If you are reading this as a Wikiversity page, proper pagebreaks should result if printed using your browser's print option. On Chrome, Explorer, and Firefox, this option is available in the upper right hand corner of your screen. But, pagebreaks do not render properly if you use "Printable version" on Wikiversity's Print/export option on the left-hand sidebar.

This document contains either a study guide OR pairs of exams taken from the same exam bank

If two exams have the same s-number, then v1 and v2 have the same questions, presented in different (random) order.

Exams with different s-numbers have different questions and may not have the same difficulty.

Click items in the table of contents and appropriate page should be reached. This feature should allow you to print only those pages that you need.

At the end of this document

Attribution for the quizzes identifies where the questions were obtained

Study guide links reading materials and/or relevant equations.

AstroTest4-v1s1

1. The range of wavelength for visible light is between

- ___ a) 600 and 1200 nanometers
 ___ b) 400 and 700 nanometers
 ___ c) 0.1 and 10 nanometers
 ___ d) 5000 and 6000 nanometers
 ___ e) 1 and 10 nanometers

2. The number of globular clusters in the Milky way galaxy is about

- ___ a) 15 million
 ___ b) 150
 ___ c) 15 thousand
 ___ d) 1,500

3. $KE = \frac{4\pi^2 MR^2}{5 P^2}$ is the kinetic energy of a solid rotating ball, where M is mass, R is radius, and P is period.
 And, $power = \frac{energy}{time}$.

You are banging espressos in a little coffeehouse with your astronomy friends, talking about a new SN remnant that closely resembles the Crab. You have observed the pulsar, and wonder what the total power output of the nebula might be. You know both the period of the pulsar, as well as τ , which represents the amount of time you think the pulsar will continue pulsing if it continues slowing down at its present rate. What formula do you write on your napkin?

- ___ a) $power = \frac{4\tau\pi^2 MR^2}{5 P^2}$
 ___ b) $power = \frac{4\pi^2 MR^2}{5\tau^2 P^2}$
 ___ c) $power = \frac{5 MR^2}{4\tau\pi^2 P^2}$
 ___ d) $power = \frac{4\pi^2 MR^2}{5\tau P^2}$
 ___ e) $power = \frac{4\pi^2 MR^2}{5 P^2} \tau^4$

4. The Hayashi and Henyey tracks refer to how T Tauri of different masses will move

- a) through an HR diagram as they are born
- b) Two of these are true
- c) through a cluster as they are born
- d) through a cluster as they die
- e) through an HR diagram as they die

5. A dying star with more than 1.4 solar masses becomes a _____, and those with more than 5 solar masses becomes a _____

- a) white dwarf....neutron star
- b) white dwarf...red dwarf
- c) white dwarf....black hole
- d) neutron star....black hole
- e) blue giant....red giant

6. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 2 cm expands out to 4 cm. To what distance would a raisin originally situated at a distance of 4 cm expand?

- a) 4
- b) 3
- c) 2
- d) 6
- e) 8

7. What causes the blue glow of the Crab nebula?

- a) the curving motion of electrons in a magnetic field; such motion resembles a radio antenna
- b) the same emission found in a Lava lamp (ultra-violet)
- c) the Gravitational blue shift
- d) the curving motion of electrons in a magnetic field; such motion traps ultra-violet and blue light
- e) the Doppler blue shift

8. Many stars in a typical open cluster are nearly as old as the universe

- a) True
- b) False

9. Stars that begin with more than 50 solar masses will typically lose _____ while on the main sequence.

- a) 10% of their magnetic field
- b) 10% their mass
- c) 50% their mass
- d) 1% their mass
- e) all of their magnetic field

10. You at the center raisin of an expanding raisinbread model of Hubble expansion, and from your location a raisin originally situated at a distance of 1 cm expands out to a distance of 4 cm. The nearest raisin with intelligent life is situated exactly halfway between your (central) location and the edge. How would this second "intelligent" raisin view an expansion of a raisin 1 cm away?

- a) expansion from 1 cm to 9 cm (since $5-1=4$)
- b) expansion from 1 cm to 4 cm (just like yours).
- c) expansion from 1 cm to 8 cm (twice yours).
- d) expansion from 1 cm to 2 cm (half of yours)
- e) expansion from 1 cm to 3 cm (since $3-1=2$)

11. Stellar parallax is

- a) an annual change in angular position of a star as seen from Earth
- b) an astronomical object with known luminosity.
- c) a numerical measure of brightness as seen from Earth
- d) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- e) the total amount of energy emitted per unit time.

12. Members of an open cluster feel significant forces only due to gravitational interaction with each other

- a) True
- b) False

13. Pre-main sequence stars are often surrounded by a protoplanetary disk and powered mainly by

- a) chemical reactions
- b) the fusion of Helium to Carbon
- c) collisions between protoplanets
- d) the fission of Carbon from Helium
- e) the release of gravitational energy

14. What was Messier doing when he independently rediscovered the Crab in 1758?

- a) Attempting one of the first star charts
- b) Looking for a comet that he knew would be appearing in that part of the sky.
- c) Attempting to count asteroids
- d) Trying to measure the orbital radius of a planet
- e) Looking for lobsters

15. In 1989 the satellite Hipparcos was launched primarily for obtaining parallaxes and proper motions allowing measurements of stellar parallax for stars up to about 500 parsecs away, which is about ____ times the diameter of the Milky Way Galaxy.

- a) 15
- b) 1.5
- c) .015
- d) 0.15
- e) 150

16. Members of a globular cluster tend to be

- a) old
- b) of all ages
- c) young

17. What causes the "finger-like" filamentary structure in the Crab nebula?

- a) a heavy (high density) fluid underneath a light (low density) fluid, like a lava lamp
- b) electrons striking oxygen molecules, like a lava lamp
- c) electrons striking hydrogen molecules, like a lava lamp
- d) a light(low density) fluid underneath a heavy(high density) fluid, like a lava lamp
- e) cyclotron motion, causing the electrons to strike oxygen molecules

18. In one respect, the universe is arguably "young", considering how much complexity it contains. This is often illustrated by a calculation of

- a) cosmic expansion
- b) recalibration of supernovae relative magnitude
- c) cosmic redshift
- d) chimps typing Shakespeare
- e) recalibration of supernovae luminosity

19. When a star with more than 10 solar masses ceases fuse hydrogen to helium, it

- a) it fuses helium to carbon to iron (and other elements), then continues to release more energy by fusing the iron to heavier elements such as uranium.
- b) ceases to convert nuclear energy.
- c) it fuses helium to carbon and other elements up to iron and then ceases to produce more energy
- d) it fuses helium to carbon and then ceases to produce more energy
- e) it fuses elements up to uranium, and continues to produce energy by the fission of uranium.

20. Based on the HR diagrams and images in stars shown in the materials, a very large red supergiant has a diameter that is about _____ greater than a small white dwarf.

- a) 3×10^{11}
- b) 3×10^7
- c) 3×10^9
- d) 3×10^5
- e) 3×10^3

21. The location of open clusters can be described as

- a) uniformly distributed within the galactic disk
- b) in the spiral arms
- c) between the spiral arms
- d) uniformly distributed in a sphere centered at the Milky Way's center

22. According to Wikipedia, a star with over 20 solar masses converts its Hydrogen to Helium in about 8 billion years, but the conversion of Oxygen to heavier elements take about _____

- a) 1 thousand years
- b) 1 million years
- c) 1 billion years
- d) 10 billion years
- e) 1 year

23. An object emits thermal (blackbody) radiation with a peak wavelength of 250nm. How does its temperature compare with the Sun?

- a) 2 times hotter than the Sun
- b) 5 times colder than the Sun
- c) The temperature is the same
- d) 2 times colder than the Sun
- e) 5 times hotter than the Sun

24. Most globular clusters that we see in the sky orbit _____ and have _____ orbits

- a) the center of the Milky way ... nearly circular
- b) within the disk of the Milky way ... nearly circular
- c) within the disk of the Milky way ... elliptic orbits
- d) the center of the Milky way ... elliptic orbits

25. Members of a globular cluster tend to have

- a) low mass
- b) high mass
- c) a wide range of masses

26. Luminosity is

- a) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- b) an astronomical object with known luminosity.
- c) an annual change in angular position of a star as seen from Earth
- d) a numerical measure of brightness as seen from Earth
- e) the total amount of energy emitted per unit time.

27. What happens if you increase the size of a giant molecular cloud while keeping temperature and mass fixed?

- a) It is more likely to collapse because this will increase the temperature
- b) It is more likely to collapse because larger things have more gravity
- c) It is less likely to collapse because temperature can never be kept fixed
- d) It is less likely to collapse spreading it out weakens the force of gravity
- e) It is equally likely to collapse because size is not part of the Jean's criterion.

28. The course materials presented three arguments suggesting that a white dwarf is roughly the size of the earth. Which best summarizes them?

- a) x-ray-emmission...doppler-shift...rotation-rate
- b) HR-diagram-location...X-ray-emmission...spectral-lines
- c) all of these are true
- d) temperature-luminosity...redshift...quantum-theory-of-solids
- e) doppler-shift...period-of-pulsation...temperature-luminosity

29. This light clock is associated with

- a) general relativity
- b) special relativity
- c) all of these are true
- d) gravitational shift
- e) doppler shift

30. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 4 cm expands out to 12 cm. To what distance would a raisin originally situated at a distance of 2 cm expand?

