Assumption

assume that

value(c) returns the hexadecimal number that is obtained by `printf("%p", c)`, when the variable `c` contains an address as its value

type(c) can be determined by the warning message of `printf("%d", c)`, when the variable `c` contains an address as its value

```
#include <stdio.h>
int main(void) {
    int c[3];
    printf ("c= %p \n", &c);
}
```

`c= 0x7fffd923487c`

```
#include <stdio.h>
int main(void) {
    int c[3];
    printf ("c= %d \n", &c);
}
```

t.c: In function 'main':
t.c:5:16: warning: format '%d' expects argument of type 'int',
but argument 2 has type 'int (*)[3]' [-Wformat=]
printf ("c= %d \n", &c);

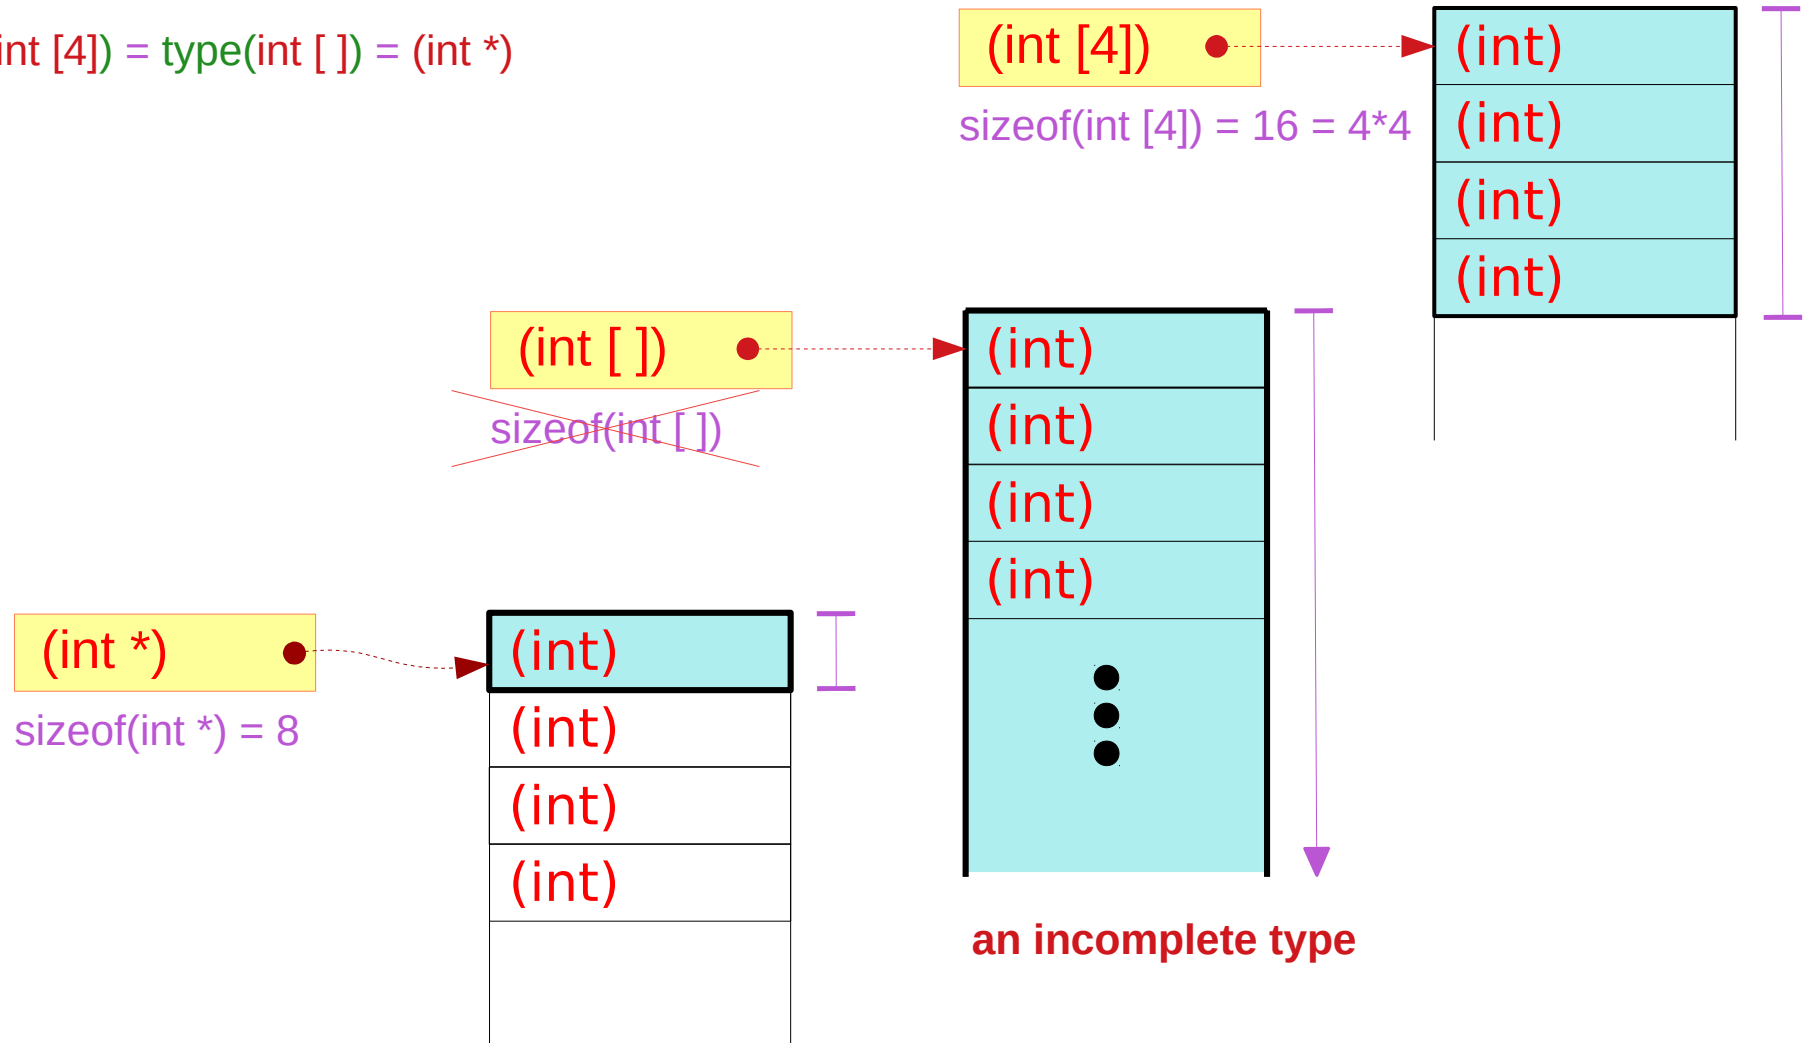

int *

int [N]

int []

Differences in pointer types – `int [4]`, `int []`, `int *`

`type(int [4]) = type(int []) = (int *)`

Integer pointer and array types – `int *`, `int [2]`, `int [3]`

`int *a;`

```
a[0] = *a  
a[1] = *(a+1)  
a[2] = *(a+2)  
a[3] = *(a+3)
```

syntactically legitimate

programmers must ensure their validity

`int b[2]`

```
b[0] = *b  
b[1] = *(b+1)  
b[2] = *(b+2)  
b[3] = *(b+3)
```

syntactically legitimate

programmers must ensure their validity

`int c[3];`

```
c[0] = *c  
c[1] = *(c+1)  
c[2] = *(c+2)  
c[3] = *(c+3)
```

syntactically legitimate

programmers must ensure their validity

Integer pointer and array types – `int *`, `int [2]`, `int [3]`

`int *a;`

`a[0] = *a`

`type(a) = int *`
`type(&a) = int **`

`value(&a) ≠ value(a)`

`sizeof(a)`
= pointer size
= `sizeof(int *)`

`int b[2]`

`b[0] = *b`

`type(b) = int *`
`type(&b) = int (*) [2]`

`value(&b) = value(b)`

`sizeof(b)`
= `sizeof(*b) * 2`
