#### Open set examples

- The *circle* represents the set of points (x, y) satisfying x<sup>2</sup> + y<sup>2</sup> = r<sup>2</sup>.
   the *circle* set is its boundary set
- The *disk* represents the set of points (x, y) satisfying x<sup>2</sup> + y<sup>2</sup> < r<sup>2</sup>.
   The *disk* set is an **open set**
- the union of the *circle* and *disk* sets is a **closed set**.

https://en.wikipedia.org/wiki/Open\_set

- an open set is a generalization of an open interval in the real line.
- a metric space is a set along with a distance defined between any two points
- in a metric space,

an **open set** is a set that, along with every point P, contains all points that are *sufficiently near* to P

• all points whose distance to *P* is less than some value depending on *P* 

https://en.wikipedia.org/wiki/Open\_set

- More generally, an **open set** is
  - a member of a given collection of subsets of a given set
  - a collection that has the property of containing
    - every union of its members
    - every finite intersection of its members
    - the empty set
    - the whole set itself

https://en.wikipedia.org/wiki/Open\_set

- These conditions are very loose, and allow enormous flexibility in the choice of open sets.
- For example,
  - every subset can be open (the discrete topology)
  - <u>no subset</u> can be open (the **indiscrete topology**) except
    - the space itself and
    - the empty set

https://en.wikipedia.org/wiki/Open\_set

< A ▶

- A set in which such a collection is given is called a topological space, and the collection is called a topology.
  - A set is a collection of distinct objects.
  - Given a set A, we say that a is an element of A

if a is one of the distinct objects in A, and we write  $a \in \overline{A}$  to denote this

 Given two sets A and B, we say that A is a subset of B if every element of A is also an element of B write A ⊆ B to denote this.

### Open set (5) Open Balls

- An open ball B<sub>r</sub>(a) in ℝ<sup>n</sup> centered at a = (a<sub>1</sub>,...a<sub>n</sub>) ∈ ℝ<sup>n</sup> with radius r is the set of all points x = (x<sub>1</sub>,...x<sub>n</sub>) ∈ ℝ<sup>n</sup> such that the distance between x and a is less than r
- In  $\mathbb{R}^2$  an open ball is often called an open disk

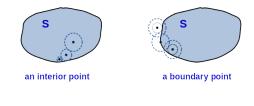

We give these definitions in general, for when one is working in  $\mathbb{R}^n$ since they are really not all that different to define in  $\mathbb{R}^n$  than in  $\mathbb{R}^2$ 

https://ximera.osu.edu/mooculus/calculusE/continuityOfFunctionsOfSeveralVariables/digInOpenAnd

## Open set (6) Interior points

- Suppose that  $S \subseteq \mathbb{R}^n$
- A point *p* ∈ S is an interior point of S if there exists an open ball B<sub>r</sub>(*p*) ⊆ S
- Intuitively, *p* is an interior point of S if we can squeeze an entire open ball centered at *p* within S

Open set (7) Boundary points

- A point *p* ∈ ℝ<sup>n</sup> is a boundary point of S if all open balls centered at *p* contain both points in S and points not in S
- The boundary of S is the set ∂S that consists of all of the boundary points of S.

 $https://ximera.osu.edu/mooculus/calculusE/continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOfFunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOffunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOffunctionsQfSeveralVariables/digInOpenAndQreaterstandormannet_continuityOffunctionsQfSeveralV$ 

Open set (8) Open and Closed Sets

- A set O ⊆ ℝ<sup>n</sup> is open if every point in O is an interior point.
- A set C ⊆ ℝ<sup>n</sup> is closed if it contains all of its boundary points.

https://ximera.osu.edu/mooculus/calculusE/continuityOfFunctionsOfSeveralVariables/digInOpenAndVariables/digI

< A >

< ∃ >

Open set (9) Bounded and Unbounded

• A set S is **bounded** if there is an open ball  $B_M(0)$  such that

#### $S \subseteq B$ .

intuitively, this means that we can enclose all of the set S within a large enough ball centered at the origin,  $B_M(0)$ 

• A set that is not bounded is called unbounded

https://ximera.osu.edu/mooculus/calculusE/continuityOfFunctionsOfSeveralVariables/digInOpenAnd

# Family of sets (1)

- a **collection** *F* of subsets of a given set *S* is called
  - a family of subsets of S, or
  - a family of sets over S.
- More generally,
  - a collection of any sets whatsoever is called
  - a family of sets,
  - set family, or
  - a set system

https://en.wikipedia.org/wiki/Family\_of\_sets

A 1

Family of sets (2)

- The term "collection" is used here because,
  - in some contexts, a **family** of **sets** may be <u>allowed</u> to contain <u>repeated</u> <u>copies</u> of any given <u>member</u>, and in other contexts.
  - in other contexts it may form a proper class rather than a set.

https://en.wikipedia.org/wiki/Family\_of\_sets

Examples of family of sets (1)

The set of all subsets of a given set S is called the **power set** of S and is denoted by *(S)*.

The power set  $\wp(S)$  of a given set S is a family of sets over S.

• A subset of *S* having *k* elements is called a *k*-subset of *S*.

The k-subset  $S^{(k)}$  of a set S form a **family** of **sets**.

https://en.wikipedia.org/wiki/Family\_of\_sets

Examples of family of sets (2)

https://en.wikipedia.org/wiki/Family\_of\_sets

### Neighbourhood basis (1)

- A neighbourhood basis or local basis
   (or neighbourhood base or local base) for a point x is a filter base of the neighbourhood filter;
- this means that it is a subset B ⊆ N(x) such that for all V ∈ N(x), there exists some B ∈ B such that B ⊆ V. That is, for any neighbourhood V we can find a neighbourhood B in the neighbourhood basis that is contained in V.

https://en.wikipedia.org/wiki/Neighbourhood\_system#Neighbourhood\_basis

▲ □ ▶ ▲ □ ▶ ▲

## Neighbourhood basis (2)

• Equivalently,  $\mathscr{B}$  is a local basis at x if and only if the neighbourhood filter  $\mathscr{N}$  can be recovered from  $\mathscr{B}$  in the sense that the following equality holds:

$$\mathscr{N}(x) = \{ V \subseteq X : B \subseteq V \text{ for some } B \in \mathscr{B} \}$$