- a) 6
- b) 2
- c) 4
- d) 8
- e) 3

31. Members of an open cluster feel significant forces from nearby giant molecular clouds

- a) True
 b) False

32. Absolute magnitude is

- a) an annual change in angular position of a star as seen from Earth
 b) the total amount of energy emitted per unit time.
 c) a numerical measure of brightness as seen from a distance of approximately 33 light-years
 d) an astronomical object with known luminosity.
 e) a numerical measure of brightness as seen from Earth

33.

This spectrum of the star Vega suggests that

- a) it is not really a black body
 b) all of these are true
 c) its surface can be associated with a range of temperatures
 d) it can be associated with an "effective" temperature
 e) it is an approximate black body

34. A starburst galaxy.

- a) usually is a result of collisions between galaxies
 b) All of these are correct
 c) Two of these are correct
 d) is a region of active stellar birth
 e) has only dead or dying stars

35. One way to determine the distance to a nebula or small cluster of clouds is to compare the angular expansion to the spectroscopic Doppler shift. Two clusters (A and B) have the same spectroscopically measured velocity. Cluster A is moving towards the observer and exhibits the greater angular expansion. Which cluster is closer?

- a) cluster A, because it exhibits greater angular expansion
- b) either cluster might be more distant
- c) cluster A, because it exhibits a blue Doppler shift
- d) cluster B, because it exhibits a red Doppler shift
- e) cluster B, because it exhibits less angular expansion

Key to AstroTest4-v1s1

1. The range of wavelength for visible light is between

- a) 600 and 1200 nanometers
- + b) 400 and 700 nanometers
- c) 0.1 and 10 nanometers
- d) 5000 and 6000 nanometers
- e) 1 and 10 nanometers

2. The number of globular clusters in the Milky way galaxy is about

- a) 15 million
- + b) 150
- c) 15 thousand
- d) 1,500

3. $KE = \frac{4\pi^2 MR^2}{5} \frac{P^2}{energy}$ is the kinetic energy of a solid rotating ball, where M is mass, R is radius, and P is period.
And, $power = \frac{energy}{time}$.

You are banging espressos in a little coffeehouse with your astronomy friends, talking about a new SN remnant that closely resembles the Crab. You have observed the pulsar, and wonder what the total power output of the nebula might be. You know both the period of the pulsar, as well as τ , which represents the amount of time you think the pulsar will continue pulsing if it continues slowing down at its present rate. What formula do you write on your napkin?

- a) $power = \frac{4\tau\pi^2 MR^2}{5} \frac{P^2}{P^2}$
- b) $power = \frac{4\pi^2 MR^2}{5\tau^2} \frac{P^2}{P^2}$
- c) $power = \frac{5}{4\tau\pi^2} \frac{MR^2}{P^2}$
- + d) $power = \frac{4\pi^2 MR^2}{5\tau} \frac{P^2}{P^2}$
- e) $power = \frac{4\pi^2 MR^2}{5} \frac{P^2}{P^2} \tau^4$

4. The Hayashi and Henyey tracks refer to how T Tauri of different masses will move

- + a) through an HR diagram as they are born
- b) Two of these are true
- c) through a cluster as they are born
- d) through a cluster as they die
- e) through an HR diagram as they die

5. A dying star with more than 1.4 solar masses becomes a _____, and those with more than 5 solar masses becomes a _____

- a) white dwarf....neutron star
- b) white dwarf...red dwarf
- c) white dwarf....black hole
- + d) neutron star....black hole
- e) blue giant....red giant

6. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 2 cm expands out to 4 cm. To what distance would a raisin originally situated at a distance of 4 cm expand?

- a) 4
- b) 3
- c) 2
- d) 6
- + e) 8

7. What causes the blue glow of the Crab nebula?

- + a) the curving motion of electrons in a magnetic field; such motion resembles a radio antenna
- b) the same emission found in a Lava lamp (ultra-violet)
- c) the Gravitational blue shift
- d) the curving motion of electrons in a magnetic field; such motion traps ultra-violet and blue light
- e) the Doppler blue shift

8. Many stars in a typical open cluster are nearly as old as the universe

- a) True
- + b) False

9. Stars that begin with more than 50 solar masses will typically lose _____ while on the main sequence.

- a) 10% of their magnetic field
- b) 10% their mass
- + c) 50% their mass
- d) 1% their mass
- e) all of their magnetic field

10. You are at the center raisin of an expanding raisinbread model of Hubble expansion, and from your location a raisin originally situated at a distance of 1 cm expands out to a distance of 4 cm. The nearest raisin with intelligent life is situated exactly halfway between your (central) location and the edge. How would this second "intelligent" raisin view an expansion of a raisin 1 cm away?

- a) expansion from 1 cm to 9 cm (since $5-1=4$)
- + b) expansion from 1 cm to 4 cm (just like yours).
- c) expansion from 1 cm to 8 cm (twice yours).
- d) expansion from 1 cm to 2 cm (half of yours)
- e) expansion from 1 cm to 3 cm (since $3-1=2$)

11. Stellar parallax is

- + a) an annual change in angular position of a star as seen from Earth
- b) an astronomical object with known luminosity.
- c) a numerical measure of brightness as seen from Earth
- d) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- e) the total amount of energy emitted per unit time.

12. Members of an open cluster feel significant forces only due to gravitational interaction with each other

- a) True
- + b) False

13. Pre-main sequence stars are often surrounded by a protoplanetary disk and powered mainly by

- a) chemical reactions
- b) the fusion of Helium to Carbon
- c) collisions between protoplanets
- d) the fission of Carbon from Helium
- + e) the release of gravitational energy

14. What was Messier doing when he independently rediscovered the Crab in 1758?

- a) Attempting one of the first star charts
- + b) Looking for a comet that he knew would be appearing in that part of the sky.
- c) Attempting to count asteroids
- d) Trying to measure the orbital radius of a planet
- e) Looking for lobsters

15. In 1989 the satellite Hipparcos was launched primarily for obtaining parallaxes and proper motions allowing measurements of stellar parallax for stars up to about 500 parsecs away, which is about ____ times the diameter of the Milky Way Galaxy.

- a) 15
- b) 1.5
- + c) .015
- d) 0.15
- e) 150

16. Members of a globular cluster tend to be

- + a) old
- b) of all ages
- c) young

17. What causes the "finger-like" filamentary structure in the Crab nebula?

- a) a heavy (high density) fluid underneath a light (low density) fluid, like a lava lamp
- b) electrons striking oxygen molecules, like a lava lamp
- c) electrons striking hydrogen molecules, like a lava lamp
- + d) a light(low density) fluid underneath a heavy(high density) fluid, like a lava lamp
- e) cyclotron motion, causing the electrons to strike oxygen molecules

18. In one respect, the universe is arguably "young", considering how much complexity it contains. This is often illustrated by a calculation of

- a) cosmic expansion
- b) recalibration of supernovae relative magnitude
- c) cosmic redshift
- + d) chimps typing Shakespeare
- e) recalibration of supernovae luminosity

19. When a star with more than 10 solar masses ceases fuse hydrogen to helium, it

- a) it fuses helium to carbon to iron (and other elements), then continues to release more energy by fusing the iron to heavier elements such as uranium.
- b) ceases to convert nuclear energy.
- + c) it fuses helium to carbon and other elements up to iron and then ceases to produce more energy
- d) it fuses helium to carbon and then ceases to produce more energy
- e) it fuses elements up to uranium, and continues to produce energy by the fission of uranium.

20. Based on the HR diagrams and images in stars shown in the materials, a very large red supergiant has a diameter that is about ____ greater than a small white dwarf.

- a) 3×10^{11}
- b) 3×10^7
- c) 3×10^9
- + d) 3×10^5
- e) 3×10^3

21. The location of open clusters can be described as

- a) uniformly distributed within the galactic disk
- + b) in the spiral arms
- c) between the spiral arms
- d) uniformly distributed in a sphere centered at the Milky Way's center

22. According to Wikipedia, a star with over 20 solar masses converts its Hydrogen to Helium in about 8 billion years, but the conversion of Oxygen to heavier elements take about _____

- a) 1 thousand years
- b) 1 million years
- c) 1 billion years
- d) 10 billion years
- + e) 1 year

23. An object emits thermal (blackbody) radiation with a peak wavelength of 250nm. How does its temperature compare with the Sun?

- + a) 2 times hotter than the Sun
- b) 5 times colder than the Sun
- c) The temperature is the same
- d) 2 times colder than the Sun
- e) 5 times hotter than the Sun

24. Most globular clusters that we see in the sky orbit _____ and have _____ orbits

- a) the center of the Milky way ... nearly circular
- b) within the disk of the Milky way ... nearly circular
- c) within the disk of the Milky way ... elliptic orbits
- + d) the center of the Milky way ... elliptic orbits

25. Members of a globular cluster tend to have

- + a) low mass
- b) high mass
- c) a wide range of masses

26. Luminosity is

- a) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- b) an astronomical object with known luminosity.
- c) an annual change in angular position of a star as seen from Earth
- d) a numerical measure of brightness as seen from Earth
- + e) the total amount of energy emitted per unit time.

27. What happens if you increase the size of a giant molecular cloud while keeping temperature and mass fixed?

- a) It is more likely to collapse because this will increase the temperature
- b) It is more likely to collapse because larger things have more gravity
- c) It is less likely to collapse because temperature can never be kept fixed
- + d) It is less likely to collapse spreading it out weakens the force of gravity
- e) It is equally likely to collapse because size is not part of the Jean's criterion.

28. The course materials presented three arguments suggesting that a white dwarf is roughly the size of the earth. Which best summarizes them?

