FPGA Carry Chain Cell

$$s_i = (a_i \oplus b_i) \oplus c_i = p_i \oplus c_i$$

$$c_{i+1} = (a_i \cdot b_i) + (a_i \oplus b_i) c_i = \bar{p}_i \cdot g_i + p_i \cdot c_i = \bar{p}_i \cdot a_i + p_i \cdot c_i = \bar{p}_i \cdot b_i + p_i \cdot c_i$$

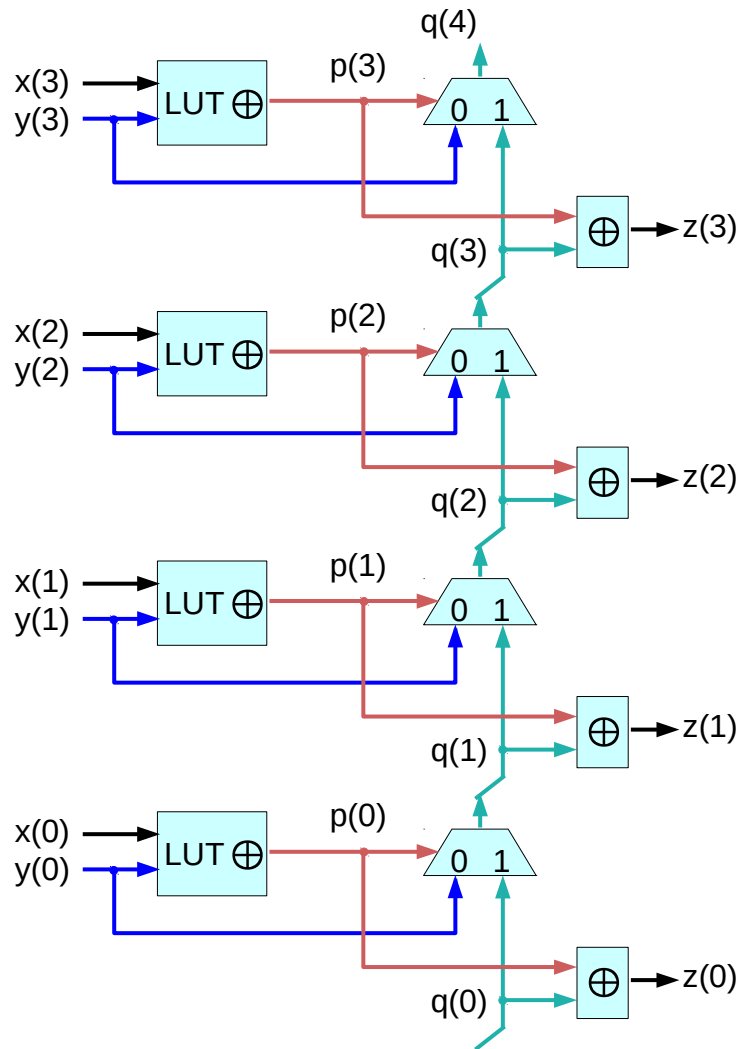

when $\bar{p}_i = 1$, then $a_i = b_i$

when $g_i = 1$, then $a_i = b_i = 1$

$p(i)$	0	1
0	0	1
1	1	0

$g(i)$	0	1
0	0	0
1	0	1

FPGA Carry Chain Cell

Synthesis of Arithmetic Circuits: FPGA, ASIC and Ebedded Systems, J-P Deschamps et al

FPGA Carry Chain

FPGAs generally contain dedicated computation resources for generating fast adders

The Virtex family programmable arrays include logic gates (**XOR**) and **multiplexers** that along with the general purpose **lookup tables** allow one to build effective carry-chain adders

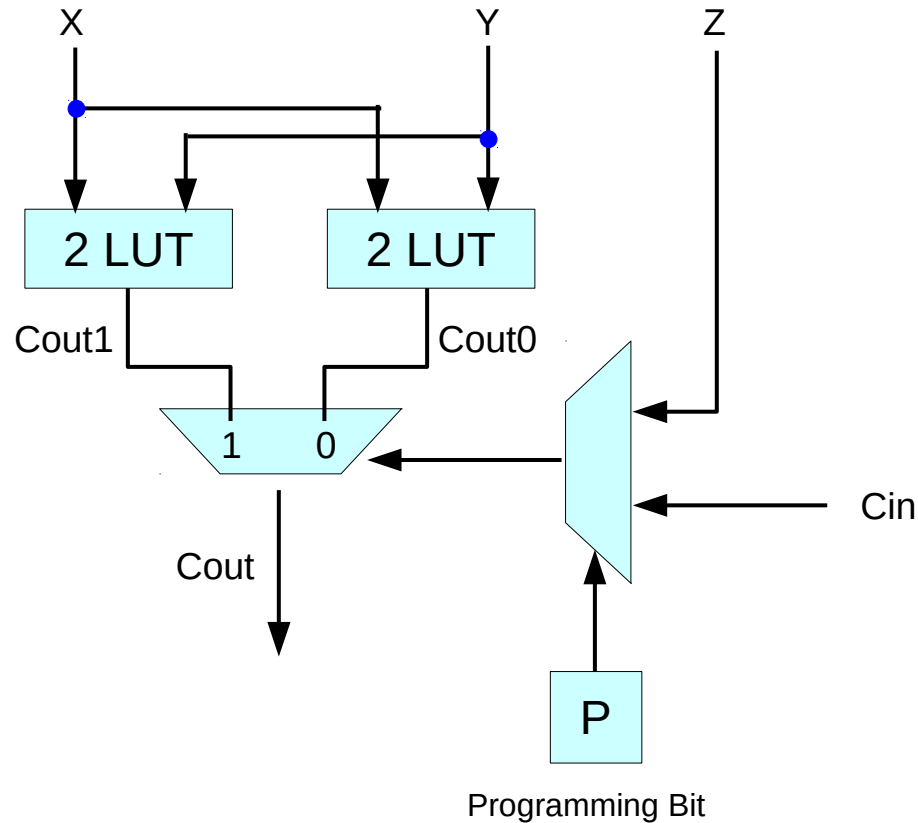

The carry chain is made up of multiplexers belonging to adjacent configurable blocks

the lookup table is used for implementing the exclusive or function

$$p(i) = x(i) \text{ xor } y(i)$$

Ripple Carry Chain

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

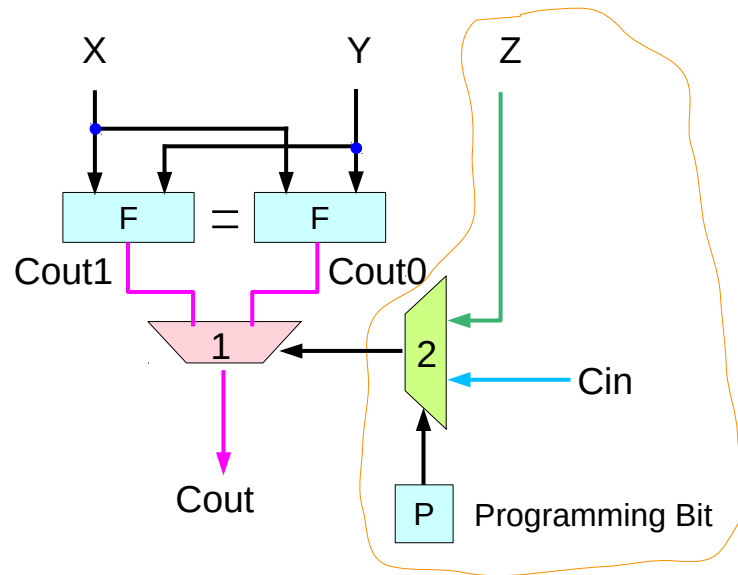

the logic cells - resources to compute a function
the exact location of logic cells depends on the user.
a user can start or end a carry computation
at any place in an fpga.