A family B ⊆ N(x) is a neighbourhood basis for x if and only if B is a cofinal subset of (N(x), ⊇) with respect to the partial order ⊇ (importantly, this partial order is the superset relation and not the subset relation).

https://en.wikipedia.org/wiki/Neighbourhood system#Neighbourhood basis

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

## A collection of sets around x

- In general, one refers to the <u>family</u> of sets containing 0, used to <u>approximate</u> 0, as a neighborhood basis;
- a member of this neighborhood basis is referred to as an **open set**.
- In fact, one may generalize these notions to an <u>arbitrary</u> set (X); rather than just the real numbers.
- In this case, given a point (x) of that set (X), one may define a collection of sets
   "around" (that is, containing) x, used to approximate x.

https://en.wikipedia.org/wiki/Open set

▲ 伊 ▶ ▲ 三 ▶

#### Smaller sets containing x

- Of course, this collection would have to satisfy certain properties (known as axioms) for otherwise we may not have a well-defined method to measure distance.
- For example, every point in X should approximate x to some degree of accuracy.
- Thus X should be in this family.
- Once we begin to define "smaller" sets containing x, we tend to approximate x to a greater degree of accuracy.
- Bearing this in mind, one may define the remaining axioms that the family of sets about x is required to satisfy.

https://en.wikipedia.org/wiki/Open\_set

▲ @ ▶ < ■ ▶</p>

Open Sets and Classes Borel Sets Stochatic Process Open Set Filter Class

## Open ball (1)

- a **ball** is the solid figure bounded by a **sphere**; it is also called a **solid sphere**.
  - a closed ball

includes the boundary points that constitute the sphere

• an **open ball** excludes them

## Open ball (2)

- A ball in *n* dimensions is called a hyperball or n-ball and is bounded by a hypersphere or (*n*−1)-sphere
- One may talk about **balls** in any topological space *X*, not necessarily induced by a metric.
- An *n*-dimensional topological ball of X is any subset of X which is homeomorphic to an Euclidean n-ball.

https://en.wikipedia.org/wiki/Ball (mathematics)

## Outline

- Measurable Space
- Topological Space
- Borel Sets

< 47 ▶

#### Homogeneous Relation

- a homogeneous relation (also called endorelation) on a set X is a binary relation between X and itself, i.e. it is a subset of the Cartesian product X × X.
- This is commonly phrased as "a relation on X" or "a (binary) relation over X".
- An example of a homogeneous relation is the relation of kinship, where the relation is between people.

https://en.wikipedia.org/wiki/Homogeneous relation

## Binary Relation (1)

- a binary relation associates elements of one set, called the domain, with elements of another set, called the codomain.
- A binary relation over sets X and Y is

   a new set of ordered pairs (x, y)
   consisting of elements x from X and y from Y.

https://en.wikipedia.org/wiki/Binary relationelation

## Binary Relation (2)

- It is a generalization of a unary function.
- It encodes the common concept of relation:
- an element x is related to an element y,
   if and only if the pair (x, y) belongs
   to the set of ordered pairs that defines the binary relation.
- A binary relation is the most studied special case n = 2 of an n-ary relation over sets X<sub>1</sub>,...,X<sub>n</sub>, which is a subset of the Cartesian product X<sub>1</sub> ×···× X<sub>n</sub>.

https://en.wikipedia.org/wiki/Binary\_relationelation

## Partially Ordered Set (1-1)

- a **partial order** on a set is an arrangement such that, for certain pairs of elements, one precedes the other.
- The word **partial** is used to indicate that <u>not</u> every <u>pair</u> of elements needs to be <u>comparable</u>; that is, there may be <u>pairs</u> for which <u>neither</u> element <u>precedes</u> the other.
- **Partial orders** thus generalize **total orders**, in which every pair is comparable.

https://en.wikipedia.org/wiki/Partially ordered set

## Partially Ordered Set (1-2)

- Formally, a **partial order** is a homogeneous binary relation that is reflexive, transitive and antisymmetric.
- A partially ordered set (poset for short) is a set on which a partial order is defined.
- A reflexive, weak, or non-strict partial order, commonly referred to simply as a partial order, is a homogeneous relation ≤ on a set P that is reflexive, antisymmetric, and transitive.

https://en.wikipedia.org/wiki/Partially ordered set

## Partially Ordered Set (2)

- a homogeneous relation ≤ on a set P that is reflexive, antisymmetric, and transitive.
- That is, for all  $a, b, c \in P$ , it must satisfy:
  - Reflexivity:

 $a \leq a$ , i.e. every element is related to itself.

• Antisymmetry:

if  $a \leq b$  and  $b \leq a$  then a = b,

i.e. no two distinct elements precede each other.

• Transitivity:

if  $a \leq b$  and  $b \leq c$  then  $a \leq c$ .

• A non-strict **partial order** is also known as an antisymmetric preorder.

https://en.wikipedia.org/wiki/Partially\_ordered\_set

Open Sets and Classes Open Borel Sets Filter Stochatic Process Class

### Filter in Set Theory (1-1)

- A filter on a set may be thought of as representing a "collection of *large* subsets", one intuitive example being the neighborhood filter.
- keep large grains excluding small impurities

https://en.wikipedia.org/wiki/Filter\_(set\_theory)#filter\_base

< ∃ >

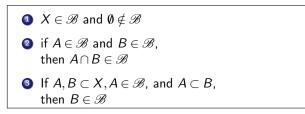

### Filter in Set Theory (1-2)

- When you put a filter in your sink, the idea is that you filter out the *big* chunks of food, and let the water and the *smaller* chunks go through (which can, in principle, be washed through the pipes).
- You filter out the *larger parts*.
- A filter filters out the *larger* sets.
- It is a way to say "these sets are 'large'"

https://en.wikipedia.org/wiki/Filter\_(set\_theory)#filter\_base

### Filter in Set Theory (1-3)

• a filter on a set X is a family  $\mathscr{B}$  of subsets such that:

https://en.wikipedia.org/wiki/Filter\_(set\_theory)#filter\_base

▲ □ ▶ ▲ □ ▶

## Filter in Set Theory (1-4)

• The set of "everything" is definitely *large* 

$$X \in \mathscr{B}$$

• and "nothing" is definitely not;

• if something is *larger* than a *large* set, then it is also *large*;

If  $A, B \subset X, A \in \mathscr{B}$ , and  $A \subset B$ , then  $B \in \mathscr{B}$ 

• and two large sets intersect on a large set.