- a) x-ray-emmission...doppler-shift...rotation-rate
- b) HR-diagram-location...X-ray-emmission...spectral-lines
- c) all of these are true
- + d) temperature-luminosity...redshift...quantum-theory-of-solids
- e) doppler-shift...period-of-pulsation...temperature-luminosity

29. This light clock is associated with

- a) general relativity
- + b) special relativity
- c) all of these are true
- d) gravitational shift
- e) doppler shift

30. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 4 cm expands out to 12 cm. To what distance would a raisin originally situated at a distance of 2 cm expand?

- + a) 6
- b) 2
- c) 4
- d) 8
- e) 3

31. Members of an open cluster feel significant forces from nearby giant molecular clouds

- + a) True
- b) False

32. Absolute magnitude is

- a) an annual change in angular position of a star as seen from Earth
- b) the total amount of energy emitted per unit time.
- + c) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- d) an astronomical object with known luminosity.
- e) a numerical measure of brightness as seen from Earth

33.

This spectrum of the star Vega suggests that

- a) it is not really a black body
- + b) all of these are true
- c) its surface can be associated with a range of temperatures
- d) it can be associated with an "effective" temperature
- e) it is an approximate black body

34. A starburst galaxy.

- a) usually is a result of collisions between galaxies
- b) All of these are correct
- + c) Two of these are correct
- d) is a region of active stellar birth
- e) has only dead or dying stars

35. One way to determine the distance to a nebula or small cluster of clouds is to compare the angular expansion to the spectroscopic Doppler shift. Two clusters (A and B) have the same spectroscopically measured velocity. Cluster A is moving towards the observer and exhibits the greater angular expansion. Which cluster is closer?

- + a) cluster A, because it exhibits greater angular expansion
- b) either cluster might be more distant
- c) cluster A, because it exhibits a blue Doppler shift
- d) cluster B, because it exhibits a red Doppler shift
- e) cluster B, because it exhibits less angular expansion

AstroTest4-v2s1

1. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 2 cm expands out to 4 cm. To what distance would a raisin originally situated at a distance of 4 cm expand?

- a) 2
- b) 4
- c) 6
- d) 8
- e) 3

2. Based on the HR diagrams and images in stars shown in the materials, a very large red supergiant has a diameter that is about ____ greater than a small white dwarf.

- a) 3×10^7
- b) 3×10^3
- c) 3×10^9
- d) 3×10^5
- e) 3×10^{11}

3. Members of a globular cluster tend to be

- a) young
- b) of all ages
- c) old

4. A starburst galaxy.

- a) usually is a result of collisions between galaxies
- b) Two of these are correct
- c) has only dead or dying stars
- d) is a region of active stellar birth
- e) All of these are correct

5. The range of wavelength for visible light is between

- a) 400 and 700 nanometers
- b) 0.1 and 10 nanometers
- c) 600 and 1200 nanometers
- d) 5000 and 6000 nanometers
- e) 1 and 10 nanometers

6. In one respect, the universe is arguably "young", considering how much complexity it contains. This is often illustrated by a calculation of

- a) recalibration of supernovae relative magnitude
- b) recalibration of supernovae luminosity
- c) chimps typing Shakespeare
- d) cosmic expansion
- e) cosmic redshift

7. One way to determine the distance to a nebula or small cluster of clouds is to compare the angular expansion to the spectroscopic Doppler shift. Two clusters (A and B) have the same spectroscopically measured velocity. Cluster A is moving towards the observer and exhibits the greater angular expansion. Which cluster is closer?

- a) cluster A, because it exhibits greater angular expansion
- b) cluster B, because it exhibits a red Doppler shift
- c) cluster A, because it exhibits a blue Doppler shift
- d) either cluster might be more distant
- e) cluster B, because it exhibits less angular expansion

8. A dying star with more than 1.4 solar masses becomes a _____, and those with more than 5 solar masses becomes a _____

- a) white dwarf....black hole
- b) neutron star....black hole
- c) white dwarf....neutron star
- d) blue giant....red giant
- e) white dwarf...red dwarf

9. Members of a globular cluster tend to have

- a) low mass
- b) high mass
- c) a wide range of masses

10. When a star with more than 10 solar masses ceases fuse hydrogen to helium, it

- a) it fuses elements up to uranium, and continues to produce energy by the fission of uranium.
- b) ceases to convert nuclear energy.
- c) it fuses helium to carbon and then ceases to produce more energy
- d) it fuses helium to carbon to iron (and other elements), then continues to release more energy by fusing the iron to heavier elements such as uranium.
- e) it fuses helium to carbon and other elements up to iron and then ceases to produce more energy

11. Many stars in a typical open cluster are nearly as old as the universe

- a) True
- b) False

12. An object emits thermal (blackbody) radiation with a peak wavelength of 250nm. How does its temperature compare with the Sun?

- a) 5 times hotter than the Sun
- b) The temperature is the same
- c) 5 times colder than the Sun
- d) 2 times colder than the Sun
- e) 2 times hotter than the Sun

13.

This spectrum of the star Vega suggests that

- a) it is not really a black body
- b) it can be associated with an "effective" temperature
- c) it is an approximate black body
- d) all of these are true
- e) its surface can be associated with a range of temperatures

14. Pre-main sequence stars are often surrounded by a protoplanetary disk and powered mainly by

- a) the release of gravitational energy
- b) the fusion of Helium to Carbon
- c) chemical reactions
- d) collisions between protoplanets
- e) the fission of Carbon from Helium

15. Absolute magnitude is

- a) an astronomical object with known luminosity.
- b) a numerical measure of brightness as seen from Earth
- c) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- d) the total amount of energy emitted per unit time.
- e) an annual change in angular position of a star as seen from Earth

16. Most globular clusters that we see in the sky orbit _____ and have _____ orbits

- a) within the disk of the Milky way ... elliptic orbits
- b) within the disk of the Milky way ... nearly circular
- c) the center of the Milky way ... elliptic orbits
- d) the center of the Milky way ... nearly circular

17. The Hayashi and Henyey tracks refer to how T Tauri of different masses will move

- a) through a cluster as they are born
- b) through an HR diagram as they are born
- c) Two of these are true
- d) through a cluster as they die
- e) through an HR diagram as they die

18. You at the center raisin of an expanding raisinbread model of Hubble expansion, and from your location a raisin originally situated at a distance of 1 cm expands out to a distance of 4 cm. The nearest raisin with intelligent life is situated exactly halfway between your (central) location and the edge. How would this second "intelligent" raisin view an expansion of a raisin 1 cm away?

- a) expansion from 1 cm to 3 cm (since $3-1=2$)
- b) expansion from 1 cm to 4 cm (just like yours).
- c) expansion from 1 cm to 9 cm (since $5-1=4$)
- d) expansion from 1 cm to 8 cm (twice yours).
- e) expansion from 1 cm to 2 cm (half of yours)

19. The number of globular clusters in the Milky way galaxy is about

- a) 1,500
- b) 15 thousand
- c) 15 million
- d) 150

20. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 4 cm expands out to 12 cm. To what distance would a raisin originally situated at a distance of 2 cm expand?

- a) 3
- b) 6
- c) 2
- d) 4
- e) 8

21. What causes the blue glow of the Crab nebula?

- a) the same emission found in a Lava lamp (ultra-violet)
- b) the Doppler blue shift
- c) the curving motion of electrons in a magnetic field; such motion resembles a radio antenna
- d) the curving motion of electrons in a magnetic field; such motion traps ultra-violet and blue light
- e) the Gravitational blue shift

22. In 1989 the satellite Hipparcos was launched primarily for obtaining parallaxes and proper motions allowing measurements of stellar parallax for stars up to about 500 parsecs away, which is about ____ times the diameter of the Milky Way Galaxy.

- a) .015
- b) 1.5
- c) 15
- d) 150
- e) 0.15

23. What happens if you increase the size of a giant molecular cloud while keeping temperature and mass fixed?

- a) It is more likely to collapse because larger things have more gravity
- b) It is less likely to collapse because temperature can never be kept fixed
- c) It is equally likely to collapse because size is not part of the Jean's criterion.
- d) It is more likely to collapse because this will increase the temperature
- e) It is less likely to collapse spreading it out weakens the force of gravity

24. Members of an open cluster feel significant forces from nearby giant molecular clouds

- a) True
- b) False

25. What causes the "finger-like" filamentary structure in the Crab nebula?

- a) electrons striking oxygen molecules, like a lava lamp
- b) cyclotron motion, causing the electrons to strike oxygen molecules
- c) electrons striking hydrogen molecules, like a lava lamp
- d) a heavy (high density) fluid underneath a light (low density) fluid, like a lava lamp
- e) a light(low density) fluid underneath a heavy(high density) fluid, like a lava lamp

26. According to Wikipedia, a star with over 20 solar masses converts its Hydrogen to Helium in about 8 billion years, but the conversion of Oxygen to heavier elements take about _____

- a) 10 billion years
- b) 1 million years
- c) 1 billion years
- d) 1 thousand years
- e) 1 year

27. Stellar parallax is

- a) the total amount of energy emitted per unit time.
- b) an annual change in angular position of a star as seen from Earth
- c) a numerical measure of brightness as seen from Earth
- d) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- e) an astronomical object with known luminosity.