But in many carry computations,
the first cell has only 2 inputs,
and forcing the carry chain
to wait for the arrival of an additional,
unnecessary input **Z** will only needlessly
slow down the circuit's computation.

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

the **first cell** in the chain

the same LUTs

the same output
regardless of Z and Cin

$Cout1 = Cout0 = Cout$
regardless of the select

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

Ripple Carry Chain

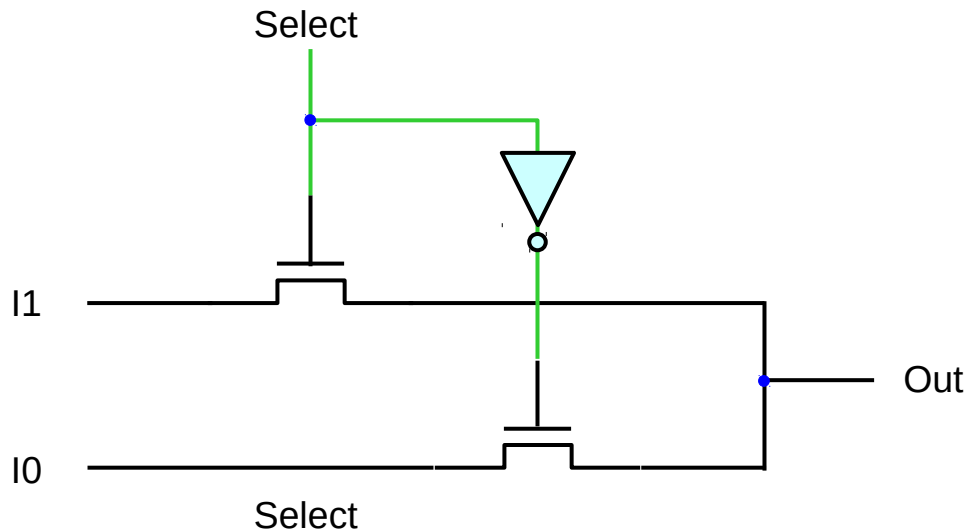

fig1b shows an implementation of a mux that does not obey this requirement

since the carry chain is part of an fpga, the input to this mux could be connected to some **unused logic** in another row which is generating **unknown values**.

if that unused logic had **multiple transitions** which caused the signal to change **quicker** than the gate could react, then it is possible that **the select signal** to this mux could be stuck midway between true and false (2.5V for 5V CMOS)

in this case, it will not be able to pass a true value from the input to the output and thus will not function properly for this application.

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

Ripple Carry Chain

however a mux built with both n-transistor and p-transistor pass gates will operate properly for this case

assume this mux implementation will be used

tristate driver based muxes could be used, which restore signal drive and cut series RC chains

Unit Gate Delay Model

All simple gate of two or three inputs that are directly implementable in **one logic level** in CMOS are considered to have a **delay of one**.

All other gate must be implemented by such gates, and have the delay of the underlying circuit.

Delay of one

- inverters and
- 2 to 3 input NAND
- 2 to 3 input NOR gates

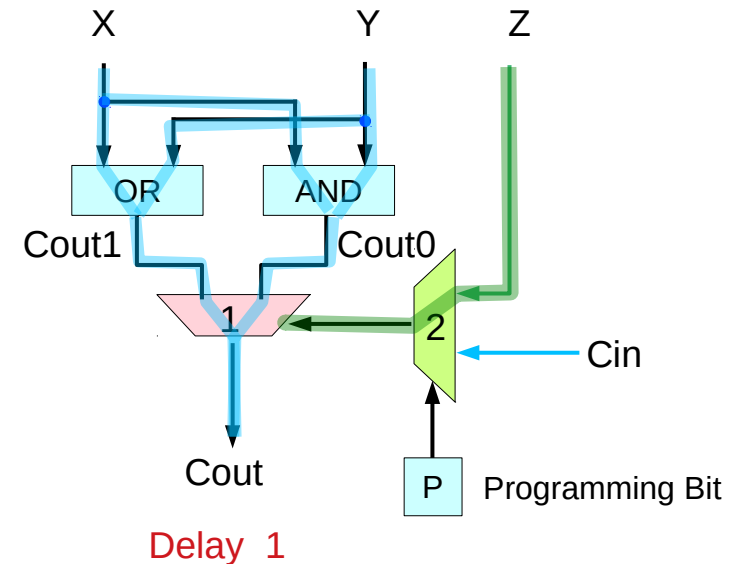

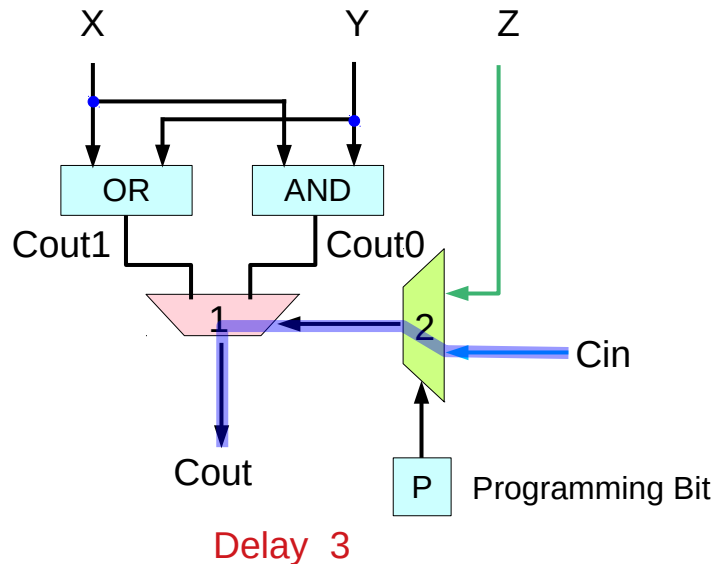

A **2:1 mux** has a **delay of one** from the I0 or I1 inputs to the output, But has a **delay of two** from the select input to the output due to the Inverter delay

Delay of zero (constant delay)

