#### ELF1 7B Loading Background - ELF Study 1999

Young W. Lim

2020-07-31 Fri

#### Outline

- Based on
- Dynamic loading and dynamic linking
  - Dynamic loading
  - Dynamic linking
  - Possible Cases of loading and linking
- 3 Load addresses
  - TOC
  - Memory Map
  - Library load addresses
- 4 Executing dynamic executables

#### Based on

"Study of ELF loading and relocs", 1999 http://netwinder.osuosl.org/users/p/patb/public\_html/elf\_ relocs.html

#### Compling 32-bit program on 64-bit gcc

- gcc -v
- gcc -m32 t.c
- sudo apt-get install gcc-multilib
- sudo apt-get install g++-multilib
- gcc-multilib
- g++-multilib
- gcc -m32
- objdump -m i386

#### TOC: Dynamic loading

dynamic loading

## Dynamic loading (1)

- suppose our program that is to be <u>executed</u> consist of various modules.
- not all the modules are loaded into the memory at once
- the main module is loaded first and then starts to execute
- some other modules are loaded only when they are required
- until loading them, the execution is stopped

# Dynamic loading (2)

- Assume a linker is called to link necessary modules into an executable module.
- In dynamic loading, after the <u>linker</u> is called, only main module is loaded into memory.
- During execution, if main module needs another module which is already linked in executable module, then calling module calls relocatable linking loader to load the called module into apporiate location in the processes logical adress space.

https://cs.stackexchange.com/questions/92484/difference-between-dynamic-loading-and-

## Dynamic loading (3)

- loading the dependent library or routine
   on-demand or
   at some time at run time <u>after</u> load time
   (the time at which the main program executable is loaded).
- this is contrast to loading all dependencies with the main program.
   at load-time together
- The loading process completes when the library has been successfully loaded into main memory.

# Dynamic loading (4)

- loading the library (or any other binary executable) into the memory during load or run time.
- dynamic loading can be imagined to be similar to plugins
  - an executable (main module) can actually start to <u>run</u> before the <u>dynamic loading</u> happens
- The dynamic loading example can be created using dlopen()
   of Dynamically Loaded (DL) libraries

 $\verb|https://stackoverflow.com/questions/10052464/difference-between-dynamic-loading-and the control of the cont$ 

## Dynamic loading (5)

- Dynamic loading: system library or other routine is loaded during run time and it is not supported by OS
- when your program runs, it's the <u>programmer</u>'s job to open that library.
   such programs are usually linked with <u>libdl</u>, which provides the ability to open a shared library.

# Dynamic loading (6)

- dynamic loading allows a computer program
  - to <u>start</u> up <u>without</u> loading these libraries,
  - to discover and load available libraries after starting
- a computer program can, at run time,
  - load a library or other binary into memory,
  - retrieve the addresses of library functions and variables
  - execute those functions or access those variables, and
  - <u>unload</u> the library from memory.
- the 3 mechanisms by which
  - dynamic loading
  - static linking
  - dynamic linking.

# Dynamic loading (7)

- With dynamic loading a module is not loaded until it is called
  - all modules are kept on a disk in a relocatable load format.
  - the main program is loaded into memory and is executed
- when a module needs to <u>call</u> <u>another module</u>, the calling module first checks to see whether it has been loaded.
  - if not , the relocatable linking loader is called to load the desired module into memory and update program's address tables to reflect this change.
  - then control is passed to newly loaded module

## Dynamic loading (8)

- an unused module is never loaded .
  - useful when the code is large
- dynamic loading does not need special support from OS
  - it is the responsibility of a <u>programmer</u>

 $\verb|https://stackoverflow.com/questions/10052464/difference-between-dynamic-loading-and the control of the cont$ 

## TOC: Dynamic linking

dynamic linking

# Dynamic linking (1)

- suppose a program has some <u>function calls</u> whose definition is located in some system library
- the <u>header</u> file only consists of the declarations of functions and not definitions
- during execution, if the function gets called
  - the system library is loaded into main memory
  - link the <u>function call</u> in the program with the <u>function definition</u> in the system library.

 $\verb|https://cs.stackexchange.com/questions/92484/difference-between-dynamic-loading-and the control of the cont$ 

## Dynamic linking (2)

- when a module needs to be called,
  - the called module is loaded into memory and
  - a link between the <u>calling module</u> and <u>called module</u>
    is established by the <u>stub</u> (a piece of code that is linked)
    in <u>static linking time</u> of the program.
  - stub is a piece of code that is linked
    - a temporary small function placed by the compiler
    - makes an indirect call to a module function
- dynamic Linking mostly used with shared libraries which different users may use.

