CORDIC Background

1. CORDIC FAQ, G. R. Griffin, www.dspguru.com/info/faqs/cordic2.htm

Complex Multiplication

Given Complex Value

$$C = I_c + j Q_c$$

Rotation Value

$$R = I_r + j Q_r$$

Rotated Complex Value

$$C' = I_c' + j Q_c'$$

$$C' = C \cdot R$$

$$\begin{aligned} I_c' + j Q_c' &= (I_c + j Q_c) \cdot (I_r + j Q_r) \\ &= (I_c I_r - Q_c Q_r) + j (Q_c I_r + I_c Q_r) \end{aligned}$$

Adding / Subtracting Phase

To **add** R' phase to C

$$C' = C \cdot R$$

$$\begin{aligned} I_c' + j Q_c' &= (I_c + j Q_c) \cdot (I_r + j Q_r) \\ &= (I_c I_r - Q_c Q_r) + j (Q_c I_r + I_c Q_r) \end{aligned}$$

To **sub** R' phase to C

$$C' = C \cdot R^*$$

$$\begin{aligned} I_c' + j Q_c' &= (I_c + j Q_c) \cdot (I_r - j Q_r) \\ &= (I_c I_r + Q_c Q_r) + j (Q_c I_r - I_c Q_r) \end{aligned}$$

Adding / Subtracting 90 Degrees

To add R' phase to C

$$C' = C \cdot (+j)$$

$$\begin{aligned} I_c' + j Q_c' &= (I_c + j Q_c) \cdot (0 + j) \\ &= (-Q_c) + j (I_c) \end{aligned}$$

To sub R' phase to C

$$C' = C \cdot (-j)$$

$$\begin{aligned} I_c' + j Q_c' &= (I_c + j Q_c) \cdot (0 - j) \\ &= (Q_c) + j (-I_c) \end{aligned}$$

Elementary Angle: $\tan^{-1}(K)$

$\theta_L = \tan^{-1}(2^{-L}) = \tan^{-1}(K)$
$\theta_0 = \tan^{-1}(2^0) = 45.00000$
$\theta_1 = \tan^{-1}(2^{-1}) = 26.56505$
$\theta_2 = \tan^{-1}(2^{-2}) = 14.03624$
$\theta_3 = \tan^{-1}(2^{-3}) = 7.12502$
$\theta_4 = \tan^{-1}(2^{-4}) = 3.57633$

Represent arbitrary angle θ

in terms of $\pm\theta_0, \pm\theta_1, \pm\theta_2, \pm\theta_3, \dots, \pm\theta_L, \dots$ $\left(K = \frac{1}{2^L}, L = 0, 1, 2, \dots\right)$

Adding / Subtracting $\tan^{-1}(K)$

To add R' phase to C

$$C' = C \cdot (1 + jK)$$

$$\begin{aligned} I_c' + j Q_c' &= (I_c + j Q_c) \cdot \boxed{(1 + jK)} \\ &= (I_c - K Q_c) + j (Q_c + K I_c) \\ &= (I_c - 2^{-L} Q_c) + j (Q_c + 2^{-L} I_c) \end{aligned}$$

To sub R' phase to C

$$C' = C \cdot (1 - jK)$$

$$\begin{aligned} I_c' + j Q_c' &= (I_c + j Q_c) \cdot \boxed{(1 - jK)} \\ &= (I_c + K Q_c) + j (Q_c - K I_c) \\ &= (I_c + 2^{-L} Q_c) + j (Q_c - 2^{-L} I_c) \end{aligned}$$

$$\theta_L = \tan^{-1}(K) = \tan^{-1}(2^{-L})$$

$$K = \frac{1}{2^L}, \quad L = 0, 1, 2, \dots$$

Phase and Magnitude of $1 + jK$ (1)

Cumulative Magnitude

		↓ 1.647

The actual CORDIC Gain depends on the *number of iterations*

For each iteration, the corresponding θ_i is *always used* (either $+\theta_i$ or $-\theta_i$)

