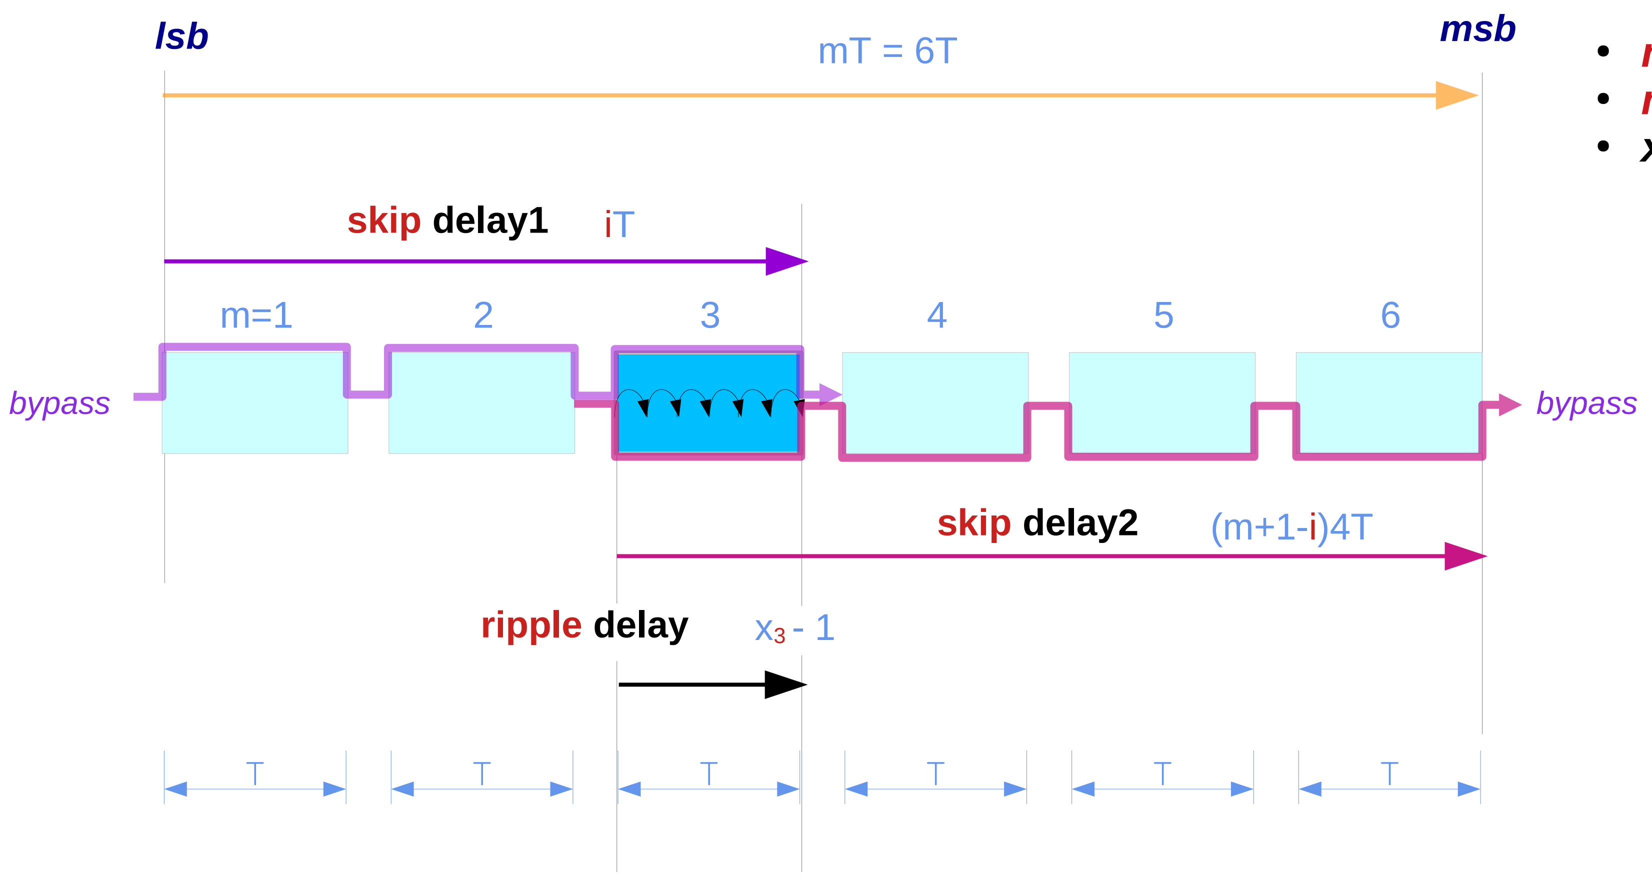
Carry Ripple delays

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Minimum skip path delay y_i of the i^{th} group

