## Accessing a **contiguous 1-d** array

- **1-d** array access
- **2-d** array access
- **3-d** array access

# Accessing an int array **a** as a **1-d** array

```
int    a [2*3*4] ;
```

```
a [k]
```

k = 0,1, ...,23

```
int a [2*3*4] ;
```

```
c[i][j][k] ≡ *(* (c+i)+j)+k    int ** c[2] ;  
b[j][k]    ≡ *(* (b+j)+k)     int * b[2*3] ;  
a[k]       ≡ *(a+k)           int a[2*3*4] ;
```

# Accessing an int array **a** as a 2-d array using **b**

```
int    a [2*3*4] ;
int *  b [2*3] ;
```

```
b[j] = &a[j*4];
```

**a, b** take actual memory locations

$$b[j][k] \equiv a[j*4 + k]$$

$j = 0, 1, 2, 3, 4$   
 $k = 0, 1, 2, 3$

```
c[i][j][k] ≡ *(* (c+i)+j)+k    int ** c[2] ;
b[j][k]    ≡ *(* (b+j)+k)      int * b[2*3] ;
a[k]       ≡ *(a+k)            int a[2*3*4] ;
```

# Accessing an int array **a** as a 3-d array

```

int      a [2*3*4] ;
int *    b [2*3] ;
int **   c [2] ;
    
```

```

c[i] = &b[i*3];
b[j] = &a[j*4];
    
```

**a**, **b**, **c** take actual memory locations

$$c[i][j][k] \equiv a[(i*3+j)*4+k]$$

*i* = 0, 1  
*j* = 0, 1, 2  
*k* = 0, 1, 2, 3

```

c[i][j][k] ≡ *(*(*c+i)+j)+k
b[j][k]    ≡ *(*b+j)+k
a[k]       ≡ *(a+k)

int ** c[2] ;
int *  b[2*3] ;
int a[2*3*4] ;
    
```

---

## Accessing a **non-contiguous 1-d** arrays

- ◆ **3-d** array access

# Accessing non-contiguous 1-d arrays as a 3-d array (1)

```
int    a [2*3*4] ;
int *  b [2*3] ;
int ** c [2] ;
```

```
c[i] = &b[i*3];
b[j] = &aj[0];
```

not c expressions

**aj, b, c** take actual memory locations

```
int a1 [4];
int a2 [4];
int a3 [4];
int a4 [4];
int a5 [4];
int a6 [4];
```

```
c [i][j][k]
```

i = 0, 1  
j = 0, 1, 2  
k = 0, 1, 2, 3

```
int* b [2*3];
```

Because the physical **allocation** of array **c** and **b**,  
the **contiguous constraints** can be **relaxed**  
contiguous **c[i][j][k]** only for **k=0,1,2,3**

# Accessing non-contiguous 1-d arrays as a 3-d array (2)

```
int    a [2*3*4] ;
int *  b [2*3]  ;
int ** c [2]    ;
```

```
not c expressions
c[i] = &bi[0];
bi[j] = &aj[0];
```

not c expressions  
aj, bi, c take actual memory locations

```
int a1 [4];
int a2 [4];
int a3 [4];
int a4 [4];
int a5 [4];
int a6 [4];
```

```
int b1 [3];
int b2 [3];
```

```
c [i][j][k]
```

i = 0, 1  
j = 0, 1, 2  
k = 0, 1, 2, 3

Because the physical **allocation** of array **c** and **b**,  
the **contiguous constraints** can be **relaxed**  
contiguous  $c[i][j][k]$  only for  $k=0,1,2,3$