28. The location of open clusters can be described as

- a) in the spiral arms
- b) between the spiral arms
- c) uniformly distributed within the galactic disk
- d) uniformly distributed in a sphere centered at the Milky Way's center

29. Members of an open cluster feel significant forces only due to gravitational interaction with each other

- a) True
- b) False

30. Luminosity is

- a) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- b) an annual change in angular position of a star as seen from Earth
- c) the total amount of energy emitted per unit time.
- d) an astronomical object with known luminosity.
- e) a numerical measure of brightness as seen from Earth

31. Stars that begin with more than 50 solar masses will typically lose _____ while on the main sequence.

- a) 10% of their magnetic field
- b) 10% their mass
- c) all of their magnetic field
- d) 1% their mass
- e) 50% their mass

32. What was Messier doing when he independently rediscovered the Crab in 1758?

- a) Attempting one of the first star charts
- b) Looking for a comet that he knew would be appearing in that part of the sky.
- c) Attempting to count asteroids
- d) Trying to measure the orbital radius of a planet
- e) Looking for lobsters

33. The course materials presented three arguments suggesting that a white dwarf is roughly the size of the earth. Which best summarizes them?

- a) x-ray-emmission...doppler-shift...rotation-rate
- b) HR-diagram-location...X-ray-emmission...spectral-lines
- c) temperature-luminosity...redshift...quantum-theory-of-solids
- d) doppler-shift...period-of-pulsation...temperature-luminosity
- e) all of these are true

34. This light clock is associated with

- a) doppler shift
- b) general relativity
- c) all of these are true
- d) gravitational shift
- e) special relativity

35. $KE = \frac{4\pi^2 MR^2}{5 P^2}$ is the kinetic energy of a solid rotating ball, where M is mass, R is radius, and P is period. And, $power = \frac{energy}{time}$.

You are banging espressos in a little coffeehouse with your astronomy friends, talking about a new SN remnant that closely resembles the Crab. You have observed the pulsar, and wonder what the total power output of the nebula might be. You know both the period of the pulsar, as well as τ , which represents the amount of time you think the pulsar will continue pulsing if it continues slowing down at its present rate. What formula do you write on your napkin?

— a) $power = \frac{4\pi^2 MR^2}{5 P^2} \tau^4$

— b) $power = \frac{4\tau\pi^2 MR^2}{5 P^2}$

— c) $power = \frac{5 MR^2}{4\tau\pi^2 P^2}$

— d) $power = \frac{4\pi^2 MR^2}{5\tau P^2}$

— e) $power = \frac{4\pi^2 MR^2}{5\tau^2 P^2}$

Key to AstroTest4-v2s1

1. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 2 cm expands out to 4 cm. To what distance would a raisin originally situated at a distance of 4 cm expand?

- a) 2
- b) 4
- c) 6
- + d) 8
- e) 3

2. Based on the HR diagrams and images in stars shown in the materials, a very large red supergiant has a diameter that is about ____ greater than a small white dwarf.

- a) 3×10^7
- b) 3×10^3
- c) 3×10^9
- + d) 3×10^5
- e) 3×10^{11}

3. Members of a globular cluster tend to be

- a) young
- b) of all ages
- + c) old

4. A starburst galaxy.

- a) usually is a result of collisions between galaxies
- + b) Two of these are correct
- c) has only dead or dying stars
- d) is a region of active stellar birth
- e) All of these are correct

5. The range of wavelength for visible light is between

- + a) 400 and 700 nanometers
- b) 0.1 and 10 nanometers
- c) 600 and 1200 nanometers
- d) 5000 and 6000 nanometers
- e) 1 and 10 nanometers

6. In one respect, the universe is arguably "young", considering how much complexity it contains. This is often illustrated by a calculation of

- a) recalibration of supernovae relative magnitude
- b) recalibration of supernovae luminosity
- + c) chimps typing Shakespeare
- d) cosmic expansion
- e) cosmic redshift

7. One way to determine the distance to a nebula or small cluster of clouds is to compare the angular expansion to the spectroscopic Doppler shift. Two clusters (A and B) have the same spectroscopically measured velocity. Cluster A is moving towards the observer and exhibits the greater angular expansion. Which cluster is closer?

- + a) cluster A, because it exhibits greater angular expansion
- b) cluster B, because it exhibits a red Doppler shift
- c) cluster A, because it exhibits a blue Doppler shift
- d) either cluster might be more distant
- e) cluster B, because it exhibits less angular expansion

8. A dying star with more than 1.4 solar masses becomes a _____, and those with more than 5 solar masses becomes a _____

- a) white dwarf....black hole
- + b) neutron star....black hole
- c) white dwarf....neutron star
- d) blue giant....red giant
- e) white dwarf...red dwarf

9. Members of a globular cluster tend to have

- + a) low mass
- b) high mass
- c) a wide range of masses

10. When a star with more than 10 solar masses ceases fuse hydrogen to helium, it

- a) it fuses elements up to uranium, and continues to produce energy by the fission of uranium.
- b) ceases to convert nuclear energy.
- c) it fuses helium to carbon and then ceases to produce more energy
- d) it fuses helium to carbon to iron (and other elements), then continues to release more energy by fusing the iron to heavier elements such as uranium.
- + e) it fuses helium to carbon and other elements up to iron and then ceases to produce more energy

11. Many stars in a typical open cluster are nearly as old as the universe

- a) True
- + b) False

12. An object emits thermal (blackbody) radiation with a peak wavelength of 250nm. How does its temperature compare with the Sun?

- a) 5 times hotter than the Sun
- b) The temperature is the same
- c) 5 times colder than the Sun
- d) 2 times colder than the Sun
- + e) 2 times hotter than the Sun

13.

This spectrum of the star Vega suggests that

- a) it is not really a black body
- b) it can be associated with an "effective" temperature
- c) it is an approximate black body
- + d) all of these are true
- e) its surface can be associated with a range of temperatures

14. Pre-main sequence stars are often surrounded by a protoplanetary disk and powered mainly by

- + a) the release of gravitational energy
- b) the fusion of Helium to Carbon
- c) chemical reactions
- d) collisions between protoplanets
- e) the fission of Carbon from Helium

15. Absolute magnitude is

- a) an astronomical object with known luminosity.
- b) a numerical measure of brightness as seen from Earth
- + c) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- d) the total amount of energy emitted per unit time.
- e) an annual change in angular position of a star as seen from Earth

16. Most globular clusters that we see in the sky orbit _____ and have _____ orbits

- a) within the disk of the Milky way ... elliptic orbits
- b) within the disk of the Milky way ... nearly circular
- + c) the center of the Milky way ... elliptic orbits
- d) the center of the Milky way ... nearly circular

17. The Hayashi and Henyey tracks refer to how T Tauri of different masses will move

- a) through a cluster as they are born
- + b) through an HR diagram as they are born
- c) Two of these are true
- d) through a cluster as they die
- e) through an HR diagram as they die

18. You at the center raisin of an expanding raisinbread model of Hubble expansion, and from your location a raisin originally situated at a distance of 1 cm expands out to a distance of 4 cm. The nearest raisin with intelligent life is situated exactly halfway between your (central) location and the edge. How would this second "intelligent" raisin view an expansion of a raisin 1 cm away?

- a) expansion from 1 cm to 3 cm (since $3-1=2$)
- + b) expansion from 1 cm to 4 cm (just like yours).
- c) expansion from 1 cm to 9 cm (since $5-1=4$)
- d) expansion from 1 cm to 8 cm (twice yours).
- e) expansion from 1 cm to 2 cm (half of yours)

19. The number of globular clusters in the Milky way galaxy is about

- a) 1,500
- b) 15 thousand
- c) 15 million
- + d) 150

20. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 4 cm expands out to 12 cm. To what distance would a raisin originally situated at a distance of 2 cm expand?

- a) 3
- + b) 6
- c) 2
- d) 4
- e) 8

21. What causes the blue glow of the Crab nebula?

- a) the same emission found in a Lava lamp (ultra-violet)
- b) the Doppler blue shift
- + c) the curving motion of electrons in a magnetic field; such motion resembles a radio antenna
- d) the curving motion of electrons in a magnetic field; such motion traps ultra-violet and blue light
- e) the Gravitational blue shift

22. In 1989 the satellite Hipparcos was launched primarily for obtaining parallaxes and proper motions allowing measurements of stellar parallax for stars up to about 500 parsecs away, which is about ____ times the diameter of the Milky Way Galaxy.

- + a) .015
- b) 1.5
- c) 15
- d) 150
- e) 0.15

23. What happens if you increase the size of a giant molecular cloud while keeping temperature and mass fixed?

- a) It is more likely to collapse because larger things have more gravity
- b) It is less likely to collapse because temperature can never be kept fixed
- c) It is equally likely to collapse because size is not part of the Jean's criterion.
- d) It is more likely to collapse because this will increase the temperature
- + e) It is less likely to collapse spreading it out weakens the force of gravity

24. Members of an open cluster feel significant forces from nearby giant molecular clouds

- + a) True
- b) False

25. What causes the "finger-like" filamentary structure in the Crab nebula?

- a) electrons striking oxygen molecules, like a lava lamp
- b) cyclotron motion, causing the electrons to strike oxygen molecules
- c) electrons striking hydrogen molecules, like a lava lamp
- d) a heavy (high density) fluid underneath a light (low density) fluid, like a lava lamp
- + e) a light(low density) fluid underneath a heavy(high density) fluid, like a lava lamp

26. According to Wikipedia, a star with over 20 solar masses converts its Hydrogen to Helium in about 8 billion years, but the conversion of Oxygen to heavier elements take about _____

- a) 10 billion years
- b) 1 million years
- c) 1 billion years
- d) 1 thousand years
- + e) 1 year

27. Stellar parallax is

- a) the total amount of energy emitted per unit time.
- + b) an annual change in angular position of a star as seen from Earth
- c) a numerical measure of brightness as seen from Earth
- d) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- e) an astronomical object with known luminosity.