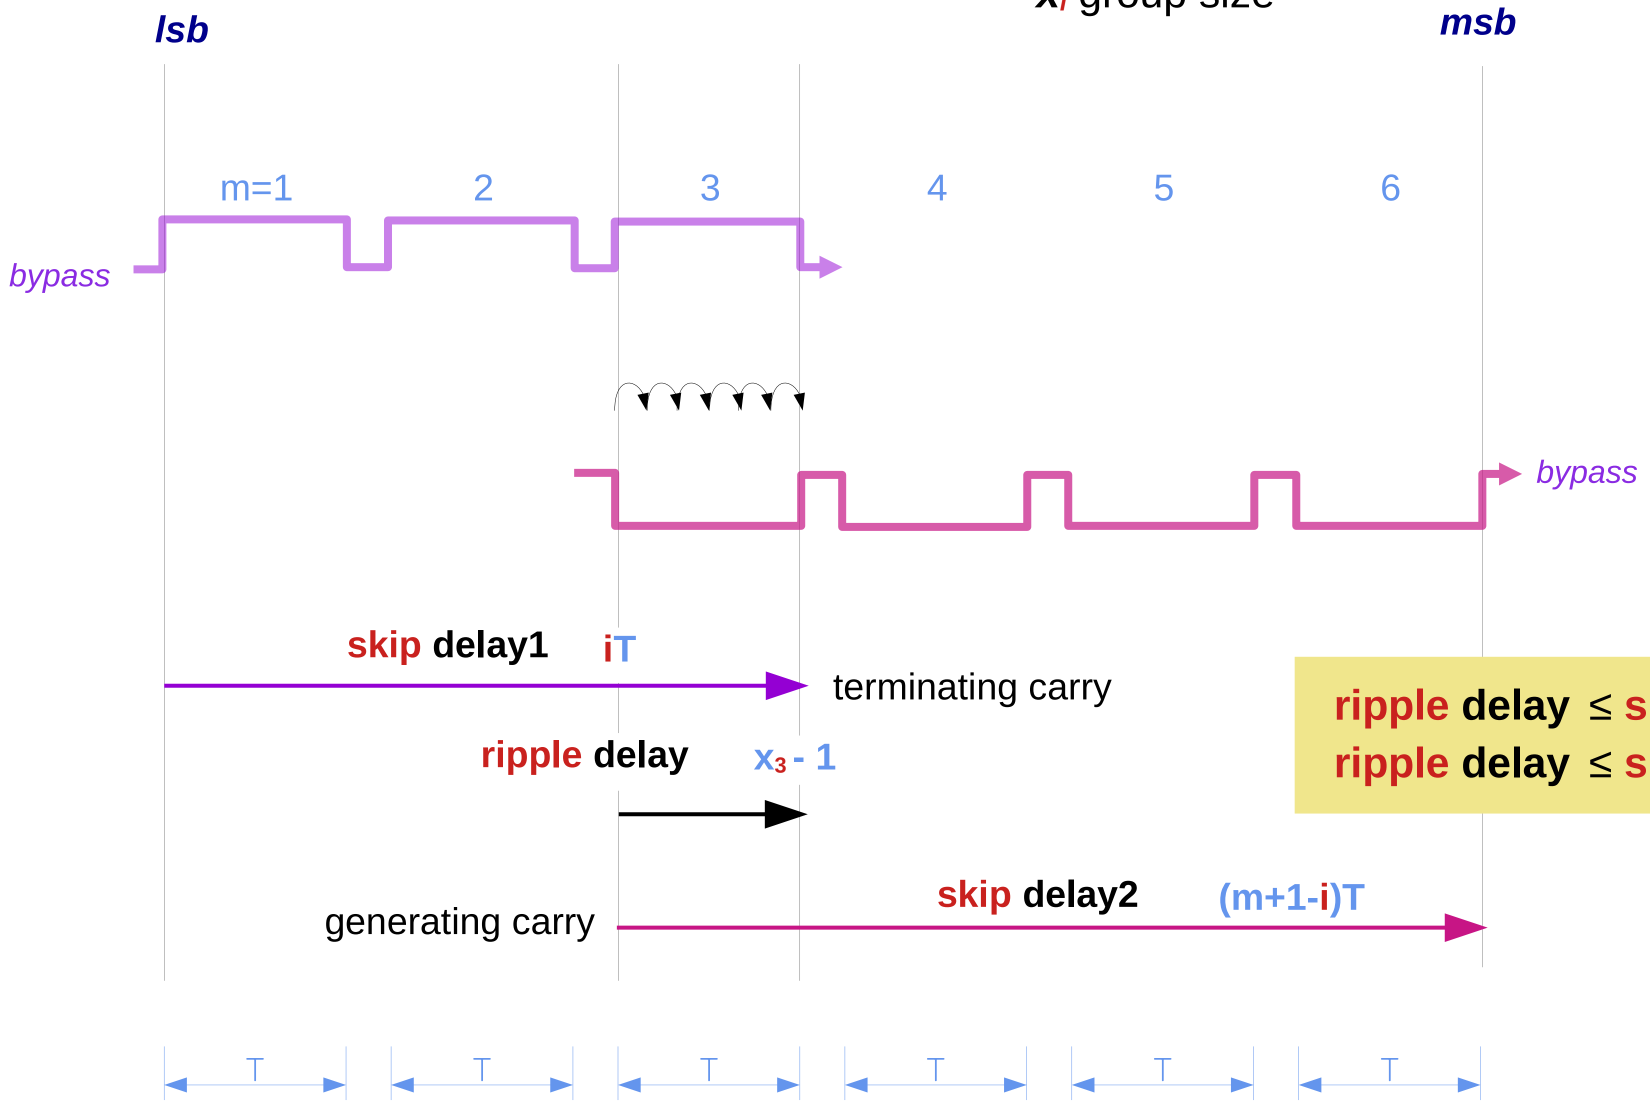


- ***n*** bits
- ***m*** groups
- x_i group size

terminating carry	**ripple delay ≤ skip delay1**
generating carry	**ripple delay ≤ skip delay2**

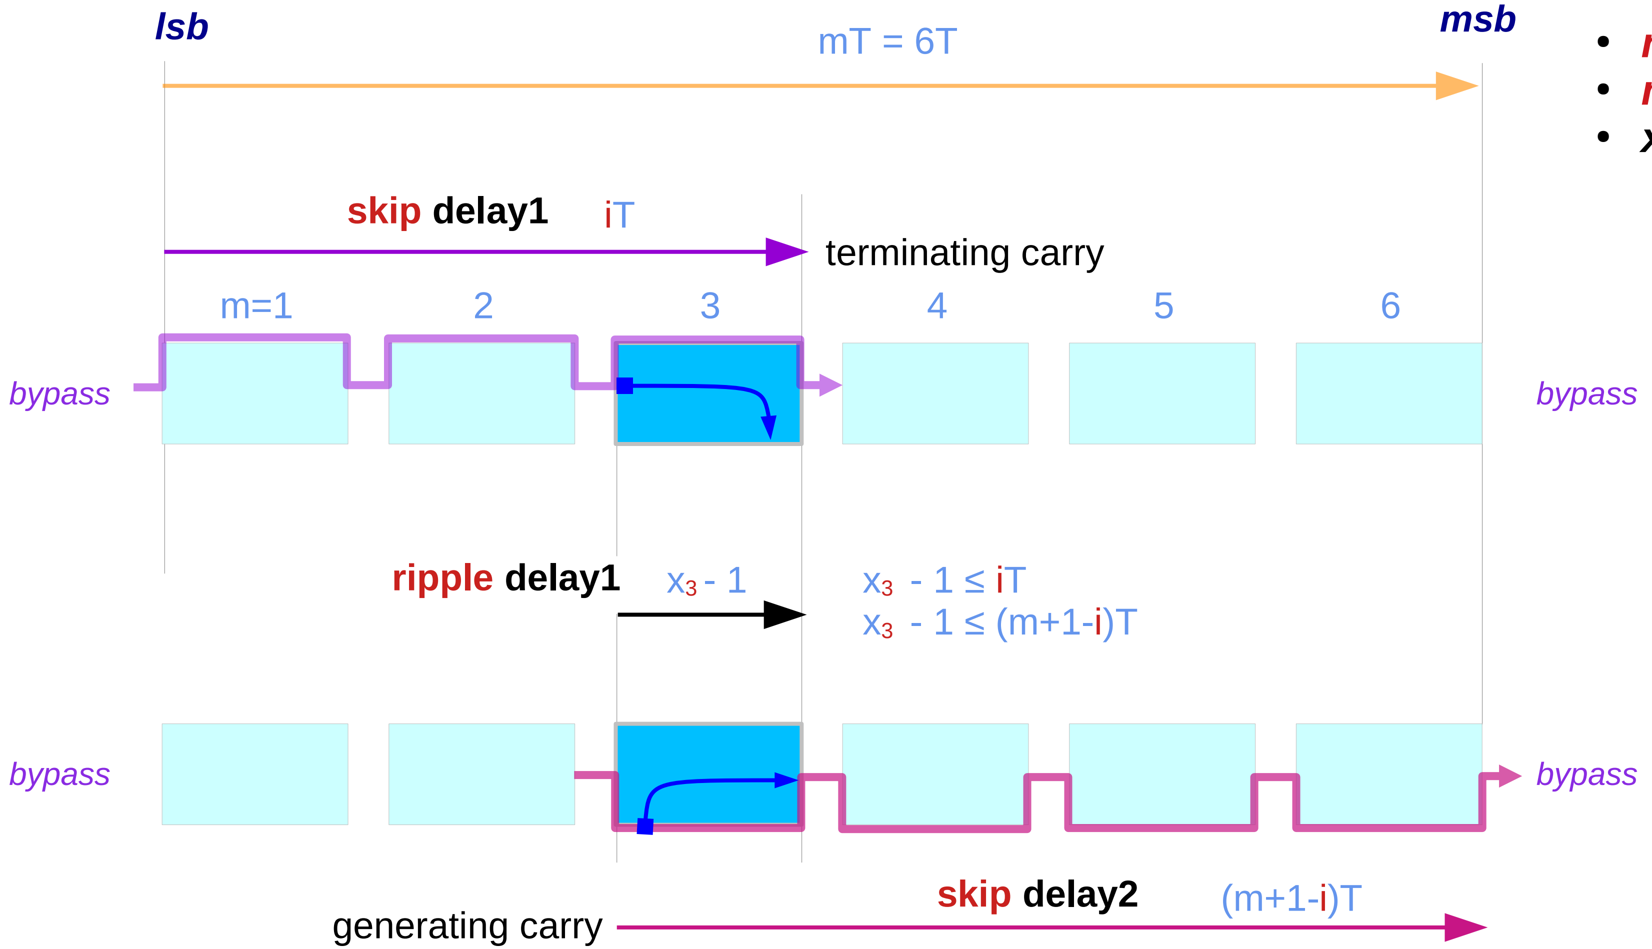
Parallel Delay Paths

- x_i group size



ripple delay ≤ **skip delay1**
ripple delay ≤ **skip delay2**

Minimum skip path delay y_i of the i^{th} group



- n bits
- m groups
- x_i group size

$$x_3 \le y_3 = \min(1 + iT, 1 + (m+1-i)T)$$

Determining *m* group size

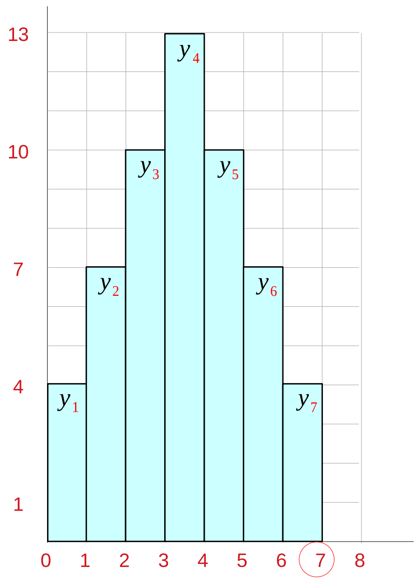
Method 1 – using a histogram

Let m be the <u>smallest</u> positive integer such that

$$n \le \sum_{i=1}^{m} y_i$$

m = 2;
while ($y_1+\cdots+y_m$ < n) m = m+1 ;

