sin(t), Asin(t)

• sin(*t*)

• not random process.

•
$$x(t) = A\sin(t)$$

- a random process because A is a random variable
- However, x(t) is not stationary, but it is cyclostationary,
- its statistical properties vary periodically.

Problem definition First order distribution Second order distribution Mean and variance

$A\sin(t+\phi)$

- $x(t) = A\sin(t+\phi)$
 - the *x*(*t*) process is **stationary** because of the added **random phase**
 - the random phase φ ∈ [0, 2π] is
 a uniformly distributed random variable which is independent of A.
 - its statistical properties are <u>independent</u> of *t*, and hence, the process is **stationary**.

Signals in an oscilloscope

When analyzing a signal with an <u>oscilloscope</u>, it can be observed that

the signal's **amplitude spectrum** does not vary over moving windows

so a sinusoidal wave is sort of stationary in frequency.

Additionally, the signal is itself stationary in envelope

(modulus 1 for the analytic version of the signal).

https://dsp.stackexchange.com/questions/32000/why-is-sint-a-stationary-process

Window function (1)

In signal processing and statistics, a **window function** is a mathematical function that is

- zero-valued outside of some chosen interval
- normally symmetric around the middle of the interval
- usually near a maximum in the middle
- usually tapering away from the middle.

https://en.wikipedia.org/wiki/Window_function

周 ト イ ヨ ト イ ヨ ト

Problem definition First order distribution Second order distribution Mean and variance

Window function (2)

when another function or waveform is "multiplied" by a **window function**,

the product is also <u>zero</u>-valued <u>outside</u> the interval: all that is left is the part where they <u>overlap</u>, the "*view through the window*".

https://en.wikipedia.org/wiki/Window_function

4 3 5 4 3 5

Problem definition First order distribution Second order distribution Mean and variance

Envelope

- the **envelope** of an oscillating signal is a smooth curve outlining its extremes.
- the envelope thus generalizes the concept of a constant amplitude into an instantaneous amplitude.
- a <u>modulated</u> sine wave varying between an upper envelope and a lower envelope.
- the **envelope function** may be a function of time, space, angle, or indeed of any variable

https://en.wikipedia.org/wiki/Envelope (waves)

Problem definition First order distribution Second order distribution Mean and variance

Random Process (1)

A random process

a function of both time t and outcome θ

 $X(t,\theta)$

assigning a time function to every outcome θ_i

 $\theta_i \rightarrow x_i(t)$

where $x_i(t) = x(t, \theta_i)$

the <u>family</u> of such time functions is called a random process and denoted by $X(t, \theta)$

イロト イヨト イヨト

Problem definition First order distribution Second order distribution Mean and variance

Random Process (2)

A random process

a random process $X(t, \theta)$ assigns a time function for a every outcome θ

 $x(t,\theta) = X(t,\theta)$

a short notation

$$\mathbf{x}(t) = X(t)$$

Problem definition First order distribution Second order distribution Mean and variance

Random phase in $X(t) = \cos(\omega t + \Theta)$

Consider the output of a sinusoidal oscillator that has a **random phase** and an **amplitude** of the form:

 $X(t) = \cos(\omega t + \Theta)$

where the random variable $\Theta \sim U([0,2\pi])$

to specify the <u>explicit dependence</u> on the underlying **sample space** Sthe oscillator output can be written as

 $x(t,\Theta) = \cos(\omega t + \Theta)$

http://ece-research.unm.edu/bsanthan/ece541/examp.pdf

Problem definition First order distribution Second order distribution Mean and variance

Random variable $X_t(\theta)$

Consider the random variable

$$X(t, \theta) = \cos(\omega t + \theta)$$

where the time t is fixed

In other words,

$$X_t(\theta) = \cos(\omega t + \theta)$$

where $\theta_0 = \omega t$ is fixed (a *non-random* quantity) thus the time t is fixed

http://ece-research.unm.edu/bsanthan/ece541/examp.pdf

Problem definition First order distribution Second order distribution Mean and variance

Values of a time function

Consider the random variable for the fixed time t

$$X_t(\theta) = \cos(\omega t + \theta)$$

if the sample value θ as well as the time t is fixed, then the values of the time function

$$x_1 = x(t_1) = \cos(\omega t_1 + \theta)$$
$$x_2 = x(t_2) = \cos(\omega t_2 + \theta)$$