---

Accessing **statically** allocated arrays

Accessing **dynamically** allocated arrays

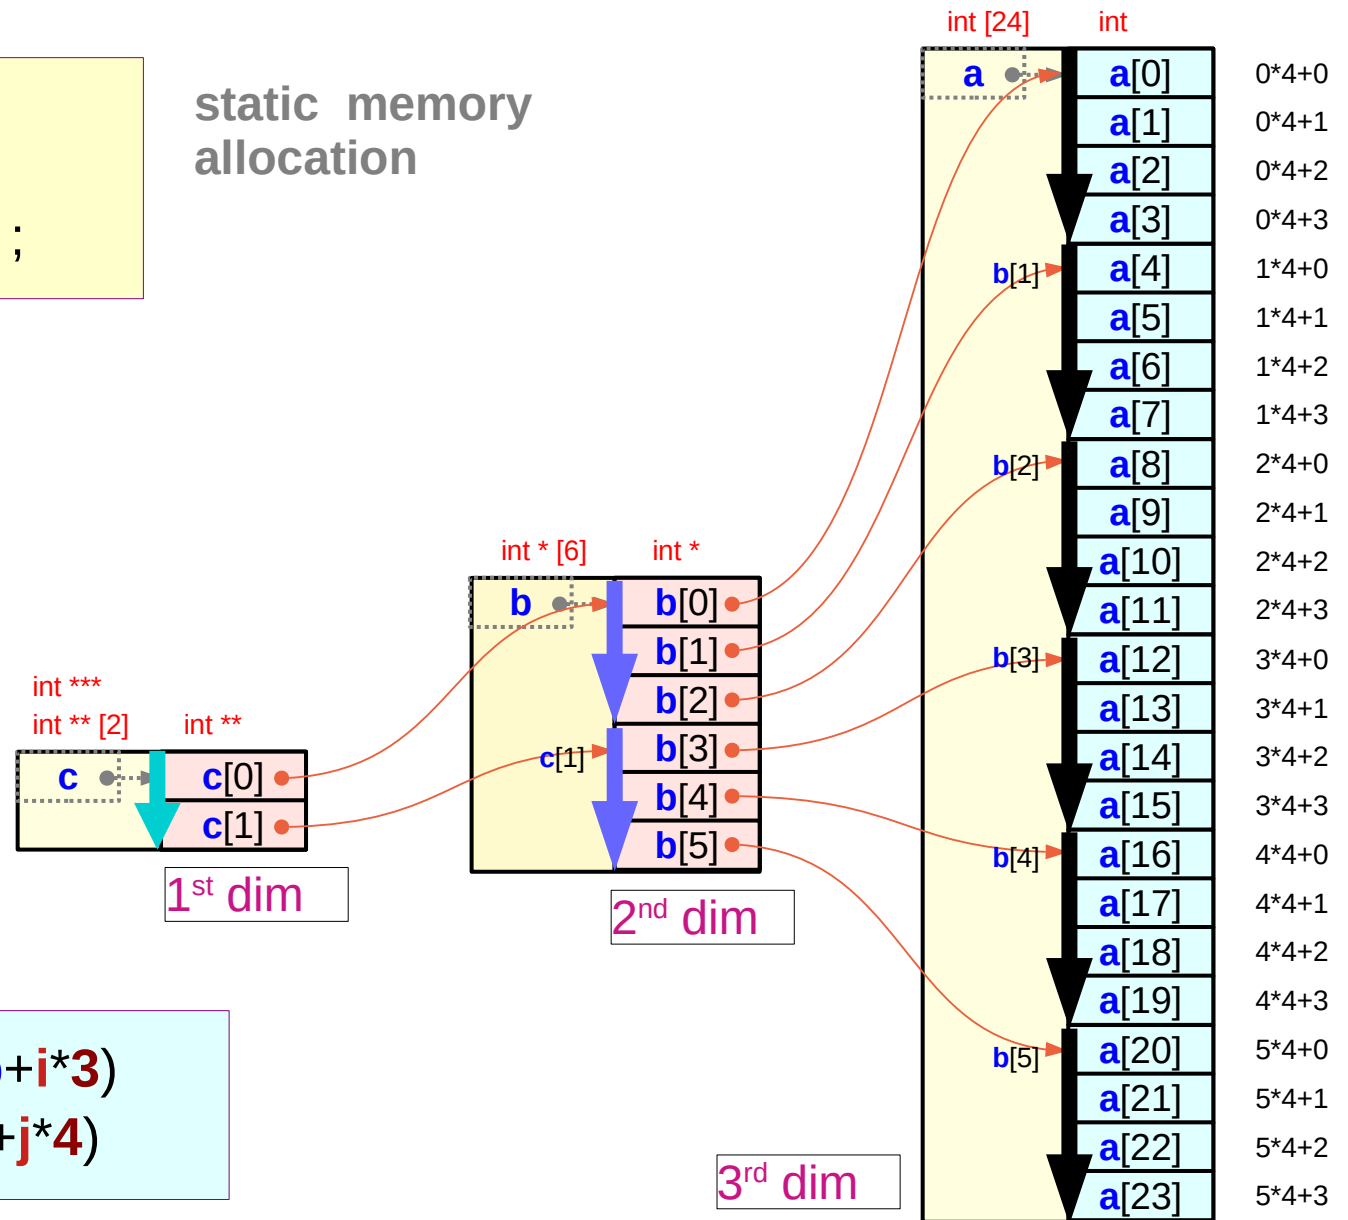

# Using arrays **a**, **b**, **c** – statically allocated

# C operators : & and \*

# Byte addresses of sub-arrays in an array

~~$\&(\&(\&(c[i])[j])[k])$~~

$\bar{\&}(\bar{\&}(\bar{\&}(c[i])[j])[k])$

## $\&$ C operator

can be applied to only **lvalue** variable

returns **address value**

thus, the above expression is **not** possible

