sin(t), Asin(t)

- sin(t)
 - not random process.
- $x(t) = A\sin(t)$
 - can be a **random process** if A is a **random variable**
 - However, x(t) is <u>not</u> **stationary**, but it is **cyclostationary**,
 - its statistical properties vary periodically.

https://dsp.stackexchange.com/questions/32000/why-is-sint-a-stationary-process

$A\sin(t+\phi)$

- $x(t) = A\sin(t+\phi)$
 - the x(t) process is stationary because of the added random phase
 - the random phase $\phi \in [0, 2\pi]$ is a **uniformly distributed random variable** which is independent of A.
 - its statistical properties are <u>independent</u> of t, and hence, the process is **stationary**.

https://dsp.stackexchange.com/questions/32000/why-is-sint-a-stationary-process

Signals in an oscilloscope

When analyzing a signal with an <u>oscilloscope</u>, it can be observed that

the signal's **amplitude spectrum** does <u>not vary</u> over moving <u>windows</u>

so a sinusoidal wave is sort of stationary in frequency.

Additionally, the signal is itself stationary in envelope (modulus 1 for the analytic version of the signal).

https://dsp.stackexchange.com/questions/32000/why-is-sint-a-stationary-process

Window function (1)

In signal processing and statistics, a window function is a mathematical function that is

- zero-valued outside of some chosen interval
- normally symmetric around the middle of the interval
- usually near a maximum in the middle
- usually tapering away from the middle.

https://en.wikipedia.org/wiki/Window function

Window function (2)

when another function or waveform is "multiplied" by a window function,

the product is also <u>zero-valued outside</u> the interval: all that is left is the part where they <u>overlap</u>, the "view through the window".

https://en.wikipedia.org/wiki/Window function

Envelope

- the envelope of an oscillating signal is a smooth curve outlining its extremes.
- the **envelope** thus <u>generalizes</u> the concept of a <u>constant amplitude</u> into an instantaneous amplitude.
- a <u>modulated</u> sine wave varying between an <u>upper envelope</u> and a <u>lower envelope</u>.
- the envelope function may be a function of time, space, angle, or indeed of any variable

https://en.wikipedia.org/wiki/Envelope (waves)

Random Variable Definition

A random variable

a real function over a sample space $S = \{s_1, s_2, s_3, ..., s_n\}$

$$s \to X(s)$$

$$x = X(s)$$

a random variable : a capital letter X a particular value : a lowercase letter x

a sample space $S = \{s_1, s_2, s_3, ..., s_n\}$ an element of S: s

Random Variable Example

Example

$$X(s_1) = x_1$$
 $s_1 \longrightarrow x_1$
 $X(s_2) = x_2$ $s_2 \longrightarrow x_2$

... ...

$$X(s_n) = x_n \qquad s_n \longrightarrow x_n$$

$$S = \{s_1, s_2, s_3, ..., s_n\}$$

 $X = \{x_1, x_2, x_3, ..., x_n\}$

a sample space a random variable

Random Process (1)

A random process

a function of both time t and outcome θ

$$X(t,\theta)$$

assigning a time function to every outcome θ_i

$$\theta_i \rightarrow x_i(t)$$

where
$$x_i(t) = x(t, \theta_i)$$

the <u>family</u> of such time functions is called a <u>random process</u> and denoted by $X(t, \theta)$

Random Process (2)

A random process

a random process $X(t, \theta)$ assigns a time function for a every outcome θ

$$x(t,\theta) = X(t,\theta)$$

a short notation

$$x(t) = X(t)$$

Ensemble of time functions

Time functions

A random process $X(t, \theta)$ represents a family or ensemble of time functions

$$X(t,\theta_1) = x_1(t) \qquad \theta_1 \longrightarrow x_1(t) = \cos(\omega t + \theta_1)$$

$$X(t,\theta_2) = x_2(t) \qquad \theta_2 \longrightarrow x_2(t) = \cos(\omega t + \theta_2)$$
...
$$X(t,\theta_n) = x_n(t) \qquad \theta_n \longrightarrow x_n(t) = \cos(\omega t + \theta_n)$$

$$S = \{ \theta_1, \theta_2, \theta_3, \dots, \theta_n \} \text{ a sample space}$$

$$X(t) = \{x_1(t), x_2(t), x_3(t), \dots, x_n(t) \} \text{ a random process}$$

A sample function $x(t, \theta)$

A random process $X(t, \theta)$ represents a family or ensemble of time functions

$$\theta \to x(t,\theta) = \cos(\omega t + \theta)$$

- $x(t, \theta)$ represents
 - a sample function
 - an ensemble member
 - a realization of the process

Random process $X(t, \theta)$

A random process $X(t, \theta)$ represents a family or ensemble of time functions

$$\theta \to x(t, \theta) = \cos(\omega t + \theta)$$

 $x(t) = X(t, \theta)$

$X(t, \theta)$ becomes

- a single time function $x(t, \theta)$
- when t is a variable and θ is fixed at an outcome