= `sizeof(int) * 2`

`&b` and `b` evaluate the same address but have different types and also different sizes

`int c[3];`

`c[0] = *c`

`type(c) = int *`
`type(&c) = int (*) [3]`

`value(&c) = value(c)`

`sizeof(c)`
= `sizeof(*c) * 3`
= `sizeof(int) * 3`

`&c` and `c` evaluate the same address but have different types and also different sizes

Integer pointer and array types – `int *`, `int [3]`

`int *a;`

`sizeof (a) = pointer size`

`value(&a) ≠ value(a)`

the address of pointer variable `a` is not equal to the pointed address

real memory location for `a`

`a` :: `int *`
`&a` :: `int **`

`int c[3];`

`sizeof (c) = sizeof(*c) * 3`

`value(&c) = value(c)`

the starting address of array variable `c` is equal to the address of the 1st element

no actual memory location for `c`

`c` :: `int *`
`&c` :: `int (*) [3]`

Integer pointer and array types – `int [3]`

```
int c[3];
```

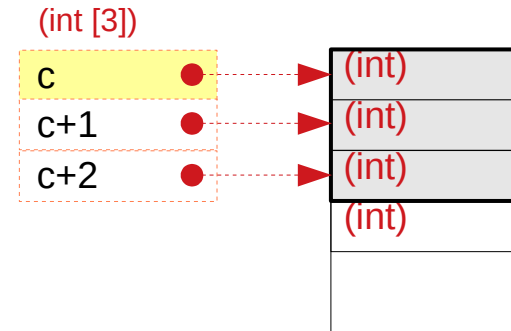

`sizeof (c) = sizeof(int) * 3`

`value(&c) = value(c)`

`type(c) = int *`

`type(&c) = int (*) [3]`

```
int c[3];
```

`sizeof (c) = sizeof(*c) * 3 ... leading element`

`sizeof (c+1) = pointer size`

`sizeof (c+2) = pointer size`

`value(&c) = value(c) ... leading element`

`value(c+1) = value(c) + sizeof(*c) * 1`

`value(c+2) = value(c) + sizeof(*c) * 2`

`type(c) = int *`

`type(c+1) = int *`

`type(c+2) = int *`

`type(&c) = int (*) [3]`

Types of multi-dimension array names

```
int a ;
```

```
int b [4];
```

```
int c [4][5];
```

```
int d [4][5][6];
```

```
a :: int
```

→ int

```
b :: int [4]
```

→ int (*)

int *

```
c :: int [4][5]
```

→ int (*)[5]

```
d :: int [4][5][6]
```

→ int (*)[5][6]