## Dynamic linking (3)

- When the program makes the <u>first call</u> to an imported function whose library may or may not have been loaded yet.
  - Initially, a stub gets called instead of the imported function
  - the stub calls into the OS.
  - if the library is currently <u>not loaded</u>,
     it gets loaded (this step is called <u>dynamic loading</u>).
  - then, the stub is modified so that it calls the imported function <u>directly</u> for subsequent calls (this step is called <u>dynamic linking</u>)
- The component of the OS that performs both steps is called the dynamic linker or the dynamic linking loader.

https://cs.stackexchange.com/questions/92484/difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-difference-between-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-loading-and-dynamic-

### Dynamic linking (4)

- dynamic linking is done during load or run time and not when the executable is created (compile time)
- the static linker does minimal work when creating the executable (generating stub functions)
- the dynamic linker has to <u>load</u> the libraries so it is called <u>linking loader</u>.

 $\verb|https://stackoverflow.com/questions/10052464/difference-between-dynamic-loading-and the control of the cont$ 

# Dynamic linking (5)

- system library or other routine is <u>linked</u> during run time and by the support of OS
- when an executable is compiled the required <u>shared libraries</u> must be specified otherwise it won't even compile.
- When your program starts it's the system's job to open these libraries
- the required libraries can be listed using the 1dd command.

 $\verb|https://stackoverflow.com/questions/10052464/difference-between-dynamic-loading-and the control of the cont$ 

## Dynamic linking (6)

- Dynamic linker is a run time program that loads and binds all of the dynamic dependencies of a program before starting to execute that program.
  - find what dynamic libraries a program requires, what libraries those libraries require . . . (dynamic dependencies)
  - load all those libraries and make all references to the functions point to the right places
- the "hello world" program requires the standar C library
  - the dynamic linker will load the standard C library before loading the hello world program and will make any calls to printf() go to the right place

https://stackoverflow.com/questions/10052464/difference-between-dynamic-loading-a

## Dynamic linking (7)

- both dynamic loading and dynamic linking happen at run time, and load whatever they need into memory.
- The key difference is that
  - dynamic loading checks
     if the routine was loaded by the loader
  - dynamic linking checks
     if the routine is in the memory.

 $\verb|https://stackoverflow.com/questions/10052464/difference-between-dynamic-loading-and the control of the cont$ 

# Dynamic linking (8)

- for dynamic linking,
   there is only one copy of the library code in the memory,
  - this may be not true for dynamic loading
  - That's why dynamic linking needs OS support to check the memory of other processes.
- this feature is very important for <u>language libraries</u>, which are shared by many programs.

### Dynamic loading and dynamic linking

- dynamic loading refers to <u>mapping</u> (or less often copying)
   an executable or library into a <u>process's memory</u>
   after the executable has been started.
- dynamic linking refers to resolving symbols
  - associating their names with addresses or offsets
  - after compile time
- the reason it's hard to make a distinction is that the two are often done together without recognizing

https://www.quora.com/Systems-Programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-dystems-programming/What-is-the-exact-dystems-programming/What-is-the-exact-dystems-programming/What-is-the-exact-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dyste

### (1) Dynamic loading, Static linking

- The executable has an address/offset table generated at compile time, but the actual code/data aren't loaded into memory at process start.
- old-fashioned overlay systems.
- some current embedded systems may work in this way
- to give the programmer control over memory use
- also to avoid the linking overhead at runtime

https://www.quora.com/Systems-Programming/What-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-is-the-exact-difference-between-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-programming/what-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-pr

## (2) Static loading, Dynamic linking

- when dynamic libraries specified at compile time
- an executable contains a reference to the dynamic/shared library, but the symbol table is missing or incomplete.
- both loading and linking occur at process start, which is considered as
  - dynamic for linking
  - static for loading.

 $\verb|https://www.quora.com/Systems-Programming/What-is-the-exact-difference-between-dynamics and the control of the control of$ 

# (3) Dynamic loading, Dynamic linking

- when you call dlopen
- the object file is <u>loaded dynamically</u> under program control (i.e. after <u>process start</u>)
- <u>symbols</u> in the calling <u>program</u> and in the <u>library</u> are <u>resolved</u> based on the process's particular memory layout at that time.