Random variables with time

a random process X(t,s) represents a single time function when t is a variable and s is fixed at an outcome

a random process X(t,s) represents a single random variable when both t and s are fixed at a time and an outcome, respectively

$$X_i = X(t_i, s) = X(t_i)$$

random variable

$$X(t,s) = X(t)$$

random process

Random phase in $X(t) = \cos(\omega t + \Theta)$

Consider the output of a sinusoidal oscillator that has a **random phase** and an **amplitude** of the form:

$$X(t) = \cos(\omega t + \Theta)$$

where the random variable $\Theta \sim U([0,2\pi])$

to specify the <u>explicit dependence</u> on the underlying **sample space** *S* the oscillator output can be written as

$$x(t,\Theta) = \cos(\omega t + \Theta)$$

Random variable $X_t(\theta)$

Consider the random variable

$$X(t,\theta) = \cos(\omega t + \theta)$$

where the time t is fixed In other words,

$$X_t(\theta) = \cos(\omega t + \theta)$$

where $\theta_0 = \omega t$ is fixed (a non-random quantity) thus the time t is fixed

Values of a time function

Consider the random variable for the fixed time t

$$X_t(\theta) = \cos(\omega t + \theta)$$

if the sample value θ as well as the time t is fixed, then the values of the time function

$$x_1 = x(t_1) = \cos(\omega t_1 + \theta)$$

$$x_2 = x(t_2) = \cos(\omega t_2 + \theta)$$

where x is the **time function** for a fixed outcome $\frac{\theta}{t}$ and let x_i denotes the value of the time function x at times t_i (here x_i is not a sample function)

Outline

 - Examples

$$f_X(x)$$
 of $X(t) = \cos(\omega t + \Theta)$

- Uniform Random Variable Θ
- Random Process $X(t) = \cos(\omega t + \Theta)$

first order distribution

To get the first order distribution of the random process

$$X(t) = \cos(\omega t + \Theta)$$

consider the first order distribution of the random variable

$$X_t(\Theta) = \cos(\theta_0 + \Theta)$$

where $\theta_0 = \omega t$ is fixed (a non-random quantity)

 $f_X(x)$ can be obtained via the **derivative method**

$$\frac{d}{dx}F_X(x) = f_{\Theta}(\theta) \cdot \frac{d\theta}{dx}$$

$$f_X(x) = \frac{1}{\pi\sqrt{1-x^2}}, \quad |x| < 1$$

$$f_X(x)$$
 of $X(t) = \cos(\omega t + \Theta)$

The first order distribution of the process $X(t) = \cos(\omega t + \Theta)$

$$f_X(x) = \frac{1}{\pi\sqrt{1-x^2}}, \qquad |x| < 1$$

- dependent only on the set of values x that the process X(t) takes
- independent of
 - the particular sampling instant t
 - the constant **phase offset** $\theta_0 = \omega t$

random variable Θ

Let Θ be a uniform **random variable** on $[0,2\pi]$, then

$$F_{\Theta}(\theta) = \frac{\theta}{2\pi}$$

Let

$$X_t(\Theta) = \cos(\theta_0 + \Theta)$$

be the **random variable** describing x in terms of Θ .

$F_X(x) = F_{\Theta}(\theta_1) - F_{\Theta}(\theta_2)$

$$F_{X}(x) = P(X \le x)$$

$$= P(\cos(\omega t + \Theta) \le x)$$

$$= P\left(\cos^{-1}(x) \le \omega t + \Theta \le 2\pi - \cos^{-1}(x)\right)$$

$$= P\left(\cos^{-1}(x) - \omega t \le \Theta \le 2\pi - \cos^{-1}(x) - \omega t\right)$$

$$= P\left(\Theta \le 2\pi - \cos^{-1}(x) - \omega t\right) - P\left(\Theta \le \cos^{-1}(x) - \omega t\right)$$

$$= F_{\Theta}\left(2\pi - \cos^{-1}(x) - \omega t\right) - F_{\Theta}\left(\cos^{-1}(x) - \omega t\right)$$

$$= F_{\Theta}\left(\theta_{1}\right) - F_{\Theta}\left(\theta_{2}\right)$$

Random variable X, a particular value x

Random variable Θ , particular values θ_1 and θ_2

https://math.stackexchange.com/questions/3456122/probability-density-function-

Chain rule

The chain rule

$$\frac{d}{dx}F_X(x) = \frac{d}{d\theta}F_{\Theta}(\theta) \cdot \frac{d\theta}{dx}$$