If  $A \in \mathscr{B}$  and  $B \in \mathscr{B}$ , then  $A \cap B \in \mathscr{B}$ 

https://en.wikipedia.org/wiki/Filter\_(set\_theory)#filter\_base

## Filter in Set Theory (1-5)

- you can think about this as
  - being co-finite,
  - or being of measure 1 on the unit interval,
  - or having a dense open subset (again on the unit interval).
- These are examples of ways

where a set can be thought of as "almost everything". and that is the idea behind a filter.

https://en.wikipedia.org/wiki/Filter\_(set\_theory)#filter\_base

# Co-finite

- a **cofinite** subset of a set X is
  - a subset A whose complement in X is a finite set.
- a subset A contains all but *finitely many* elements of X
- If the complement is <u>not</u> finite, <u>but</u> is countable, then one says the set is **cocountable**.
- These arise naturally when <u>generalizing</u> structures on finite sets to infinite sets, particularly on infinite products, as in the product topology or direct sum.
- This use of the prefix "**co**" to describe a property possessed by a set's complement is *consistent* with its use in other terms such as "comeagre set".

https://en.wikipedia.org/wiki/Cofiniteness

< □ ▶ < / □ ▶

### Unit interval

- the **unit interval** is the closed interval [0,1], that is, the set of all real numbers that are greater than or equal to 0 and less than or equal to 1.
- It is often denoted I (capital letter I).
- In addition to its role in real analysis, the **unit interval** is used to study homotopy theory in the field of topology.
- the term "**unit interval**" is sometimes applied to the other shapes that an interval from 0 to 1 could take: (0,1], [0,1), and (0,1).
- However, the notation I is most commonly reserved for the closed interval [0,1].

https://en.wikipedia.org/wiki/Unit\_interval

< □ > < 同 > < 回 >

#### Dense set

- In topology, a subset A of a topological space X is said to be dense in X if every point of X either <u>belongs</u> to A or else is arbitrarily "close" to a member of A
  - for instance, the rational numbers are a **dense** subset of the real numbers because every real number either is a rational number or has a rational number arbitrarily close to it (see **Diophantine approximation**).
- Formally, A is **dense** in X if the *smallest* closed subset of X containing A is X itself.
- The **density** of a topological space X is the least cardinality of a **dense subset** of X.

https://en.wikipedia.org/wiki/Dense\_set

Image: Image:

# Ultrafilter (1-1)

- an ultrafilter on a given partially ordered set (or "poset") P is a certain subset of P, namely a maximal filter on P; that is, a proper filter on P that <u>cannot</u> be enlarged to a <u>bigger</u> proper filter on P.
- If X is an arbitrary set, its power set P(X), ordered by set inclusion,

is always a Boolean algebra and hence a poset, and ultrafilters on  $\mathcal{P}(X)$  are usually called ultrafilter on the set X.

https://en.wikipedia.org/wiki/Ultrafilter

< A >

# Ultrafilter (1-2)

- An ultrafilter on a set X may be considered as a finitely additive measure on X.
- In this view, every subset of X is either considered "almost everything" (has measure 1) or "almost nothing" (has measure 0), depending on whether it belongs to the given ultrafilter or not

https://en.wikipedia.org/wiki/Ultrafilter

## Ultrafilter on partial orders (1)

• In order theory, an ultrafilter is

a subset of a partially ordered set that is maximal among all proper filters.

- This implies that any filter that properly contains an ultrafilter has to be equal to the whole poset.
- Formally, if P is a set, partially ordered by  $\leq$  then

https://en.wikipedia.org/wiki/Ultrafilter

## Ultrafilter on partial orders (2)

- a subset F ⊆ P is called a filter on P if F is nonempty, for every x, y ∈ F, there exists some element z ∈ F such that z ≤ x and z ≤ y, and for every x ∈ F and y ∈ P, x ≤ y implies that y is in F too;
- a proper subset U of P is called an ultrafilter on P if U is a filter on P, and there is no proper filter F on P that properly extends U (that is, such that U is a proper subset of F).

https://en.wikipedia.org/wiki/Ultrafilter

#### Filter in Set Theory (2-1)

- Let X = 1, 2, 3Choose some element from X say F = 1, 1, 2, 1, 3, 1, 2, 3
- Then every intersection of an element of F with another element in F is in F again.

Examples:  $1 \cap 1, 2, 3 = 1$   $1, 2 \cap 1, 2, 3 = 1, 2$  $1.3 \cap 1.2.3 = 1.3$   $1.2.3 \cap 1.2.3 = 1.2.3$ 

• Also the original X = 1, 2, 3 is also in F. Here F = 1, 1, 2, 1, 3, 1, 2, 3 is called the filter on X = 1, 2, 3

> https://math.stackexchange.com/guestions/2816362/meaning-behind-filter-in-settheory

## Filter in Set Theory (2-2)

- .Suppose we have the collection G = 1, 1, 2, 1, 3, 2, 3, 1, 2, 3
- Then we have 1,3∩2,3 = 3 but 3 isn't in G.
   So this G is not called a filter.
- Now with *F* = 1, 1, 2, 1, 3, 1, 2, 3

can we put as any other element in it so that after placing the extra element it is still a filter? Probably <u>not</u> in this case. So on X = 1,2,3, F = 1,1,2,1,3,1,2,3 is an Ultrafilter.

https://math.stackexchange.com/questions/2816362/meaning-behind-filter-in-settheory

### Filter in Set Theory (3-1)

 If we have started say with H = 1,1,2,1,2,3 this is still a filter on X = 1,2,3 but we can still add 1,3 and it will still be classified as filter.

```
• So on X = 1,2,3
```

F = 1, 1, 2, 1, 3, 1, 2, 3 is an Ultrafilter but H = 1, 1, 2, 1, 2, 3 is a filter but not an Ultrafilter.

https://math.stackexchange.com/questions/2816362/meaning-behind-filter-in-set-

theory

### Filter in Set Theory (3-2)

- Now suppose we have X = 1,2,3,4 Let F = 1,4,1,2,4,1,3,4,1,2,3,4
- Every in intersection of element of F is in F again. We have as examples  $1,4 \cap 1,4 = 1,4$   $1,4 \cap 1,2,4 = 1,4$  $1,4 \cap 1,3,4 = 1,4$   $1,2,4 \cap 1,2,4 = 1,2,4$   $1,2,4 \cap 1,3,4 = 1,4$  $1,3,4 \cap 1,3,4 = 1,3,4$   $1,2,3,4 \cap 1,2,3,4 = 1,2,3,4$
- Also X = 1, 2, 3, 4 is also in F = 1, 4, 1, 2, 4, 1, 3, 4, 1, 2, 3, 4and the null element  $\emptyset$  = is not in F.