array types

specific types

array pointer types

general type

Array pointers v.s. Array

int ** **→** **int *** **→** **int**

int (*) [4] **→** **int [4]** **→** **int**
int
int
int
int

Types of integer pointers

Variable declaration of integer pointers

`int *q = &p;`

`int *p = &a;`

`int a;`

`int (*r)[4] = &c;`

`int c[4];`

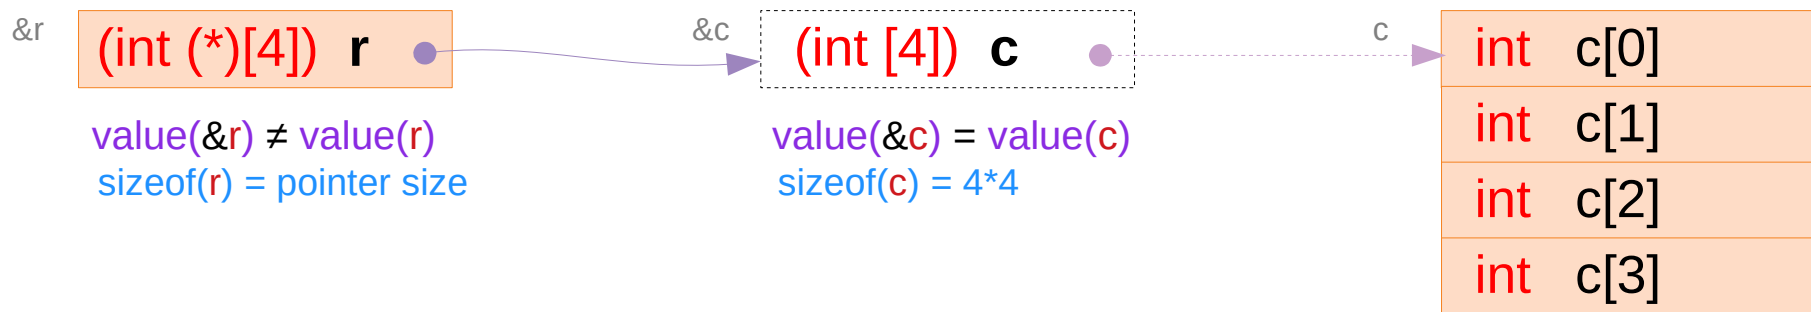

Types and sizes of integer pointers

`type(int [4]) = type(int []) = (int *)`

```
int a;  
int *p = &a;  
int *q = &p;
```

```
int c[4];  
int (*r)[4] = &c;
```

Sizes of integer pointers

a pointer to an `int`

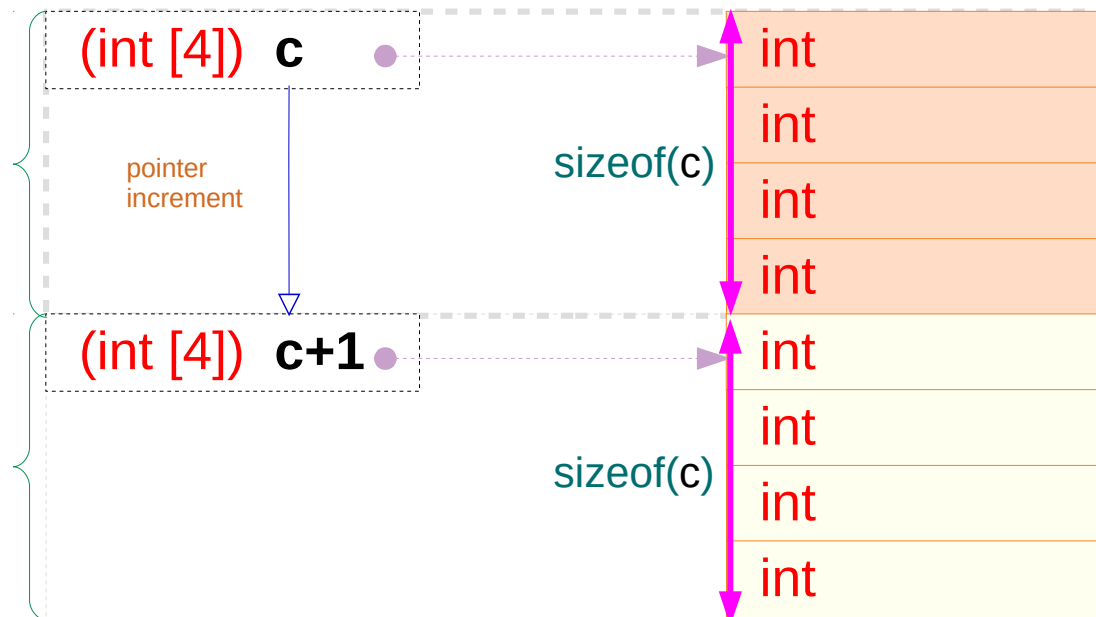

`sizeof(p)` = pointer size
= 8 bytes on 64-bit machine
= 4 bytes on 32-bit machine

an `int` array name

an array :
an aggregate type

`sizeof(c)`
= `sizeof(*c) * 4`
= `sizeof(int) * 4`
= `4 * 4 = 16 bytes`

`type(int [4]) = type(int []) = (int *)`

Double integer pointer type – (int **)

(int **) type can point only to **(int *)** type – an **int** array name (X)

$\text{type}(\text{int } [4]) = \text{type}(\text{int } []) = (\text{int } *)$
each of these types points to an **int** type data

Integer array pointer type – (int (*)[4])

Array Pointers

Pointer to an array – variable declarations

```
int m ;
```

```
int *n ;
```

an integer pointer

Array **Pointer Approach**
(**pointer to arrays**)

```
int a [4]
```

```
int (*p) [4]
```

an array pointer

```
int func (int a, int b) ;
```

```
int (*fp) (int a, int b) ;
```

a function pointer

Pointer to an array – a type view

int 4 byte data

int *

an integer pointer

array pointer:
a pointer to an array

pointer array:
an array of pointers

int [4] 4*4 byte data

int (*) [4]

an array pointer

int (int, int) instructions

int (*) (int, int)

a function pointer

Pointer to a 1-d array – (1) type declarations

`&a` and `a` print
the same address
but have different types

`value(&a) = value(a)`

`type(&a) ≠ type(a)`

`int (*)[4] ≠ int [4]`

those values are evaluated as addresses

Pointer to a 1-d array – (2) types and sizes

```
int a [4];
```

assignment

equivalence

```
int (*p) [4];
```

```
p = &a
```

```
a ≡ &a[0]
```

(int (*) [4])

(int [4]) = (int *) = (int (*))