28. The location of open clusters can be described as

- + a) in the spiral arms
- b) between the spiral arms
- c) uniformly distributed within the galactic disk
- d) uniformly distributed in a sphere centered at the Milky Way's center

29. Members of an open cluster feel significant forces only due to gravitational interaction with each other

- a) True
- + b) False

30. Luminosity is

- a) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- b) an annual change in angular position of a star as seen from Earth
- + c) the total amount of energy emitted per unit time.
- d) an astronomical object with known luminosity.
- e) a numerical measure of brightness as seen from Earth

31. Stars that begin with more than 50 solar masses will typically lose _____ while on the main sequence.

- a) 10% of their magnetic field
- b) 10% their mass
- c) all of their magnetic field
- d) 1% their mass
- + e) 50% their mass

32. What was Messier doing when he independently rediscovered the Crab in 1758?

- a) Attempting one of the first star charts
- + b) Looking for a comet that he knew would be appearing in that part of the sky.
- c) Attempting to count asteroids
- d) Trying to measure the orbital radius of a planet
- e) Looking for lobsters

33. The course materials presented three arguments suggesting that a white dwarf is roughly the size of the earth. Which best summarizes them?

- a) x-ray-emmission...doppler-shift...rotation-rate
- b) HR-diagram-location...X-ray-emmission...spectral-lines
- + c) temperature-luminosity...redshift...quantum-theory-of-solids
- d) doppler-shift...period-of-pulsation...temperature-luminosity
- e) all of these are true

34. This light clock is associated with

- a) doppler shift
- b) general relativity
- c) all of these are true
- d) gravitational shift
- + e) special relativity

35. $KE = \frac{4\pi^2 MR^2}{5 P^2}$ is the kinetic energy of a solid rotating ball, where M is mass, R is radius, and P is period. And, $power = \frac{energy}{time}$.

You are banging espressos in a little coffeehouse with your astronomy friends, talking about a new SN remnant that closely resembles the Crab. You have observed the pulsar, and wonder what the total power output of the nebula might be. You know both the period of the pulsar, as well as τ , which represents the amount of time you think the pulsar will continue pulsing if it continues slowing down at its present rate. What formula do you write on your napkin?

- a) $power = \frac{4\pi^2 MR^2}{5 P^2} \tau^4$

- b) $power = \frac{4\tau\pi^2 MR^2}{5 P^2}$

- c) $power = \frac{5 MR^2}{4\tau\pi^2 P^2}$

+ d) $power = \frac{4\pi^2 MR^2}{5\tau P^2}$

- e) $power = \frac{4\pi^2 MR^2}{5\tau^2 P^2}$

AstroTest4-v1s2

1. Many stars in a typical open cluster are nearly as old as the universe

- a) True
- b) False

2. A grouping with a hundred stars is probably a

- a) elliptical galaxy
- b) open cluster
- c) globular cluster
- d) dwarf galaxy
- e) A-B association

3. Giant molecular clouds with sufficient conditions to form a star cluster would have formed them long ago. Any stellar births in the past couple of billions of years probably resulted from _____ between clouds.

- a) None of these is correct.
- b) collisions
- c) ion exchange
- d) Two of these are correct
- e) photon exchange

4. A dying star with more than 1.4 solar masses becomes a _____, and those with more than 5 solar masses becomes a _____

- a) neutron star....black hole
- b) blue giant....red giant
- c) white dwarf....neutron star
- d) white dwarf....black hole
- e) white dwarf...red dwarf

5. Why is a star made of plasma?

- a) plasma is generic word for "important"
- b) plasma is always present when there are strong magnetic fields
- c) it is so hot that electrons are stripped away from the protons
- d) the interstellar gas was mostly plasma
- e) the intense gravity liquifies the substance, just as red blood cells liquify plasma in the body

6. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 2 cm expands out to 4 cm. To what distance would a raisin originally situated at a distance of 4 cm expand?

- a) 8
- b) 3
- c) 2
- d) 4
- e) 6

7. Members of an open cluster feel significant forces from nearby giant molecular clouds

- a) True
- b) False

8. What causes the blue glow of the Crab nebula?

- a) the Gravitational blue shift
- b) the Doppler blue shift
- c) the same emission found in a Lava lamp (ultra-violet)
- d) the curving motion of electrons in a magnetic field; such motion traps ultra-violet and blue light
- e) the curving motion of electrons in a magnetic field; such motion resembles a radio antenna

9. The range of wavelength for visible light is between

- a) 1 and 10 nanometers
- b) 400 and 700 nanometers
- c) 5000 and 6000 nanometers
- d) 0.1 and 10 nanometers
- e) 600 and 1200 nanometers

10. What is the difference between a constellation and an asterism?

- a) constellations represent regions of the sky, like state boundaries on a map of the USA
- b) asterisms are larger than constellations
- c) constellations consist of never more than ten stars.
- d) none of these is correct
- e) asterisms are smaller than constellations

11. Based on the HR diagrams and images in stars shown in the materials, a very large red supergiant has a diameter that is about ____ greater than a small white dwarf.

- a) 3×10^{11}
- b) 3×10^5
- c) 3×10^7
- d) 3×10^9
- e) 3×10^3

12. The "normalized intensity" of a Sun-like star situated one parsec from Earth would be $4\pi I = 1$. What is $4\pi I$ for a star with 100 times the Sun's energy output that is situated 10pc from Earth?

- a) 10^{-2}
- b) 10^{-1}
- c) 10^{-4}
- d) 1
- e) 10^{-3}

13. Which of the following changes in the properties of a giant molecular cloud might cause it to collapse?

- a) Increase size at fixed pressure and mass
- b) Two of these are correct
- c) Increase temperature at fixed mass and size
- d) Increase mass at fixed temperature and size
- e) Decrease mass at fixed temperature and size

14. Most globular clusters that we see in the sky orbit _____ and have _____ orbits

- a) the center of the Milky way ... elliptic orbits
- b) within the disk of the Milky way ... nearly circular
- c) the center of the Milky way ... nearly circular
- d) within the disk of the Milky way ... elliptic orbits

15. Relative magnitude is

- a) an astronomical object with known luminosity.
- b) an annual change in angular position of a star as seen from Earth
- c) the total amount of energy emitted per unit time.
- d) a numerical measure of brightness as seen from Earth
- e) a numerical measure of brightness as seen from a distance of approximately 33 light-years

16. What happens if you increase the size of a giant molecular cloud while keeping temperature and mass fixed?

- a) It is more likely to collapse because larger things have more gravity
- b) It is less likely to collapse because temperature can never be kept fixed
- c) It is equally likely to collapse because size is not part of the Jean's criterion.
- d) It is more likely to collapse because this will increase the temperature
- e) It is less likely to collapse spreading it out weakens the force of gravity

17. Members of an open cluster feel significant forces only due to gravitational interaction with each other

- a) True
- b) False

18. Comparing Hubble's original (1929) plot of redshift versus distance with the later one in 2007, the latter extends farther into space by a factor of

- a) 100
- b) 1000
- c) 10,000
- d) 100,000
- e) 10

19. The course materials present two cosmic expansion plots. The more recent (2007) plot used

- a) novae
- b) entire galaxies
- c) supernovae
- d) Cepheid variables
- e) red giants

20. A grouping with 100 thousand stars would probably be a

- a) globular cluster
- b) A-B association
- c) dwarf galaxy
- d) elliptical galaxy
- e) open cluster

21. A standard candle is

- a) an annual change in angular position of a star as seen from Earth
- b) a numerical measure of brightness as seen from Earth
- c) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- d) the total amount of energy emitted per unit time.
- e) an astronomical object with known luminosity.

22. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 4 cm expands out to 12 cm. To what distance would a raisin originally situated at a distance of 2 cm expand?

- a) 2
- b) 4
- c) 6
- d) 3
- e) 8

23. A star that is increasing it's temperature while maintaining constant luminosity is

- a) getting smaller in size
- b) on the verge of becoming a supernovae
- c) in the process of dying
- d) turning red
- e) getting larger in size

24. An object emits thermal (blackbody) radiation with a peak wavelength of 250nm. How does its temperature compare with the Sun?

- a) 5 times colder than the Sun
- b) 2 times colder than the Sun
- c) The temperature is the same
- d) 2 times hotter than the Sun
- e) 5 times hotter than the Sun

25. Suppose the light clock involved a ball being tossed back and forth on a train going just under the speed of sound. In contrast to the situation for light reflecting back and forth on a train going just under the speed of light, there is virtually no time dilation. Why?

- a) Special relativity is valid only for objects travelling in a vacuum.
- b) The observer on the ground would perceive the ball to be travelling faster.
- c) The observer on the ground would perceive the width the train to be smaller.
- d) The observer on the ground would perceive the width the train to be greater.
- e) The observer on the ground would perceive the ball to be travelling more slowly.

26. Many supernovae begin as a shock wave in the core that was caused by

- a) all of these processes contribute to the shock wave
- b) carbon and other elements fusing into iron
- c) iron fusing into heavier elements such as uranium
- d) the conversion of carbon into diamonds,
- e) electrons being driven into protons to form neutrons

27.

What best explains this figure?

a) The photon slows down, by the Doppler shift, $E=hf$, and therefore by $c=f\lambda$ it turns red.

b) The photon slows down, by the Doppler shift, $c=f\lambda$, and therefore by $E=hf$ it turns red.

c) The photon loses energy, not speed. By $E=hf$, it loses frequency, and by $c=f\lambda$ it increases wavelength and turns red.

d) The photon loses energy, not speed. By $c=f\lambda$, it loses frequency, and by $E=hf$ it increases wavelength and turns red.

e) The photon slows down as it goes uphill, and by $c=f\lambda$ it increases wavelength therefore by $E=hf$, it turns red.