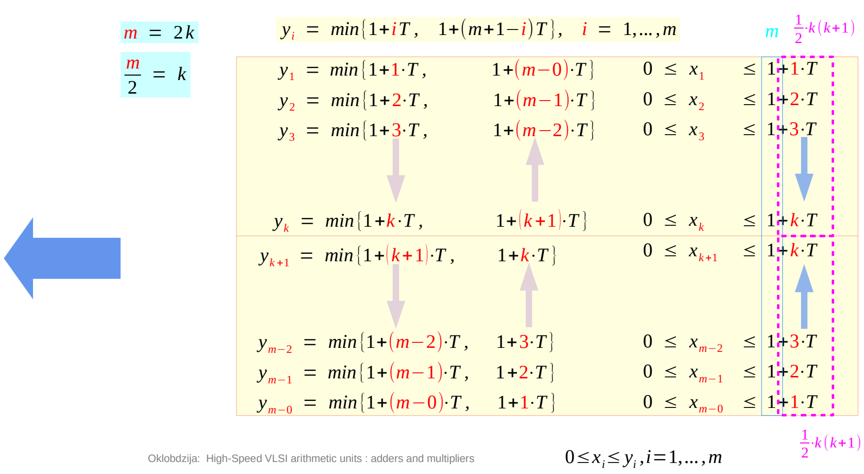
$$y_i = \min\{1+iT,\ 1+(m+1-i)T\}, \quad i = 1,\ldots,m$$



Method 2 – using a *closed formula*

Let m be the <u>smallest</u> positive integer such that

$$n \le m + \frac{1}{2}mT + \frac{1}{4}m^2T + (1-(-1)^m)\frac{1}{8}T$$



Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Determining *m* group size

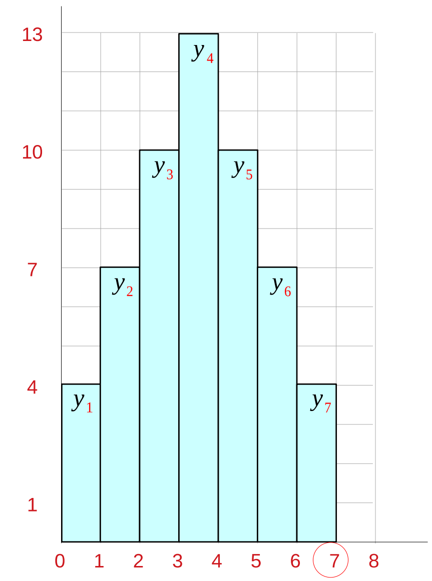
Method 1 – using a histogram

Let m be the <u>smallest</u> positive integer such that

$$n \le \sum_{i=1}^{m} y_i$$

m = 2;
while ($y_1+\cdots+y_m < n$) m = m+1 ;

$$y_i = min\{1+iT, 1+(m+1-i)T\}, \quad i = 1, \ldots, m$$



m = 2; T = 3
y_1 = min {1+T, 1+2T} = 1+T = 4
y_2 = min {1+2T, 1+T} = 1+T = 4

m = 3; T = 3
y_1 = min {1+T, 1+3T} = 1+T = 4
y_2 = min {1+2T, 1+2T} = 1+2T = 7
y_3 = min {1+3T, 1+T} = 1+T = 4

m = 4; T = 3

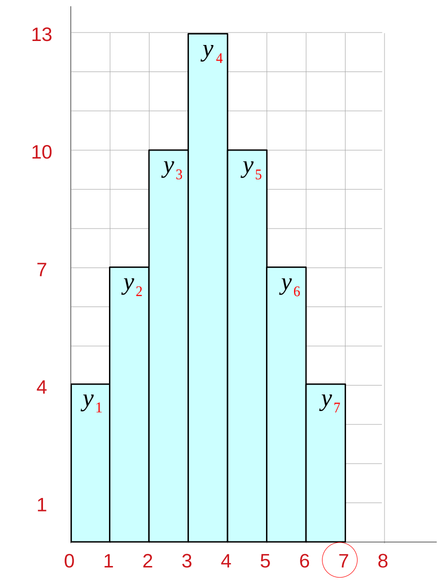
$$n \le \sum_{i=1}^{m} y_i$$

m = 2;
while ($y_1 + \cdots + y_m$ < n) m = m+1 ;

$$y_i = min\{1 + iT, 1 + (m+1-i)T\}, \quad i = 1, \ldots, m$$



$m = 2$	$m = 3$	$m = 4$	$m = 5$	$m = 6$	$m = 7$
$\sum_{i=1}^{2} y_i$	$\sum_{i=1}^{3} y_i$	$\sum_{i=1}^{4} y_i$	$\sum_{i=1}^{5} y_i$	$\sum_{i=1}^{6} y_i$	$\sum_{i=1}^{7} y_i$
$2 + 2 \cdot T$	$3 + 4 \cdot T$	$4 + 6 \cdot T$	$5 + 9 \cdot T$	$6 + 12 \cdot T$	$7 + 16 \cdot T$
$2 + 2 \cdot T < n$	$3 + 4 \cdot T < n$	$4 + 6 \cdot T < n$	$5 + 9 \cdot T < n$	$6 + 12 \cdot T < n$	$7 + 16 \cdot T > n$
$2 + 2 \cdot 3 < 48$	$3 + 4 \cdot 3 < 48$	$4 + 6 \cdot 3 < 48$	$5 + 9 \cdot 3 < 48$	$6 + 12 \cdot 3 < 48$	$7 + 16 \cdot 3 > 48$
$8 < 48$	$15 < 48$	$22 < 48$	$32 < 48$	$42 < 48$	$55 > 48$

$m = 7$

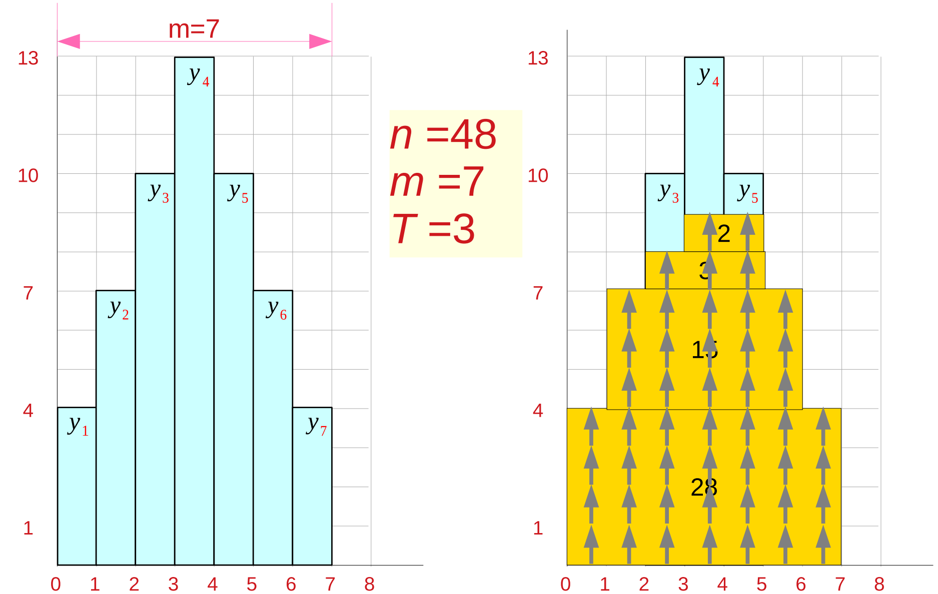
$n = 48$
$T = 3$
→ $m = 7$

Determining x_i

construct a histogram
whose i-*th* column has height y_i

so these y_i's are at least n unit squares
in the histogram, starting with the first row,
shade in n of the squares, row by row

let x_i denote the number of shaded squares
in column i of the histogram,
$i = 1, \ldots, m$

