoverflow.com/questions/49138195/whats-the-difference-between-rpath-like the additional content of the content$

Warning and error messages

- make a program prog that depends on libfoobar.so:
 - the *nested* dependencies are <u>not</u> specified (-lfoo -lbar) though with the correct search path (-L.)
 - not found libfoo.so ← -lfoo not specified
 - not found libbar.so ← -lbar not specified
 - undefined reference to bar ← -lbar not resolved
 - undefined reference to foo ← -lfoo not resolved

```
$ gcc -c -Wall main.c
$ gcc -o prog main.o -L. -lfoobar
/usr/bin/ld: warning: libfoo.so, needed by ./libfoobar.so, not found
(try using -rpath or -rpath-link)
/usr/bin/ld: warning: libbar.so, needed by ./libfoobar.so, not found
(try using -rpath or -rpath-link)
./libfoobar.so: undefined reference to 'bar'
./libfoobar.so: undefined reference to 'foo'
collect2: error: ld returned 1 exit status
```

https://stackoverflow.com/questions/49138195/whats-the-difference-between-rpath-like the properties of the contraction of the

2024-07-25 Thr

Using only -L and -1 to make an application

- to resolve the nested dependencies, we will consider the following ways
 - -L and -1
 - 2 -rpath-link
 - -rpath
- let us first ignore the gcc compiler's advice

```
try using -rpath or -rpath-link
```

- to handle nested dependencies, try first using -L and -1
 - search path for nested dependencies: -L.
 (the same directory specified for libfoobar.so)
 - nested dependencies : -lfoo -lbar
 - \$ gcc -o prog main.o -L. -lfoobar -lfoo -lbar

 $https://stacko\,verflow.\,com/questions/49138195/whats-the-difference-between-rpath-like and the stack of the$

TOC: 4. Running an application

- Need to specify runtime search paths
- More experiment with nested dependencies
- Specifying the runtime shared library paths
- Using LD_LIBRARY_PATH to run an application

Need to specify runtime search paths

 now, the application prog can be made, but cannot be made to run:

```
$ gcc -o prog main.o -L. -lfoobar -lfoo -lbar
$ ./prog
./prog: error while loading shared libraries: libfoobar.so:\
cannot open shared object file: No such file or directory
```

- at the runtime, the <u>loader</u> (ld.so) could not find <u>libfoobar</u>.so nor <u>libfoo</u>.so nor <u>libbar</u>.so
- need to specify the runtime search paths

More experiment with nested dependencies

- before specifying runtime search paths,
 let's experiment more with nested dependencies
- move libfoo.so and libbar.so libraries to lib2

```
$ mkdir lib2
$ mv libfoo.so libbar.so lib2
```

• then, make prog as before

```
$ gcc -o prog main.o -L. -lfoobar -lfoo -lbar
```

- the nested dependencies were specified (-lfoo -lbar)
- but the linker (ld) could not find libfoo.so and libbar.so at the specified directory (-L.)

```
/usr/bin/ld: cannot find -lfoo
/usr/bin/ld: cannot find -lbar
collect2: error: ld returned 1 exit status
```

• the correct search path -Llib2 must also be specified

Specifying the runtime shared library paths

now move libfoo.so, libbar.so back to the current directory .
 and make prog again

```
mv lib2/libfoo.so lib2/libbar.so .
$ gcc -o prog main.o -L. -lfoobar -lfoo -lbar
```

- the -L option is used to tell the linker (1d)
 where to find the libraries (shared objects)
 at the compile, and link time
- lots of ways to tell the runtime <u>linker</u> (dynamic loader ld.so)
 where to find the libraries (shared objects) at the runtime
 - -R
 - LD_LIBRARY_PATH
 - LD_RUN_PATH

https://stackoverflow.com/questions/31455979/how-to-specify-libraries-paths-in-gc

Using LD_LIBRARY_PATH to run an application

prog is made by using -L and -l only
 not by using -rpath nor -rpath-link
 gcc -o prog main.o -L. -lfoobar -lfoo -lbar

prog is made run by us LD_LIBRAY_PATH

```
$ export LD_LIBRARY_PATH=.
$ ./prog
foo
bar
```

at the runtime, LD_LIBRARY_PATH enables the <u>loader</u> (ld.so) to find <u>libfoobar.so</u>, <u>libfoo.so</u>, and <u>libbar.so</u> in the current directory .
 export LD_LIBRARY_PATH=.

https://stackoverflow.com/questions/49138195/whats-the-difference-between-rpath-like the difference-between-rpath-like the difference-betwee

NEEDED entries of each binary

binary	dependencies	entry	section
prog	libfoobar.so	NEEDED	.dynamic
libfoobar.so	libfoo.so, libbar.so	NEEDED	.dynamic

 $\verb|https://stackoverflow.com/questions/49138195/whats-the-difference-between-rpath-like the property of the p$