(int)

variables

sizeof(p) =
8 bytes

sizeof(a) =
4*4 bytes

4

sizeof(a[0]) =
4 bytes

addresses

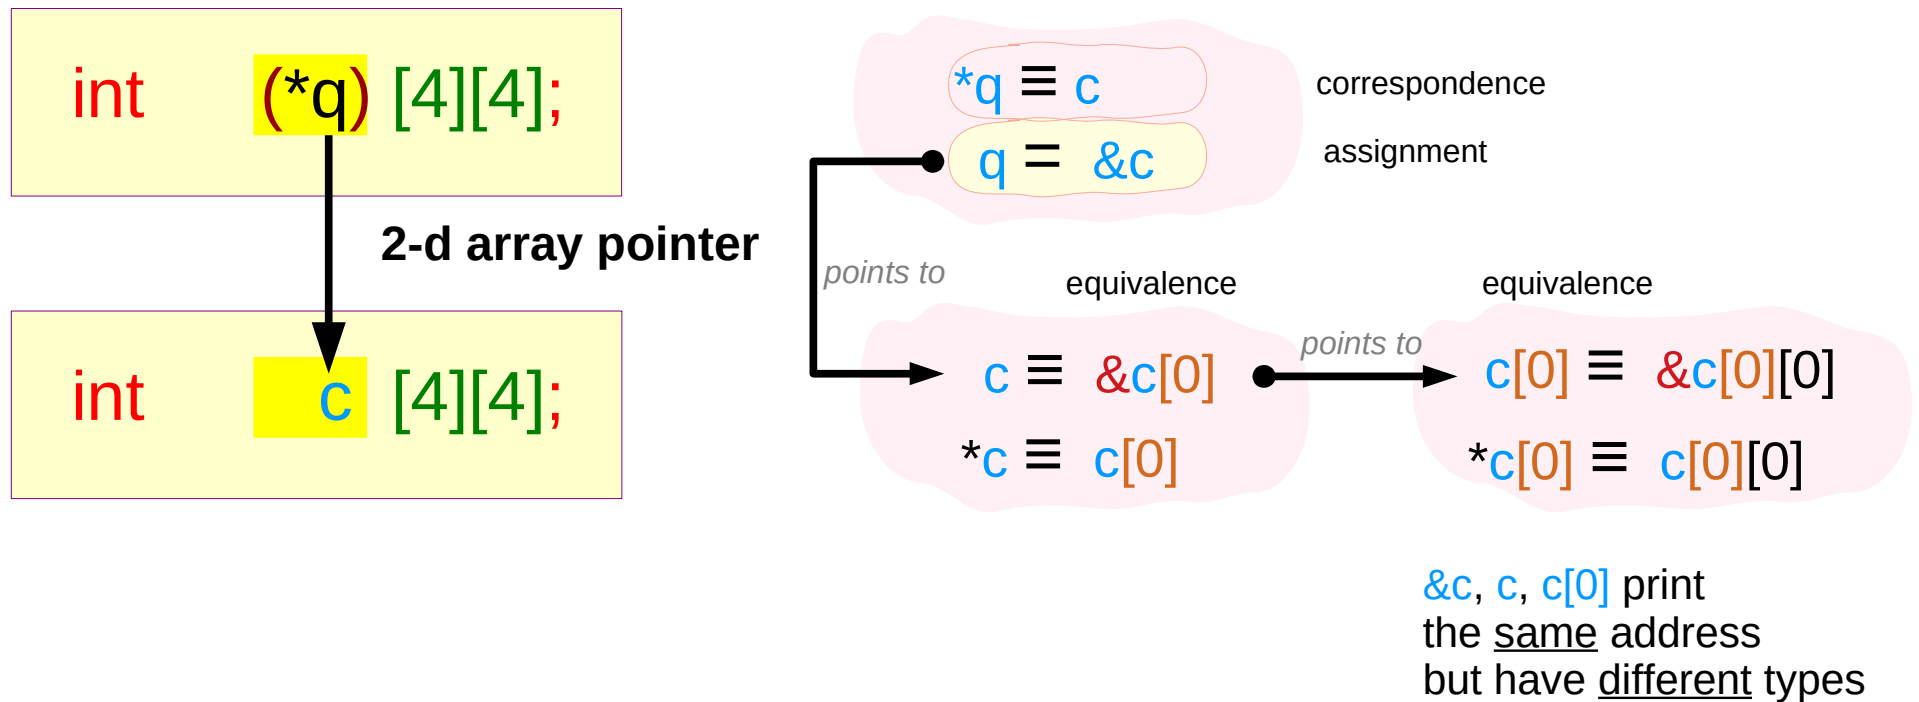

Pointer to a 1-d array – (3) an assignment & equivalences

Pointer to a 1-d array – (4) a chain of pointers view

Pointer to a 2-d array – (1) type declarations

`value(&c) = value(c) = value(c[0])`

`type(&c) ≠ type(c) ≠ type(c[0])`

`int (*)[4][4] ≠ int [4][4] ≠ int [4]`

those values are evaluated as addresses

Pointer to a 2-d array – (2) types and sizes

```
int c [4][4];
```

assignment

equivalence

equivalence

```
int (*q) [4];
```

$q = \&c$

$c \equiv \&c[0]$

$c[0] \equiv \&c[0][0]$

(int (*) [4][4])

(int (*) [4])

(int [4]) = (int *)

(int)

q

c

c[0]

c[0][0]

sizeof(q) =
8 bytes

sizeof(c) =
4*4*4 bytes

4

sizeof(c[0]) =
4*4 bytes

4

sizeof(c[0][0]) =
4 bytes

&q

&c

&c[0]

&c[0][0]