Random variable X, a particular value xRandom variable Θ , a particular value θ

$$\frac{d}{d\theta}F_{\Theta}(\theta) = f_{\Theta}(\theta) \qquad \qquad \frac{d}{d\theta}\left(\frac{\theta}{2\pi}\right) = \frac{1}{2\pi}$$

$$\frac{d}{dx}F_X(x) = \frac{d}{d\theta}F_{\Theta}(\theta) \cdot \frac{d\theta}{dx} = f_{\Theta}(\theta) \cdot \frac{d\theta}{dx} = \frac{1}{2\pi}\frac{d\theta}{dx}$$

https://math.stackexchange.com/questions/3456122/probability-density-function-of-harmonic-oscillation

derivative of $F_X(x)$

Differentiating both sides, we get:

$$\begin{split} \frac{d}{dx}F_{\chi}(x) &= \frac{d}{dx}\left\{F_{\Theta}\left(2\pi - \cos^{-1}(x) - \omega t\right) - F_{\Theta}\left(\cos^{-1}(x) - \omega t\right)\right\} \\ &= \frac{d}{d\theta}F_{\Theta}\left(2\pi - \cos^{-1}(x) - \omega t\right) \frac{d}{dx}\left(2\pi - \cos^{-1}(x) - \omega t\right) \\ &- \frac{d}{d\theta}F_{\Theta}\left(\cos^{-1}(x) - \omega t\right) \frac{d}{dx}\left(\cos^{-1}(x) - \omega t\right) \end{split}$$

note

$$\theta_1 = 2\pi - \cos^{-1}(x) - \omega t \qquad \frac{d\theta_1}{dx} = -\frac{d}{dx}\cos^{-1}(x)$$

$$\theta_2 = \cos^{-1}(x) - \omega t \qquad \frac{d\theta_2}{dx} = +\frac{d}{dx}\cos^{-1}(x)$$

https://math.stackexchange.com/questions/3456122/probability-density-function-density-fun

$f_X(x)$ of $X(t) = \cos(\omega t + \Theta)$

$$X_t(\Theta) = \cos(\omega t + \Theta)$$
$$\cos^{-1}(x) \le \omega t + \Theta \le 2\pi - \cos^{-1}(x)$$

$$F_X(x) = F_{\Theta} \left(2\pi - \cos^{-1}(x) - \omega t \right) - F_{\Theta} \left(\cos^{-1}(x) - \omega t \right)$$

using the chain rule

$$\frac{d}{dx}F_X(x) = \frac{d}{d\theta}F_{\Theta}(\theta)\frac{d\theta}{dx} = f_{\Theta}(\theta)\frac{d\theta}{dx} = \frac{1}{2\pi}\frac{d\theta}{dx}$$

$$f_X(x) = f_{\Theta} \left(2\pi - \cos^{-1}(x) - \omega t \right) \frac{d}{dx} \left(-\cos^{-1}(x) \right)$$
$$- f_{\Theta} \left(\cos^{-1}(x) - \omega t \right) \frac{d}{dx} \left(\cos^{-1}(x) \right)$$

https://math.stackexchange.com/questions/3456122/probability-density-function-

$f_X(x)$ of $X(t) = \cos(\omega t + \Theta)$

$$f_X(x) = f_{\Theta} \left(2\pi - \cos^{-1}(x) - \omega t \right) \frac{d}{dx} \left(-\cos^{-1}(x) \right)$$
$$-f_{\Theta} \left(\cos^{-1}(x) - \omega t \right) \frac{d}{dx} \left(\cos^{-1}(x) \right)$$

Now, since $f_{\Theta}(\theta) = \frac{1}{2\pi}$ and $\frac{d}{dx}\cos^{-1}(x) = -\frac{1}{\sqrt{1-x^2}}$, we have:

$$f_X(x) = \frac{1}{2\pi} \left(\frac{1}{\sqrt{1-x^2}} + \frac{1}{\sqrt{1-x^2}} \right)$$

= $\frac{1}{\pi\sqrt{1-x^2}}$

https://math.stackexchange.com/questions/3456122/probability-density-function-

$$f_X(x)$$
 of $X(t) = \cos(\omega t + \Theta)$ (10)

Consider the output of a sinusoidal oscillator that has a random phase and an amplitude of the form:

$$X(t) = \cos(\omega t + \Theta)$$

where Θ is a uniform random variable on $[0,2\pi]$ then the **first order pdf** of X(t) is

$$f_X(x) = \frac{1}{\pi\sqrt{1-x^2}}, \quad x \in (-1,1)$$

Note that the probability is unaffected by angular velocity and initial phase (ω, θ_0) , which is, intuitively, expected.

https://math.stackexchange.com/questions/3456122/probability-density-function-probability-function-pr

$$f_X(x)$$
 of $X = \cos(\omega T + \phi)$ (1)

- Uniform Random Variable T
- Random Variable $X = \cos(\omega T + \phi)$

$$f_X(x)$$
 of $X = \cos(\omega T + \phi)$ (2)