theory

くロト く得ト くヨト くヨト

Open Sets and Classes Open Borel Sets Filter Stochatic Process Class

#### Filter in Set Theory (3-3)

- We call F a filter but not an Ultrafilter on X = 1, 2, 3, 4
- We can still <u>add</u> element in it and it will still be a filter for instance by adding the element 1 from X = 1,2,3,4 we can have the filter F = 1,1,4,1,2,4,1,3,4,1,2,3,4
- This is an Ultrafilter on X = 1,2,3,4
   as we cannot add any further element from X = 1,2,3,4
   that satisfies closures on intersection.

https://math.stackexchange.com/questions/2816362/meaning-behind-filter-in-settheory

#### Filter in Set Theory (4)

• There is another collection of sets taken from *X* = 1,2,3,4 Which is the powerset

P = ,1,2,3,4,1,2,1,3,1,4,2,3,2,4,3,4,1,2,3,1,2,4,1,3,4,2,3,4,1,2,3,4This contain the null element  $\emptyset =$  so we cannot call this as Ultrafilter. This is not a proper filter according to the article in Wikipedia. In the powerset every intersection of element is again in the powerset again but it contains the null element  $\emptyset =$  and isn't classified as proper filter.

https://math.stackexchange.com/questions/2816362/meaning-behind-filter-in-set-theory

#### 1 **Open Sets and Classes** • Open Set • Filter Class

- Measurable Space
- Topological Space
- Borel Sets

< 47 ▶

#### • a class is a collection of sets

(or sometimes other mathematical objects) that can be unambiguously <u>defined</u> by a property that all its members share.

 Classes act as a way to have set-like collections while differing from sets so as to avoid Russell's paradox

https://en.wikipedia.org/wiki/Class\_(set\_theory)

< 47 ►

< ∃ >

Open Sets and Classes Borel Sets Stochatic Process Open Set Filter Class

- A class that is not a set is called a proper class, and
- a class that is a set is sometimes called a small class.
- the followings are proper classes in many formal systems
  - the class of all sets
  - the class of all ordinal numbers
  - the class of all cardinal numbers

https://en.wikipedia.org/wiki/Class\_(set\_theory)

- consider "the set of all sets with property X."
- especially when dealing with categories, since the objects of a concrete category are all sets with certain additional structure.
- However, if we're <u>not</u> careful about this we can get into serious trouble –

https://www.quora.com/In-set-theory-what-is-the-difference-between-a-set-ofobjects-and-a-class-of-objects

- let X be the set of all sets which do not contain *themselves*
- Since X is a set, we can ask whether X is an element of *itself*.
- But then we run into a paradox if X contains itself as an element, then it does not, and vice versa.

https://www.quora.com/In-set-theory-what-is-the-difference-between-a-set-of-

objects-and-a-class-of-objects

- In order to avoid this paradox, we <u>cannot</u> consider the collection of <u>all</u> sets to be itself a set.
- This means we have to *throw out* the whole "the set of all sets with property X" construction. But we wanted that.
- So the way we get around it is to say that there's something called a class, which is like a set but not a set.

https://www.quora.com/In-set-theory-what-is-the-difference-between-a-set-of-

objects-and-a-class-of-objects

- Then we can talk about
   "the class X of all sets with property Y."
- Since X is <u>not</u> a set, it can't be an element of itself, and we're fine.
- Of course, if we need to talk about the collection of all classes, we need to create another name that goes another step back, and so forth.

https://www.quora.com/In-set-theory-what-is-the-difference-between-a-set-of-

objects-and-a-class-of-objects

# Class Examples (1)

- The collection of all algebraic structures of a given type will usually be a proper class.
   (a class that is not a set is called a proper class)
  - the class of all groups
  - the class of all vector spaces
  - and many others.
- Within set theory, many collections of sets turn out to be proper classes.

https://en.wikipedia.org/wiki/Class\_(set\_theory)

Open Sets and Classes Borel Sets Stochatic Process Open Set Filter Class

## Class Examples (2)

- One way to prove that a class is proper is to place it in bijection with the class of all ordinal numbers.
  - Cardinal numbers indicate an <u>amount</u> how many of something we have: one, two, three, four, five.
  - Ordinal numbers indicate <u>position</u> in a series: first, second, third, fourth, fifth.

```
https://en.wikipedia.org/wiki/Class_(set_theory)
https://editarians.com/cardinals-ordinals/
```

< A ▶

# Class Paradoxes (1)

- The **paradoxes** of naive set theory can be explained in terms of the *inconsistent tacit assumption* that "all classes are sets".
- These paradoxes do <u>not</u> arise with classes because there is no notion of classes containing classes.
- Otherwise, one could, for example, define a class of all classes that do <u>not</u> contain themselves, which would lead to a Russell paradox for classes.

https://en.wikipedia.org/wiki/Class\_(set\_theory)

### Class Paradoxes (2)

- With a rigorous foundation, these paradoxes instead suggest proofs that certain classes are proper (i.e., that they are not sets).
  - Russell's paradox suggests a proof that the class of <u>all sets</u> which do not contain themselves is proper
  - the **Burali-Forti paradox** suggests that the class of all ordinal numbers is proper.

https://en.wikipedia.org/wiki/Class\_(set\_theory)

Russell's Paradox (1)

 According to the unrestricted comprehension principle, for any sufficiently well-defined property, there is the set of all and only the objects that have that property.

https://en.wikipedia.org/wiki/Russell%27s paradox

#### Russell's Paradox (2)

- Let R be the set of all sets  $(R = \{x \mid x \notin x\})$ that are not members of themselves  $(R \notin R)$ .
  - if R is <u>not</u> a member of itself (R ∉ R), then its definition (the set of all sets) entails <u>that</u> it is a member of itself (R ∈ R);
  - yet, *if* it is a member of itself (R ∈ R), *then* it is <u>not</u> a member of itself (R ∉ R), since it is the set of all sets that are not members of themselves (R ∉ R)
- the resulting contradiction is Russell's paradox.
- Let  $R = \{x \mid x \notin x\}$ , then  $R \in R \iff R \notin R$

https://en.wikipedia.org/wiki/Russell%27s paradox

#### Russell's Paradox (3)

- Most sets commonly encountered are not members of themselves.
- For example, consider the set of all squares in a plane.
- This set is <u>not</u> itself a <u>square</u> in the plane, thus it is <u>not</u> a <u>member</u> of itself.
- Let us call a set "normal" if it is <u>not</u> a member of itself, and "abnormal" if it is a member of itself.