 $\verb|https://www.quora.com/Systems-Programming/What-is-the-exact-difference-between-dynamics and the control of the control of$ 

# (4) Static loading, Dtatic linking

- everything is resolved at compile time.
- everything is <u>loaded</u> into memory immediately at <u>process start</u>
- no further resolution (linking)
- does not require to load a single file
- but no known implementation for <u>multiple</u> file loading without dynamic linking

https://www.quora.com/Systems-Programming/What-is-the-exact-difference-between-dystems-Programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-difference-between-dystems-programming/What-is-the-exact-dystems-programming/What-is-the-exact-dystems-programming/What-is-the-exact-dystems-programming/What-is-the-exact-dystems-programming/What-is-the-exact-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-programming/What-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program-dystems-program

- i386 Load addreses 1999 (increasing from the bottom)
- Linux run-time memory image
- mmpa
- sys\_brk

#### Load address

- in a typical Linux system,
   the addresses 0 3fff\_ffff (4 GB)
   are available for the user program space.
- <u>exectuable</u> <u>binary</u> <u>files</u> include header information that indicates a load address
- <u>libraries</u>, because they are <u>position-independent</u>, do not need a <u>load address</u>, but contain a 0 in this field.

http://netwinder.osuosl.org/users/p/patb/public\_html/elf\_relocs.html

#### mmap(1)

- mmap (2) is a POSIX-compliant Unix system call that maps files or devices into memory.
- a method of memory-mapped file I/O
- implements demand paging,
  - file contents are not read from disk directly
  - initially do not use physical RAM at all.
- The actual reads from disk are performed in a lazy manner, after a specific location is accessed.

https://en.wikipedia.org/wiki/Mmap

#### mmap (2)

• #include <sys/mman.h>

- creates a <u>new mapping</u> in the *virtual address space* of the calling process
- the starting address for the new mapping is specified in addr
- the length argument specifies the length of the mapping
- the contents of a file mapping are initialized using length bytes starting at offset offset in the file (or other object) referred to by the file descriptor fd

http://man7.org/linux/man-pages/man2/mmap.2.html

#### sys\_brk (1)

- the sys\_brk system call is provided by the kernel,
   to allocate memory without the need of moving it later
- allocates memory right behind the application image in the memory
- allows you to set the highest available address in the data section.
  - takes one parameter (the highest memory address)

## sys\_brk (2)

• #include <unistd.h>

```
int brk(void *addr);
void *sbrk(intptr_t increment);
```

- brk() and sbrk() change the location of the program break, which defines the end of the process's data segment
- the program break is the first location after the end of the uninitialized data segment
- increasing / decreasing the program break has the effect of allocating / deallocating memory to the process;
- sbrk() increments the program's data space by increment bytes.

http://man7.org/linux/man-pages/man2/brk.2.html

#### TOC: Library load addresses

- Library load addresses
- Shared library address
- Dyn loader names
- load address example

## Library load addresses (1)

- The kernel has a preferred location for mmap data objects at 0x4000\_0000.
- since the shared libraries are loaded by mmap, they end up here.
- large mallocs are realized by creating a mmap, so these end up in the pool at 0x4000\_0000.

# Library load addresses (2)

- the library GLIBC that is mostly used for malloc handles small mallocs by calling sys\_brk(), which extends the data area after the app, at 0x0800\_0000+sizeof(app).
- As the mmap pool grows upward, the stack grows downward. between them, they share 2G bytes.

#### Shared library address

- The shared library design usually <u>loads</u> <u>app</u> <u>first</u>, then the <u>loader</u> notices that it need support and loads the <u>dynamic loader</u> library (using .interp section) (usually /lib/ld-linux.so.2) at 0x4000\_0000
- other libraries are loaded after ld.so.1
- see which and where libraries will be loaded by 1dd 1dd foo\_app

## Dynamic loader names

- dynamic loader
- dynamic linker
- runtime linker
- interpreter
- ld-linux.so.2
- ld-linux.so
- ld.so

### load address example (1)

- consider a diagnostic case where the app (foo\_app) is invoked by /lib/ld-linux.so.2 foo\_app foo\_arg ....
  - the ld-linux.so.2 is loaded as an app
  - since it was built as a library, it tries to load at 0
  - [In ArmLinux, this is forbidden, so the kernel pushes it up to 0x1000
- Once ld-linux.so.2 is <u>loaded</u>, it <u>reads</u> it argv[1] and <u>loads</u> the foo\_app at its preferred location (0x0800.0000)
- other libraries are loaded up a the mmap area.