Pointer to a 2-d array – (3) an assignment & equivalences

Pointer to a 2-d array – (4) a chain of pointers view

1-d and 0-d array pointers to an 1-d array

1-d array pointer

correspondence

`*q ≡ c;`

`(int(*)[4])`

`q = &c;`

`(*q)[i] ≡ q[0][i] ≡ c[i]`

0-d array pointer : int pointer

correspondence

`*p ≡ *c;`

`(int *)`

`p = c;`

`p[i] ≡ c[i]`

2-d and 1-d array pointers to a 2-d array

2-d array pointer

correspondence

$*q \equiv c;$

$(int(*)[4][4])$

$q = \&c;$

$(*q)[i][j] \equiv q[0][i][j] \equiv c[i][j]$

1-d array pointer

correspondence

$*p \equiv *c;$

$(int (*) [4])$

$p = c;$

$p[i] \equiv c[i]$

Pointer types to a 1-d array : 2 cases

Pointer types to a 1-d array : sizes of pointer dereferences

assignment

p = &**a**;

substitution

(*p)[i] \equiv **p[0][i]** \equiv **a[i]**

sizeof(p) = 4 or 8 bytes : the size of a pointer

sizeof(*p) = 4*4 bytes : the size of an 1-d array

assignment

q = **a**;

substitution

q[i] \equiv **a[i]**

sizeof(q) = 4 or 8 bytes : the size of a pointer

sizeof(*q) = 4 bytes : the size of a 0-d array (int)