https://en.wikipedia.org/wiki/Russell%27s\_paradox

#### Russell's Paradox (4)

- Clearly every set must be either normal or abnormal.
- The set of squares in the plane is normal.
- In contrast, the complementary set that contains everything which is <u>not</u> a <u>square</u> in the plane is itself <u>not</u> a <u>square</u> in the plane, and so it is one of its own members and is therefore abnormal.

https://en.wikipedia.org/wiki/Russell%27s\_paradox

## Russell's Paradox (5)

- Now we consider the set of all normal sets, *R*, and try to determine whether *R* is normal or abnormal.
  - If R were normal, it would be contained in the set of all normal sets (itself), and therefore be abnormal;
  - on the other hand *if R* were abnormal, it would <u>not</u> be contained in the set of all normal sets (itself), and therefore be normal.
- This leads to the conclusion that *R* is neither normal nor abnormal: **Russell's paradox**.

Measurable Space Topological Space Borel Sets

# Structure (2)

#### • A partial list of possible structures are

- measures
- algebraic structures (groups, fields, etc.)
- topologies
- metric structures (geometries)
- orders
- events
- equivalence relations
- differential structures
- categories.

https://www.localmaxradio.com/questions/what-is-a-mathematical-space

< A >

• A space consists of

selected mathematical objects that are treated as points, and selected relationships between these points.

- the *nature* of the points can vary widely: for example, the points can be
  - elements of a set
  - functions on another space
  - subspaces of another space
- It is the relationships between points that define the *nature* of the **space**.

https://en.wikipedia.org/wiki/Space (mathematics)

Measurable Space Topological Space Borel Sets

- modern mathematics uses many types of spaces, such as
  - Euclidean spaces
  - linear spaces
  - topological spaces
  - Hilbert spaces
  - probability spaces
- *modern mathematics* does <u>not</u> <u>define</u> the notion of **space** itself.

https://en.wikipedia.org/wiki/Space (mathematics)

Measurable Space Topological Space Borel Sets

a space is

a set (or a universe) with some added features

- it is <u>not</u> always clear whether a given mathematical object should be considered as a geometric space, or an algebraic structure
- a general <u>definition</u> of **structure** embraces all common types of **space**

https://en.wikipedia.org/wiki/Space\_(mathematics)

Measurable Space Topological Space Borel Sets

#### Mathematical space (1)

- A mathematical space is, informally, a collection of mathematical objects under consideration.
- The universe of mathematical objects within a space are *precisely* defined entities whose rules of *interaction* come baked into the rules of the space.

Measurable Space Topological Space Borel Sets

#### Mathematical space (2)

- A space differs from a mathematical set in several important ways:
  - A mathematical set is also a collection of objects
  - but these objects are being pulled from a **space** (or **universe**) of objects where the rules and definitions have already been <u>agreed</u> upon

Measurable Space Topological Space Borel Sets

#### Mathematical space (3)

- A space differs from a mathematical set in several important ways:
  - a mathematical set has no internal structure,
  - a **space** usually has some internal structure.

Measurable Space Topological Space Borel Sets

#### Mathematical space (4)

- having some internal structure could mean a variety of things, but typically it involves
  - *interactions* and *relationships* between elements of the **space**
  - *rules* on how to *create* and *define new* elements of the **space**

Measurable Space Topological Space Borel Sets

### Measurable space (1)

#### A measurable space is any space with a sigma-algebra which can then be equipped with a measure

• collection of subsets of the space following certain rules with a way to assign sizes to those sets.

https://www.quora.com/What-is-a-measurable-space-and-probability-space-

intuitively-What-differences-do-they-have

Measurable Space Topological Space Borel Sets

## Measurable space (2)

#### Intuitively,

certain sets belonging to a measurable space can be given a size in a *consistent way*.

consistent way means that certain axioms are met:

- the empty set is given a size of zero
- if a measurable set is contained inside another one, then its size is less than or equal to the size of the containing set
- the size of a disjoint union of sets is the sum of the individual sets' sizes

https://www.quora.com/What-is-a-measurable-space-and-probability-space-

intuitively-What-differences-do-they-have

Measurable Space Topological Space Borel Sets

### The set of all real numbers

 In the set of all real numbers, one has the natural Euclidean metric; that is, a function which *measures* the distance between two real numbers: d(x,y) = |x - y|.

https://en.wikipedia.org/wiki/Open\_set

< D > < A > < B > < B >

< ∃ →

#### All points close to a real number x

- Therefore, given a real number x, one can speak of the set of all points <u>close</u> to that real number x; that is, within ɛ of x.
- In essence, points within ε of x
   approximate x to an accuracy of degree ε.
- Note that ɛ > 0 always, but as ɛ becomes smaller and smaller, one obtains points that approximate x to a higher and higher degree of accuracy.

Measurable Space Topological Space Borel Sets

#### The points within $\varepsilon$ of x

- For example, if x = 0 and ε = 1, the points within ε of x are precisely the points of the interval (-1,1);
- However, with ε = 0.5, the points within ε of x are precisely the points of (-0.5, 0.5).
- Clearly, these points <u>approximate</u> x to a greater degree of accuracy than when ε = 1.

Open Sets and Classes Mea Borel Sets Top Stochatic Process Bore

Measurable Space Topological Space Borel Sets

## without a concrete Euclidean metric

The previous examples shows,

for the case x = 0, that one may **approximate** x to *higher* and *higher* degrees of accuracy by defining  $\varepsilon$  to be *smaller* and *smaller*.

- In particular, sets of the form  $(-\varepsilon, \varepsilon)$ give us a lot of <u>information</u> about points close to x = 0.
- Thus, <u>rather than</u> speaking of a <u>concrete</u> <u>Euclidean metric</u>, one may <u>use sets</u> to <u>describe</u> points <u>close</u> to <u>x</u>.