successive application of  $\&$  is **not** possible

In contrast, **\*p** becomes a lvalue variable

**\*** operator can be applied successively.

## $\bar{\&}$ mathematical operator

# Decomposing de-referencing operation using value()

## Address-of operation

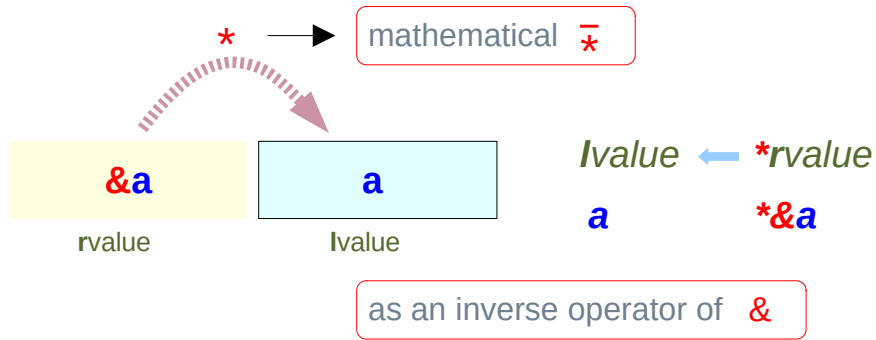

$\bar{\&}$  is a mathematical operator (the inverse operator of  $*$ )

$$\text{value}(\&X) = \text{value}(\text{value}(\bar{\&X})) = \text{value}(\bar{\&X}) = \&X$$