- the delay of the 2-LUTs,
- any routing leading to them,

FPGA Carry Chain Cell

Significantly slower
two muxes on the carry chain in each cell

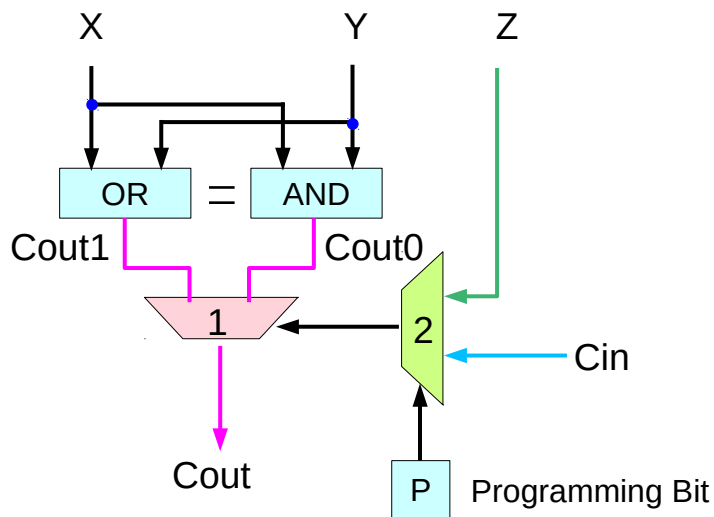

Delay 1 for first cell
Delay 3 for each additional cell in the carry chain
1 delay for mux2 and
2 delays for mux1

Overall $2n-2$ for an n -cell carry chain

The critical path comes from the 2-LUTs
and not input Z
since the delay through the 2-LUTs
will be larger than through mux 2 in the first cell

FPGA Carry Chain Cell

- to reduce the delay of the ripple carry chain
 - remove mux2 from the carry path.
 - no need to choose between Cin and Z for the select line to the output mux1
 - two separate muxes, mux1 and mux2, controlled by Cin and Z respectively.
 - the circuit chooses between these outputs with mux3.

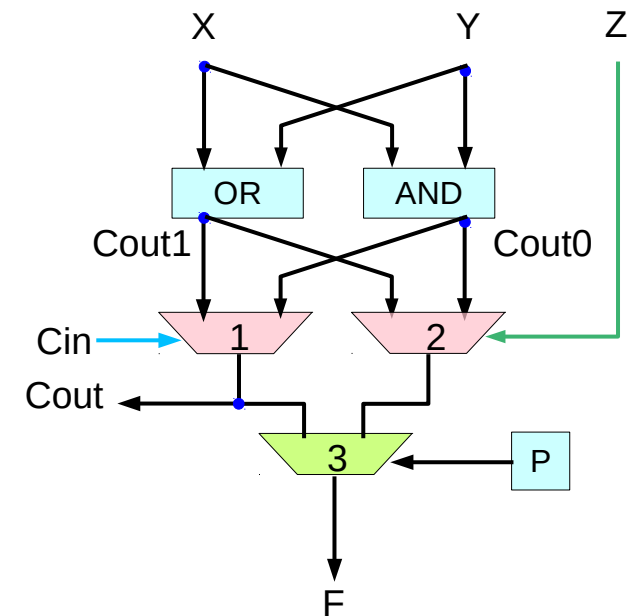

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

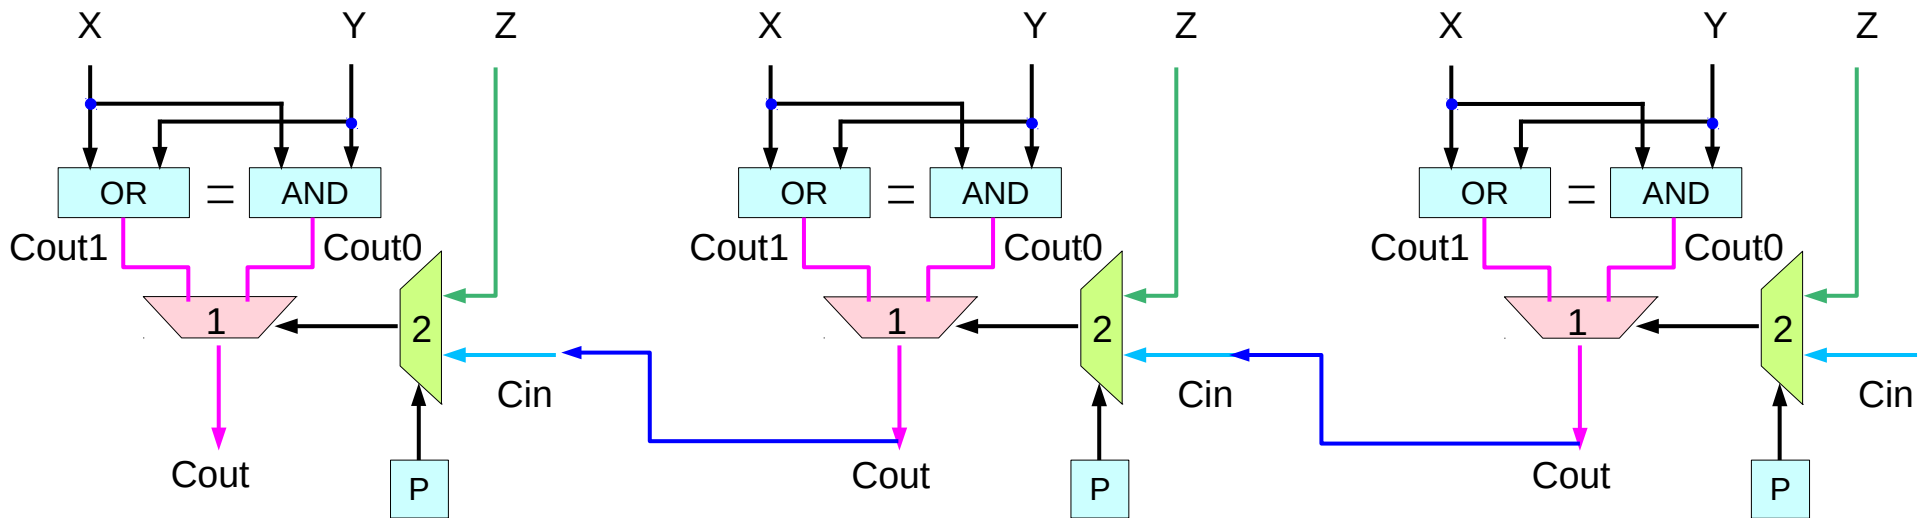

although this design is 1 gate delay slower than that of fig 2a, it provides the ability to have a carry input to the first cell in a carry chain, something that is important in many computations.

Also, for carry computations that do not need this feature, the first cell in a carry chain built from fig 2b can be configured to bypass mux1, reducing the overall delay to $2n$, which is identical to that of fig2a.