#### Different collections of sets containing 0

 This innovative idea has far-reaching consequences; in particular, by defining

> $\frac{\text{different collections of sets containing 0}}{(\text{distinct from the sets } (-\varepsilon, \varepsilon)),}$ one may find <u>different results</u> regarding the <u>distance</u> between 0 and other real numbers.

Measurable Space Topological Space Borel Sets

## A set for measuring distance

- For example, if we were to define *R* as the *only* such set for "*measuring distance*", all points are close to 0
- since there is only <u>one</u> possible degree of accuracy one may achieve in <u>approximating</u> 0: being a member of *R*.

#### The measure as a binary condition

- Thus, we find that in some sense, every real number is distance 0 away from 0.
- It may help in this case to think of the measure as being a binary condition:
  - all things in **R** are equally close to 0,
  - while any item that is not in R is not close to 0.

Measurable Space Topological Space Borel Sets

# Probability space

- A probability space is simply
  - a measurable space equipped with a probability measure.
- A probability measure has the special property of giving the entire **space** a size of **1**.
  - this then implies that the size of any <u>disjoint union</u> of sets (the <u>sum</u> of the sizes of the sets) in the **probability space** is <u>less than</u> or <u>equal to</u> **1**

https://www.quora.com/What-is-a-measurable-space-and-probability-space-

intuitively-What-differences-do-they-have

 topology from the Greek words τόπος, 'place, location', and λόγος, 'study'

https://en.wikipedia.org/wiki/Topology

▲ @ ▶ < ■ ▶</p>

• topology is concerned with

the *properties* of a geometric object that are *preserved* 

- under continuous deformations such as
  - stretching
  - twisting
  - crumpling
  - bending

https://en.wikipedia.org/wiki/Topology

- that is, without
  - closing holes
  - opening holes
  - tearing
  - gluing
  - passing through itself

▲ 🗇 🕨 🔺 🖻 🕨

Measurable Space Topological Space Borel Sets

## Topological space (1)

• a topological space is, roughly speaking,

a geometrical space in which closeness is defined

but <u>cannot</u> <u>necessarily</u> be measured by a numeric distance.

https://en.wikipedia.org/wiki/Borel\_set

< ∃ >

< 47 ▶

## Topological space (2)

- More specifically, a topological space is
  - a set whose elements are called points,
  - along with an additional structure called a topology,
- which can be defined as
  - a set of neighbourhoods for each point
  - that satisfy some <u>axioms</u> formalizing the concept of <u>closeness</u>.

https://en.wikipedia.org/wiki/Borel\_set

< (目) → (目)

Topological space (3)

• There are several *equivalent* definitions of a **topology**, the most commonly used of which is the definition through open sets,

which is easier than the others to manipulate.

https://en.wikipedia.org/wiki/Borel\_set

< D > < A > < B > < B >

## Topological space (4)

#### • A topological space is

the most general type of a mathematical space that allows for the definition of

- limits
- continuity
- connectedness
- Although very general,

the concept of **topological spaces** is fundamental, and used in virtually every branch of modern mathematics.

• The study of **topological spaces** in their own right is called point-set topology or general topology.

 $https://en.wikipedia.org/wiki/Topological\_space$ 

< ロ > < 同 > < 三 > .

#### Topological space (5)

- Common types of topological spaces include
  - Euclidean spaces : a set of points satisfying certain relationships, expressible in terms of distance and angles.
  - metric spaces : a set together with a notion of distance between points. The distance is measured by a function called a metric or distance function.
  - manifolds : a topological space that *locally* resembles
     Euclidean space near each point. More precisely, an n-manifold is a topological space with the property that each point has a neighborhood that is homeomorphic to an open subset of n-dimensional Euclidean space.

https://en.wikipedia.org/wiki/Topological\_space

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

## Discrete Topology

• a discrete space is a topological space,

in which the points form a discontinuous sequence, meaning they are isolated from each other in a certain sense.

• The discrete topology is

the finest topology that can be given on a set.

- every subset is open
- every singleton subset is an open set

https://en.wikipedia.org/wiki/Discrete space

< 47 ►

- a singleton, also known as a unit set or one-point set, is a set with exactly one element.
- for example, the set {0} is a singleton whose single element is 0

https://en.wikipedia.org/wiki/Discrete space

## Indiscrete Space (1)

- a **topological space** with the **trivial topology** is one where the only open sets are the empty set and the entire space.
- Such spaces are commonly called **indiscrete**, **anti-discrete**, **concrete** or **codiscrete**.
  - every subset can be open (the discrete topology), or
  - <u>no subset</u> can be open (the **indiscrete topology**) except the space itself and the empty set .

https://en.wikipedia.org/wiki/Discrete space

< A ▶

## Indiscrete Space (2)

- Intuitively, this has the consequence that all points of the space are "lumped together" and <u>cannot</u> be <u>distinguished</u> by topological means (not topologically <u>distinguishable</u> points)
- Every **indiscrete space** is a **pseudometric space** in which the distance between any two points is zero.

https://en.wikipedia.org/wiki/Discrete\_space

# T<sub>0</sub> Space

- a topological space X is a T<sub>0</sub> space or *if* for every pair of distinct points of X, <u>at least</u> one of them has a neighborhood not containing the other.
- In a  $T_0$  space, all points are topologically distinguishable.
- This condition, called the *T*<sub>0</sub> condition, is the weakest of the separation axioms.
- Nearly all topological spaces *normally* studied in mathematics are *T*<sub>0</sub> **space**.

https://en.wikipedia.org/wiki/Kolmogorov space

## Topologically distinguishable points

- Intuitively, an open set provides a *method* to *distinguish* two points.
- two points in a topological space, there exists an open set
  - containing one point but
  - not containing the other (distinct) point
  - the two points are topologically distinguishable.

https://en.wikipedia.org/wiki/Open set

- 4 同 1 4 回 1 4 回 1

#### Topologically distinguishable points

- Intuitively, an open set provides a *method* to *distinguish* two points.
- two points in a topological space, there exists an open set
  - containing one point but
  - not containing the other (distinct) point
  - the two points are topologically distinguishable.

https://en.wikipedia.org/wiki/Open set

- 4 同 1 4 回 1 4 回 1

#### Metric spaces

- In this manner, one may speak of whether <u>two</u> points, or more generally <u>two</u> subsets, of a topological space are "near" without concretely defining a distance.
- Therefore, topological spaces may be seen as a generalization of spaces equipped with a notion of distance, which are called metric spaces.

https://en.wikipedia.org/wiki/Open set

< A >

# Examples of topoloy (1)

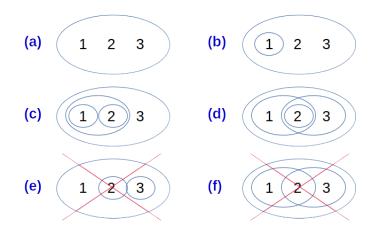

- Let τ be denoted with the circles, here are four examples (a), (b), (c), (d), and two non-examples (e), (f) of topologies on the three-point set {1,2,3}.
- (e) is <u>not</u> a topology because the union of {2} and {3} [i.e. {2,3}] is missing;
- (f) is not a topology because the intersection of {1,2} and {2,3} [i.e. {2}], is missing.