1-d pointer to a 1-d array – a variable view

```
int (*p) [4];
```

correspondence

$$*p \equiv a$$

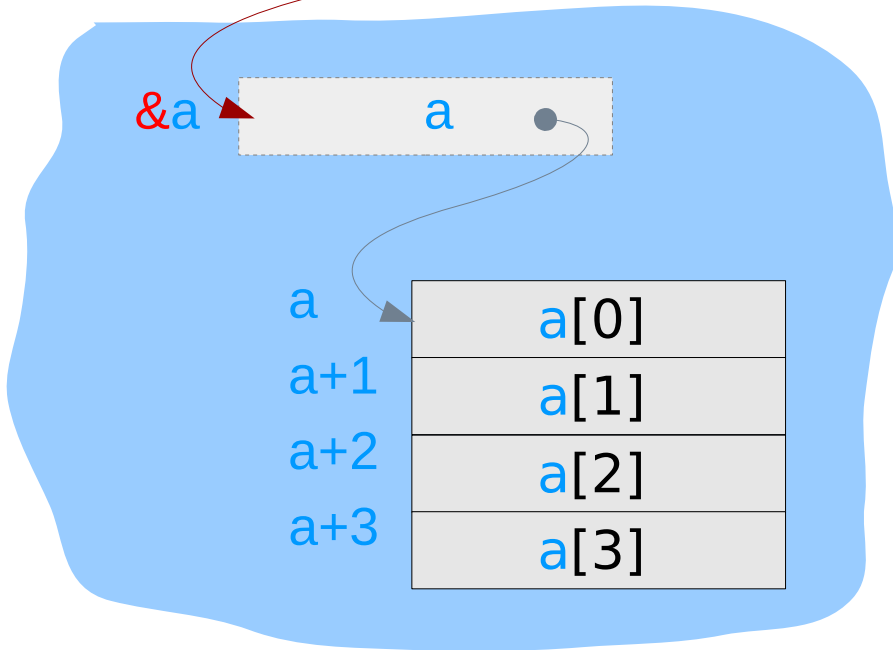

assignment

$$p = \&a$$

1-d array pointer

points to a 1-d array –
a aggregated type data

```
int a [4];
```

p : int (*) [4] type

0-d pointer to a 1-d array – a variable view

```
int (*q);
```

correspondence

$$*q \equiv a[0]$$

$$*q \equiv *a$$

assignment

$$q = \&a[0]$$

$$q = a$$

0-d array pointer

points to an array element – an integer type data

```
int a[4];
```

$q : \text{int } (*) = \text{int } * \text{ type}$

Incrementing a 1-d array pointer

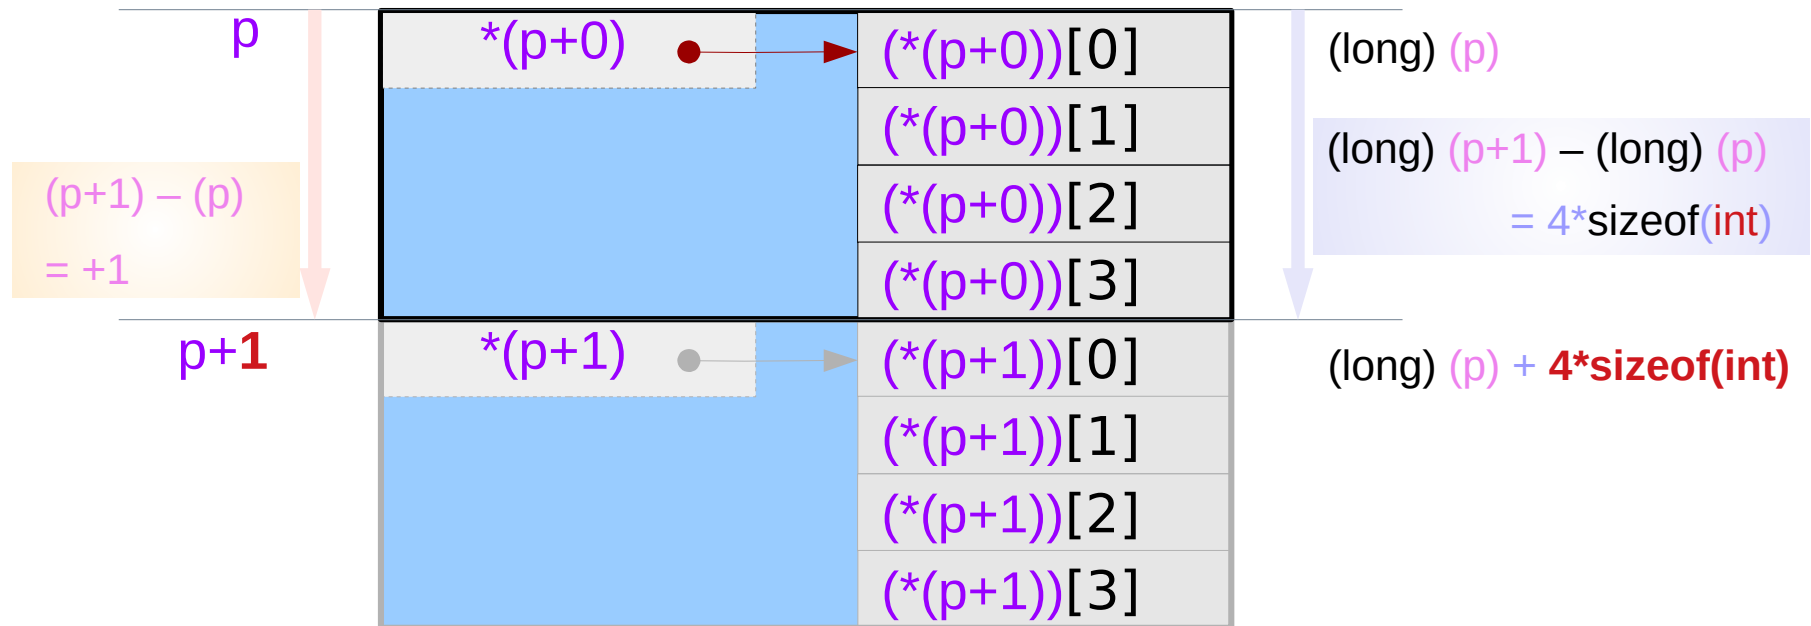

```
int (*p) [4];
```

$$\begin{aligned} \text{value}(p+1) - \text{value}(p) &= \text{sizeof}(*p) \\ &= (\text{long})(p+1) - (\text{long})(p) &= 4 * \text{sizeof}(\text{int}) \end{aligned}$$