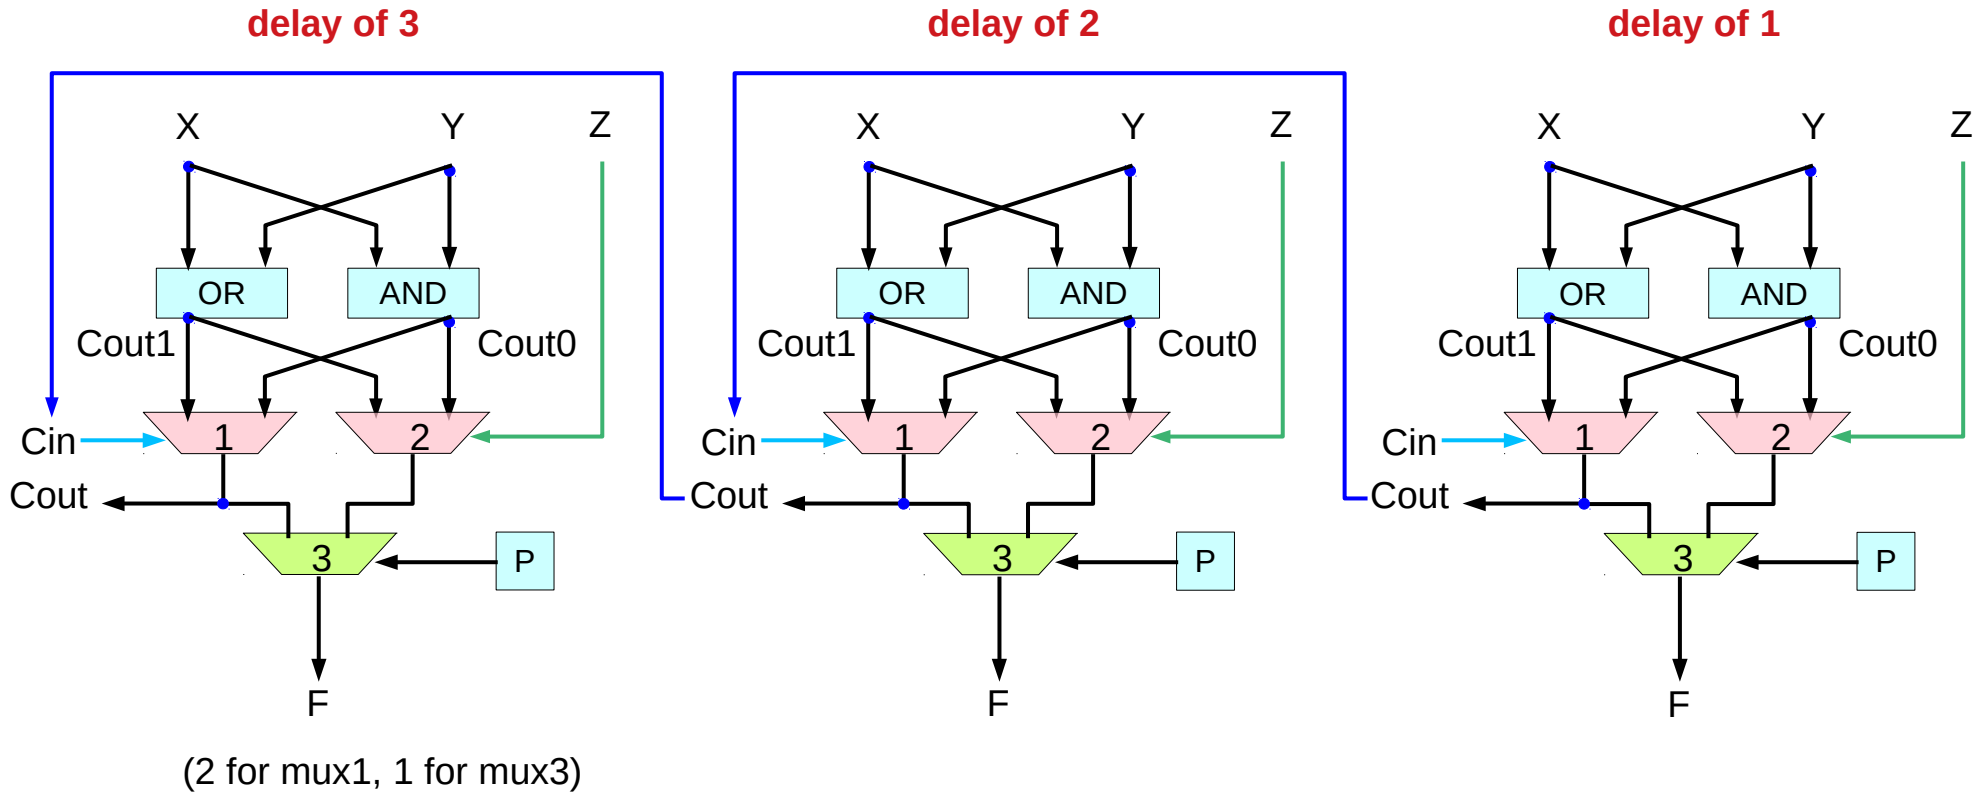

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

on the other hand, in order to implement a n-bit carry chain with a carry input, the design of fig 2a requires an additional cell at the beginning of the chain to bring in this input, resulting in a delay of $2(n+1)=2n+2$, which is lower than that of the design in fig2b thus, the design of fig 2b is the preferred ripple carry design among those presented so far

FPGA Carry Chain Cell

delay of $2n$ for an n -bit ripple carry chain

50% faster circuit than the original design

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

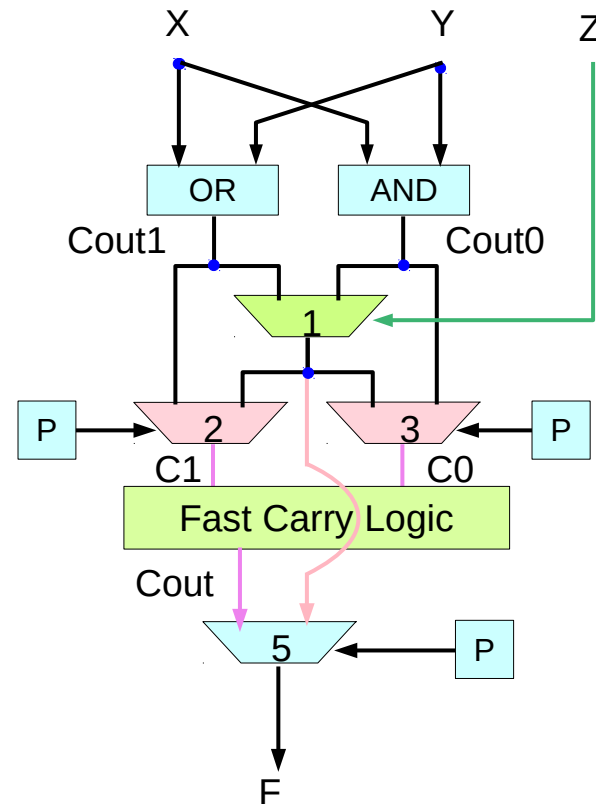

FPGA Carry Chain Cell

various high performance carry chains can be developed based on the carry cell of fig 2c

