Array Declaration (1)

- $T A[N]$
- allocation of contiguous region of NL bytes
- L : the byte size of the data type T
- x_A denote the starting address of the region
- index between 0 and $N-1$
- the i -th element is at $x_A + iL$

Array Declaration (2)

```
char    A[12];  
char *  B[8];  
double  C[6];  
double * D[5];
```

- $x_A + i$
- $x_B + 4i$
- $x_C + 8i$
- $x_D + 4i$

Array Declaration (3)

```
int    E[12];
```

- $E[i]$ access
 - `%edx` : the starting address of E
 - `%ecx` : the index value i

```
movl  (%edx,%ecx,4), %eax
```

- $(\%edx + \%ecx)$
- $x_E + 4i$

Pointer Arithmetic (1)

- leal - to generate and address
- movl - to reference memory

```
movl %edx, %eax ; (int *) E
```

- x_E

```
movl %(%edx), %eax ; (int) E[0]
```

- $M[\$x_E\$]$

```
movl (%edx,%ecx,4), %eax ; (int) E[i]
```

- $M[\$x_E\$+4i]$

Pointer Arithmetic (2)

```
leal 8(%edx),%eax ; (int *) &E[2]
```

- $x_E + 8$

```
leal -4(%edx,%ecx,4),%eax ; (int *) E+i-1
```

- $x_E + 4i - 4$

```
movl(%edx,%ecx,8),%eax ; (int) *(&E[i]+i)
```

- $x_E + 8i$

```
movl %ecx,%eax ; (int) &E[i]-E
```

- i

Array and Loop (1)

```
int decimal5(int* x) {
    int i;
    int val=0;

    for (i=0; i<5; ++i)
        val = (10*val) + x[i];
    return(val);
}
```

```
int decimal5_opt(int *x) {
    int val = 0;
    int *xend = x + 4;

    do {
        val = (10*val) + *x;
        x++;
    } while (x <= xend);

    return val;
}
```

Array and Loop (2)

```
movl 8(%ebp), %ecx
xorl %eax, %eax
leal 16(%ecx), %ebx
```

.L12:

```
leal (%eax,%eax,4), %edx
movl (%eax,%edx,2), %eax
leal (%eax,%edx,2), %eax
addl $4, %ecx
cmpl %ebx, %ecx
jbe .L12
```

```
int decimal5_opt(int *x) {
    int val = 0;
    int *xend = x + 4;

    do {
        val = (10*val) + *x;
        x++;
    } while (x <= xend);

    return val;
}
```

Nested Array

```
int A[4][3]
```

```
typedef int Row[3]; // Row type definition  
Row A[4];           // A is an array of Row type
```

2-D Array (1)

```
#define N 16
typedef int fmatrix[N][N];

. . .

fmatrix A; // int A[16][16]
fmatrix B; // int B[16][16]
```

2-D Array (2)

```
int iprod(fmatrix A,
fmatrix B, int i, int k)
{
    int j;
    int result = 0;

    for (j=0; j<N; j++)
        result +=
            A[i][j] * B[j][k];

    return result;
}
```

```
int iprod_opt(fmatrix A,
fmatrix B, int i, int k) {
    int *Ap = &A[i][0];
    int *Bp = &B[0][k];
    int result = 0;

    do {
        result += (*Ap) * (*Bp);
        Ap += 1;
        Bp += N;
        cnt--;
    } while (cnt >= 0);
    return result;
}
```

2-D Array (3)

.L23:

```
movl (%edx), %eax
imull (%ecx), %eax
addl %eax, %esi
addl $64, %ecx
addl $4, %edx
decl %ebx
jns .L23
```

```
int iprod_opt(fmatrix A,
fmatrix B, int i, int k) {
    int *Ap = &A[i][0];
    int *Bp = &B[0][k];
    int result = 0;

    do {
        result += (*Ap) * (*Bp);
        Ap += 1;
        Bp += N;
        cnt--;
    } while (cnt >= 0);
    return result;
}
```

Dynamically Allocated Array (1)

```
typedef int *vmatrix;
. . .
vmatrix A // int *A;
. . .
vmatrix func(int n) {
    return (vmatrix)
        calloc(
            sizeof(int), n*n);
}
. . .
int foo(vmatrix A, int i,
int j, int n) {
    return A[(i*n) + j];
}
```

```
movl 8(%ebp), %edx
movl 12(%ebp), %eax
imull 20(%ebp), %eax
addl 16(%ebp), %eax
movl (%eax, %eax, 4), %eax
```

Dynamically Allocated Array (2)

```
typedef int *vmatrix;

int vprod(vmatrix A,
vmatrix B, int i,
int k, int n) {
    int j;
    int result = 0;

    for (j=0; j<n; j++) {
        result +=
            A[i*n+j] * B[j*n+k];
    }

    return result;
}
```

```
int vprod(vmatrix A,
vmatrix B, int i,
int k, int n) {
    int *Ap = &A[i*n];
    int nT = n, result = 0;

    if (n <= 0) return result;
    do {
        result += (*Ap) * B[nT];
        Ap++;
        nT+= n;
        cnt--;
    } while (cnt);
    return result;
}
```

Dynamically Allocated Array (3)

.L37:

```
movl 12(%ebp), %eax
movl (%ebx), %edi
addl $4, %ebx
imull (%eax,%ecx,4), %edi
addl %edi, %esi
addl 24(%ebp), %ecx
decl %edx
jnz .L37
```

```
int vprod(vmatrix A,
vmatrix B, int i,
int k, int n) {
    int *Ap = &A[i*n];
    int nT = n, result = 0;

    if (n <= 0) return result;
    do {
        result += (*Ap) * B[nT];
        Ap++;
        nT+= n;
        cnt--;
    } while (cnt);
    return result;
}
```