Aggregate Type Size

pointer variable increment

actual address numbers

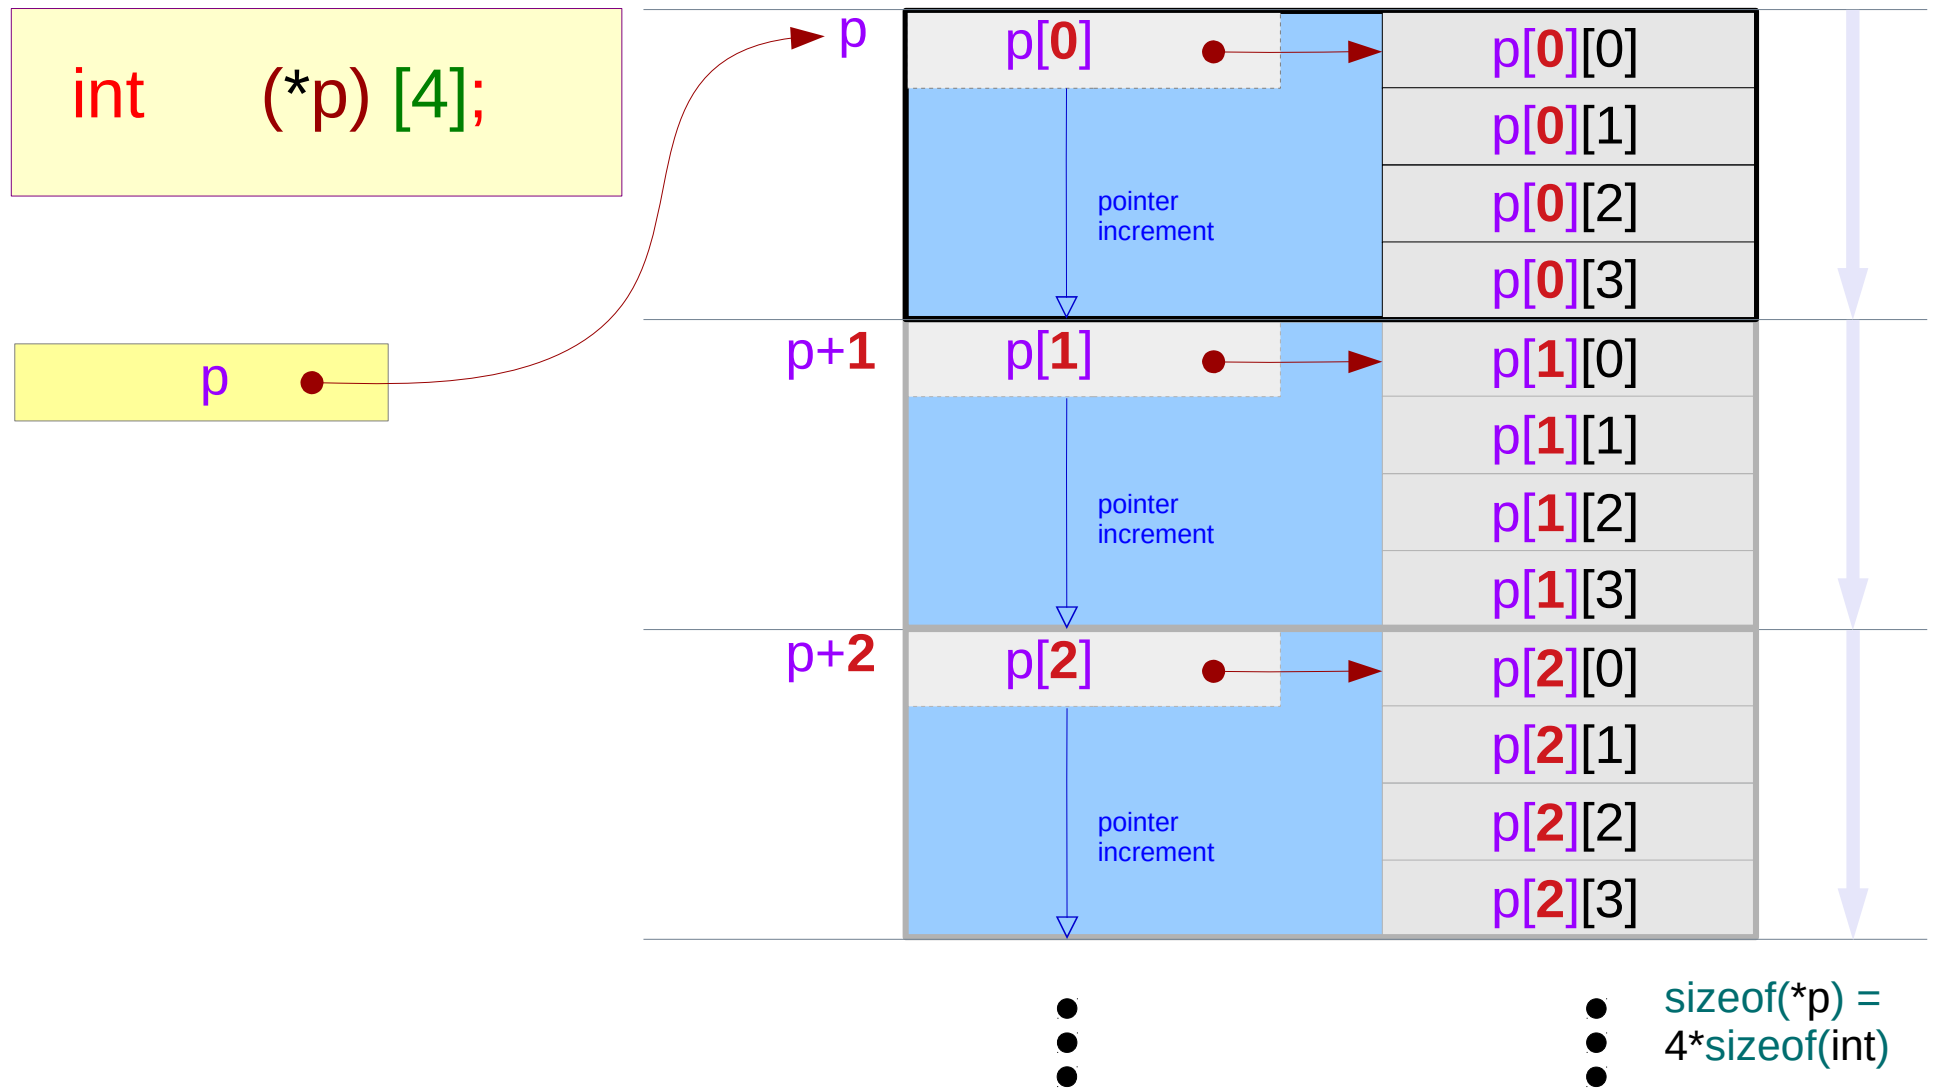

Incrementing a 1-d array pointer – extending a dimension

$(*(p+1)) \equiv p[1]$ || equivalence

Substitution using a 1-d array pointer

A 1-d array pointer – extending a dimension

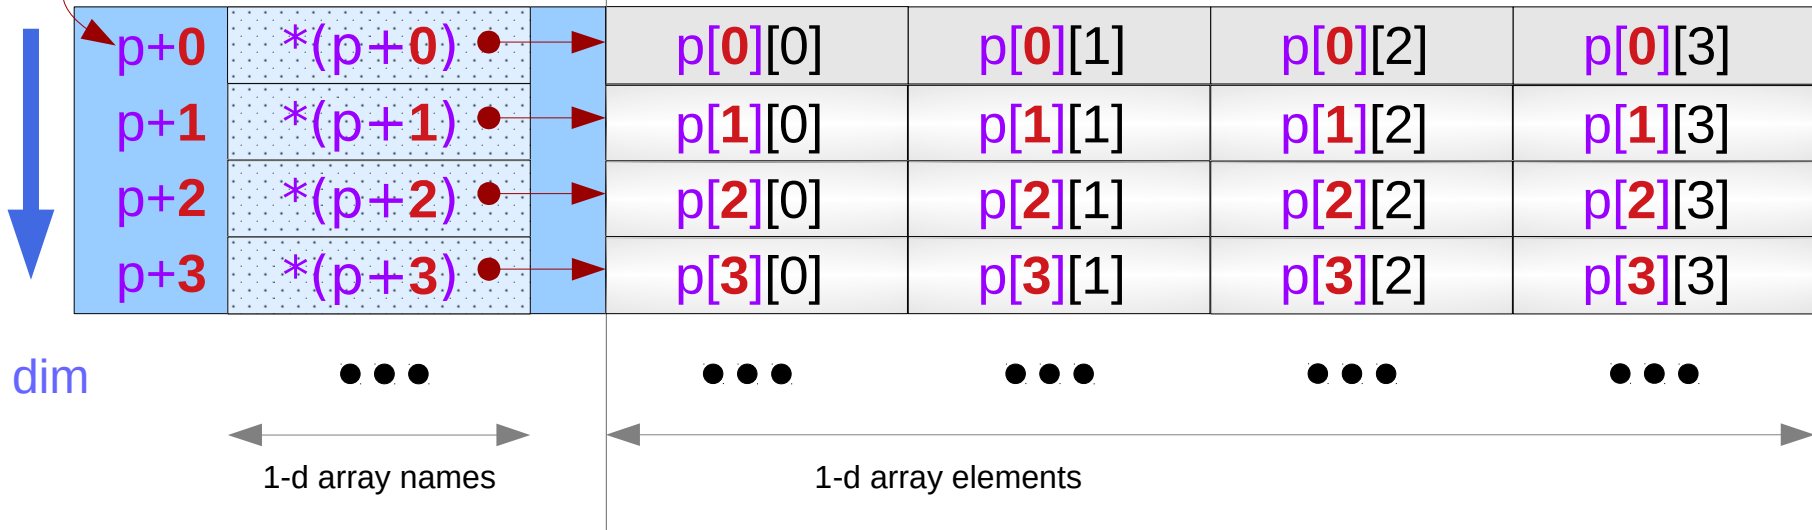

```
int (*p) [4] ;
```

1-d array pointer

can be viewed as a 2-d array name
: an additional dimension is extended

2nd dim

A 1-d array pointer and a 1-d array

```
int a[4];
```

1-d array pointer

$p = \&a$
assignment

$\&a$

```
int (*p)[4] = &a;
```

1-d array pointer

p

$*p \equiv a$
equivalence

p[0][0]
p[0][1]
p[0][2]
p[0][3]