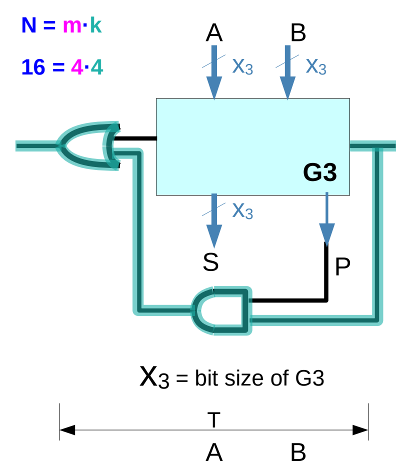


$$0 \le x_i \le y_i, \quad i = 1, \ldots, m$$

$$n = \sum_{i=1}^{m} x_i \le \sum_{i=1}^{m} y_i$$

$$n = \sum_{i=1}^{7} x_i$$

$$n = 4+7+8+9+9+7+4 = 48 < 7+16\cdot 3 = 55$$



$m = 7$; $T = 3$

$x_1 = 4 \le y_1 = 4$

$x_2 = 7 \le y_2 = 7$

$x_3 = 8 < y_3 = 10$

$x_4 = 9 < y_4 = 13$

$x_5 = 9 < y_5 = 10$

$x_6 = 7 \le y_6 = 7$

$x_7 = 4 \le y_7 = 4$

Procedure

(I) Let m be the smallest positive integer such that

$$n \le m + \frac{1}{2} m T + \frac{1}{4} m^2 T + \left(1 - (-1)^m\right) \frac{1}{8} T = \sum_{i=1}^{m} y_i$$

- total n =48 bits
- m =7 groups
- i-th group has x_i bits (size)
- constant skip delay $T = T(x_i) = 3$

(II) Let

$$y_i = min\{1 + iT, 1 + (m+1-i)T\}, \quad i = 1, \dots, m$$

and construct a histogram whose *i-th* column has height y_i

for example, for T=3, and n=48, we have m=7

(III) It is easily verified that the area of the histogram in (II) is

$$\sum_{i=1}^{m} y_i = m + \frac{1}{2} m T + \frac{1}{4} m^2 T + \left(1 - (-1)^m\right) \frac{1}{8} T \ge n$$

so these are at least n unit squares in the histogram
starting with the first row, shade in n of the squares, row by row
Let x_i denote the number of shaded squares in column i of the histogram,
$i = 1, \dots, m$

$$n = \sum_{i=1}^{m} x_i \le \sum_{i=1}^{m} y_i$$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Maximum propagation time P

$$y_i = min\{1+iT, 1+(m+1-i)T\}, \quad i = 1, \ldots, m$$

the scheme (i), (ii), (iii)
gives the max prop time *mT*

$$y_1 = min\{1+1 \cdot T, 1+(m+1-1)T\} = 1 + T$$

$$y_m = min\{1+m \cdot T, 1+(m+1-m)T\} = 1 + T$$

$$x_1 \leq y_1 = 1+T$$

$$x_m \leq y_m = 1+T$$

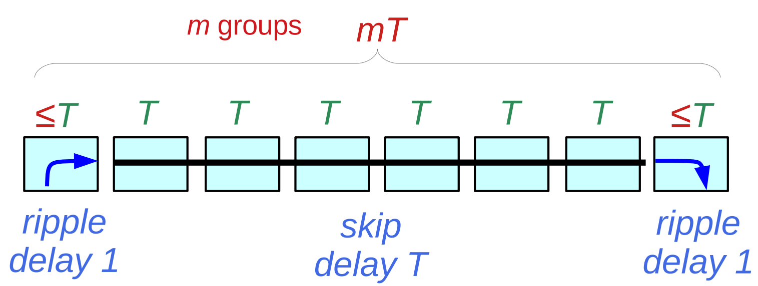
$x_1 - 1 \leq 1T$
$x_1 - 1 \leq (m+1-1)T$

$x_1 - 1 \leq T$
$x_1 - 1 \leq mT$

$x_m - 1 \leq mT$
$x_m - 1 \leq (m+1-m)T$

$x_m - 1 \leq mT$
$x_m - 1 \leq T$

maximum propagation time



$$P_{max} = P_{1,m} \leq mT$$

$$P = P_{i,j} \leq mT$$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Maximum propagation time P

Lemma 1 When the bits of a carry skip adder are grouped according to the scheme (i)-(iii), the maximum propagation time of a carry signal is mT

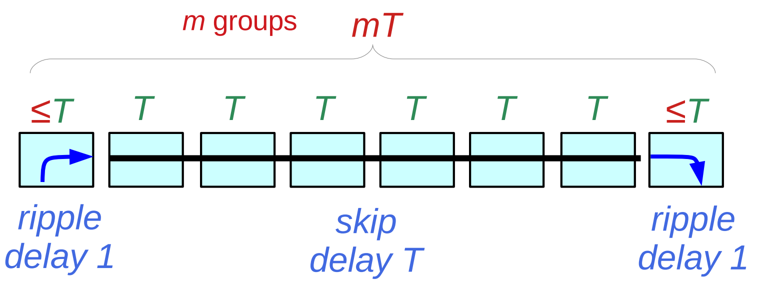
the scheme (i), (ii), (iii) gives the max prop time mT

The carry generated at the 2^{nd} bit position and terminating at the $(n\text{-}1)^{th}$ bit position clearly has propagation time mT.

We must show that *any other* carry signal has propagation time smaller than or equal to mT

propagation time of a carry signal $\leq mT$
the maximum propagation time = mT

maximum propagation time



$$P_{max} = P_{1,m} \leq mT$$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Propagation Time P

the scheme (i), (ii), (iii)
gives the max propagation time *mT*

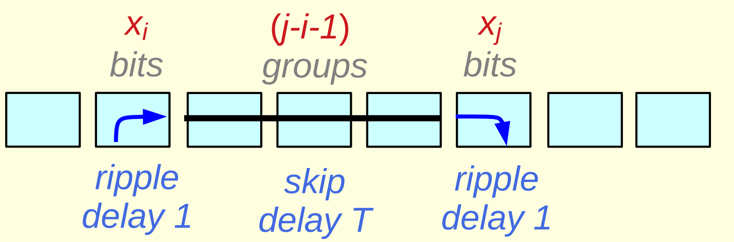
propagation time of a carry signal $\le mT$
the maximum propagation time = mT

Let *m* be the <u>smallest</u> positive integer such that

$$n \le \sum_{i=1}^{m} y_i = \sum_{i=1}^{m} min\{1+iT, 1+(m+1-i)T\}$$

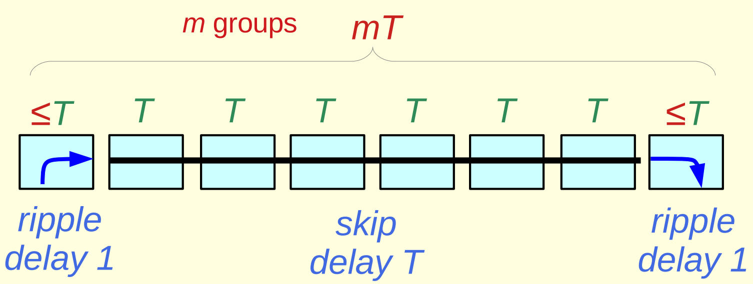
```
m = 2;
while (y_1+···+y_m < n) m = m+1 ;
```

propagation time



$$P = P_{i,j} \qquad \forall i, \forall j \quad 1 \le i, j \le m$$

maximum propagation time



$$P_{max} = P_{1,m} \le mT$$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Maximum delay and optimal group size

the maximum propagation time
$\propto$ the number of groups

$$D \propto m$$

- when optimal group size = m
  the maximum delay $D_m = mT$
- when optimal group size = $(m-1)$
  the maximum delay $D_{m-1} = (m-1)T$
- when optimal group size = r
  the maximum delay $D_r = rT$
- *larger number of groups →*
  larger delays →
  not optimal

- when group size m is not *optimal*

  then there is an optimal group size = r

  - the maximum delay
    with the group size m $D_m = mT$
  - the maximum delay
    with the group size r $D_r = rT$
  - *r must be smaller than m* $r \leq m$

$$D_r \leq D_m$$

$$\Rightarrow rT \leq mT$$

$$\Rightarrow r \leq m$$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Maximum delay of a carry signal

Lemma 2 Let *D* denote the maximum delay of a carry signal in a *n* bit carry skip adder with group sizes chosen optimally. Then

