æ

• Whenever the <u>destination</u> operand equals Zero, the <u>Zero</u> flag is <u>set</u>

ZF examples	
movw \$1, %cx subw \$1, %cx movw \$0xFFFF, %ax	; $%cx = 0$, ZF = 1
incw %ax incw %ax	; AX = 0, ZF = 1 ; AX = 1, ZF = 0

https://www.csie.ntu.edu.tw/~cyy/courses/assembly/12fall/lectures/handouts/lec14_:

- the Sign flag is set when the destination operand is negative
- the Sign flag is clear when the destination operand is positive

SF examples	
movw \$0, %cx subw \$1, %cx addw \$2, %cx	; %cx = -1, SF = 1 ; %cx = 1, SF = 0

https://www.csie.ntu.edu.tw/~cyy/courses/assembly/12fall/lectures/handouts/lec14_:

Carry flag CF

- Addition : copy carry out of MSB to CF
- Subtraction : copy inverted carry out of MSB to CF
- INC / DEC : not affect CF
- Applying NEG to a nonzero operand sets CF

CF example	s	
<pre>movw \$0x00ff, addw \$1,</pre>		%ax = 0x0100, SF = 0, ZF = 0, CF = 0
subw \$1, addb %1,		%cx = 0x00ff, SF = 0, ZF = 0, CF = 0 %al = 0x00, SF = 0, ZF = 1, CF = 1
movb \$0x6c,	%bh	Mai - 0x00, 51 - 0, 21 - 1, 51 - 1
addb %0x95,	%bh	%bh = 0x01, SF = 0, ZF = 0, CF = 1
movb \$2,	%al	
subb \$3,	%al	%al = 0xff, SF = 1, ZF = 0, CF = 1

https://www.csie.ntu.edu.tw/~cyy/courses/assembly/12fall/lectures/handouts/lec14_:

Image: A matrix and a matrix

Overflow flag OF

- the overflow flag is set when the signed result of an operation is invalid or out of range
 - case 1: adding two positive operands produces a negative number
 - case 2: adding two negative operands produces a positive number

OF examples		
movb \$+127, %al addb \$1, %al	; %al = -128, OF = 1	
movb \$0x7F, %al addb \$1, %al	; %al = 0x80, OF = 1	
movb \$0x80, %al addb \$0x92, %al	; 0x80 + 0x92 = 0x112 ; %al = 0x12, OF = 1	
movb \$-2, %al addb \$+127 %al	; 0xfe + 0x7f = 0x17d ; %al = 0x7d, OF = 0

Borrow and subtraction (1)

- While the carry flag is well-defined for addition,
- there are two ways in common use to use the carry flag for subtraction operations.
 - subtract with borrow uses the carry bit as a borrow flag
 subtract with carry uses the identity directly -x = (not x)+1 (i.e. without storing the carry bit inverted)

Borrow and subtraction (2)

- subtract with borrow uses the carry bit as a borrow flag
- when computing a b
 - if a < b, the carry bit is set and a borrow must be performed.
 - If a >= b, the bit is *cleared*.
- a SBB (subtract with borrow) instruction will compute a-b-C = a-(b+C)
- a SUB (subtract without borrow) acts a-b-0 = a - b as if the borrow bit were clear.

• subtract with carry uses the identity directly -x = (not x)+1

(i.e. without storing the <u>carry bit</u> inverted)

- computes a b as a+(not b)+1 the carry bit is set according to this addition
- subtract with carry computes a+not(b)+C
- subtract without carry acts as if the carry bit were set
- The result is that the <u>carry bit</u> is set if a >= b, clear if a < b.

• the first approach : subtract with borrow

- The 8080, 6800, Z80, 8051, x86 and 68k families (among others) use a borrow bit.
- the second approach : subtract with carry
 - The System/360, 6502, MSP430, COP8, ARM and PowerPC processors use this convention.
 - The 6502 is a particularly well-known example because it does not have a subtract without carry operation, so programmers must ensure that the carry flag is set before every subtract operation where a borrow is not required.

- However, there are exceptions in both directions; the VAX, NS320xx, and Atmel AVR architectures use the borrow bit convention, but *call* their a-b-C operation subtract with carry (SBWC, SUBC and SBC).
- The PA-RISC and PICmicro architectures use the carry bit convention, but *call* their a+not(b)+C operation subtract with borrow (SUBB and SUBWFB).

- The ST6 8-bit microcontrollers are perhaps the most confusing of all.
 Although they do not have any sort of subtract with carry instruction, they do have a carry bit which is set by a subtract instruction, and the convention depends on the processor model.
- The ST60 processor uses the "carry" convention, while the ST62 and ST63 processors use the "borrow" convention.