28. What was Messier doing when he independently rediscovered the Crab in 1758?

a) Looking for lobsters

b) Trying to measure the orbital radius of a planet

c) Looking for a comet that he knew would be appearing in that part of the sky.

d) Attempting one of the first star charts

e) Attempting to count asteroids

29. The course materials present two cosmic expansion plots. Hubble's original (1929) plot used

a) novae

b) entire galaxies

c) supernovae

d) Cepheid variables

e) red giants

30. Members of a globular cluster tend to have

a) a wide range of masses

b) low mass

c) high mass

31. Many stars in a typical globular cluster are nearly as old as the universe

- a) True
 b) False

32. Aside from its location on the HR diagram, evidence that the white dwarf has a small radius can be found from

- a) the doppler shift
 b) the expansion of the universe
 c) the temperature
 d) the mass as measured by Kepler's third law (modified by Newton)
 e) the gravitational redshift

33. This light clock is associated with

- a) gravitational shift
 b) general relativity
 c) doppler shift
 d) special relativity
 e) all of these are true

34. What causes the "finger-like" filamentary structure in the Crab nebula?

- a) a light(low density) fluid underneath a heavy(high density) fluid, like a lava lamp
 b) cyclotron motion, causing the electrons to strike oxygen molecules
 c) electrons striking hydrogen molecules, like a lava lamp
 d) a heavy (high density) fluid underneath a light (low density) fluid, like a lava lamp
 e) electrons striking oxygen molecules, like a lava lamp

35. A starburst galaxy.

- a) All of these are correct
- b) usually is a result of collisions between galaxies
- c) has only dead or dying stars
- d) Two of these are correct
- e) is a region of active stellar birth

Key to AstroTest4-v1s2

1. Many stars in a typical open cluster are nearly as old as the universe
 - a) True
 - + b) False

2. A grouping with a hundred stars is probably a
 - a) elliptical galaxy
 - + b) open cluster
 - c) globular cluster
 - d) dwarf galaxy
 - e) A-B association

3. Giant molecular clouds with sufficient conditions to form a star cluster would have formed them long ago. Any stellar births in the past couple of billions years probably resulted from _____ between clouds.
 - a) None of these is correct.
 - + b) collisions
 - c) ion exchange
 - d) Two of these are correct
 - e) photon exchange

4. A dying star with more than 1.4 solar masses becomes a _____, and those with more than 5 solar masses becomes a _____
 - + a) neutron star....black hole
 - b) blue giant....red giant
 - c) white dwarf....neutron star
 - d) white dwarf....black hole
 - e) white dwarf...red dwarf

5. Why is a star made of plasma?

- a) plasma is generic word for "important"
- b) plasma is always present when there are strong magnetic fields
- + c) it is so hot that electrons are stripped away from the protons
- d) the interstellar gas was mostly plasma
- e) the intense gravity liquifies the substance, just as red blood cells liquify plasma in the body

6. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 2 cm expands out to 4 cm. To what distance would a raisin originally situated at a distance of 4 cm expand?

- + a) 8
- b) 3
- c) 2
- d) 4
- e) 6

7. Members of an open cluster feel significant forces from nearby giant molecular clouds

- + a) True
- b) False

8. What causes the blue glow of the Crab nebula?

- a) the Gravitational blue shift
- b) the Doppler blue shift
- c) the same emission found in a Lava lamp (ultra-violet)
- d) the curving motion of electrons in a magnetic field; such motion traps ultra-violet and blue light
- + e) the curving motion of electrons in a magnetic field; such motion resembles a radio antenna

9. The range of wavelength for visible light is between

- a) 1 and 10 nanometers
- + b) 400 and 700 nanometers
- c) 5000 and 6000 nanometers
- d) 0.1 and 10 nanometers
- e) 600 and 1200 nanometers

10. What is the difference between a constellation and an asterism?

- + a) constellations represent regions of the sky, like state boundaries on a map of the USA
- b) asterisms are larger than constellations
- c) constellations consist of never more than ten stars.
- d) none of these is correct
- e) asterisms are smaller than constellations

11. Based on the HR diagrams and images in stars shown in the materials, a very large red supergiant has a diameter that is about ____ greater than a small white dwarf.

- a) 3×10^{11}
- + b) 3×10^5
- c) 3×10^7
- d) 3×10^9
- e) 3×10^3

12. The "normalized intensity" of a Sun-like star situated one parsec from Earth would be $4\pi I = 1$. What is $4\pi I$ for a star with 100 times the Sun's energy output that is situated 10pc from Earth?

- a) 10^{-2}
- b) 10^{-1}
- c) 10^{-4}
- + d) 1
- e) 10^{-3}

13. Which of the following changes in the properties of a giant molecular cloud might cause it to collapse?

- a) Increase size at fixed pressure and mass
- b) Two of these are correct
- c) Increase temperature at fixed mass and size
- + d) Increase mass at fixed temperature and size
- e) Decrease mass at fixed temperature and size

14. Most globular clusters that we see in the sky orbit _____ and have _____ orbits

- + a) the center of the Milky way ... elliptic orbits
- b) within the disk of the Milky way ... nearly circular
- c) the center of the Milky way ... nearly circular
- d) within the disk of the Milky way ... elliptic orbits

15. Relative magnitude is

- a) an astronomical object with known luminosity.
- b) an annual change in angular position of a star as seen from Earth
- c) the total amount of energy emitted per unit time.
- + d) a numerical measure of brightness as seen from Earth
- e) a numerical measure of brightness as seen from a distance of approximately 33 light-years

16. What happens if you increase the size of a giant molecular cloud while keeping temperature and mass fixed?

- a) It is more likely to collapse because larger things have more gravity
- b) It is less likely to collapse because temperature can never be kept fixed
- c) It is equally likely to collapse because size is not part of the Jean's criterion.
- d) It is more likely to collapse because this will increase the temperature
- + e) It is less likely to collapse spreading it out weakens the force of gravity

17. Members of an open cluster feel significant forces only due to gravitational interaction with each other

- a) True
- + b) False

18. Comparing Hubble's original (1929) plot of redshift versus distance with the later one in 2007, the latter extends farther into space by a factor of

- a) 100
- b) 1000
- c) 10,000
- d) 100,000
- + e) 10

19. The course materials present two cosmic expansion plots. The more recent (2007) plot used

- a) novae
- b) entire galaxies
- + c) supernovae
- d) Cepheid variables
- e) red giants

20. A grouping with 100 thousand stars would probably be a

- + a) globular cluster
- b) A-B association
- c) dwarf galaxy
- d) elliptical galaxy
- e) open cluster

21. A standard candle is

- a) an annual change in angular position of a star as seen from Earth
- b) a numerical measure of brightness as seen from Earth
- c) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- d) the total amount of energy emitted per unit time.
- + e) an astronomical object with known luminosity.

22. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 4 cm expands out to 12 cm. To what distance would a raisin originally situated at a distance of 2 cm expand?

- a) 2
- b) 4
- + c) 6
- d) 3
- e) 8

23. A star that is increasing its temperature while maintaining constant luminosity is

- + a) getting smaller in size
- b) on the verge of becoming a supernovae
- c) in the process of dying
- d) turning red
- e) getting larger in size

24. An object emits thermal (blackbody) radiation with a peak wavelength of 250nm. How does its temperature compare with the Sun?

- a) 5 times colder than the Sun
- b) 2 times colder than the Sun
- c) The temperature is the same
- + d) 2 times hotter than the Sun
- e) 5 times hotter than the Sun

25. Suppose the light clock involved a ball being tossed back and forth on a train going just under the speed of sound. In contrast to the situation for light reflecting back and forth on a train going just under the speed of light, there is virtually no time dilation. Why?

- a) Special relativity is valid only for objects travelling in a vacuum.
- + b) The observer on the ground would perceive the ball to be travelling faster.
- c) The observer on the ground would perceive the width the train to be smaller.
- d) The observer on the ground would perceive the width the train to be greater.
- e) The observer on the ground would perceive the ball to be travelling more slowly.

26. Many supernovae begin as a shock wave in the core that was caused by

- a) all of these processes contribute to the shock wave
- b) carbon and other elements fusing into iron
- c) iron fusing into heavier elements such as uranium
- d) the conversion of carbon into diamonds,
- + e) electrons being driven into protons to form neutrons

27.

What best explains this figure?

- a) The photon slows down, by the Doppler shift, $E=hf$, and therefore by $c=f\lambda$ it turns red.
- b) The photon slows down, by the Doppler shift, $c=f\lambda$, and therefore by $E=hf$ it turns red.
- + c) The photon loses energy, not speed. By $E=hf$, it loses frequency, and by $c=f\lambda$ it increases wavelength and turns red.
- d) The photon loses energy, not speed. By $c=f\lambda$, it loses frequency, and by $E=hf$ it increases wavelength and turns red.
- e) The photon slows down as it goes uphill, and by $c=f\lambda$ it increases wavelength therefore by $E=hf$, it turns red.