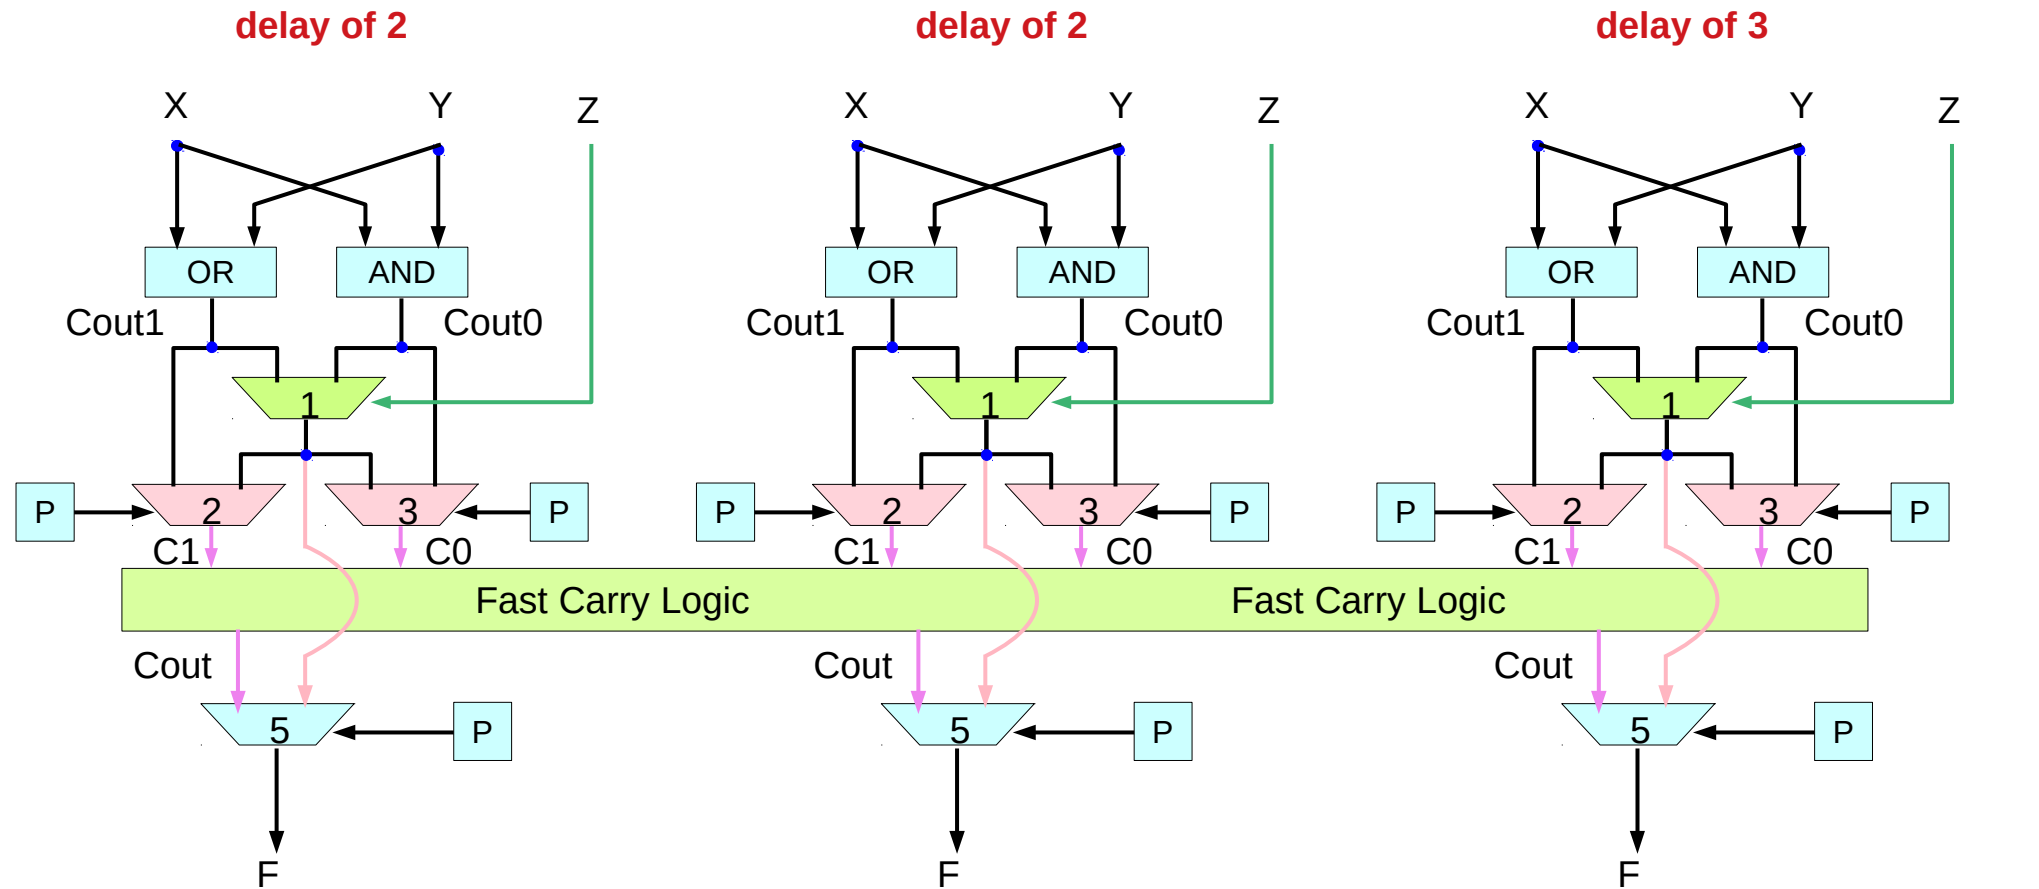

this cell is very similar to that of fig 2b, except that the actual carry chain (mux4) has been replaced by an abstract fast carry logic unit and mux5 has been added

this extra mux5 is present because although some of our faster carry chains will have much faster carry propagation for long carry chains, they incur significant delay for non-carry computations

thus, when the cell is used as a simple normal 3LUT, using inputs X, Y, and Z mux5 allows us to bypass the carry chain by selecting the output of mux1