- ***n*** bits
- ***r*** groups

$$(m-1)T \le D \le mT$$

Since we have exhibited a <u>division</u> of the carry chain into groups
In such a way that the maximum delay of a carry signal is *mT*
We clearly have $D \le mT$

the **maximum delay** = *D*
the **optimal group size** = *m*

$$(m-1)T \le D \le mT$$

- ***If*** the number of division *m* is <u>not</u> optimal
  - → maximum delay over *m* groups : $D_m \le mT$
  - → there is a number of division *r*
  - → maximum delay over *r* groups : $D_r \le rT < D_m \le mT$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Maximum delay of a carry signal

$$(m-1)T \le D \le mT$$

Assume there are ***r*** *groups*

then 2 cases : ***even r**, **odd r***

for each of these 2 cases

prove $mT - D < T + 1$

$mT - D \le T$

then $(m-1)T \le D$

P: ***the propagation delay of any carry signal path ≤ mT***

upper bound

D: ***the max of P***

diff (mT, D) ≤ T

diff (mT,** max **P) ≤ T

lower bound

(m-1)T ≤ D

Optimal division into groups (1-1)

Theorem 1

The scheme 2(i) – 2(iii) given above
for dividing the bits of a carry skip adder into groups
is optimal for $2 \le T \le 7$

dividing the bits into groups by the scheme 2(i) – 2(iii)
gives *m* groups

propagation time of a carry signal $\le mT$
the maximum propagation time = mT

the maximum delay = D
the optimal group size = m

$$(m-1)T \le D \le mT$$

(I) Let *m* be the smallest positive integer such that

$$n \le m + \frac{1}{2} m T + \frac{1}{4} m^2 T + \left(1-(-1)^m\right)\frac{1}{8} T$$

(II) Let $y_i = min\{1+iT, 1+(m+1-i)T\}$,
$i = 1, \dots, m$

and construct a histogram
whose *i-th* column has height y_i

(III) the area of the histogram in (II) is

$$m + \frac{1}{2} m T + \frac{1}{4} m^2 T + \left(1-(-1)^m\right)\frac{1}{8} T \ge n$$

so these are at least *n* unit squares
in the histogram starting with the first row,
shade in *n* of the squares, row by row
Let x_i denote the number of shaded squares
in column *i* of the histogram,
$i = 1, \dots, m$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (1-2)

Assume

- the scheme by 2(i) – 2(iii) (*m* groups) is not optimal
- let ***D*** be the maximum delay corresponding to an optimal division of the bits into groups
- there are ***r*** groups in the optimal division.

Since a carry in signal to the least significant bit group can skip over each group

we have $rT \le D \le mT$ so $r \le m$

> *if m is not optimal, but r is*
> *then* $mT \ge rT$ (smaller delay rT)
> *thus* $m \ge r$ (smaller r exists)

m groups
- *not optimal division*
- ***D*** = maximum delay
- ***m****T* skip delay

r groups
- optimal division
- ***r****T* skip delay

skip delay
$rT \le D \le mT$

$r \le m$

__D__ = max delay is assumed
To be greater than all skip
delay __rT__ of the optimal division

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (1-2)

If the optimal division gives *m groups*

m groups  mT

(*m-1*) groups $(m-1)T$

$$D \le mT$$

$$(m-1)T \le D$$

- when optimal group size = m
  the maximum delay $D_m \le mT$
- when optimal group size = (*m-1*)
  the maximum delay $D_{m-1} \le (m-1)T$

Normally, by 2(i) – 2(iii) (*m groups*) is optimal
and its maximum delay *D* is less than all skip delay mT

$D \le mT$

To prove this, first, negate that

- *m is not by the optimal division, but r is*
- *D is greater than all skip delay of the optimal division*

D = maximum delay

$rT \le D \le mT$

$r \le m$ ➡ $r < (m-1)$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (1-2)

$rT \le D \le mT$ so $r \le m$

Optimal division : r groups

$D' \le$ *all skip delay* rT (r *groups*)

Non-optimal division : m groups

$D \le$ *all skip delay* mT (m *groups*)

too many partitions m $r \le m$

Assume max delay D is greater than all skip delay rT of the optimal division

if m *is* ***not*** *optimal,* ***but*** r *is*
then $mT \ge rT$ (smaller delay rT)
thus $m \ge r$ (smaller r exists)

D *is max delay for* m *groups*
D' *is max delay for* r *groups*
then $D' \le rT \le D \le mT$

D = maximum delay

$rT \le D \le mT$

$r \le m$ ➡ $r < (m-1)$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (2)

we have $rT \leq D \leq mT$ so $r \leq m$

If $r = m$

then $D = mT$ ➡ $D = rT$ $rT = D$

If $r = m-1$, ($r < m$)

$D \geq (m-1)T$ ➡ $D \geq (m-1)T = rT$ $rT \leq D$

if $r < m-1$, ($r < m$) $r = m-2, m-3, m-3, \ ...$

$D \geq (m-1)T$ ➡ $D \geq (m-1)T > rT$ $rT < D$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (3)

we have $rT \le D \le mT$ so $r \le m$

If $r = m$ then $D = mT$
and the **theorem** holds by **lemma** 1

When the bits of a carry skip adder are grouped according to the scheme (i)-(iii), the maximum propagation time of a carry signal is mT

$(m-1)T \le D \le mT$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Lemma 1 *When the bits of a carry skip adder are grouped according to the scheme (i)-(iii), the maximum propagation time of a carry signal is mT*

Theorem 1 *The scheme 2(i) – 2(iii) given above for dividing the bits of a carry skip adder into groups is optimal for* $2 \le T \le 7$

(5) $r = 2k$ $\quad X = 4 - T^2$

$$mT - D \le T + \frac{-8(T/n)+4}{\sqrt{4(T/n)+8(T/n^2)} + \sqrt{4(T/n)+4/n^2}}$$

$r = 2k+1$ $\quad X = 4$

$$mT - D \le T + \frac{(T-2)^2/n}{\sqrt{4(T/n)+4(T/n^2)} + \sqrt{4(T/n)+(T/n)^2+4/n^2}}$$

m groups – not optimal division
r groups – optimal division

D = maximum delay

$rT \le D \le mT$

$r \le m$

Optimal division into groups (3)

If $r = m-1$, ($r < m$)
m and r have different parities and
it follows from (5)
that $mT - D \leq T$ for $2 \leq T \leq 7$

so that $D \geq (m-1)T$
since $r = m-1$,
$D \geq (m-1)T = rT$ $\quad rT \leq D$

This means that a signal which
skips over each of the r groups (rT)
has delay less than the maximum D.

$rT \leq D \leq mT$

m is not optimal division
r is optimal division

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Lemma 1 *When the bits of a carry skip adder are grouped according to the scheme (i)-(iii), the maximum propagation time of a carry signal is mT*

Theorem 1 *The scheme 2(i) – 2(iii) given above for dividing the bits of a carry skip adder into groups is optimal for $2 \leq T \leq 7$*

(5) $r = 2k$ $\qquad X = 4 - T^2$

$$mT - D \leq T + \frac{-8(T/n)+4}{\sqrt{4(T/n)+8(T/n^2)} + \sqrt{4(T/n)+4/n^2}}$$

$r = 2k+1$ $\qquad X = 4$

$$mT - D \leq T + \frac{(T-2)^2/n}{\sqrt{4(T/n)+4(T/n^2)} + \sqrt{4(T/n)+(T/n)^2+4/n^2}}$$

m groups – not optimal division
r groups – optimal division

D = maximum delay

$rT \leq D \leq mT$

$r \leq m$

Optimal division into groups (4)

Similarly,
if $r < m\text{-}1$, ($r < m$)

$(m\text{-}1)T \le D$

since $r < m\text{-}1$,
$rT < (m\text{-}1)T \le D$

so that a signal which skips over each group
has delay $rT < D$.