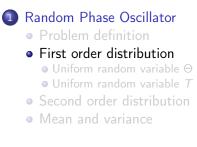

where x is the **time function** for a fixed outcome θ and let x_i denotes the value of the time function x at times t_i (here x_i is not a sample function)

Problem definition First order distribution Second order distribution Mean and variance

First order distribution (1)

The first order distribution of the process $X(t) = \cos(\omega t + \Theta)$ can be found by looking at the distribution of the random variable

$$X_t(\Theta) = \cos(\theta_0 + \Theta)$$

where $\theta_0 = \omega t$ is fixed (a *non-random* quantity) this can easily be shown via the **derivative method** to be of the form:

$$f_X(x) = rac{1}{\pi \sqrt{1-x^2}}, \qquad |x| < 1$$

Problem definition First order distribution Second order distribution Mean and variance

pdf of $X(t) = \cos(\omega t + \Theta)$

Consider the output of a sinusoidal oscillator that has a random phase and an amplitude of the form:

$$X(t) = cos(\omega t + \Theta)$$

where Θ is a uniform random variable on $[0, 2\pi]$ then the first order pdf of X(t) is

$$f_X(x) = rac{1}{\pi \sqrt{1-x^2}}, \qquad x \in (-1,1)$$

Note that the probability is unaffected by angular velocity and initial phase (ω, θ_0) , which is, intuitively, expected.

Problem definition First order distribution Second order distribution Mean and variance

PDF of $X = \cos(\omega T + \phi)$

Let *T* be a uniform random variable on $[0, \frac{2\pi}{\omega}]$ that describes time. Then $F_T(t) = \frac{\omega}{2\pi} \cdot t = ft$, where *f* is the oscilation's frequency. Now, let:

$$X = \cos(\omega T + \phi)$$

be the **random variable** describing x in terms of T. not a time function

$$X(t) \neq \cos(\omega T + \phi)$$

Problem definition First order distribution Second order distribution Mean and variance

pdf of $X(t) = \cos(\omega t + \Theta)$

Differentiating both sides, we get:

$$\begin{aligned} \frac{d}{dx}F_X(x) &= \frac{d}{dx} \left\{ F_T \left(\frac{2\pi - \cos^{-1}(x) - \phi}{\omega} \right) - F_T \left(\frac{\cos^{-1}(x) - \phi}{\omega} \right) \right\} \\ &= \frac{d}{dt}F_T \left(\frac{2\pi - \cos^{-1}(x) - \phi}{\omega} \right) \frac{d}{dx} \left(-\frac{\cos^{-1}(x)}{\omega} \right) \\ &- \frac{d}{dt}F_T \left(\frac{\cos^{-1}(x) - \phi}{\omega} \right) \frac{d}{dx} \left(\frac{\cos^{-1}(x)}{\omega} \right) \\ &f_X(x) &= f_T \left(\frac{\cos^{-1}(x) - \phi}{\omega} \right) \frac{d}{dx} \left(-\frac{\cos^{-1}(x)}{\omega} \right) \\ &- f_T \left(\frac{2\pi - \cos^{-1}(x) - \phi}{\omega} \right) \frac{d}{dx} \left(\frac{\cos^{-1}(x)}{\omega} \right) \end{aligned}$$

https://math.stackexchange.com/questions/3456122/probability-density-function-

Young W Lim Stationary Random Processes - Examples

Problem definition First order distribution Second order distribution Mean and variance

PDF of $X = \cos(\omega T + \phi)$

Differentiating both sides, we get:

$$f_X(x) = f_T\left(\frac{\cos^{-1}(x) - \phi}{\omega}\right) \frac{\left(-\cos^{-1}(x)\right)'}{\omega} - f_T\left(\frac{2\pi - \cos^{-1}(x) - \phi}{\omega}\right) \frac{\left(\cos^{-1}(x)\right)'}{\omega}$$

Now, since $f_T(t) = f = \frac{\omega}{2\pi}$ and $\frac{d}{dx}\cos^{-1}(x) = -\frac{1}{\sqrt{1-x^2}}$, we have:

$$egin{aligned} f_X(x) &= rac{1}{2\pi} \left(rac{1}{\sqrt{1-x^2}} + rac{1}{\sqrt{1-x^2}}
ight) \ &= rac{1}{\pi\sqrt{1-x^2}} \end{aligned}$$