Summary of different uses of carry flag in subtraction

Carry or	Subtract without	Subtract	Subtract
borrow bit	carry/borrow	with borrow	with carry
C = 0	a - b	a - b - 0	a - b - 1
	= a+not(b)+1	= a+not(b)+1	= a+not(b)+ 0
C = 1	a - b	a - b - 1	a - b - 0
	= $a+not(b)+1$	= a+not(b)+0	= $a+not(b)+1$

https://en.wikipedia.org/wiki/Carry_flag

э

< A 1

The ADC (add with carry) instruction adds both a source operand and the contents of the Carry flag to a destination operand: ADC op1, op2; op1 += op2, op1 += CF The instruction formats are the same as for the ADD instruction: ADC reg, reg ADC mem, reg ADC reg, mem ADC mem, imm ADC reg, imm

http://www.c-jump.com/CIS77/MLabs/M11arithmetic/M11_0180_sbb_instruction.htm

The ADC instruction does not distinguish between signed or unsigned operands.

Instead, the processor evaluates the result for both data types and sets OF flag to indicate a carry out from the signed result.

CF flag to indicate a carry out from the unsigned result.

The sign flag SF indicates the sign of the signed result.

The ADC instruction is usually executed as part of a chained multibyte or multiword addition, in which an ADD or ADC instruction is followed by another ADC instruction.

http://www.c-jump.com/CIS77/MLabs/M11arithmetic/M11_0180_sbb_instruction.htm

The following fragment adds two 8-bit integers (FFh + FFh), producing a 16-bit sum in DL:AL, which is 01h:FEh.

mov dl, 0 mov al, 0FFh add al, 0FFh ; AL = FEh, CF = 1 adc dl, 0 ; DL += CF, add "leftover" carry

Similarly, the following instructions add two 32-bit integers (FFFFFFF + FFFFFFFh).

The result is a 64-bit sum in EDX:EAX, 0000000lh:FFFFFFEh, mov edx, 0 mov eax, 0FFFFFFFh add eax, 0FFFFFFFh adc edx, 0 ; EDX += CF, add "leftover" carry

 $\tt http://www.c-jump.com/CIS77/MLabs/M11arithmetic/M11_0180_sbb_instruction.htm$

The following instructions add two 64-bit numbers received in EBX:EAX and EDX:ECX:

The result is returned in EBX:EAX.

Overflow/underflow conditions are indicated by the Carry flag.

add eax, ecx ; add low parts EAX += ECX, set CF adc ebx, edx ; add high parts EBX += EDX, EBX += CF ; The result is in EBX:EAX ; NOTE: check CF or OF for overflow (*)

The 64-bit subtraction is also simple and similar to the 64-bit addition: sub eax, ecx ; subtract low parts EAX -= ECX, set CF (borrow) sbb ebx, edx ; subtract high parts EBX -= EDX, EBX -= CF ; The result is in EBX:EAX ; NOTE: check CF or OF for overflow (*)

 $(\ensuremath{^*})$ The Carry flag CF is normally used for unsigned arithmetic.

The Overflow flag OF is normally used for signed arithmetic.

http://www.c-jump.com/CIS77/MLabs/M11arithmetic/M11_0180_sbb_instruction.htm

(I) < ((()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) < (()) <

After subtraction, the carry flag CF = 1 indicates a need for a borrow. The SBB (subtract with borrow) instruction subtracts both a source operand and the value of the Carry flag CF from a destination operand: SBB op1, op2 ; op1 -= op2, op1 -= CF The possible operands are the same as for the ADC instruction. The following fragment of code performs 64-bit subtraction: mov edx, 1 ; upper half mov eax, 0 ; lower half sub eax, 1 ; subtract 1 from the lower half, set CF. sbb edx, 0 ; subtract carry CF from the upper half.

http://www.c-jump.com/CIS77/MLabs/M11arithmetic/M11_0180_sbb_instruction.htm

The example logic: Sets EDX:EAX to 0000001h:0000000h. Subtracts 1 from the value in EDX:EAX. The lower 32 bits are subtracted first, setting the Carry flag CF. The upper 32 bits are subtracted next, including the Carry flag.

http://www.c-jump.com/CIS77/MLabs/M11arithmetic/M11_0180_sbb_instruction.htm

When an immediate value is used in SBB as an operand, it is sign-extended to the length of the destination operand.

The SBB instruction does not distinguish between signed or unsigned operands.

Instead, the processor evaluates the result for both data types and sets the OF flag to indicate a borrow in the signed result.

CF flag to indicate a borrow in the unsigned result.

The SF flag indicates the sign of the signed result.

The SBB instruction is usually executed as part of a chained multibyte or multiword subtraction, in which a SUB or SBB instruction is followed by another SBB instruction.