## Definition via Neighborhoods (4)

- The first three axioms for neighbourhoods have a clear meaning.
- The fourth axiom has a very important use in the structure of the theory, that of linking together the neighbourhoods of different points of X.
- A standard example of such a system of neighbourhoods is for the real line ℝ, where a subset N of ℝ is defined to be a neighbourhood of a real number x if it includes an open interval containing x.

https://en.wikipedia.org/wiki/Topological space

< /₽ ► < Ξ ►

#### Definition via Neighborhoods (5)

- Given such a structure, a subset U of X is defined to be **open** if U is a neighbourhood of all points in U.
- The **open sets** then satisfy the axioms given below.
- Conversely, when given the open sets of a topological space, the neighbourhoods satisfying the above axioms can be recovered by defining N to be a neighbourhood of x if N includes an open set U such that x ∈ U.

https://en.wikipedia.org/wiki/Topological space

< ロ > < 同 > < 三 > .

# Definitions via Closed Sets (1)

#### • Using de Morgan's laws,

the above axioms defining **open sets** become axioms defining **closed sets**:

- The empty set and X are closed.
  - The intersection of any collection of **closed sets** s also **closed**.
  - The union of any finite number of closed sets is also closed.
- Using these axioms, another way to define a topological space is as a set X together with a collection τ of closed subsets of X. Thus the sets in the topology τ are the closed sets, and their complements in X are the open sets.

https://en.wikipedia.org/wiki/Open\_set

# Sigma algebra (1)

- We term the structures which allow us to use measure to be sigma algebras
- the only requirements for sigma algebras (on a set X) are:
  - the {} and X are in the **set**.
  - if A is in the **set**, complement(A) is in the **set**.
  - for any sets  $E_i$  in the set,  $\bigcup_i E_i$  is in the set (for countable *i*).

https://medium.com/intuition/measure-theory-for-beginners-an-intuitive-approach-

f5cea0cc2e7

- 4 同 6 4 日 6 4 日

# Sigma algebra (2)

- The most intuitive way to think about a **sigma algebra** is that it is the kind of **structure** we can do **probability** on.
  - for example, we can assign <u>ratios</u> of <u>areas</u> and <u>length</u>, so the measure on such a set X tells something about the probability of its subsets.
  - we can find the probability of subsets A and B because we know their ratios with respect to a set X ;
  - we also know that
    - (the measure of) their complements are defined, and
    - their unions and intersections are defined,
    - so we know how to find the probability of things in this set X.

https://medium.com/intuition/measure-theory-for-beginners-an-intuitive-approach-

f5cea0cc2e7

<ロト < 同ト < 三ト <

# Sigma algebra (3)

- The sigma algebra which contains the standard topology on R (that is, *all* open sets on R) is called the **Borel Sigma Algebra**, and the elements of this set are called **Borel sets**.
- What this gives us, is the set of sets on which outer measure gives our list of dreams. That is, if we take a Borel set and we check that length follows translation, additivity, and interval length, it will always hold.

https://medium.com/intuition/measure-theory-for-beginners-an-intuitive-approach-

f5cea0cc2e7

# Sigma algebra (4)

- The set of Lebesgue measurable sets is the set of **Borel sets**, along with (union) all the sets which differ from a Borel set by a set of measure 0.
- More intuitively, it is all the sets we can normally measure, plus a bunch of stuff that <u>doesn't</u> affect our ideas of area or volume (think about the border of the circle above).

https://medium.com/intuition/measure-theory-for-beginners-an-intuitive-approach-

f5cea0cc2e7

# Borel Sets (1-1)

- a Borel set is any set in a topological space that can be formed from open sets (or, equivalently, from closed sets) through the operations of
  - countable union,
  - countable intersection, and
  - relative complement.

https://en.wikipedia.org/wiki/Borel\_set

# Borel Sets (1-2)

- For a topological space X, the collection of all Borel sets on X forms a σ-algebra, known as the Borel algebra or Borel σ-algebra.
- The Borel algebra on X is the smallest σ-algebra containing all open sets (or, equivalently, all closed sets).

https://en.wikipedia.org/wiki/Borel\_set

4 A<sup>2</sup>
 ▶

# Borel Sets (1-3)

- Borel sets are important in measure theory, since any measure defined on the open sets of a space, or on the closed sets of a space, must also be defined on all Borel sets of that space.
- Any measure defined on the Borel sets is called a **Borel measure**.
- Borel sets and the associated Borel hierarchy also play a fundamental role in descriptive set theory.

https://en.wikipedia.org/wiki/Borel set

Open Sets and Classes Borel Sets Stochatic Process Development Borel Sets Borel Sets

- Borel sets are those obtained from intervals by means of the operations allowed in a σ-algebra. So we may construct them in a (transfinite) "sequence" of steps:
- ... And again and again.

< ロ > < 同 > < 三 > .