Problem definition First order distribution Second order distribution Mean and variance

Example: $X(t) = \cos(\omega t + \Theta)$

Looking at the **mean** and the **variance** of the random process X(t)we can see that they are <u>shift-invariant</u> and consequently the process is **first-order stationary**. The ACF and other second-order statistics of the process are dependent only on the variable $\tau = t_1 - t_2$. The random process X(t) is therefore a **WSS** process also. The ACF can then expressed in terms of the variable $\tau = t_1 - t_2$ as:

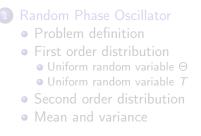

$$R_{XX}(\tau) = \left(\frac{1}{2}\right)\cos(\omega\tau)$$

A white noise is not necessarily strictly stationary.

Let ω be a random variable uniformly distributed in the interval $(0, 2\pi)$

define the time series $\{X(t)\}$

$$X(t) = \cos(\omega t) \quad (t = 1, 2, ...)$$

https://en.wikipedia.org/wiki/Stationary process

伺 ト イヨト イヨト

Examples - A Examples - B

Example A.1: $X(t) = \cos(\omega t)$

Then

$$E[X(t)] = \frac{1}{2\pi} \int_0^{2\pi} \cos(t\omega) d\omega = 0$$
$$Var(X(t)) = \frac{1}{2\pi} \int_0^{2\pi} \cos^2(t\omega) d\omega = 1/2$$
$$Cov(x(t), x(s)) = \frac{1}{2\pi} \int_0^{2\pi} \cos(t\omega) \cos(s\omega) d\omega = 0 \quad \forall t \neq s$$

So $\{X(t)\}$ is a white noise, however it is not strictly stationary.

https://en.wikipedia.org/wiki/Stationary process

A B F A B F

A 1

Example A.2: $X(t) = \cos(t+U)$

a **stationary process** example for which any <u>single</u> <u>realisation</u> has an apparently noise-free structure,

Let U have a uniform distribution on $(0,2\pi]$ and define the time series $\{X(t)\}$ by

$$X(t) = \cos(t+U)$$
 for $t \in \mathbb{R}$

then $\{X(t)\}$ is strictly stationary (SSS).

Examples - A Examples - B

Example A.2: $X(t) = \cos(t+U)$

$$\begin{aligned} R_X(t_1, t_2) &= E[X(t_1)X(t_2)] \\ &= E[\cos(t_1 + U)\cos(t_2 + U)] \\ &= E\left[\frac{1}{2}\cos(t_1 + t_2 + 2U) + \frac{1}{2}\cos(t_1 - t_2)\right] \\ &= E\left[\frac{1}{2}\cos(t_1 + t_2 + 2U)\right] + E\left[\frac{1}{2}\cos(t_1 - t_2)\right] \\ &= \frac{1}{2\pi}\int_0^{2\pi}\cos(t_1 + t_2 + u) \, du + \frac{1}{2}\cos(t_1 - t_2) \\ &= 0 + \frac{1}{2}\cos(t_1 - t_2) = \frac{1}{2}\cos(t_1 - t_2), \quad \text{for all } t_1, t_2 \in \mathbb{R}. \end{aligned}$$

https://www.probabilitycourse.com/chapter10/10_1_4_stationary_processes.php

Example A.3: $X(t) = \alpha \cos(\omega t + \Theta)$

The random phase signal $X(t) = \alpha cos(\omega t + \Theta)$ where $\Theta \in U[0, 2\pi]$ is **SSS** it is known that the **first order pdf** is

$$f_{X(t)}(x) = rac{1}{\pi lpha \sqrt{1 - (x/lpha)^2}}, \quad -lpha < x < +lpha$$

which is independent of t, and is therefore stationary

http://isl.stanford.edu/~abbas/ee278/lect07.pdf

- - E + - E +

Example A.3: $X(t) = \alpha \cos(\omega t + \Theta)$

To find the second order pdf,

note that if we are given the value of X(t) at one point, say t_1 , there are (at most) two possible sample functions