A 1-d array pointer and a 1-d array – a type view

```
int    a [4];
```

1-d array pointer

```
(int (*)[4]) p ●
```

```
int (*p) [4] = &a;
```

1-d array pointer

```
(int (*)[4]) p ●
```

`p[0][0]`

A 1-d array pointer and a 2-d array

```
int c [4][4];
```

```
int (*p) [4] = &c[0];
```

1-d array pointer

p

c

&c[0]

c[0]

p = c
p = &c[0]
assignment

c[0][0]

c[0][1]

c[0][2]

c[0][3]

1-d array pointer

p

p

*p

*p ≡ c[0]
equivalence

(*p)[0]

(*p)[1]

(*p)[2]

(*p)[3]

p[0][0]

p[0][1]

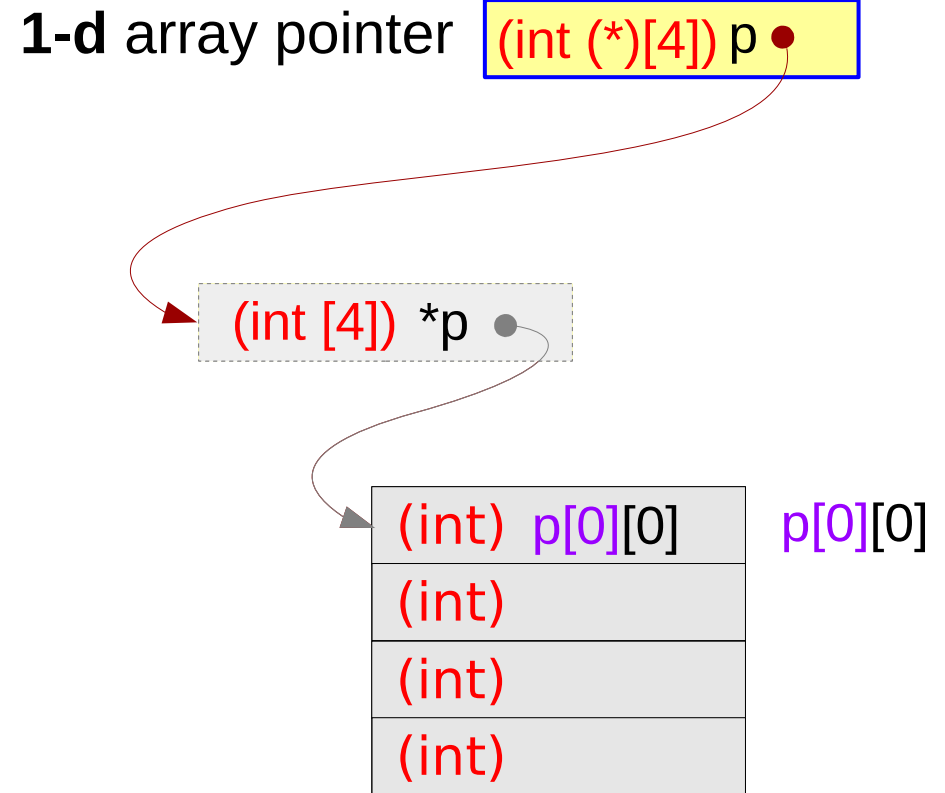

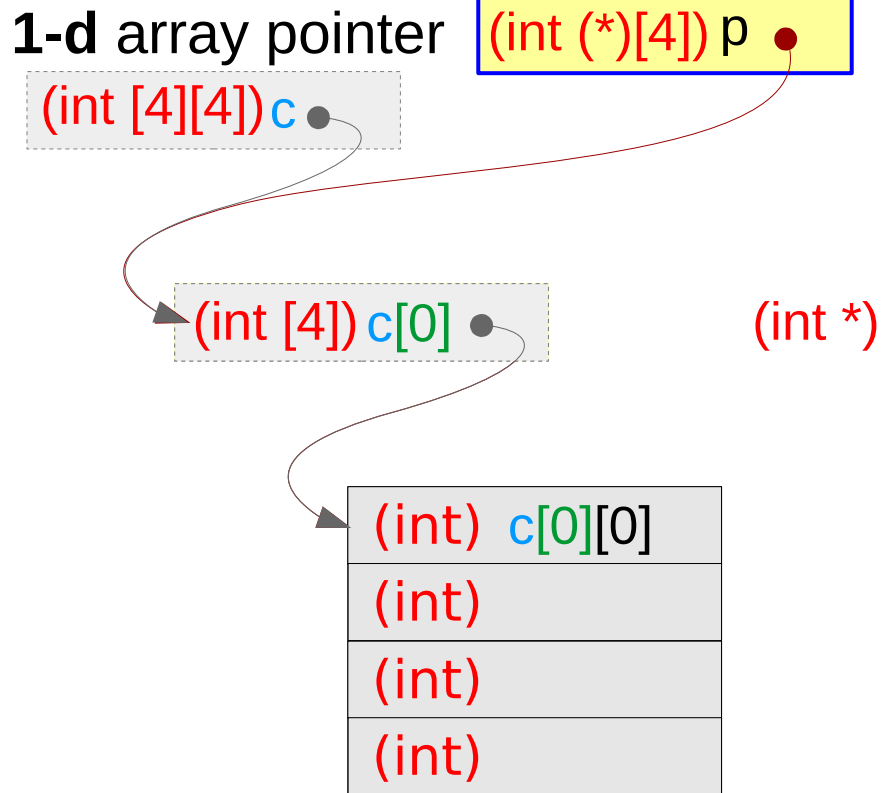

p[0][2]

p[0][3]

A 1-d array pointer and a 2-d array – a type view

```
int c [4][4];
```

```
int (*p) [4] = &c[0];
```