$rT < D \le mT$

m is <u>not</u> optimal division
r is optimal division

m groups – not optimal division
r groups – optimal division

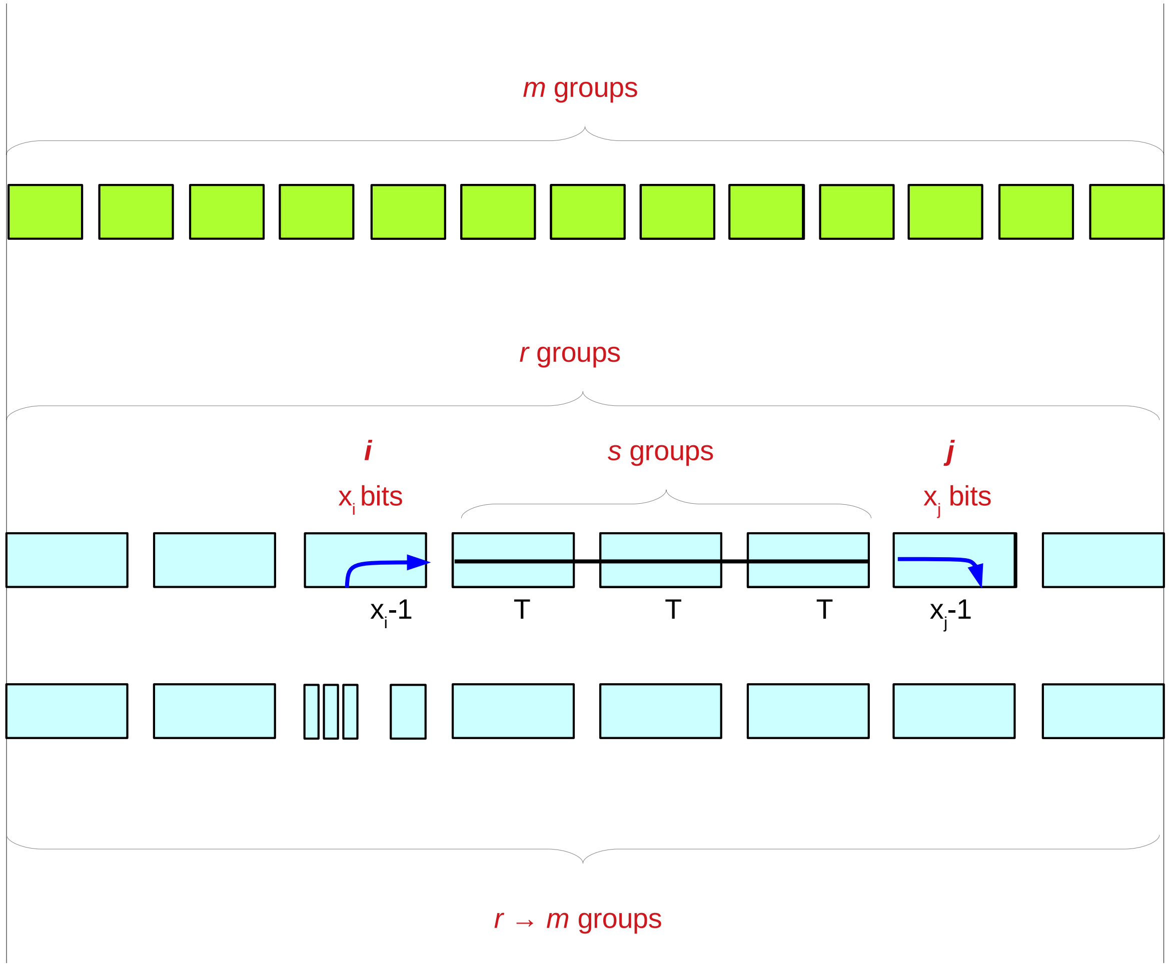
D = maximum delay

$rT \le D \le mT$

$r \le m$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (5)



m groups – not optimal division
r groups – optimal division

D = maximum delay

$rT \leq D \leq mT$

$r \leq m$

if m is <u>not</u> optimal, <u>but</u> r is

(((*r* +1) +1) +1) … → *m*

contradiction! r must be m

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

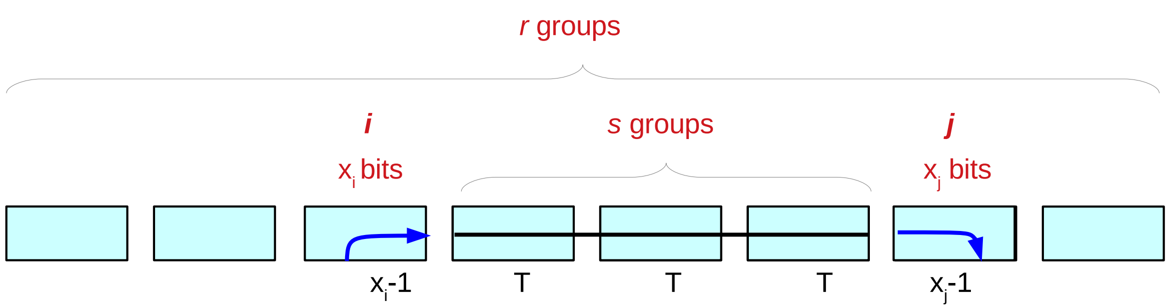
Optimal division into groups (5)

It follows that a signal with delay *D*

must start in a group *i*,
ripple to the end of group *i*,

then skip over *s* < *r* groups and

either terminate, or ripple through
the first few bits of a group *j* > *i*.



m groups – not optimal division
r groups – optimal division

D = maximum delay

$rT \le D \le mT$

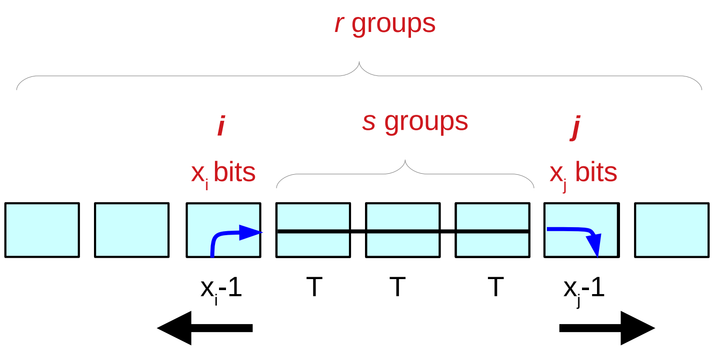
$r \le m$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (6-1)

Let x_i and x_j denote
the lengths of the *i-th* and *j-th* groups respectively.

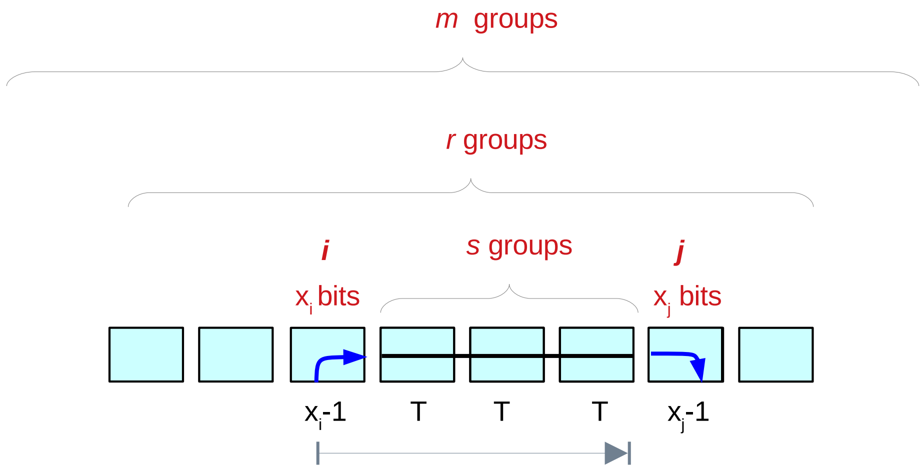
Assume that *i* is chosen as small as possible
and *j* as large as possible. (longer path)



Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (6-2)

A signal <u>originating</u> in group i, <u>rippling</u> to the end of this group i and then skipping over the next *s* group has delay $(x_i - 1) + sT$



$$
\begin{aligned}
D &\le (x_i - 1) + sT \\
&\le (x_i - 1) + (r-1)T \\
&\le (x_i - 1) + (m-2)T .
\end{aligned}
$$

$s < r$ groups ➡ $s \le (r-1)$

$r < m$ groups ➡ $r \le (m-1)$

$$
\begin{aligned}
D &\le (x_i - 1) + sT \\
&< (x_i - 1) + rT \\
&< (x_i - 1) + mT .
\end{aligned}
$$

if m is <u>not</u> optimal, <u>but</u> r is

$$s < r < m$$

$$s \le (r-1) < (m-1)$$

$$s \le (r-1) \le (m-2)$$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (6-3)

$$D \le (x_i - 1) + sT$$
$$\le (x_i - 1) + (r-1)T$$
$$\le (x_i - 1) + (m-2)T$$

$$(m-1)T \le D$$
$$D \le (x_i - 1) + (m-2)T$$

$$(m-1)T \le D \le (x_i - 1) + (m-2)T$$

$$(m-1)T \le (x_i - 1) + (m-2)T$$

Since $D \geq (m-1)T$
this implies that $x_i \geq T+1$

$$T \le (x_i - 1)$$

$$T + 1 \le x_i$$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (7)