 $\tt http://www.c-jump.com/CIS77/MLabs/M11arithmetic/M11_0180_sbb_instruction.htm$

- condition code registers describe attributes of the most recent arithmetic or logical operation
- these registers can be tested to perform conditional branches
- the most useful condition codes are as belows

CF	Carry Flag
ZF	Zero Flag
SF	Sign Flag
OF	Overflow Flag

• as a result of the most recent operation

CF a carry was generated out of the msb used to detect overflow for unsigned operations

- ZF a zero was yielded
- SF a negative value was yielded
- OF a 2's complement overflow was happened either neagtive or positive

 assume addl is used to perform t = a + b and a, b, t are of type int

CF	unsigned overflow	(unsigned t) < (unsigned a)
ZF	zero	(t == 0)
SF	negative	(t < 0)
OF	signed overflow	(a < 0 == b < 0) && (t < 0 != a < 0)

47 ▶

CF	(unsigned t) < (unsigned a)	mag(t) < mag(a) if C=1
ZF	(t == 0)	zero t
SF	(t < 0)	negative t
OF	(a<0 = b<0) && (t<0 ! a<0)	sign(a) = sign(b) ! sign(t)

イロン イ団 と イヨン ・

• The condition codes are grouped into three blocks :

Z, O, S, P	Zero
	Overflow
	Sign
	Parity
unsigned arithmetic	Above
	Below
signed arithmetic	Greater
	Less

- JB would be "Jump if Below" (unsigned)
- JL would be "Jump if Less" (signed)

Image: A matrix and a matrix

Flag registers (3)

• In 16 bits, subtracting 1 from 0

from	to	
0	65,535	unsigned arithmetic
0	-1	signed arithmetic
0x0000	OxFFFF	bit representation

- It's only by interpreting the condition codes that the meaning is clear.
- 1 is subtracted from 0x8000:

from	to	
32,768	32,767	unsigned arithmetic
-32,768	32,767	signed arithmetic
0x8000	0x7FFF	bit representation

 $(0111\ 1111\ 1111\ 1111\ +\ 1 = 1000\ 0000\ 0000\ 0000)$

https://riptutorial.com/x86/example/6976/flags-register

Young W. Lim

- accessing the condition codes
 - to read the condition codes directly
 - to set an integer register
 - to perform a conditional branch

based on some combination of condition codes

- the set instructions set a <u>single</u> byte to 0 or 1 depending on some combination of the <u>condition</u> codes
- the destination operand D is
 - either one of the eight single byte register elements
 - or a memory location where the single byte is to be stored
- to generate a 32-bit result, the high-order 24-bits must be *cleared*

a typical assembly for a c predicate

; a is in %edx
; b is in %eax
cmpl %eax, %edx ; compare a and b ; (a - b)
setl %al ; set low order byte of %eax to 0 or 1
movzbl %al, %eax ; set remaining bytes of %eax to 0

- movzbl instruction is used to clear the high-order three bytes
- | set(1, ge) | D | (less, signed <) | D \leftarrow SF^OF |

・ 何 ト ・ ヨ ト ・ ヨ

- Purpose: To convert an unsigned integer to a wider unsigned integer
- opcode src.rx, dst.wy
- dst <- zero extended src;

- MOVZBW (Move Zero-extended Byte to Word) 8-bit zero BW
- MOVZBL (Move Zero-extended Byte to Long) 24-bit zero BL
- MOVZWL (Move Zero-extended <u>Word</u> to <u>Long</u>) 16-bit zero WL

• MOVZ BW (Move Zero-extended <u>Byte</u> to <u>Word</u>) 8-bit zero

- the \underline{low} 8 bits of the destination are replaced by the source operand
- the top 8 bits are set to 0.
- MOVZ BL (Move Zero-extended Byte to Long) 24-bit zero
 - the low 8 bits of the destination are replaced by the source operand.
 - the top 24 bits are set to 0.
- MOVZ WL (Move Zero-extended Word to Long) 16-bit zero
 - the low 16 bits of the destination are replaced by the source operand.
 - the top 16 bits are set to 0.
- The source operand is unaffected.

- for some of the underlying machine instructions, there are multiple possible names (synonyms),
 - setg (set greater)
 - setnle (set not less or equal)
- compilers and disassemblers make arbitrary choices of which names to use

- although all arithmetic operations set the condition codes, the descriptions of the different set commands apply to the case where a comparison instruction has been executed, setting the condition codes according to the computation t = a - b
- for example, consider the sete, or "Set when equal" instruction
- when a = b, we will have t = 0, and hence the zero flag indicates equality

- Similarly, consider testing a signed comparison with the set1 or "Set when less"
- when a and b are in two's complement form, then for a < b we will have a - b < 0 if the true difference were computed
- when there is no overflow, this would be indicated by having the sign flag set

```
    when there is positive overflow,
    because a - b is a large positive number, however,
    we will have t < 0</li>
```

- when there is negative overflow,
 because a b is a small negative number,
 we will have t > 0
- in either case, the sign flag will indicate the opposite of the sign of the true difference

- in either case, the sign flag will indicate the opposite of the sign of the true difference
- hence, the Exclusive-Or of the overflow and sign bits provides a test for whether a < b
- the other signed comparison tests are based on other combinations of SF $^\circ$ OF and ZF

- for the testing of unsigned comparisons, the carry flag will be set by the cmpl instruction when the integer difference a - b of the unsigned arguments a and b would be negative, that is when (unsinged) a < (unsigned) b
- thus, these tests use combinations of the carry and zero flags