FPGA Carry Chain Cell

(1 for mux1, 1 for mux2, 1 in mux4)

delay of $2n+1$ for an **n-bit** ripple carry chain

1 gate delay slower

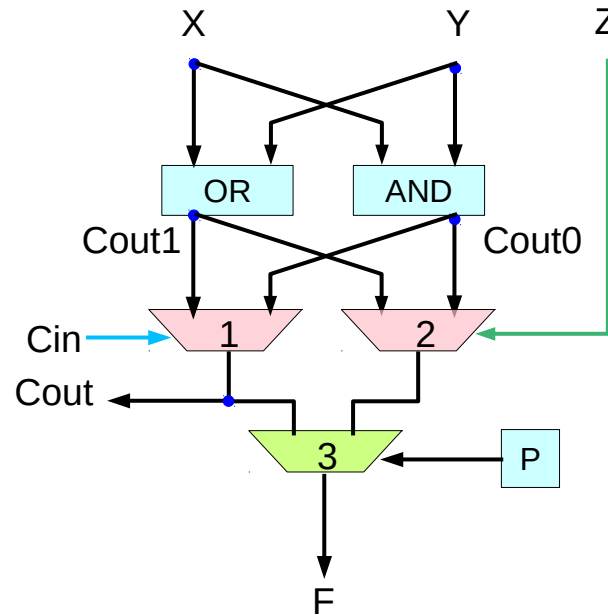

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

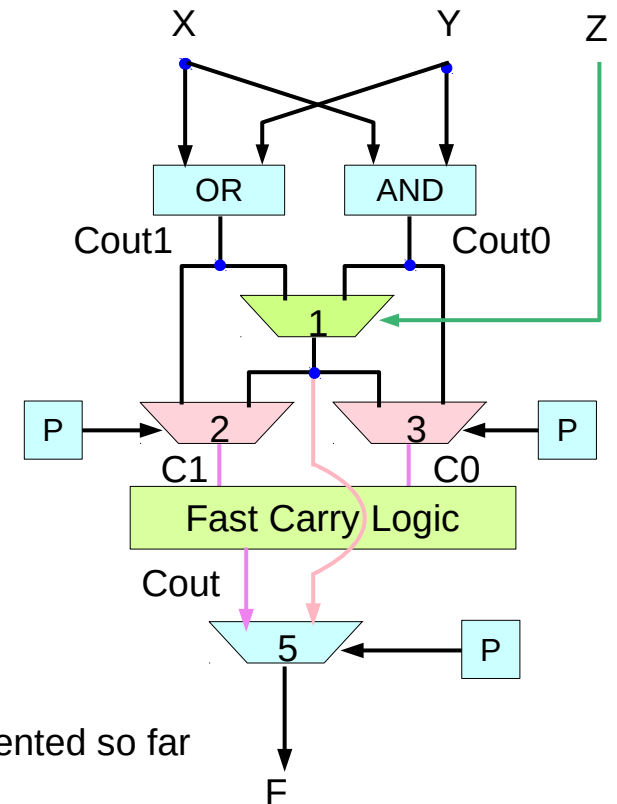

2n+2

2n

2n+1

t
thus, the design of fig 2b is the preferred ripple carry design among those presented so far

FPGA Carry Chain Cell

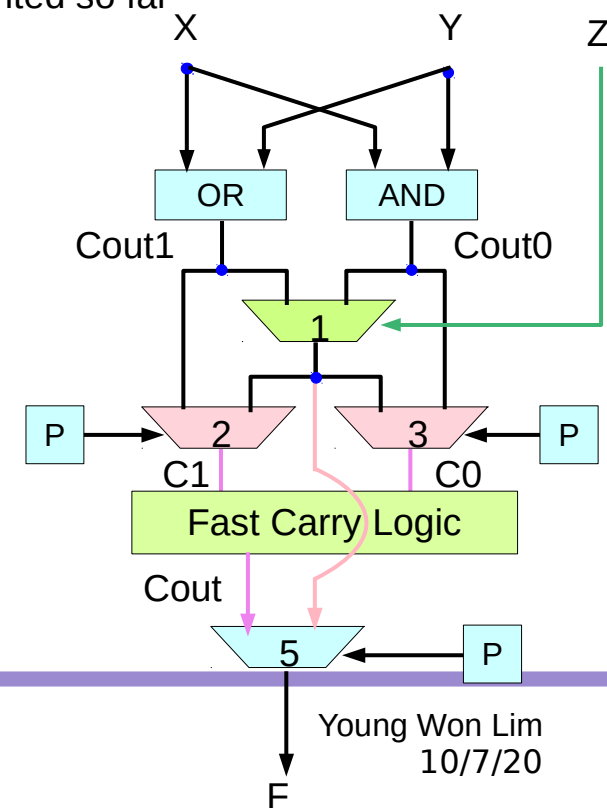

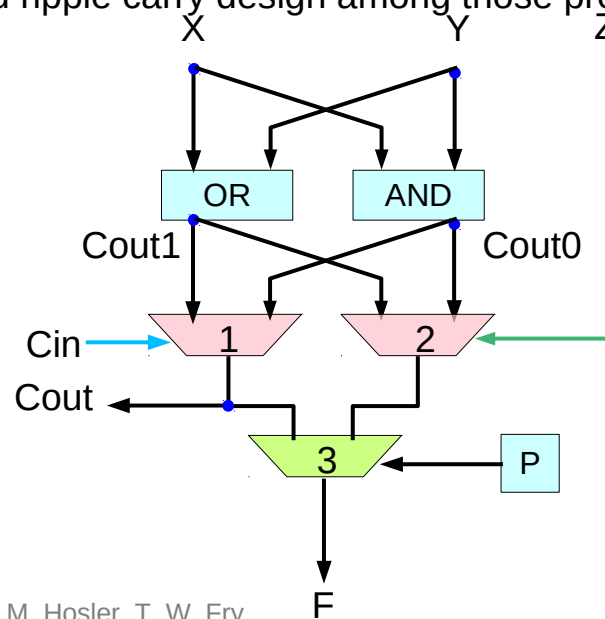

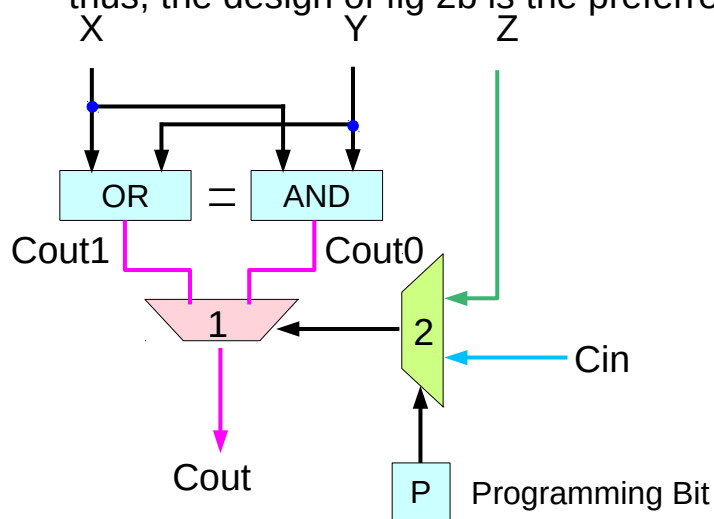

However, carry chains built from this design have a delay of 3 in the first cell (1 in mux1, 1 in mux2, 1 in mux4) and 2 in all other cells in the carry chain, yielding an overall delay of $2n+1$ for an n -bit carry chain.

thus, although this design is 1 gate delay slower than that of fig 2a, it provides the ability to have a carry input to the first cell in a carry chain, something that is important in many computations.