Let T be a uniform random variable on $[0, \frac{2\pi}{\omega}]$ that describes time. Then

$$F_T(t) = \frac{\omega}{2\pi} \cdot t = ft$$

where f is the oscillation's frequency. Now, let:

$$X = \cos(\omega T + \phi)$$

be the **random variable** describing x in terms of T. it is not a time function

$$X(t) \neq \cos(\omega T + \phi)$$

$f_X(x)$ of $X = \cos(\omega T + \phi)$ (3)

$$F_X(x) = P(X \le x)$$

$$= P(\cos(\omega T + \phi) \le x)$$

$$= P\left(\cos^{-1}(x) \le \omega T + \phi \le 2\pi - \cos^{-1}(x)\right)$$

$$= P\left(\frac{\cos^{-1}(x) - \phi}{\omega} \le T \le \frac{2\pi - \cos^{-1}(x) - \phi}{\omega}\right)$$

$$= P\left(T \le \frac{2\pi - \cos^{-1}(x) - \phi}{\omega}\right) - P\left(T \le \frac{\cos^{-1}(x) - \phi}{\omega}\right)$$

$$= F_T\left(\frac{2\pi - \cos^{-1}(x) - \phi}{\omega}\right) - F_T\left(\frac{\cos^{-1}(x) - \phi}{\omega}\right)$$

$$= F_T(t_1) - F_T(t_2)$$

the probability is unaffected by angular velocity (ω) and initial phase (ϕ) , which is, intuitively, expected.

https://math.stackexchange.com/questions/3456122/probability-density-function-of-harmonic-oscillation

Outline

- Random Phase Oscillator
 - Problem definition
 - First order distribution
 - Uniform random variable Θ
 - Uniform random variable T
 - Second order distribution
 - Mean and variance
- 2 Stationary Process Examples
 - Examples A
 - Examples B
- Cyclo-stationary Process Examples
 - Examples

Second order distribution (1)

to get the second-order distribution use the conditional distribution $f_{X(t_1)|X(t_2)}(x_1|x_2)$ as in :

$$f_{X(t_1),X(t_2)}(x_1,x_2) = f_{X(t_2)}(x_2)f_{X(t_1)|X(t_2)}(x_1|x_2)$$

Second order distribution (2)

$$x_2 = x(t_2) = \cos(\omega t_2 + \theta)$$

This can happen only when :

$$(\omega t_2 + \theta) = \cos^{-1}(x_2)$$

 $(\omega t_2 + \theta) = 2\pi - \cos^{-1}(x_2)$

$$\theta = \cos^{-1}(x_2) - \omega t_2$$

$$\theta = 2\pi - \cos^{-1}(x_2) - \omega t_2$$

where
$$0 \le \cos^{-1}(x_2) \le \pi$$
 and $0 \le \theta \le 2\pi$

Second order distribution (3)

given that $x_2 = x(t_2) = \cos(\omega t_2 + \theta)$: find θ ,

$$\theta = \begin{cases} +\left(\cos^{-1}(x_2) - \omega t_2\right) \\ -\left(\cos^{-1}(x_2) + \omega t_2\right) \end{cases}$$

then $x_1 = x(t_1) = \cos(\omega t_1 + \theta)$ have two values

$$x(t_1) = \begin{cases} \cos(\omega t_1 + (\cos^{-1}(x(t_2)) - \omega t_2)) = x_{11} \\ \cos(\omega t_1 - (\cos^{-1}(x(t_2)) + \omega t_2)) = x_{12} \end{cases}$$

Second order distribution (4)

given that
$$x_2 = x(t_2) = \cos(\omega t_2 + \theta)$$

find θ , then $x_1 = x(t_1) = \cos(\omega t_1 + \theta)$
has only two values with an equal probability 0.5

$$x(t_1) = \begin{cases} \cos(\omega t_1 + (\cos^{-1}(x(t_2)) - \omega t_2)) = x_{11} \\ \cos(\omega t_1 - (\cos^{-1}(x(t_2)) + \omega t_2)) = x_{12} \end{cases}$$

Second order distribution (5)

the **conditional distribution** of $x(t_1) = x_1$ given that $x(t_2) = x_2$:

$$f_{X(t_1)|X(t_2)}(x_1|x_2) = \left(\frac{1}{2}\delta(x_1 - x_{11}) + \frac{1}{2}\delta(x_1 - x_{12})\right)$$
$$= \frac{1}{2}\delta\left(x_1 - \cos\left[\omega t_1 + \left(\cos^{-1}(x_2) - \omega t_2\right)\right]\right)$$
$$+ \frac{1}{2}\delta\left(x_1 - \cos\left[\omega t_1 - \left(\cos^{-1}(x_2) + \omega t_2\right)\right]\right)$$

$$f_{X(t_1)|X(t_2)}(x(t_1)|x(t_2)) = \left(\frac{1}{2}\delta(x(t_1) - x_{11}) + \frac{1}{2}\delta(x(t_1) - x_{12})\right)$$

$$= \frac{1}{2}\delta(x(t_1) - \cos\left[\omega t_1 + (\cos^{-1}(x(t_2) - \omega t_2))\right]$$

$$+ \frac{1}{2}\delta(x(t_1) - \cos\left[\omega t_1 - (\cos^{-1}(x(t_2) + \omega t_2))\right]$$