The magnitude is growing → for correction multiply by $0.6073 = 1 / 1.647$

Calculating Magnitude (1)

Each iteration, the magnitude is increased by $\sqrt{1^2 + K^2}$

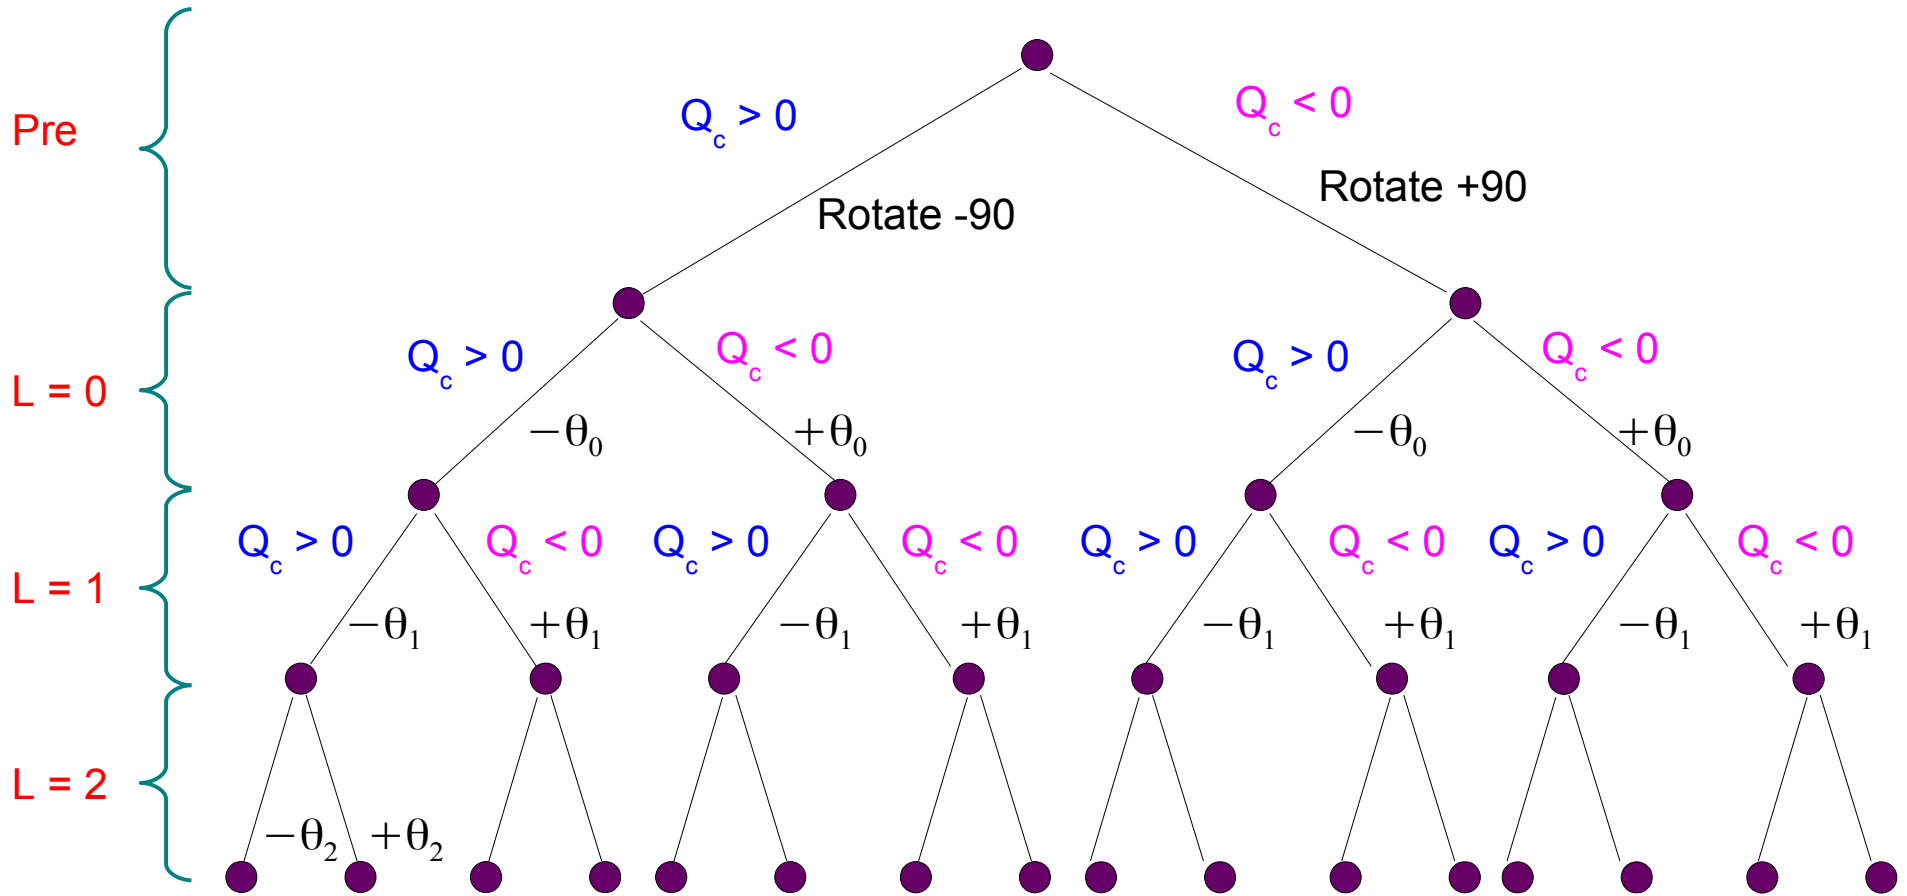

CORDIC Gain (cumulative gain)
 $\simeq 1.647 = 0.607^{-1}$

To compensate, multiply by 0.607

Can't perform this gain adjustment by simple shift and add

- This adjustment can be done in other part of a system
- When relative magnitude is enough

Calculating Magnitude (2)

Multiplication of $\pm j$

Positive Phase ($Q_c > 0$) \rightarrow Rotate by -90 degrees

$$\begin{array}{cc} I_c & j Q_c \\ \begin{array}{c} \uparrow \\ \downarrow \\ 0 \end{array} & \begin{array}{c} \uparrow \\ \downarrow \\ -j \end{array} \\ (Q_c) & + j (-I_c) \end{array}$$

Negative Phase ($Q_c < 0$) \rightarrow Rotate by $+90$ degrees

$$\begin{array}{cc} I_c & j Q_c \\ \begin{array}{c} \uparrow \\ \downarrow \\ 0 \end{array} & \begin{array}{c} \uparrow \\ \downarrow \\ j \end{array} \\ (-Q_c) & + j (I_c) \end{array}$$