Also, for carry computations that do not need this feature, the first cell in a carry chain built from fig 2b can be configured to bypass mux1, reducing the overall delay to $2n$, which is identical to that of fig 2a.

on the other hand, in order to implement a n -bit carry chain with a carry input, the design of fig 2a requires an additional cell at the beginning of the chain to bring in this input, resulting in a delay of $2(n+1)=2n+2$, which is lower than that of the design in fig 2b

thus, the design of fig 2b is the preferred ripple carry design among those presented so far

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

to optimize a ripple carry chain structure for use in FPGAs
while this provides some performance gain over the basis ripple carry scheme
found in many current FPGAs, it is still much slower than what is done in custom logic
There have been tremendous amounts of work done on developing alternative
carry chain scheme that overcome the linear delay growth of ripple carry adders
Although these techniques have not yet been applied to FPGAs,
demonstrate how these advanced adder techniques can be integrated into reconfigurable logic

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

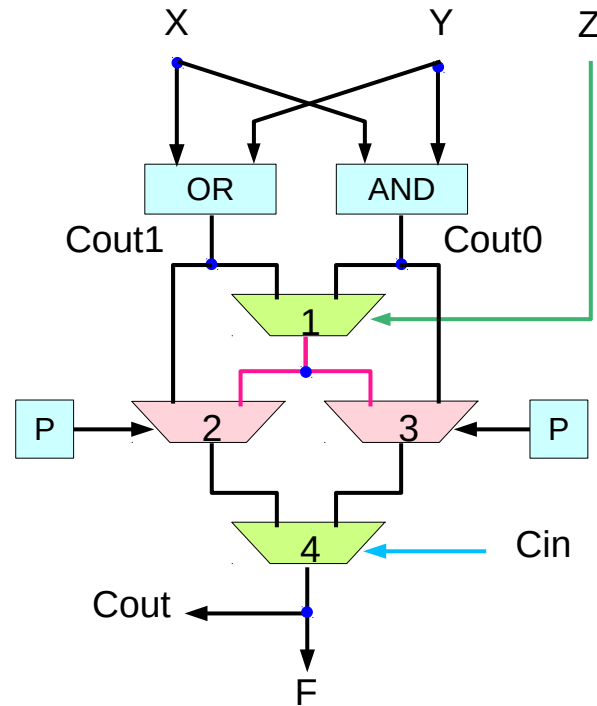

- not logically equivalent
- no longer use the Z input in the first cell since Z is only attached to mux2 and mux 2 does not lead to the carry cells

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

for cells in the middle of a carry chain
mux2 passes Cout1
mux3 passes Cout0
mux4 receives Cout1 and Cout0
provides a standard ripple carry path.

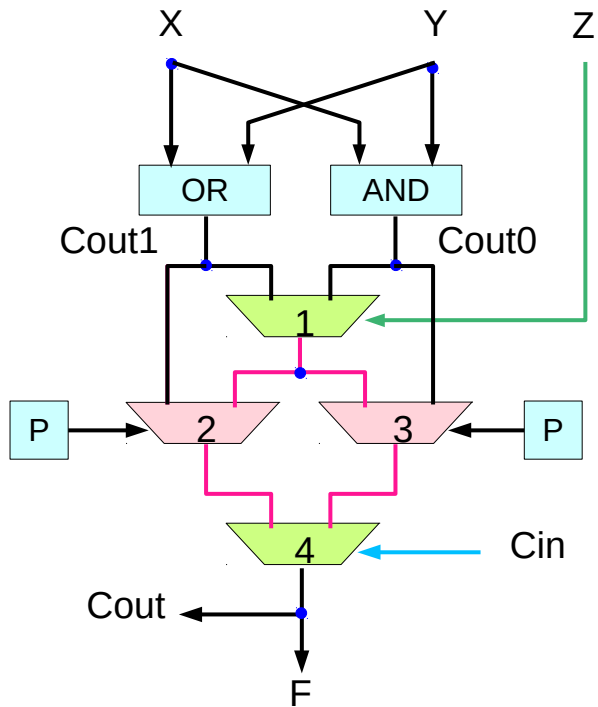

For the first cell in a carry chain
with a carry input (provided by input Z),
mux2 and mux3 both pass the value from mux1

the two main inputs to mux4 are identical
the output of mux4 (Cout) will be the same
as the output of mux1 (ignoring Cin)

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

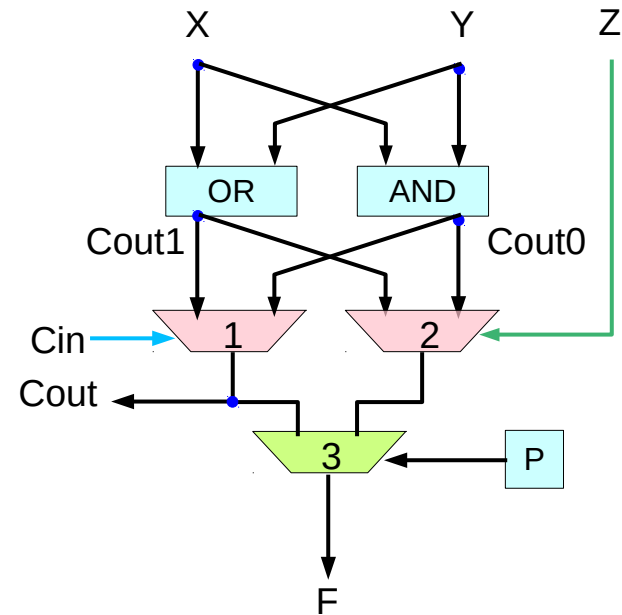

FPGA Carry Chain Cell

mux1's main inputs are driven by two 2-LUTs (OR, AND) controlled by X and Y
mux1 forms a 3-LUT with the other 2-LUTs

When mux2 and mux3 pass the value from mux1 (Cout1 and Cout2 respectively) the circuit is configured to continue the carry chain