First order distribution $f_X(x)$ (1)

the first order distribution of $x(t_2) = x_2 = \cos(\omega t_2 + \theta)$:

$$f_{X(t_2)}(x_2) = \frac{1}{2\pi\sqrt{1-x_2^2}}$$

$$f_{X(t_2)}(x(t_2)) = \frac{1}{2\pi\sqrt{1-x^2(t_2)}}$$

First order distribution $f_X(x)$ (2)

the first order distribution $f_X(x)$ of $X(t,\theta) = \cos(\omega t + \theta)$

- dependent only on the set of values x $(-1 \le x \le 1)$ that the process $X(t, \theta)$ takes
- independent of
 - the particular sampling instant t
 - the constant phase offset $\theta_0 = \omega t$

Second order distribution (7)

The second order pdf of the process $X(t) = cos(\omega t + \Theta)$

$$\begin{split} f_{X(t_1),X(t_2)}(x_1,x_2) &= f_{X(t_1)}(x_1) f_{X(t_2)|X(t_1)}(x_2|x_1) \\ &= f_{X(t_1)}(x_1) \left(\frac{1}{2} \delta(x_2 - x_{21}) + \frac{1}{2} \delta(x_2 - x_{22}) \right) \\ f_{X(t_1),X(t_2)}(x_1,x_2) &= f_{X(t_2)}(x_2) f_{X(t_1)|X(t_2)}(x_1|x_2) \\ &= f_{X(t_1)}(x_2) \left(\frac{1}{2} \delta(x_1 - x_{11}) + \frac{1}{2} \delta(x_1 - x_{12}) \right) \end{split}$$

where
$$x(t_1) = x_1$$
 and $x(t_2) = x_2$

Second order distribution (8)

$$f_{X(t_1),X(t_2)}(x_1,x_2) = f_{X(t_2)}(x_2)f_{X(t_1)|X(t_2)}(x_1|x_2)$$

$$= \left\{ \frac{1}{2\pi\sqrt{1-x_2^2}} \right\} \delta\left(x_1 - \cos\left[\omega t_1 + \left(\cos^{-1}(x_2) - \omega t_2\right)\right]\right)$$

$$+ \left\{ \frac{1}{2\pi\sqrt{1-x_2^2}} \right\} \delta\left(x_1 - \cos\left[\omega t_1 - \left(\cos^{-1}(x_2) + \omega t_2\right)\right]\right)$$

Second order distribution (9)

$$= \left\{ \frac{1}{2\pi\sqrt{1-x^2(t_2)}} \right\} \delta\left(x(t_1) - \cos\left[\omega t_1 + \left(\cos^{-1}(x(t_2)) - \omega t_2\right)\right]\right)$$

 $f_{X(t_1),X(t_2)}(x(t_1),x(t_2)) = f_{X(t_2)}(x(t_2))f_{X(t_1)|X(t_2)}(x(t_1)|x(t_2))$

$$+\left\{\frac{1}{2\pi\sqrt{1-x^2(t_2)}}\right\}\delta\left(x(t_1)-\cos\left[\omega t_1-\left(\cos^{-1}(x(t_2))+\omega t_2\right)\right]\right)$$

Second order distribution (10)

The second order pdf can thus be written as

$$f_{X(t_1),X(t_2)}(x_1,x_2) = f_{X(t_2)}(x_2)f_{X(t_2)|X(t_1)}(x_1|x_2)$$

$$= f_{X(t_2)}(x_2)\left(\frac{1}{2}\delta(x_1 - x_{11}) + \frac{1}{2}\delta(x_1 - x_{12})\right)$$

$$f_{X(t_1),X(t_2)}(x(t_1),x(t_2)) = f_{X(t_2)}(x(t_2))f_{X(t_2)|X(t_1)}(x(t_1)|x(t_2))$$

$$= f_{X(t_2)}(x(t_2)) \left(\frac{1}{2}\delta(x(t_1)-x_{11}) + \frac{1}{2}\delta(x(t_1)-x_{12})\right)$$

These depend only on $t_2 - t_1$, and thus the second order pdf is stationary

Second order distribution (11)

given that $x(t_2) = x_2 = \cos(\omega t_2 + \theta)$ find θ , then $x(t_1) = x_1 = \cos(\omega t_1 + \theta)$ has only two values with an equal probability 0.5

$$x(t_1) = \begin{cases} x_{11} = \cos(\omega t_1 + (\cos^{-1}(x(t_2)) - \omega t_2)) \\ x_{12} = \cos(\omega t_1 - (\cos^{-1}(x(t_2)) + \omega t_2)) \end{cases}$$

$$f_{X(t_1),X(t_2)}(x(t_1),x(t_2)) = f_{X(t_2)}(x(t_2))f_{X(t_2)|X(t_1)}(x(t_1)|x(t_2))$$

$$= f_{X(t_2)}(x(t_2)) \left(\frac{1}{2}\delta(x(t_1)-x_{11}) + \frac{1}{2}\delta(x(t_1)-x_{12})\right)$$