## De-reference operation

# Introducing mathematical operators : $\bar{\&}$ and $\bar{*}$

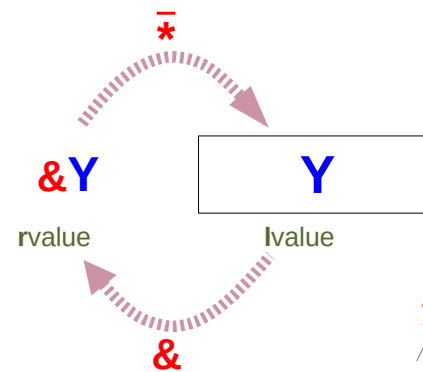

# & and mathematical $\bar{*}$

$$\cancel{\&}\bar{*}X = X$$

$$\cancel{*}\bar{\&}Y = Y$$

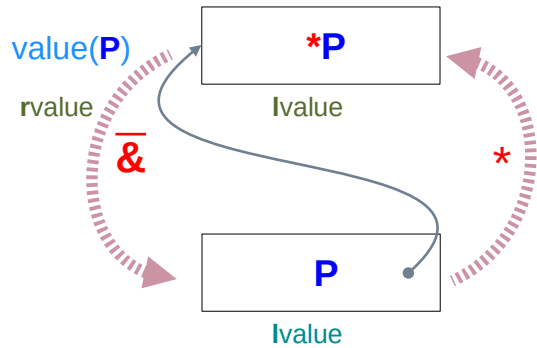

$$\&\bar{*}X = X$$

$$\bar{*}\&Y = Y$$

# \* and mathematical $\bar{\&}$

$$\bar{\&} * P = P$$

$$* \bar{\&} Q = Q$$

# & and \* operators in two steps

## Two step Address-of operation

## Two step De-reference operation

# C operators and mathematical operators

## Address-of operation

## De-reference operation

# Inverse operators $\bar{*}$ and $\&$

$lvalue = \bar{*}rvalue$   
 $a \leftarrow \bar{*}\&a$

$lvalue = \bar{*}rvalue$

# Accessing $c[i][j][k]$ – Conditions

## General requirements

```
 $c[i][j][k] = *(c[i][j]+k)$   
 $c[i][j] = *(c[i]+j)$   
 $c[i] = *(c+i)$ 
```

```
 $\&c[i][j][k] = c[i][j]+k$   
 $\&c[i][j] = c[i]+j$   
 $\&c[i] = c+i$ 
```

```
 $\&c[i][j][0] = c[i][j]$   
 $\&c[i][0] = c[i]$   
 $\&c[0] = c$ 
```

## Pointer array approach

```
 $int^{**} c[2];$   
 $int^* b[2*3];$   
 $int c[2*3*4];$ 
```

```
 $c[i][j][k] :: int$   
 $c[i][j] :: int^*$   
 $c[i] :: int^{**}$ 
```

```
 $c[i] \leftarrow \&b[i*3]$   
 $b[j] \leftarrow \&a[j*4]$ 
```

## Hierarchical Pointer Arrays

## Array pointer approach

```
 $int c[2][3][4];$ 
```

```
 $c[i][j][k] :: int$   
 $c[i][j] :: int [4]$   
 $c[i] :: int [3][4]$ 
```

```
 $c \leftarrow \&c[0][0][0]$   
 $c[i] \leftarrow \&c[i][0][0]$   
 $c[i][j] \leftarrow \&c[i][j][0]$ 
```

## Virtual Array Pointers

# Accessing $c[i][j][k]$ – Pointer Array Approach (1)

$c[i]$  ←  $\&b[i*3]$   
 $b[j]$  ←  $\&a[j*4]$

$[2][3][4]$

$c[i] \equiv *(c + i)$   
 $c[i][j] \equiv *(c[i] + j)$   
 $c[i][j][k] \equiv *(c[i][j] + k)$

$\&c[i] \equiv (c + i)$   
 $\&c[i][j] \equiv (c[i] + j)$   
 $\&c[i][j][k] \equiv (c[i][j] + k)$

$b[j] \equiv (a + j*4)$

$*(b[j] + k) = *(a + j*4 + k);$

# Address replication

## equivalence relations – c expressions

$$\begin{aligned} \mathbf{c[i][j][k]} &= \mathbf{*(c[i][j] + k)} \\ \mathbf{c[i][j]} &= \mathbf{*(c[i] + j)} \\ \mathbf{c[i]} &= \mathbf{*(c + i)} \end{aligned}$$

$$\begin{aligned} \mathbf{\&c[i][j][k]} &= \mathbf{(c[i][j] + k)} \\ \mathbf{\&c[i][j]} &= \mathbf{(c[i] + j)} \\ \mathbf{\&c[i]} &= \mathbf{(c + i)} \end{aligned}$$

## address replication – math expressions

$$\begin{aligned} \text{value}(\mathbf{c[i][j]}) &= \text{value}(\mathbf{(c[i] + j)<sub>4-43-4-4</sub>$$

# Applying address replication

---

# const pointers

# const type, const pointer type (1)

```
const int * p;
```

```
int * const q ;
```

```
const int * const r ;
```

```
int * p;
```

```
int * q ;
```

```
int * r ;
```

*constant*    *must not be changed*  
*must not be updated*  
*must not be written*  
*must not be assigned*