28. What was Messier doing when he independently rediscovered the Crab in 1758?

- a) Looking for lobsters
- b) Trying to measure the orbital radius of a planet
- + c) Looking for a comet that he knew would be appearing in that part of the sky.
- d) Attempting one of the first star charts
- e) Attempting to count asteroids

29. The course materials present two cosmic expansion plots. Hubble's original (1929) plot used

- a) novae
- + b) entire galaxies
- c) supernovae
- d) Cepheid variables
- e) red giants

30. Members of a globular cluster tend to have

- a) a wide range of masses
- + b) low mass
- c) high mass

31. Many stars in a typical globular cluster are nearly as old as the universe

- + a) True
- b) False

32. Aside from its location on the HR diagram, evidence that the white dwarf has a small radius can be found from

- a) the doppler shift
- b) the expansion of the universe
- c) the temperature
- d) the mass as measured by Kepler's third law (modified by Newton)
- + e) the gravitational redshift

33. This light clock is associated with

- a) gravitational shift
- b) general relativity
- c) doppler shift
- + d) special relativity
- e) all of these are true

34. What causes the "finger-like" filamentary structure in the Crab nebula?

- + a) a light(low density) fluid underneath a heavy(high density) fluid, like a lava lamp
- b) cyclotron motion, causing the electrons to strike oxygen molecules
- c) electrons striking hydrogen molecules, like a lava lamp
- d) a heavy (high density) fluid underneath a light (low density) fluid, like a lava lamp
- e) electrons striking oxygen molecules, like a lava lamp

35. A starburst galaxy.

- a) All of these are correct
- b) usually is a result of collisions between galaxies
- c) has only dead or dying stars
- + d) Two of these are correct
- e) is a region of active stellar birth

AstroTest4-v2s2

1. Many stars in a typical open cluster are nearly as old as the universe

- a) True
- b) False

2. Members of a globular cluster tend to have

- a) low mass
- b) a wide range of masses
- c) high mass

3. Relative magnitude is

- a) an annual change in angular position of a star as seen from Earth
- b) an astronomical object with known luminosity.
- c) a numerical measure of brightness as seen from a distance of approximately 33 light-years
- d) a numerical measure of brightness as seen from Earth
- e) the total amount of energy emitted per unit time.

4. What causes the "finger-like" filamentary structure in the Crab nebula?

- a) cyclotron motion, causing the electrons to strike oxygen molecules
- b) electrons striking hydrogen molecules, like a lava lamp
- c) a heavy (high density) fluid underneath a light (low density) fluid, like a lava lamp
- d) electrons striking oxygen molecules, like a lava lamp
- e) a light(low density) fluid underneath a heavy(high density) fluid, like a lava lamp

5. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 4 cm expands out to 12 cm. To what distance would a raisin originally situated at a distance of 2 cm expand?

- a) 3
- b) 2
- c) 6
- d) 8
- e) 4

6. A starburst galaxy.

- a) has only dead or dying stars
- b) is a region of active stellar birth
- c) usually is a result of collisions between galaxies
- d) All of these are correct
- e) Two of these are correct

7. An object emits thermal (blackbody) radiation with a peak wavelength of 250nm. How does its temperature compare with the Sun?

- a) 5 times hotter than the Sun
- b) 5 times colder than the Sun
- c) 2 times hotter than the Sun
- d) 2 times colder than the Sun
- e) The temperature is the same

8. Aside from its location on the HR diagram, evidence that the white dwarf has a small radius can be found from

- a) the expansion of the universe
- b) the temperature
- c) the mass as measured by Kepler's third law (modified by Newton)
- d) the doppler shift
- e) the gravitational redshift

9. Giant molecular clouds with sufficient conditions to form a star cluster would have formed them long ago. Any stellar births in the past couple of billions of years probably resulted from _____ between clouds.

- a) collisions
- b) None of these is correct.
- c) photon exchange
- d) Two of these are correct
- e) ion exchange

10. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 2 cm expands out to 4 cm. To what distance would a raisin originally situated at a distance of 4 cm expand?

- a) 6
- b) 8
- c) 3
- d) 2
- e) 4

11. The "normalized intensity" of a Sun-like star situated one parsec from Earth would be $4\pi I = 1$. What is $4\pi I$ for a star with 100 times the Sun's energy output that is situated 10pc from Earth?

- a) 10^{-4}
- b) 10^{-2}
- c) 1
- d) 10^{-3}
- e) 10^{-1}

12. A grouping with a hundred stars is probably a

- a) open cluster
- b) elliptical galaxy
- c) dwarf galaxy
- d) globular cluster
- e) A-B association

13. A star that is increasing its temperature while maintaining constant luminosity is

- a) in the process of dying
- b) getting smaller in size
- c) on the verge of becoming a supernovae
- d) getting larger in size
- e) turning red

14.

What best explains this figure?

a) The photon slows down, by the Doppler shift, $E=hf$, and therefore by $c=f\lambda$ it turns red.

b) The photon slows down as it goes uphill, and by $c=f\lambda$ it increases wavelength therefore by $E=hf$, it turns red.

c) The photon slows down, by the Doppler shift, $c=f\lambda$, and therefore by $E=hf$ it turns red.

d) The photon loses energy, not speed. By $E=hf$, it loses frequency, and by $c=f\lambda$ it increases wavelength and turns red.

e) The photon loses energy, not speed. By $c=f\lambda$, it loses frequency, and by $E=hf$ it increases wavelength and turns red.

15. Suppose the light clock involved a ball being tossed back and forth on a train going just under the speed of sound. In contrast to the situation for light reflecting back and forth on a train going just under the speed of light, there is virtually no time dilation. Why?

- a) The observer on the ground would perceive the width the train to be smaller.
- b) The observer on the ground would perceive the ball to be travelling faster.
- c) The observer on the ground would perceive the ball to be travelling more slowly.
- d) Special relativity is valid only for objects travelling in a vacuum.
- e) The observer on the ground would perceive the width the train to be greater.

16. What is the difference between a constellation and an asterism?

- a) constellations consist of never more than ten stars.
- b) asterisms are smaller than constellations
- c) constellations represent regions of the sky, like state boundaries on a map of the USA
- d) asterisms are larger than constellations
- e) none of these is correct

17. What happens if you increase the size of a giant molecular cloud while keeping temperature and mass fixed?

- a) It is less likely to collapse spreading it out weakens the force of gravity
- b) It is more likely to collapse because larger things have more gravity
- c) It is less likely to collapse because temperature can never be kept fixed
- d) It is equally likely to collapse because size is not part of the Jean's criterion.
- e) It is more likely to collapse because this will increase the temperature

18. Members of an open cluster feel significant forces only due to gravitational interaction with each other

- a) True
- b) False

19. Members of an open cluster feel significant forces from nearby giant molecular clouds

- a) True
- b) False

20. What was Messier doing when he independently rediscovered the Crab in 1758?

- a) Attempting to count asteroids
- b) Attempting one of the first star charts
- c) Trying to measure the orbital radius of a planet
- d) Looking for a comet that he knew would be appearing in that part of the sky.
- e) Looking for lobsters

21. A dying star with more than 1.4 solar masses becomes a _____, and those with more than 5 solar masses becomes a _____

- a) blue giant....red giant
- b) white dwarf....black hole
- c) white dwarf....neutron star
- d) white dwarf...red dwarf
- e) neutron star....black hole

22. The course materials present two cosmic expansion plots. The more recent (2007) plot used

- a) red giants
- b) novae
- c) supernovae
- d) Cepheid variables
- e) entire galaxies

23. Many supernovae begin as a shock wave in the core that was caused by

- a) all of these processes contribute to the shock wave
- b) carbon and other elements fusing into iron
- c) iron fusing into heavier elements such as uranium
- d) electrons being driven into protons to form neutrons
- e) the conversion of carbon into diamonds,

24. A standard candle is

- a) an astronomical object with known luminosity.
- b) a numerical measure of brightness as seen from Earth
- c) an annual change in angular position of a star as seen from Earth
- d) the total amount of energy emitted per unit time.
- e) a numerical measure of brightness as seen from a distance of approximately 33 light-years

25. Based on the HR diagrams and images in stars shown in the materials, a very large red supergiant has a diameter that is about ____ greater than a small white dwarf.

- a) 3×10^7
- b) 3×10^9
- c) 3×10^{11}
- d) 3×10^5
- e) 3×10^3

26. Most globular clusters that we see in the sky orbit _____ and have _____ orbits

- a) the center of the Milky way ... elliptic orbits
- b) the center of the Milky way ... nearly circular
- c) within the disk of the Milky way ... nearly circular
- d) within the disk of the Milky way ... elliptic orbits

27. A grouping with 100 thousand stars would probably be a

- a) dwarf galaxy
- b) globular cluster
- c) elliptical galaxy
- d) A-B association
- e) open cluster

28. Comparing Hubble's original (1929) plot of redshift versus distance with the later one in 2007, the latter extends farther into space by a factor of

- a) 10,000
- b) 1000
- c) 100
- d) 100,000
- e) 10

29. This light clock is associated with

- a) special relativity
- b) gravitational shift
- c) doppler shift
- d) general relativity
- e) all of these are true

30. The range of wavelength for visible light is between

- a) 600 and 1200 nanometers
- b) 1 and 10 nanometers
- c) 5000 and 6000 nanometers
- d) 400 and 700 nanometers
- e) 0.1 and 10 nanometers

31. What causes the blue glow of the Crab nebula?

- a) the Doppler blue shift
- b) the curving motion of electrons in a magnetic field; such motion resembles a radio antenna
- c) the Gravitational blue shift
- d) the same emission found in a Lava lamp (ultra-violet)
- e) the curving motion of electrons in a magnetic field; such motion traps ultra-violet and blue light

32. The course materials present two cosmic expansion plots. Hubble's original (1929) plot used

- a) supernovae
- b) novae
- c) red giants
- d) Cepheid variables
- e) entire galaxies

33. Which of the following changes in the properties of a giant molecular cloud might cause it to collapse?

- a) Decrease mass at fixed temperature and size
- b) Two of these are correct
- c) Increase mass at fixed temperature and size
- d) Increase size at fixed pressure and mass
- e) Increase temperature at fixed mass and size

34. Many stars in a typical globular cluster are nearly as old as the universe

- a) True
- b) False

35. Why is a star made of plasma?

- a) it is so hot that electrons are stripped away from the protons
- b) the interstellar gas was mostly plasma
- c) plasma is generic word for "important"
- d) plasma is always present when there are strong magnetic fields
- e) the intense gravity liquifies the substance, just as red blood cells liquify plasma in the body

Key to AstroTest4-v2s2

1. Many stars in a typical open cluster are nearly as old as the universe
 - a) True
 - + b) False

2. Members of a globular cluster tend to have
 - + a) low mass
 - b) a wide range of masses
 - c) high mass

3. Relative magnitude is
 - a) an annual change in angular position of a star as seen from Earth
 - b) an astronomical object with known luminosity.
 - c) a numerical measure of brightness as seen from a distance of approximately 33 light-years
 - + d) a numerical measure of brightness as seen from Earth
 - e) the total amount of energy emitted per unit time.