These depend only on $t_2 - t_1$, and thus the second order pdf is stationary

Second order distribution (12)

$$\delta(x(t_1)-x_{11})$$
 when $x(t_1)$ is equal to $x_{11}=\cos(\omega t_1+\theta_1)$ $\delta(x(t_1)-x_{12})$ when $x(t_1)$ is equal to $x_{12}=\cos(\omega t_1+\theta_2)$

$$f_{X(t_2)}(x(t_2)) = \frac{1}{2\pi\sqrt{1-x^2(t_2)}}$$

These depend only on $t_2 - t_1$, and thus the second order pdf is stationary

Second-Order Stationary Process

$$f_X(x_1,x_2;t_1,t_2)$$

if X(t) is to be a second-order stationary

$$f_X(x_1,x_2;t_1,t_2) = f_X(x_1,x_2;t_1+\Delta,t_2+\Delta)$$

must be true for any time t_1 , t_2 and any real number Δ

the second order density function does not change with a shift in time origin

Second-Order Stationary Process

$f_X(x_1,x_2;t_1,t_2)$

- f_X(x₁,x₂; t₁,t₂) is independent of t₁ and t₂ the second order density function does not change with a shift in time origin
- the autocorrelation function

$$R_{XX}(t, t+\tau) = E[X(t)X(t+\tau)] = R_{XX}(\tau)$$

Random Phase Oscillator Stationary Process Examples Cyclo-stationary Process Examples Problem definition First order distribution Second order distribution Mean and variance

Outline

- Random Phase Oscillator
 - Problem definition
 - First order distribution
 - Uniform random variable Θ
 - Uniform random variable T
 - Second order distribution
 - Mean and variance
- Stationary Process Examples
 - Examples A
 - Examples B
- Cyclo-stationary Process Examples
 - Examples

Example: $X(t) = \cos(\omega t + \Theta)$

- the random process X(t)
- the **first-order** moments μ_X
- the second-order moments σ_X^2

The **mean** of the process is obtained by taking the **expectation** operator with respect to the **random** parameter Θ on both sides

$$X_t(\Theta) = \cos(\omega t + \Theta)$$

 $E_{\Theta}[X_t(\Theta)] = E_{\Theta}[\cos(\omega t + \Theta)]$

note that the **expectation** integral is a linear operation:

$$\mu_{X} = E_{\Theta}[X_{t}(\Theta)] = E_{\Theta}[\cos(\omega t + \Theta)]$$

$$= E_{\Theta}[\cos(\omega t)\cos(\Theta) - \sin(\omega t)\sin(\Theta)]$$

$$= E_{\Theta}[\cos(\Theta)]\cos(\omega t) - E_{\Theta}[\sin(\Theta)]\sin(\omega t)$$

Since the random parameter Θ is uniformly distributed

$$\begin{split} \mu_X &= E_{\Theta}[\cos(\Theta)]\cos(\omega t) - E_{\Theta}[\sin(\Theta)]\sin(\omega t) \\ &= \cos(\omega t) \left(\frac{1}{2\pi}\right) \int_0^{2\pi} \cos(\theta) d\theta - \sin(\omega t) \left(\frac{1}{2\pi}\right) \int_0^{2\pi} \sin(\theta) d\theta \\ &= 0 \end{split}$$

The variance of the random process X(t)

$$\sigma_X^2 = E_{\Theta}[(x_t(\Theta) - \mu_X)^2] = E_{\Theta}[[x_t(\Theta)]^2] - \mu_X^2$$

Substituting the mean of the process

$$\sigma_X^2 = \left(\frac{1}{2\pi}\right) \int_0^{2\pi} \cos^2(\omega t + \theta) d\theta$$

$$= \left(\frac{1}{2\pi}\right) \int_0^{2\pi} [1 + \cos(2\omega t + 2\theta)2] d\theta$$

$$= \frac{1}{2}$$

the average power of the random sinusoidal signal X(t)

$$P_{ave}^X = \sigma_X^2 = \frac{1}{2}$$

.

the same as the average power of a sinusoid the phase is $\underline{\mathsf{not}}$ random

the correlation between the R.Vs $x(t_1)$ and $x(t_2)$ denoted as $R_{XX}(t_1,t_2)$

$$R_{XX}(t_1, t_2) = E_{\Theta}[x(t_1)x(t_2)] = \int_0^{2\pi} \cos[\omega t_1 + \theta] \cos[\omega t_2 + \theta] d\theta$$

$$= \left(\frac{1}{4\pi}\right) \int_0^{2\pi} \cos[\omega(t_1 + t_2) + 2\theta] d\theta$$

$$+ \left(\frac{1}{4\pi}\right) \int_0^{2\pi} \cos[\omega(t_1 - t_2)] d\theta$$

$$= \left(\frac{1}{2}\right) \cos[\omega(t_1 - t_2)]$$

The covariance of R.Vs $X(t_1)$ and $X(t_2)$ denoted $C_{XX}(t_1,t_2)$

$$C_{XX}(t_1, t_2) = R_{XX}(t_1, t_2) - \mu_X(t_1)\mu_X(t_2) = \left(\frac{1}{2}\right)\cos[\omega(t_1 - t_2)]$$

The correlation coefficient of the R.Vs $X(t_1)$ and $X(t_2)$ denoted $\rho_{XX}(t_1,t_2)$

$$\rho_{XX}(t_1,t_2) = \cos[\omega(t_1-t_2)]$$

.