Resulting Phase \rightarrow $[-90, +90]$

Multiplication of $1 \pm jK$

Positive Phase ($Q_c > 0$) \Rightarrow Rotate by $1 - jK$

$$(I_c + 2^{-L} Q_c) + j(Q_c - 2^{-L} I_c)$$

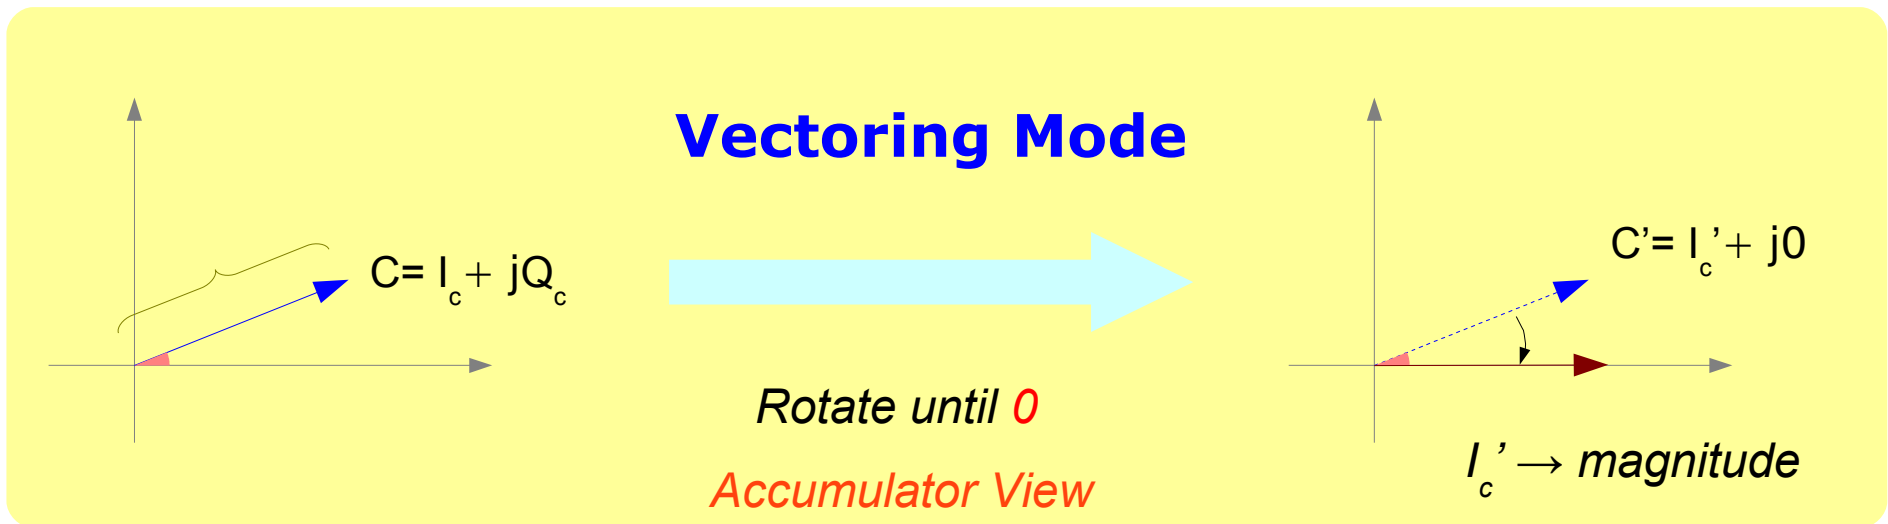

Negative Phase ($Q_c < 0$) \Rightarrow Rotate by $1 + jK$

$$(I_c - 2^{-L} Q_c) + j(Q_c + 2^{-L} I_c)$$

After iterations, the result \Rightarrow $I_c + j0$

Calculating Phase

Phase of R

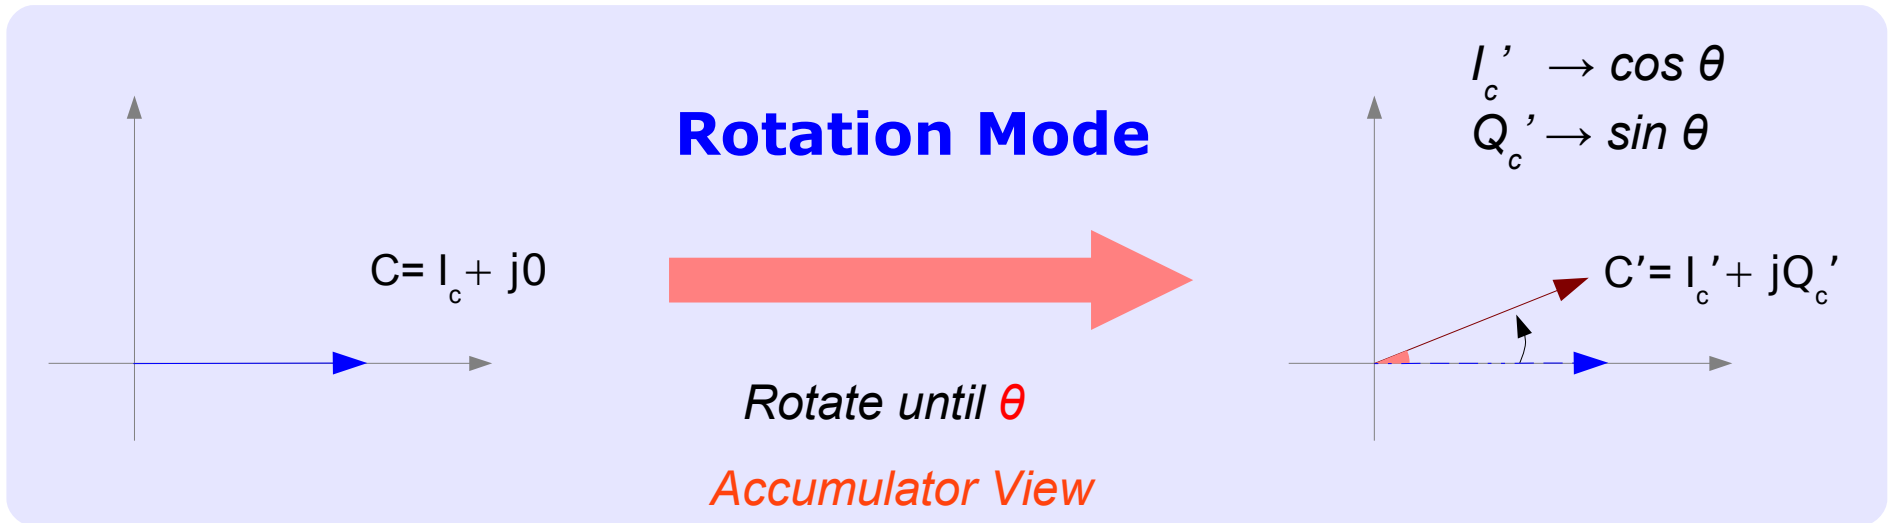

$$\begin{aligned} \theta_0 &= \tan^{-1}(2^0) = 45^\circ \\ \theta_1 &= \tan^{-1}(2^{-1}) = 26.56505^\circ \\ \theta_2 &= \tan^{-1}(2^{-2}) = 14.03624^\circ \\ \theta_3 &= \tan^{-1}(2^{-3}) = 7.12502^\circ \\ \theta_4 &= \tan^{-1}(2^{-4}) = 3.57633^\circ \\ \theta_5 &= \tan^{-1}(2^{-5}) = 1.78991^\circ \end{aligned}$$

...

$$\theta \pm \theta_0 \pm \theta_1 \pm \theta_2 \pm \theta_3 \cdots = 0$$

Accumulate each rotating angles
then *negate* the result

Calculating Sine and Cosine (1)

Calculating Sine and Cosine (3)

$\Theta > +90$ \Rightarrow starting from $0 + j1$

$\Theta < +90$ \Rightarrow starting from $1 + j0$

$\Theta < -90$ \Rightarrow starting from $0 - j1$

$\Theta > -90$ \Rightarrow starting from $1 - j0$

Initialize the accumulate rotation \Rightarrow -90, +90, 0

Calculating Sine and Cosine (3)

In each iteration

$(\Theta - \text{the accumulated rotation}) < 0$

➔ then *add* the next angle

$(\Theta - \text{the accumulated rotation}) > 0$

➔ then *subtract* the next angle

The final

I_c ➔ *cosine*

Q_c ➔ *sine*