4. What causes the "finger-like" filamentary structure in the Crab nebula?
 - a) cyclotron motion, causing the electrons to strike oxygen molecules
 - b) electrons striking hydrogen molecules, like a lava lamp
 - c) a heavy (high density) fluid underneath a light (low density) fluid, like a lava lamp
 - d) electrons striking oxygen molecules, like a lava lamp
 - + e) a light(low density) fluid underneath a heavy(high density) fluid, like a lava lamp

5. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 4 cm expands out to 12 cm. To what distance would a raisin originally situated at a distance of 2 cm expand?

- a) 3
- b) 2
- + c) 6
- d) 8
- e) 4

6. A starburst galaxy.

- a) has only dead or dying stars
- b) is a region of active stellar birth
- c) usually is a result of collisions between galaxies
- d) All of these are correct
- + e) Two of these are correct

7. An object emits thermal (blackbody) radiation with a peak wavelength of 250nm. How does its temperature compare with the Sun?

- a) 5 times hotter than the Sun
- b) 5 times colder than the Sun
- + c) 2 times hotter than the Sun
- d) 2 times colder than the Sun
- e) The temperature is the same

8. Aside from its location on the HR diagram, evidence that the white dwarf has a small radius can be found from

- a) the expansion of the universe
- b) the temperature
- c) the mass as measured by Kepler's third law (modified by Newton)
- d) the doppler shift
- + e) the gravitational redshift

9. Giant molecular clouds with sufficient conditions to form a star cluster would have formed them long ago. Any stellar births in the past couple of billions years probably resulted from _____ between clouds.

- + a) collisions
- b) None of these is correct.
- c) photon exchange
- d) Two of these are correct
- e) ion exchange

10. Place yourself in an expanding raisinbread model of Hubble expansion. A raisin originally situated at a distance of 2 cm expands out to 4 cm. To what distance would a raisin originally situated at a distance of 4 cm expand?

- a) 6
- + b) 8
- c) 3
- d) 2
- e) 4

11. The "normalized intensity" of a Sun-like star situated one parsec from Earth would be $4\pi I = 1$. What is $4\pi I$ for a star with 100 times the Sun's energy output that is situated 10pc from Earth?

- a) 10^{-4}
- b) 10^{-2}
- + c) 1
- d) 10^{-3}
- e) 10^{-1}

12. A grouping with a hundred stars is probably a

- + a) open cluster
- b) elliptical galaxy
- c) dwarf galaxy
- d) globular cluster
- e) A-B association

13. A star that is increasing its temperature while maintaining constant luminosity is

- a) in the process of dying
- + b) getting smaller in size
- c) on the verge of becoming a supernovae
- d)e) getting larger in size
- e) turning red

14.

What best explains this figure?

- a) The photon slows down, by the Doppler shift, $E=hf$, and therefore by $c=f\lambda$ it turns red.
- b) The photon slows down as it goes uphill, and by $c=f\lambda$ it increases wavelength therefore by $E=hf$, it turns red.
- c) The photon slows down, by the Doppler shift, $c=f\lambda$, and therefore by $E=hf$ it turns red.
- + d) The photon loses energy, not speed. By $E=hf$, it loses frequency, and by $c=f\lambda$ it increases wavelength and turns red.
- e) The photon loses energy, not speed. By $c=f\lambda$, it loses frequency, and by $E=hf$ it increases wavelength and turns red.

15. Suppose the light clock involved a ball being tossed back and forth on a train going just under the speed of sound. In contrast to the situation for light reflecting back and forth on a train going just under the speed of light, there is virtually no time dilation. Why?

- a) The observer on the ground would perceive the width the train to be smaller.
- + b) The observer on the ground would perceive the ball to be travelling faster.
- c) The observer on the ground would perceive the ball to be travelling more slowly.
- d) Special relativity is valid only for objects travelling in a vacuum.
- e) The observer on the ground would perceive the width the train to be greater.

16. What is the difference between a constellation and an asterism?

- a) constellations consist of never more than ten stars.
- b) asterisms are smaller than constellations
- + c) constellations represent regions of the sky, like state boundaries on a map of the USA
- d) asterisms are larger than constellations
- e) none of these is correct

17. What happens if you increase the size of a giant molecular cloud while keeping temperature and mass fixed?

- + a) It is less likely to collapse spreading it out weakens the force of gravity
- b) It is more likely to collapse because larger things have more gravity
- c) It is less likely to collapse because temperature can never be kept fixed
- d) It is equally likely to collapse because size is not part of the Jean's criterion.
- e) It is more likely to collapse because this will increase the temperature

18. Members of an open cluster feel significant forces only due to gravitational interaction with each other

- a) True
- + b) False

19. Members of an open cluster feel significant forces from nearby giant molecular clouds

- + a) True
- b) False

20. What was Messier doing when he independently rediscovered the Crab in 1758?

- a) Attempting to count asteroids
- b) Attempting one of the first star charts
- c) Trying to measure the orbital radius of a planet
- + d) Looking for a comet that he knew would be appearing in that part of the sky.
- e) Looking for lobsters

21. A dying star with more than 1.4 solar masses becomes a _____, and those with more than 5 solar masses becomes a _____

- a) blue giant....red giant
- b) white dwarf....black hole
- c) white dwarf....neutron star
- d) white dwarf...red dwarf
- + e) neutron star....black hole

22. The course materials present two cosmic expansion plots. The more recent (2007) plot used

- a) red giants
- b) novae
- + c) supernovae
- d) Cepheid variables
- e) entire galaxies

23. Many supernovae begin as a shock wave in the core that was caused by

- a) all of these processes contribute to the shock wave
- b) carbon and other elements fusing into iron
- c) iron fusing into heavier elements such as uranium
- + d) electrons being driven into protons to form neutrons
- e) the conversion of carbon into diamonds,

24. A standard candle is

- + a) an astronomical object with known luminosity.
- b) a numerical measure of brightness as seen from Earth
- c) an annual change in angular position of a star as seen from Earth
- d) the total amount of energy emitted per unit time.
- e) a numerical measure of brightness as seen from a distance of approximately 33 light-years

25. Based on the HR diagrams and images in stars shown in the materials, a very large red supergiant has a diameter that is about ____ greater than a small white dwarf.

- a) 3×10^7
- b) 3×10^9
- c) 3×10^{11}
- + d) 3×10^5
- e) 3×10^3

26. Most globular clusters that we see in the sky orbit _____ and have _____ orbits

- + a) the center of the Milky way ... elliptic orbits
- b) the center of the Milky way ... nearly circular
- c) within the disk of the Milky way ... nearly circular
- d) within the disk of the Milky way ... elliptic orbits

27. A grouping with 100 thousand stars would probably be a

- a) dwarf galaxy
- + b) globular cluster
- c) elliptical galaxy
- d) A-B association
- e) open cluster

28. Comparing Hubble's original (1929) plot of redshift versus distance with the later one in 2007, the latter extends farther into space by a factor of

- a) 10,000
- b) 1000
- c) 100
- d) 100,000
- + e) 10

29. This light clock is associated with

- + a) special relativity
- b) gravitational shift
- c) doppler shift
- d) general relativity
- e) all of these are true

30. The range of wavelength for visible light is between

- a) 600 and 1200 nanometers
- b) 1 and 10 nanometers
- c) 5000 and 6000 nanometers
- + d) 400 and 700 nanometers
- e) 0.1 and 10 nanometers

31. What causes the blue glow of the Crab nebula?

- a) the Doppler blue shift
- + b) the curving motion of electrons in a magnetic field; such motion resembles a radio antenna
- c) the Gravitational blue shift
- d) the same emission found in a Lava lamp (ultra-violet)
- e) the curving motion of electrons in a magnetic field; such motion traps ultra-violet and blue light

32. The course materials present two cosmic expansion plots. Hubble's original (1929) plot used

- a) supernovae
- b) novae
- c) red giants
- d) Cepheid variables
- + e) entire galaxies

33. Which of the following changes in the properties of a giant molecular cloud might cause it to collapse?

- a) Decrease mass at fixed temperature and size
- b) Two of these are correct
- + c) Increase mass at fixed temperature and size
- d) Increase size at fixed pressure and mass
- e) Increase temperature at fixed mass and size

34. Many stars in a typical globular cluster are nearly as old as the universe

- + a) True
- b) False

35. Why is a star made of plasma?

- + a) it is so hot that electrons are stripped away from the protons
- b) the interstellar gas was mostly plasma
- c) plasma is generic word for "important"
- d) plasma is always present when there are strong magnetic fields
- e) the intense gravity liquifies the substance, just as red blood cells liquify plasma in the body