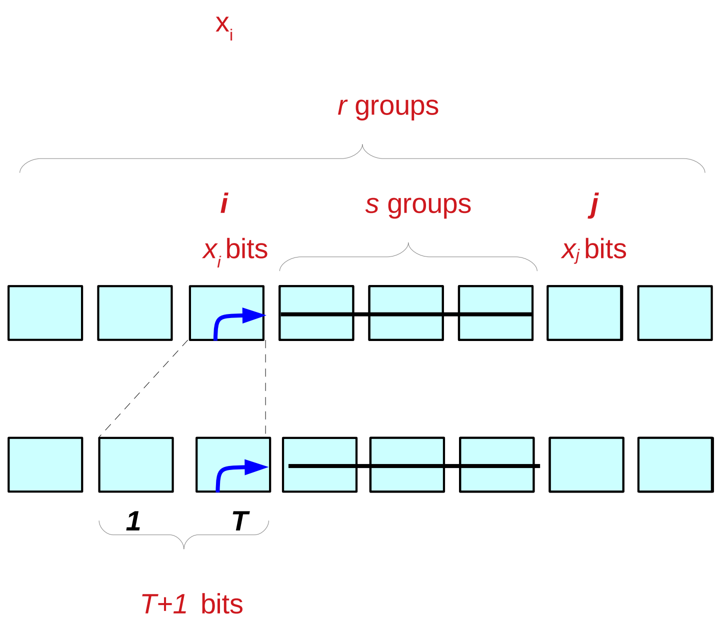
Divide group *i* into two groups
such that the group containing the msb has size *T*.

Since the *i*-th group is the first group
in which a signal having maximum delay can originate,

this subdivision does not increase
the delay of any carry signal of maximum delay

However, it increases the number of groups by **1**

$x_i \geq T+1$ *bits size*



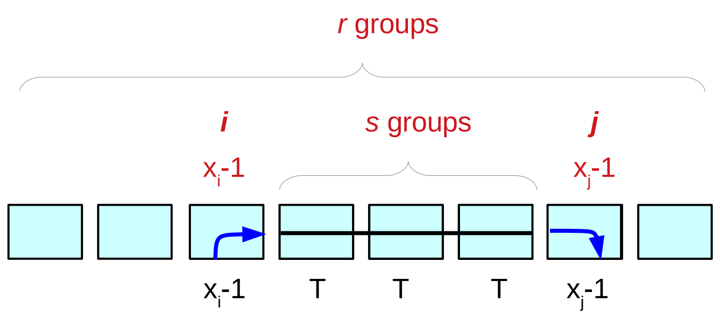
$$D \leq (x_i - 1) + s\,T$$
$$\leq (x_i - 1) + (r-1)\,T$$
$$\leq (x_i - 1) + (m-2)\,T\,.$$

$$(m-1)\,T < D$$
$$D < (x_i - 1) + (m-2)\,T$$
$$x_i \geq (T+1)$$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (8-1)

Suppose now that a carry signal
originates in a group *i*, ripples to its end,
skips over $s \le r\text{-}2$ groups and
finally ripples through the first few bits of a group *j*
and terminates.



We then have

$$D \le (x_i - 1) + sT + (x_j - 1)$$
$$\le x_i + x_j - 2 + (m-3)T$$

So that either $x_i \ge T+1$ or $x_j \ge T+1$

$s < r$ groups	$s < r$ groups
$s \le (r\text{-}1)$ groups	$s \le (r\text{-}2)$ groups
$r < m$ groups	$r < m$ groups
$r \le (m\text{-}1)$ groups	$r \le (m\text{-}2)$ groups

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

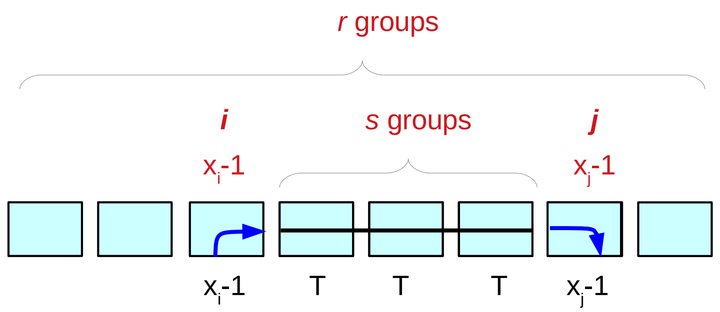
Optimal division into groups (8-2)

$s < r < m$

$s \le (r-1) < (m-1)$

$s \le (r-1) \le (m-2)$

$s \le (r-2) \le (m-3)$



$s \le (r-2)$

$$D \le (x_i - 1) + sT + (x_j - 1)$$
$$\le x_i + x_j - 2 + (r-2)T$$
$$\le x_i + x_j - 2 + (m-3)T$$

$(m-1)T < D$

$D < (x_i - 1) + (m-2)T \Leftrightarrow x_i \ge (T+1)$

$D < (x_j - 1) + (m-2)T \Leftrightarrow x_j \ge (T+1)$

So that either $x_i \ge T+1$ or $x_j \ge T+1$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

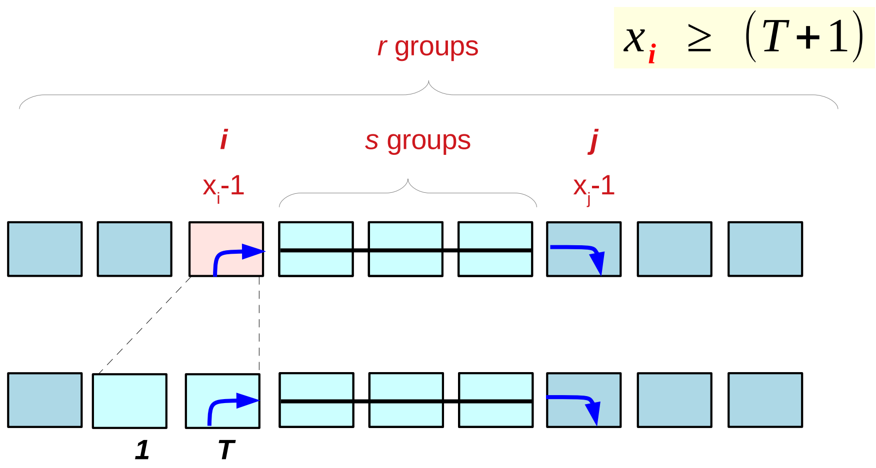
Optimal division into groups (9)

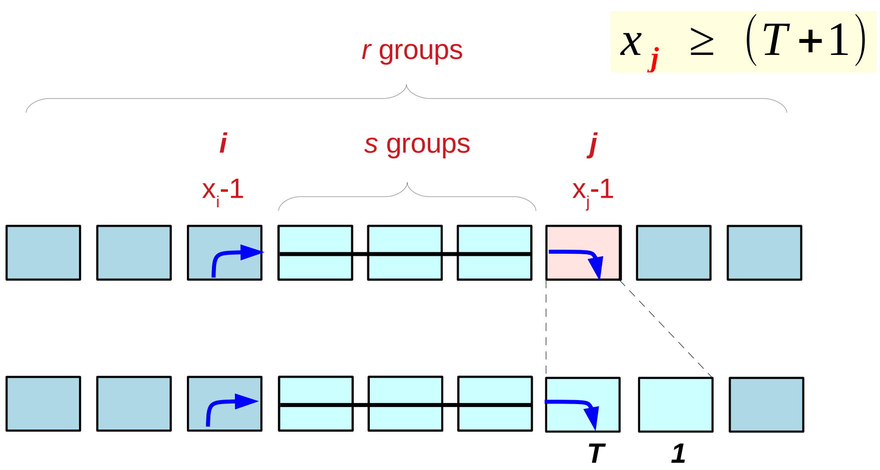
So that either $x_i \geq T+1$ or $x_j \geq T+1$

This means that we can subdivide
one of the groups i, j
without increasing D
not both of them

Continuing in this way, we can always increase
the number r of group in an optimal division
of a carry chain by 1
without increasing D if $r < m$

This means that we can arrive
at an optimal division of the carry chain
into m groups.