Open Sets and Classes Borel Sets Stochatic Process Borel Sets Borel Sets

# Borel Sets (3-1)

- 1. Start with finite unions of closed-open intervals. These sets are completely elementary, and they form an algebra.
- 2. Adjoin countable unions and intersections of elementary sets. What you get already includes open sets and closed sets, intersections of an open set and a closed set, and so on. Thus you obtain an algebra, that is still <u>not</u> a  $\sigma$ -algebra.

https://math.stackexchange.com/questions/220248/understanding-borel-sets

Open Sets and Classes Borel Sets Stochatic Process Development Borel Sets Borel Sets

- Again, adjoin countable unions and intersections to 2. Observe that you get a strictly larger class, since a countable intersection of countable unions of intervals is <u>not</u> <u>necessarily</u> included in 2. Explicit examples of sets in 3 but not in 2 include F<sub>σ</sub> sets, like, say, the set of *rational numbers*.
- 4. And do the same again.

https://math.stackexchange.com/questions/220248/understanding-borel-sets

Open Sets and Classes Borel Sets Stochatic Process Borel Sets Borel Sets

# Borel Sets (4-1)

• And even after a sequence of steps we are not yet finished. Take, say, a countable union of a set constructed at step 1, a set constructed at step 2, and so on. This union may very well not have been constructed at any step yet. By axioms of  $\sigma$ -algebra, you should include it as well - if you want, as step  $\infty$ 

https://math.stackexchange.com/questions/220248/understanding-borel-sets

Open Sets and Classes Borel Sets Stochatic Process Devel Sets Borel Sets

# Borel Sets (4-2)

- (or, technically, the first infinite ordinal, if you know what that means).
- And then continue in the same way until you reach the first uncountable ordinal. And only then will you finally obtain the generated  $\sigma$  -algebra.

### Stochastic Process (1)

In probability theory and related fields, a **stochastic** (/stoʊ'kæstık/) or **random** process is a mathematical object usually defined as a family of **random variables**.

The word stochastic in English was originally used as an adjective with the definition "pertaining to **conjecturing**", and stemming from a Greek word meaning "to <u>aim</u> at a mark, <u>guess</u>", and the Oxford English Dictionary gives the year 1662 as its earliest occurrence.

From Ancient Greek στοχαστικός (stokhastikós), from στοχάζομαι (stokházomai, "aim at a target, guess"), from στόχος (stókhos, "an aim, a guess").

> https://en.wikipedia.org/wiki/Stochastic https://en.wiktionary.org/wiki/stochastic

< ロ > < 同 > < 三 > .

Stochastic Process (2)

The definition of a **stochastic process** varies, but a **stochastic process** is *traditionally* defined as a collection of **random variables** indexed by some set.

The terms **random process** and **stochastic process** are considered <u>synonyms</u> and are used <u>interchangeably</u>, without the **index set** being precisely specified.

Both "collection", or "family" are used while instead of "index set", sometimes the terms "parameter set" or "parameter space" are used.

### Stochastic Process (3)

The term **random function** is also used to refer to a **stochastic** or **random process**, though sometimes it is only used when the stochastic process takes <u>real values</u>.

This term is also used when the **index sets** are **mathematical spaces** other than the **real line**,

while the terms **stochastic process** and **random process** are usually used when the **index set** is interpreted as <u>time</u>,

and other terms are used such as random field when the index set is *n*-dimensional Euclidean space  $\mathbb{R}^n$  or a manifold

### Stochastic Process (4)

A stochastic process can be denoted, by  $\{X(t)\}_{t\in T}$ ,  $\{X_t\}_{t\in T}$ ,  $\{X(t)\}$ ,  $\{X_t\}$  or simply as X or X(t), although X(t) is regarded as an abuse of function notation.

For example, X(t) or  $X_t$  are used to refer to the **random variable** with the **index** t, and not the entire **stochastic process**.

If the **index set** is  $T = [0, \infty)$ , then one can write, for example,  $(X_t, t \ge 0)$  to denote the **stochastic process**.

# Stochastic Process Definition (1)

A stochastic process is defined as a <u>collection</u> of **random variables** defined on a <u>common</u> probability space  $(\Omega, \mathcal{F}, P)$ ,

- Ω is a sample space,
- $\mathscr{F}$  is a  $\sigma$  -algebra,
- P is a probability measure;
- the random variables, indexed by some set T,
- all take values in the same **mathematical space** S, which must be **measurable** with respect to some  $\sigma$  -algebra  $\Sigma$

#### Stochastic Process Definition (2)

In other words, for a given probability space  $(\Omega, \mathscr{F}, P)$ and a measurable space  $(S, \Sigma)$ , a stochastic process is a collection of S-valued random variables, which can be written as:

 $\{X(t):t\in T\}.$ 

#### Stochastic Process Definition (3)

Historically, in many problems from the natural sciences a point  $t \in T$  had the meaning of time, so X(t) is a **random variable** representing a value observed at time t.

A stochastic process can also be written as  $\{X(t, \omega) : t \in T\}$ to reflect that it is actually a function of two variables,  $t \in T$  and  $\omega \in \Omega$ .

# Stochastic Process Definition (4)

There are <u>other</u> ways to consider a stochastic process, with the above definition being considered the <u>traditional</u> one.

For example, a stochastic process can be interpreted or defined as a  $S^{T}$ -valued **random variable**, where  $S^{T}$  is the space of all the possible functions from the set T into the space S.

However this alternative definition as a "**function-valued random variable**" in general requires additional regularity assumptions to be **well-defined**.

# The set T is called the **index set** or **parameter set** of the **stochastic process**.

Often this set is some <u>subset</u> of the <u>real line</u>, such as the natural numbers or an interval, giving the set T the interpretation of time.

In addition to these sets, the index set T can be another set with a **total order** or a more general set, such as the Cartesian plane  $R^2$  or *n*-dimensional **Euclidean space**, where an element  $t \in T$  can represent a point in space.

That said, many results and theorems are only possible for **stochastic processes** with a **totally ordered index set**.

The mathematical space S of a stochastic process is called its state space.

This mathematical space can be defined using integers, real lines, *n*-dimensional Euclidean spaces, complex planes, or more abstract mathematical spaces.

The **state space** is defined using elements that reflect the different values that the **stochastic process** can take.

# Sample function (1)

A sample function is a single outcome of a stochastic process, so it is formed by taking a single possible value of each random variable of the stochastic process.

More precisely, if  $\{X(t, \omega) : t \in T\}$  is a **stochastic process**, then for any point  $\omega \in \Omega$ , the mapping  $X(\cdot, \omega) : T \to S$ , is called a **sample function**, a **realization**, or, particularly when T is interpreted as <u>time</u>, a **sample path** of the **stochastic process**  $\{X(t, \omega) : t \in T\}$ .

# Sample function (2)

#### This means that for a fixed $\omega \in \Omega$ , there exists a sample function that maps the index set T to the state space S.

# Other names for a **sample function** of a **stochastic process** include **trajectory**, **path function** or **path**