Example: $X(t) = \cos(\omega t + \Theta)$

Looking at the mean and the variance of the random process X(t)

we can see that they are <u>shift-invariant</u> and consequently the process is **first-order stationary**.

The ACF and other second-order statistics of the process are dependent only on the variable $\tau = t_1 - t_2$.

The random process X(t) is therefore a WSS process also.

The ACF can then expressed in terms of the variable $\tau=t_1-t_2$ as:

$$R_{XX}(\tau) = \left(\frac{1}{2}\right)\cos(\omega\tau)$$

Outline

- Random Phase Oscillator
 - Problem definition
 - First order distribution

Example A.1: $X(t) = \cos(\omega t)$

A white noise is <u>not</u> <u>necessarily</u> strictly stationary.

Let ω be a random variable uniformly distributed in the interval $(0,2\pi)$

define the time series $\{X(t)\}$

$$X(t) = \cos(\omega t) \quad (t = 1, 2, \dots)$$

https://en.wikipedia.org/wiki/Stationary_process

Example A.1: $X(t) = \cos(\omega t)$

Then

$$E[X(t)] = \frac{1}{2\pi} \int_0^{2\pi} \cos(t\omega) d\omega = 0$$

$$Var(X(t)) = \frac{1}{2\pi} \int_0^{2\pi} \cos^2(t\omega) d\omega = 1/2$$

$$Cov(x(t), x(s)) = \frac{1}{2\pi} \int_0^{2\pi} \cos(t\omega) \cos(s\omega) d\omega = 0 \quad \forall t \neq s$$

So $\{X(t)\}$ is a white noise, however it is not strictly stationary.

https://en.wikipedia.org/wiki/Stationary process

Example A.2: $X(t) = \cos(t + U)$

a **stationary process** example for which any <u>single</u> <u>realisation</u> has an apparently noise-free structure,

Let U have a uniform distribution on $(0,2\pi]$ and define the time series $\{X(t)\}$ by

$$X(t) = \cos(t + U)$$
 for $t \in \mathbb{R}$

then $\{X(t)\}$ is strictly stationary (SSS).

https://en.wikipedia.org/wiki/Stationary process

Example A.2: $X(t) = \cos(t + U)$

Show that X(t) is a **WSS** process. We need to check two conditions:

$$\mu_X(t) = \mu_X$$
 for $t \in \mathbb{R}$

$$R_X(t_1, t_2) = R_X(t_1 - t_2)$$
 for $t_1, t_2 \in \mathbb{R}$

https://www.probabilitycourse.com/chapter10/10 1 4 stationary processes.php

Example A.2: $X(t) = \cos(t + U)$

$$\mu_X(t) = E[X(t)]$$

$$= E[\cos(t+U)]$$

$$= \frac{1}{2\pi} \int_0^{2\pi} \cos(t+u) du$$

$$= 0, \quad \text{for all } t \in \mathbb{R}.$$

https://www.probabilitycourse.com/chapter10/10 1 4 stationary processes.php

Example A.2: $X(t) = \cos(t + U)$

$$R_X(t_1, t_2) = E[X(t_1)X(t_2)]$$

$$= E[\cos(t_1 + U)\cos(t_2 + U)]$$

$$= E\left[\frac{1}{2}\cos(t_1 + t_2 + 2U) + \frac{1}{2}\cos(t_1 - t_2)\right]$$

$$= E\left[\frac{1}{2}\cos(t_1 + t_2 + 2U)\right] + E\left[\frac{1}{2}\cos(t_1 - t_2)\right]$$

$$= \frac{1}{2\pi} \int_0^{2\pi} \cos(t_1 + t_2 + u) du + \frac{1}{2}\cos(t_1 - t_2)$$

$$= 0 + \frac{1}{2}\cos(t_1 - t_2) = \frac{1}{2}\cos(t_1 - t_2), \quad \text{for all } t_1, t_2 \in \mathbb{R}.$$

The random phase signal $X(t) = \alpha cos(\omega t + \Theta)$ where $\Theta \in U[0, 2\pi]$ is **SSS** it is known that the **first order pdf** is

$$f_{X(t)}(x) = \frac{1}{\pi \alpha \sqrt{1 - (x/\alpha)^2}}, \quad -\alpha < x < +\alpha$$

which is independent of t, and is therefore stationary

To find the second order pdf, note that if we are given the value of X(t) at one point, say t_1 , there are (at most) two possible sample functions

- $X(t_1) = x_1$
 - ullet at t_1 , two sinusoid waves intersect with each other
- $X(t_2) = x_{21}$ or x_{22}
 - at t_2 , two sinusoid waves do <u>not</u> intersect with each other