## load address example (2)

So, in this case, the user memory map appears as

start	Len	Usage
0000_0000	128M	ld-linux.so.2
		followed by small-malloc() space
0800_0000	896M	app code/data space
4000_0000	1G	mmap space
		lib space
		large-malloc() space
8000_0000	1G	stack space,
		working backward from BFFF_FFE0

## load address example (3)

 Notice that the small malloc space is much smaller in this case (128M),
 but this is supposed to be for <u>load</u> <u>testing</u> and <u>diagnostics</u>

#### library built with -fPIC

- the vast majority of pages are exactly the same for every process
- different processes <u>load</u> the library at <u>different</u> <u>logical</u> <u>addresses</u>, but they will point to the <u>same</u> <u>physical</u> <u>pages</u> thus, the memory will be shared.
- the data in <u>RAM</u> exactly <u>matches</u> what is on <u>disk</u>,
   so it can be loaded only when needed by the <u>page fault</u> handler.

 $\verb|https://unix.stackexchange.com/questions/116327/loading-of-shared-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-red-libraries-and-$ 

#### library built without -fPIC

- most pages of the library will need link edits, and will be different
- each process has <u>separate</u> <u>physical pages</u>
   because they contain different data (as a result of execution)
- that means they're not shared.
- the pages don't match what is on disk
- in the worst case, the entire library could be <u>loaded</u> and then subsequently be <u>swapped</u> out to disk (in the swapfile)

https://stackoverflow.com/questions/311882/what-do-statically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked-and-dynamically-linked

## shared library and re-entrant code (1)

- the concept of re-entrant code, i.e.,
   programs that cannot modify themselves while running.
   it is necessary to write libraries.
- re-entrant code is useful for shared libraries
- Some functions in a library may be reentrant, whereas others in the same library are non-reentrant.
- A library is reentrant if and only if all of the functions in it are reentrant.

http://cs.boisestate.edu/~amit/teaching/297/notes/libraries-and-plugins-handout.phttps://bytes.com/topic/c/answers/528112-basic-doubt-shared-libraries

### shared library and re-entrant code (2)

- a shared library does not need to be reentrant
- the code area of the library is shared by multiple processes
- the data area of the library is copied separately for each process
- reentrant codes are required when running in multi-thread

http://cs.boisestate.edu/~amit/teaching/297/notes/libraries-and-plugins-handout.phttps://bytes.com/topic/c/answers/528112-basic-doubt-shared-libraries

#### e\_entry

- This is the memory address of the entry point from where the process starts executing.
   This field is either 32 or 64 bits long depending on the format defined earlier.
- File header
  - The ELF header defines whether to use 32-bit or 64-bit addresses.
     The header contains three fields that are affected by this setting and offset other fields that follow them.
     The ELF header is 52 or 64 bytes long for 32-bit and 64-bit binaries respectively.

https://en.wikipedia.org/wiki/Executable\_and\_Linkable\_Format

#### stripped executables

- If you compile an executable with gcc's -g flag, it contains debugging information.
- for each instruction there is information
   which line of the source code generated it,
   the name of the variables in the source code is retained and
   can be associated to the matching memory at runtime etc.
- Strip can remove this debugging information and other data included in the executable which is not necessary for execution in order to reduce the size of the executable.

https://unix.stackexchange.com/questions/2969/what-are-stripped-and-not-stripped-

- gcc being a compiler/linker, its -s option is something done while linking.
- It's also not configurable it has a set of information which it removes, no more no less.
- removes the relocation information along with the symbol table which is not done by "strip".
- Note that, removing relocation information would have some effect on Address space layout randomization

https://stackoverflow.com/questions/1349166/what-is-the-difference-between-gcc-s-

#### strip

- strip is something which can be run on an object file which is already compiled.
- It also has a variety of command-line options which you can use to configure which information will be removed.
- For example, -g strips only the debug information which gcc -g adds.
- Note that strip is not a bash command, though you may be running it from a bash shell.
- It is a command totally separate from bash, part of the GNU binary utilities suite.

https://stackoverflow.com/questions/1349166/what-is-the-difference-between-gcc-s-

# finding main function's entry point (1)

- once a program has been <u>stripped</u>, there is <u>no</u> straightforward way to <u>locate</u> the function that the symbol <u>main</u> would have otherwise referenced.
- The <u>value</u> of the symbol <u>main</u> is <u>not</u> required for program <u>start-up</u>:

https://stackoverflow.com/questions/9885545/how-to-find-the-main-functions-entry-

# finding main function's entry point (2)

- in the ELF format, the start of the program is <u>specified</u> by the <u>e\_entry</u> field of the ELF executable header.
- This field normally points to the C library's initialization code, and not directly to main.
- While the C library's initialization code does call main() after it has set up the C run time environment, this call is a normal function call that gets fully resolved at link time

https://stackoverflow.com/questions/9885545/how-to-find-the-main-functions-entry-
