`int` primitive data

# Virtual array pointers and abstract data

```
int c [2][3][4];
```

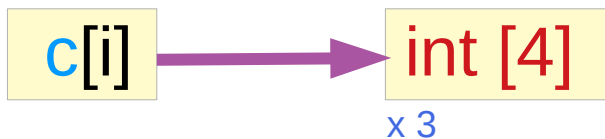

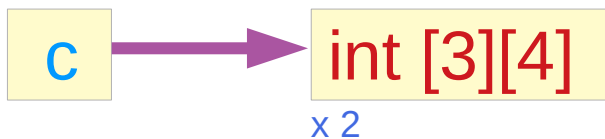

all these pointers are virtual, and take no actual memory locations

exploiting the **contiguity** of allocated memory locations

# Abstract Data Sizes

```
int c [2][3][4];
```

the size of a pointer type is fixed  
Here, the sizes of virtual pointers are shown  
i.e, the sizes of different abstract data types

sizeof( c )	=	sizeof(int [2][3][4])
sizeof(*c)	=	sizeof(int [3][4])
sizeof( c[i] )	=	sizeof(int [3][4])
sizeof(*c[i] )	=	sizeof(int [4])
sizeof( c[i][j] )	=	sizeof(int [4])
sizeof(*c[i][j] )	=	sizeof(int)

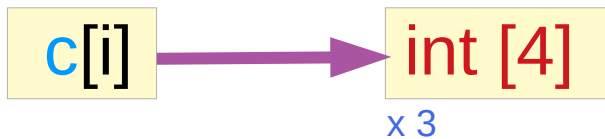

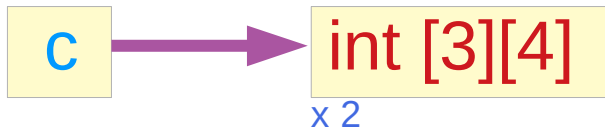

all are sizes of arrays

c, c[i], c[i][j] are virtual array pointers  
and they are also abstract data (arrays)

when sizes are considered,  
view them as abstract data (arrays)

# Virtual array pointer sizes and abstract data sizes

```