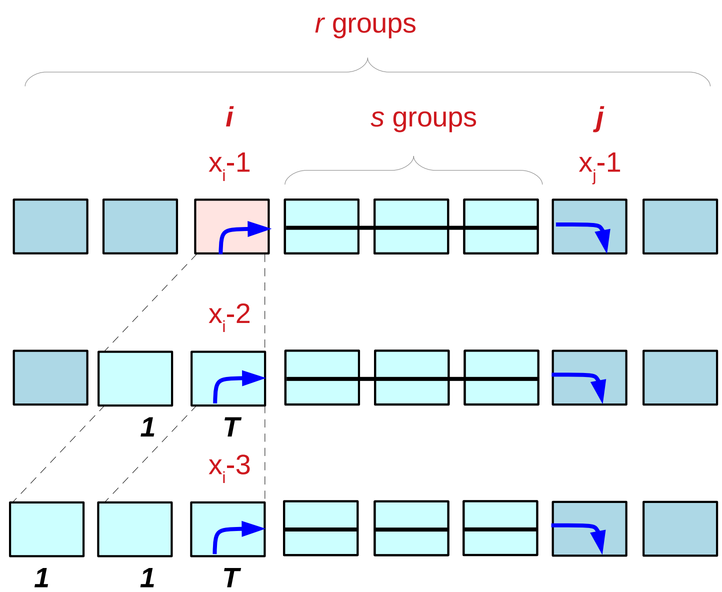
Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (9)

$x_i \geq (T+1) > (T+2) \cdots$

$x_i \geq (T+1)$

$x_i \geq (T+2)$



$$D \leq (x_i - 1) + sT$$
$$\leq (x_i - 1) + (r-1)T$$
$$\leq (x_i - 1) + (m-2)T$$

$$(m-1)T \leq D \leq (x_i - 1) + (m-2)T$$

if m is not optimal, but r is

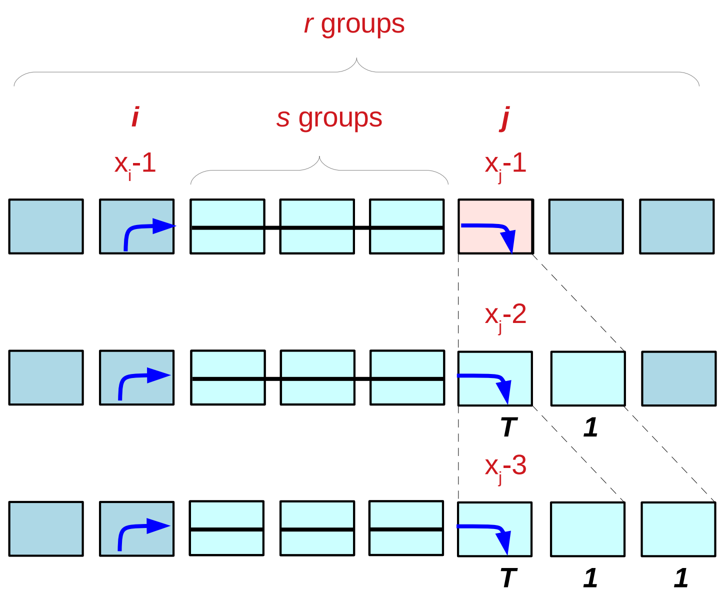
(((*r* +1) +1) +1) … → *m*

contradiction! m must be r

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (9)

$$x_j \geq (T+1) > (T+2) \cdots$$



$$x_j \geq (T+1)$$

$$x_j \geq (T+2)$$

$$\begin{aligned} D &\leq (x_i - 1) + sT \\ &\leq (x_i - 1) + (r-1)T \\ &\leq (x_i - 1) + (m-2)T \end{aligned}$$

$$(m-1)T \leq D \leq (x_i - 1) + (m-2)T$$

if m is <u>not</u> optimal, <u>but</u> r is

$(((r\ \ +1)\ \ +1)\ \ +1)\ \ \ldots \longrightarrow m$

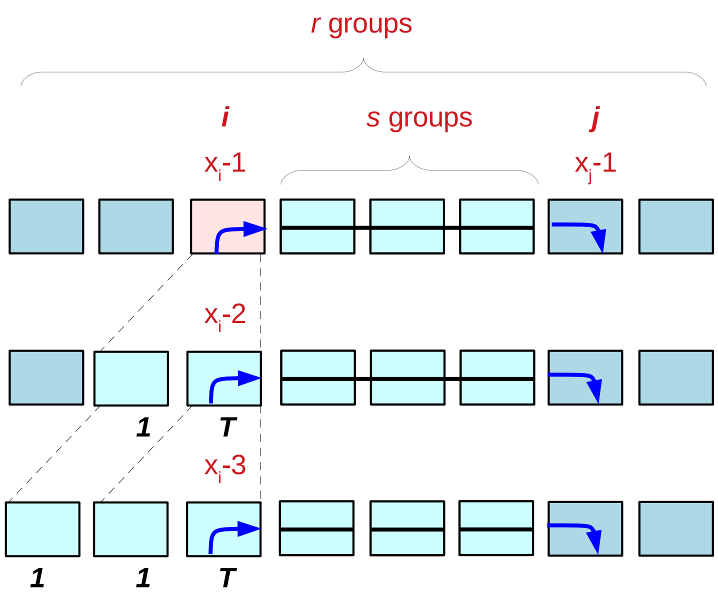
contradiction! m must be r

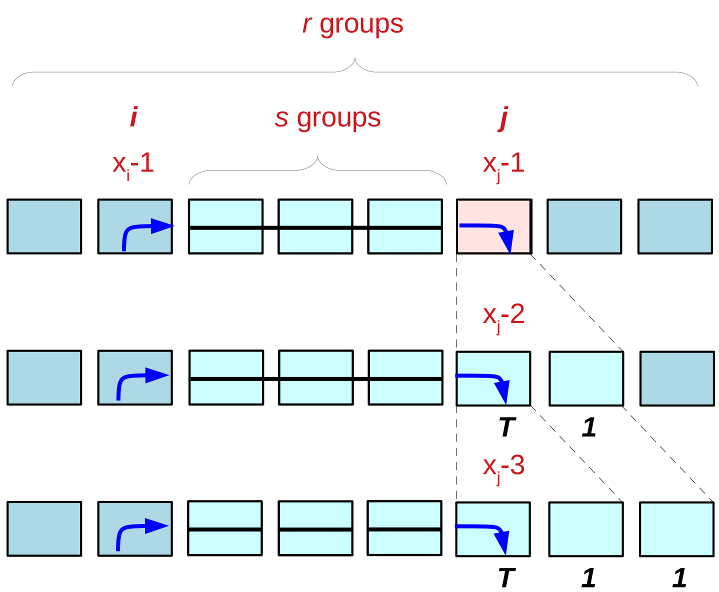
Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (9)

$x_i \geq (T+1) > (T+2) \cdots$

$x_j \geq (T+1) > (T+2) \cdots$





if m is not optimal, but r is

$(((r \ +1) \ +1) \ +1) \ \ldots \longrightarrow m$

contradiction! m must be r

if m is not optimal, but r is

$(((r \ +1) \ +1) \ +1) \ \ldots \longrightarrow m$

contradiction! m must be r

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (9)

Normally, by 2(i) – 2(iii) (m groups) is optimal
and its maximum delay D is less than all skip delay mT

$$D \le mT$$

To prove this, first, negate that

- *m is not by the optimal division, but r is*
- *D is greater than all skip delay of the optimal division*

Assume

- the scheme by 2(i) – 2(iii) (m groups) is not optimal
- let ***D*** be the maximum delay corresponding to an optimal division
- there are ***r*** groups in the optimal division.

(...(((r+1)+1)+1) … +1) → m : optimal

if m is not optimal, but r is

$(((r\ +1)\ +1)\ +1)\ \ldots \rightarrow m$

contradiction! m must be r

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers

Optimal division into groups (11)

We must then have $D \geq mT$
which, together with **Lemma 2**,
Implies $D = mT$

This completes the proof of the theorem

m groups – not optimal division
r groups – optimal division

D = maximum delay

$rT \leq D \leq mT$

$r \leq m$

Lemma 2
Let D denote the maximum delay
of a carry signal in a n bit carry skip adder
with group sizes chosen optimally.

$$(m-1)T \leq D \leq mT$$

Theorem 1

The scheme 2(i) – 2(iii) given above
for dividing the bits of a carry skip adder into groups
is optimal for $2 \leq T \leq 7$

Oklobdzija: High-Speed VLSI arithmetic units : adders and multipliers