The **second order pdf** can thus be written as

$$f_{X(t_1),X(t_2)}(x_1,x_2) = f_{X(t_1)}(x_1)f_{X(t_2)|X(t_1)}(x_2|x_1)$$

$$= f_{X(t_1)}(x_1)\left(\frac{1}{2}\delta(x_2 - x_{21}) + \frac{1}{2}\delta(x_2 - x_{22})\right)$$

which depends only on $t_2 - t_1$, and thus the second order pdf is **stationary**

- if we know that $X(t_1) = x_1$ and $X(t_2) = x_2$, the sample path is totally <u>determined</u> except when $x_1 = x_2 = 0$,
- when $x_1 = x_2 = 0$, two paths may be possible
- thus all n-th order pdfs are stationary http://isl.stanford.edu/~abbas/ee278/lect07.pdf

Outline

- Random Phase Oscillator

Example B.1: X(t) = Y

Let Y be any scalar random variable, and define a time-series $\{X(t)\}$, by

$$X(t) = Y$$
 for all t .

Then $\{X(t)\}$ is a **stationary** time series

- realisations consist of a series of constant values,
- a different constant value for each realisation.

https://en.wikipedia.org/wiki/Stationary_process

Example B.1: X(t) = Y

$$X(t) = Y$$
 for all t .

X(t) is a first-order stationary

$$f_X(x_1; t_1) = f_X(x_1; t_1 + \Delta) = const$$

X(t) is a second-order stationary

$$f_X(x_1, x_2; t_1, t_2) = f_X(x_1, x_2; t_1 + \Delta, t_2 + \Delta) = const$$

X(t) is to be a N^{th} -order stationary

$$f_X(x_1,\dots,x_N;t_1,\dots,t_N) = f_X(x_1,\dots,x_N;t_1+\Delta,\dots,t_N+\Delta) = const$$

Let X(t) and Y(t) be two jointly **WSS** random processes.

Consider the random process Z(t)

$$Z(t) = X(t) + Y(t)$$

Show that Z(t) is **WSS**.

Since X(t) and Y(t) are jointly WSS, we conclude

$$\mu_{X(t)} = \mu_X$$
 $\mu_{Y(t)} = \mu_Y$
 $R_X(t_1, t_2) = R_X(t_1 - t_2)$
 $R_Y(t_1, t_2) = R_Y(t_1 - t_2)$
 $R_{XY}(t_1, t_2) = R_{XY}(t_1 - t_2)$

Since X(t) and Y(t) are jointly WSS, we conclude

$$\mu_{Z}(t) = E[X(t) + Y(t)]$$

= $E[X(t)] + E[Y(t)]$
= $\mu_{X} + \mu_{Y}$.

Since X(t) and Y(t) are jointly WSS, we conclude

$$R_{Z}(t_{1}, t_{2}) = E\left[\left(X(t_{1}) + Y(t_{1})\right)\left(X(t_{2}) + Y(t_{2})\right)\right]$$

$$= E[X(t_{1})X(t_{2})] + E[X(t_{1})Y(t_{2})]$$

$$+ E[Y(t_{1})X(t_{2})]E[Y(t_{1})Y(t_{2})]$$

$$= R_{X}(t_{1} - t_{2}) + R_{XY}(t_{1} - t_{2})$$

$$+ R_{YX}(t_{1} - t_{2}) + R_{Y}(t_{1} - t_{2}).$$

Example B.3: $X(t) = \pm \sin t, \pm \cos t$

Let

$$X(t) = \begin{cases} +\sin t & p_0 = \frac{1}{4} \\ -\sin t & p_1 = \frac{1}{4} \\ +\cos t & p_2 = \frac{1}{4} \\ -\cos t & p_3 = \frac{1}{4} \end{cases}$$

$$E[X(t)] = 0$$

 $R_X(t_1, t_2) = \frac{1}{2}cos(t_2 - t_1)$

thus X(t) is WSS

Example B.3: $X(t) = \pm \sin t, \pm \cos t$

Let

$$X(t) = \begin{cases} +\sin t & p_0 = \frac{1}{4} \\ -\sin t & p_1 = \frac{1}{4} \\ +\cos t & p_2 = \frac{1}{4} \\ -\cos t & p_3 = \frac{1}{4} \end{cases}$$

But X(0) and $X(\frac{\pi}{4})$ do not have the same pmf (different ranges), so the first order pmf is not stationary, and the process is not **SSS**

Cyclostationary Process

- A cyclostationary process is one whose <u>distribution</u> is <u>periodic</u> in time.
- Cyclostationarity is a characteristic of a probability distribution.
- A random variable whose distribution changes periodically with time, or is perodically time-varying, is referred to as a cyclostationary process.
- Let's return to the example of flipping a coin but with a caveat: the coin will only be flipped on Mondays and not flipped all other days of the week.
- However, the distribution is periodically time-varying when focusing on each week day individually. For example, the distribution of the coin flip on Monday is defined as
- (2) \begin{equation*}p_{c,weekly}\left(x | \text{day} = \text{Monday}\right) = \begin{cases}0.5; & x = 1 \text{\$\text{day}\$}