# const type, const pointer type (2)

**const int** \* p ;

constant integer

int \* **const q** ;

constant pointer

**const int** \* **const r** ;

constant integer

**const int** \* **const r** ;

constant pointer

**const** [ ]

group with the following

\*p : constant integer value

q : constant (int \*) pointer

\*r : constant integer value

r : constant (int \*) pointer

# const type, const pointer type (3)

`const int *p;`

`int *const q;`

`const int *const r;`

# const examples (1)

```
const int * pc;  
int * p, i;  
const int ic;
```

```
pc = &i; // (const int *) ← (int *)  
*pc = 5; // (const int) error
```

Writing to the writable memory location (i)  
is forbidden via **pc** ... (no harm, OK)

```
p = &ic; // (int *) ← (const int *) warning  
*p = 5; // (int)
```

Writing to the read only memory location (ic)  
is not forbidden via **p** ... (hazardous, not OK)

**pc** can point to **i**  
**\*pc** must be **const**

the same memory location  
that can be written via **i**  
cannot be written via **\*pc**

**\*pc** should not write  
the writable memory location

Assume **p** points to **const ic**

the same memory location  
that cannot be written via **ic**,  
can be written via **\*p**

thus **\*p** can write  
the **const** memory location

therefore, **p** should not point to **const ic**

# const examples (2)

```
const int * pc;  
    int * p, i = 5;  
const int ic = 7;
```

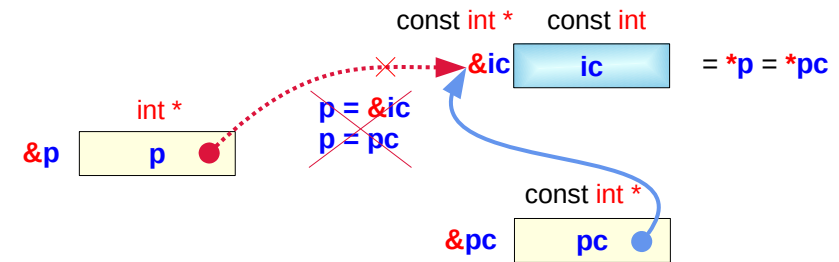

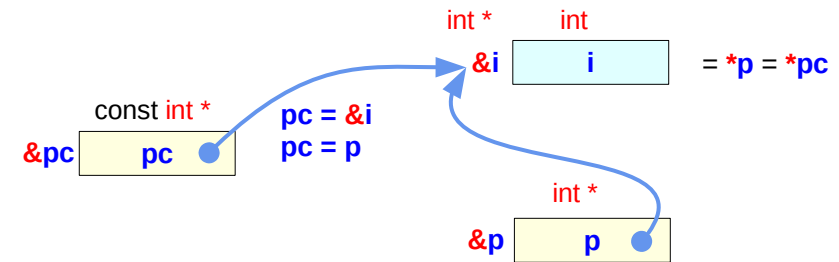

```
p = &i;  
pc = &ic
```

// more constrained type ← general type (O)

```
pc = &i; // (const int * ← int *)  
pc = p; // (const int * ← int *)
```

// general type ← more constrained type (X)

```
p = &ic; // (int * ← const int *) warning  
p = pc; // (int * ← const int *) warning
```

C A Reference Manual, Harbison & Steele Jr.

# const examples (3)

```
const int * pc;
      int * p, i;
const int ic;
```

```
p = &i; // (int *) ← (int *)
*p = 5; // (int)
pc = &i; // (const int *) ← (int *)
*pc = 5; // (const int) error
```

```
p = &ic; // (int *) ← (const int *) warning
*p = 5; // (int)
pc = &ic; // (const int *) ← (const int *)
*pc = 5; // (const int) error
```

C A Reference Manual, Harbison & Steele Jr.

# const examples (4)

```
const int * pc;  
int * p, i;  
const int ic;
```

```
pc = p = &i;  
pc = &ic  
*p = 5;  
*pc = 5; // invalid *pc :: const int
```

```
pc = &i; // (const int * ← int *)  
pc = p; // (const int * ← int *)  
p = &ic; // invalid (int * ← const int *)  
p = pc; // invalid (int * ← const int *)  
p = (int *) &ic; // type cast  
p = (int *) pc; // type cast
```