Functionally equivalent

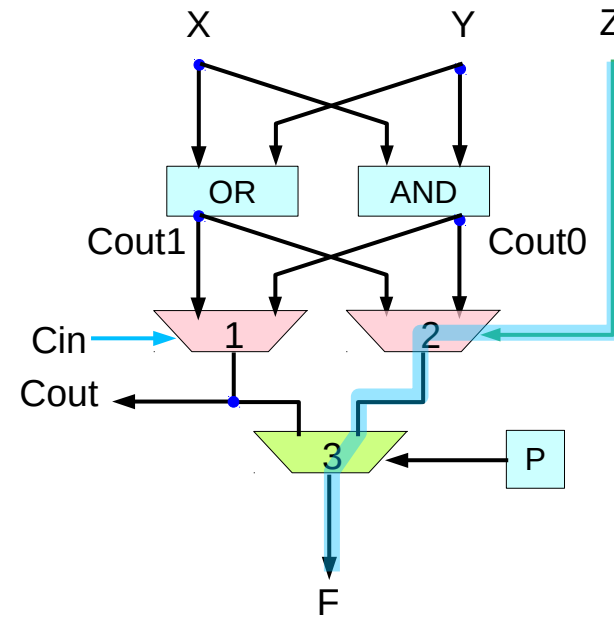

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

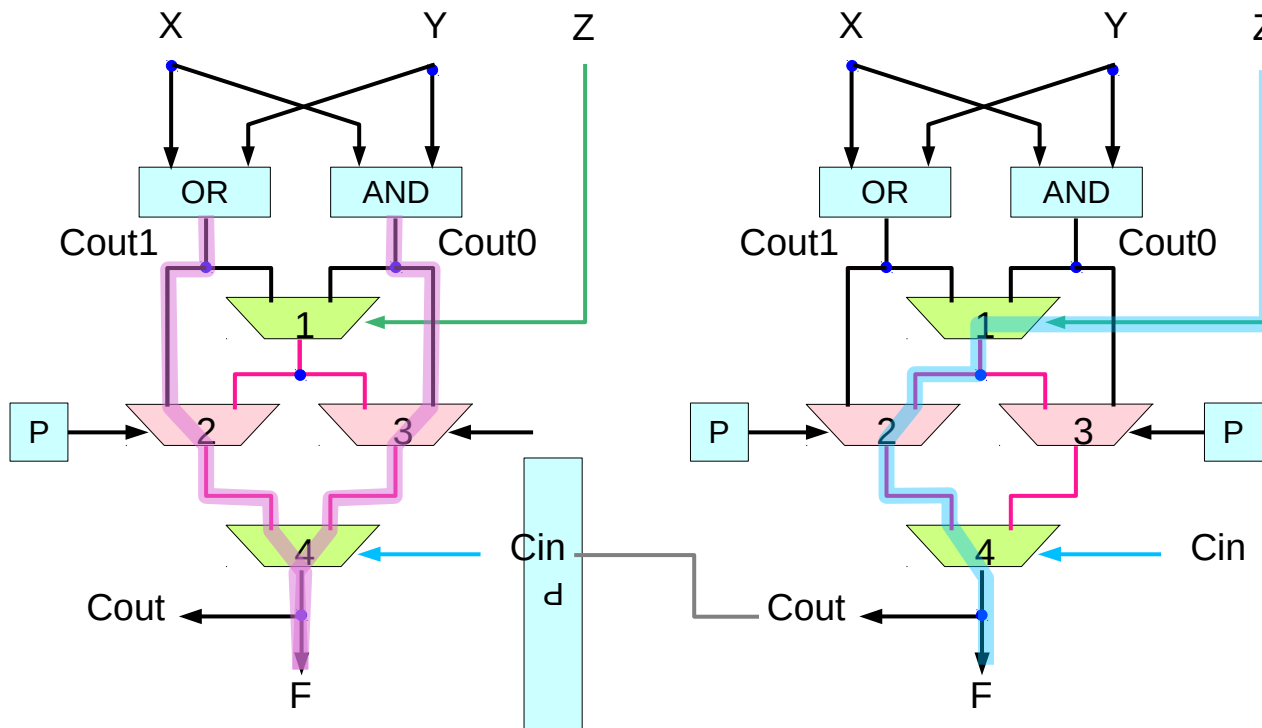

a delay of 3 in the first cell
 (1 in mux1, 1 in mux2, 1 in mux4)
 2 in all other cells in the carry chain
 an total delay of $2n+1$ for an n -bit carry chain

1 gate delay slower than that of fig 2a,
 a carry input to the first cell is enabled

High Performance Carry Chains for FPGAs, S. Hauck, M. M. Hosler, T. W. Fry

FPGA Carry Chain Cell

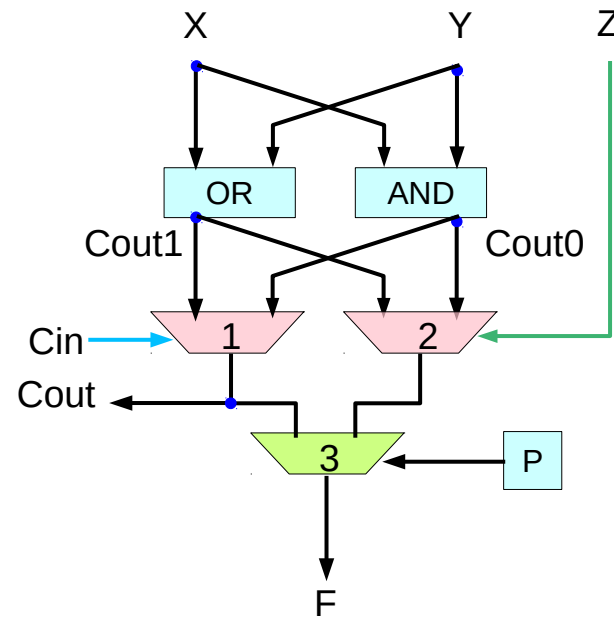

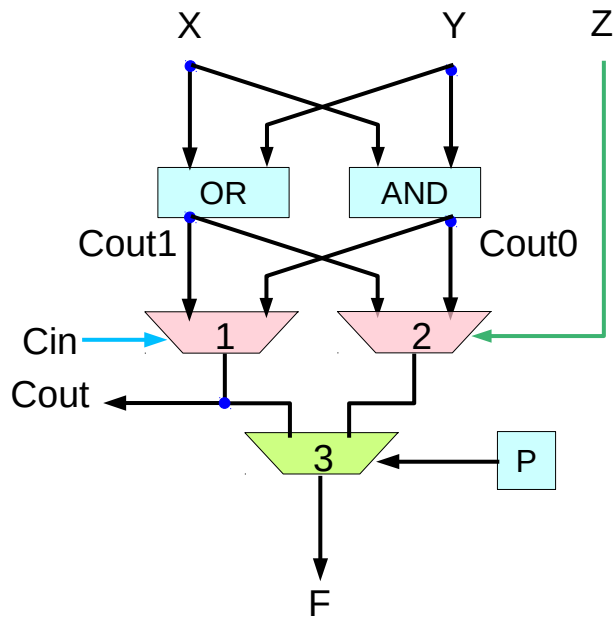

Also, for carry computations that do not need this feature, the first cell in a carry chain built from fig 2b can be configured to bypass mux1, reducing the overall delay to $2n$, which is identical to that of fig2a.

in order to implement a n -bit carry chain with a carry in, the design of fig 2a requires an additional cell at the beginning of the chain to bring in this input, resulting in a delay of $2(n+1)=2n+2$, which is lower than that of the design in fig2b

thus, the design of fig 2b is the preferred ripple carry design among those presented so far