• $X(t_1) = x_1$

• at t_1 , two sinusoid waves intersect with each other

•
$$X(t_2) = x_{21}$$
 or x_{22}

 \bullet at $t_2,$ two sinusoid waves do not intersect with each other <code>http://isl.stanford.edu/~abbas/ee278/lect07.pdf</code>

A (1) < A (2) < A (2) </p>

Examples - A Examples - B

Example A.3: $X(t) = \alpha \cos(\omega t + \Theta)$

The second order pdf can thus be written as

$$f_{X(t_1),X(t_2)}(x_1,x_2) = f_{X(t_1)}(x_1)f_{X(t_2)|X(t_1)}(x_2|x_1)$$

= $f_{X(t_1)}(x_1)\left(\frac{1}{2}\delta(x_2-x_{21}) + \frac{1}{2}\delta(x_2-x_{22})\right)$

which depends only on $t_2 - t_1$, and thus the second order pdf is **stationary**

http://isl.stanford.edu/~abbas/ee278/lect07.pdf

- **B b** - **b b**

Examples - A Examples - B

Example A.3: $X(t) = \alpha \cos(\omega t + \Theta)$

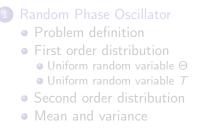

- if we know that $X(t_1) = x_1$ and $X(t_2) = x_2$, the sample path is totally <u>determined</u> except when $x_1 = x_2 = 0$,
- when x₁ = x₂ = 0, two paths may be possible
- thus all n-th order pdfs are stationary

http://isl.stanford.edu/~abbas/ee278/lect07.pdf

Outline

Examples - B

Examples - A Examples - B

Example B.1: X(t) = Y

Let Y be any scalar random variable, and define a time-series $\{X(t)\}$, by

X(t) = Y for all t.

Then $\{X(t)\}$ is a **stationary** time series

- realisations consist of a series of constant values,
- a different constant value for each realisation.

https://en.wikipedia.org/wiki/Stationary process

伺 ト イヨト イヨト

Examples - A Examples - B

Example B.1: X(t) = Y

$$X(t) = Y$$
 for all t .

X(t) is a first-order stationary

$$f_X(x_1; t_1) = f_X(x_1; t_1 + \Delta) = const$$

X(t) is a second-order stationary

 $f_X(x_1, x_2; t_1, t_2) = f_X(x_1, x_2; t_1 + \Delta, t_2 + \Delta) = const$

X(t) is to be a **N**th-order stationary

 $f_X(x_1,\cdots,x_N;t_1,\cdots,t_N) = f_X(x_1,\cdots,x_N;t_1+\Delta,\cdots,t_N+\Delta) = const$

https://en.wikipedia.org/wiki/Stationary_process

3

Examples - A Examples - B

Example B.2: Z(t) = X(t) + Y(t)

Let X(t) and Y(t) be two jointly **WSS** random processes.

Consider the random process Z(t)

Z(t) = X(t) + Y(t)

Show that Z(t) is **WSS**.

Examples - A Examples - B

Example B.3: $X(t) = \pm \sin t, \pm \cos t$

Let

$$X(t) = \begin{cases} +\sin t & p_0 = \frac{1}{4} \\ -\sin t & p_1 = \frac{1}{4} \\ +\cos t & p_2 = \frac{1}{4} \\ -\cos t & p_3 = \frac{1}{4} \end{cases}$$

$$E[X(t)] = 0$$

 $R_X(t_1, t_2) = rac{1}{2}cos(t_2 - t_1)$

thus X(t) is WSS

http://isl.stanford.edu/~abbas/ee278/lect07.pdf

Image: Image:

- * E > * E >

э

Examples - A Examples - B

Example B.3: $X(t) = \pm \sin t, \pm \cos t$

Let

$$X(t) = \begin{cases} +\sin t & p_0 = \frac{1}{4} \\ -\sin t & p_1 = \frac{1}{4} \\ +\cos t & p_2 = \frac{1}{4} \\ -\cos t & p_3 = \frac{1}{4} \end{cases}$$

But X(0) and $X(\frac{\pi}{4})$ do not have the same pmf (different ranges), so the first order pmf is not stationary, and the process is not **SSS**
